

# Counterfactual Query Rewriting to Use Historical Relevance Feedback

Jüri Keller, Maik Fröbe, Gijs Hendriksen, Daria Alexander, Martin Potthast, Matthias Hagen, Philipp Schaer

*The same query...  
...over and over again.*

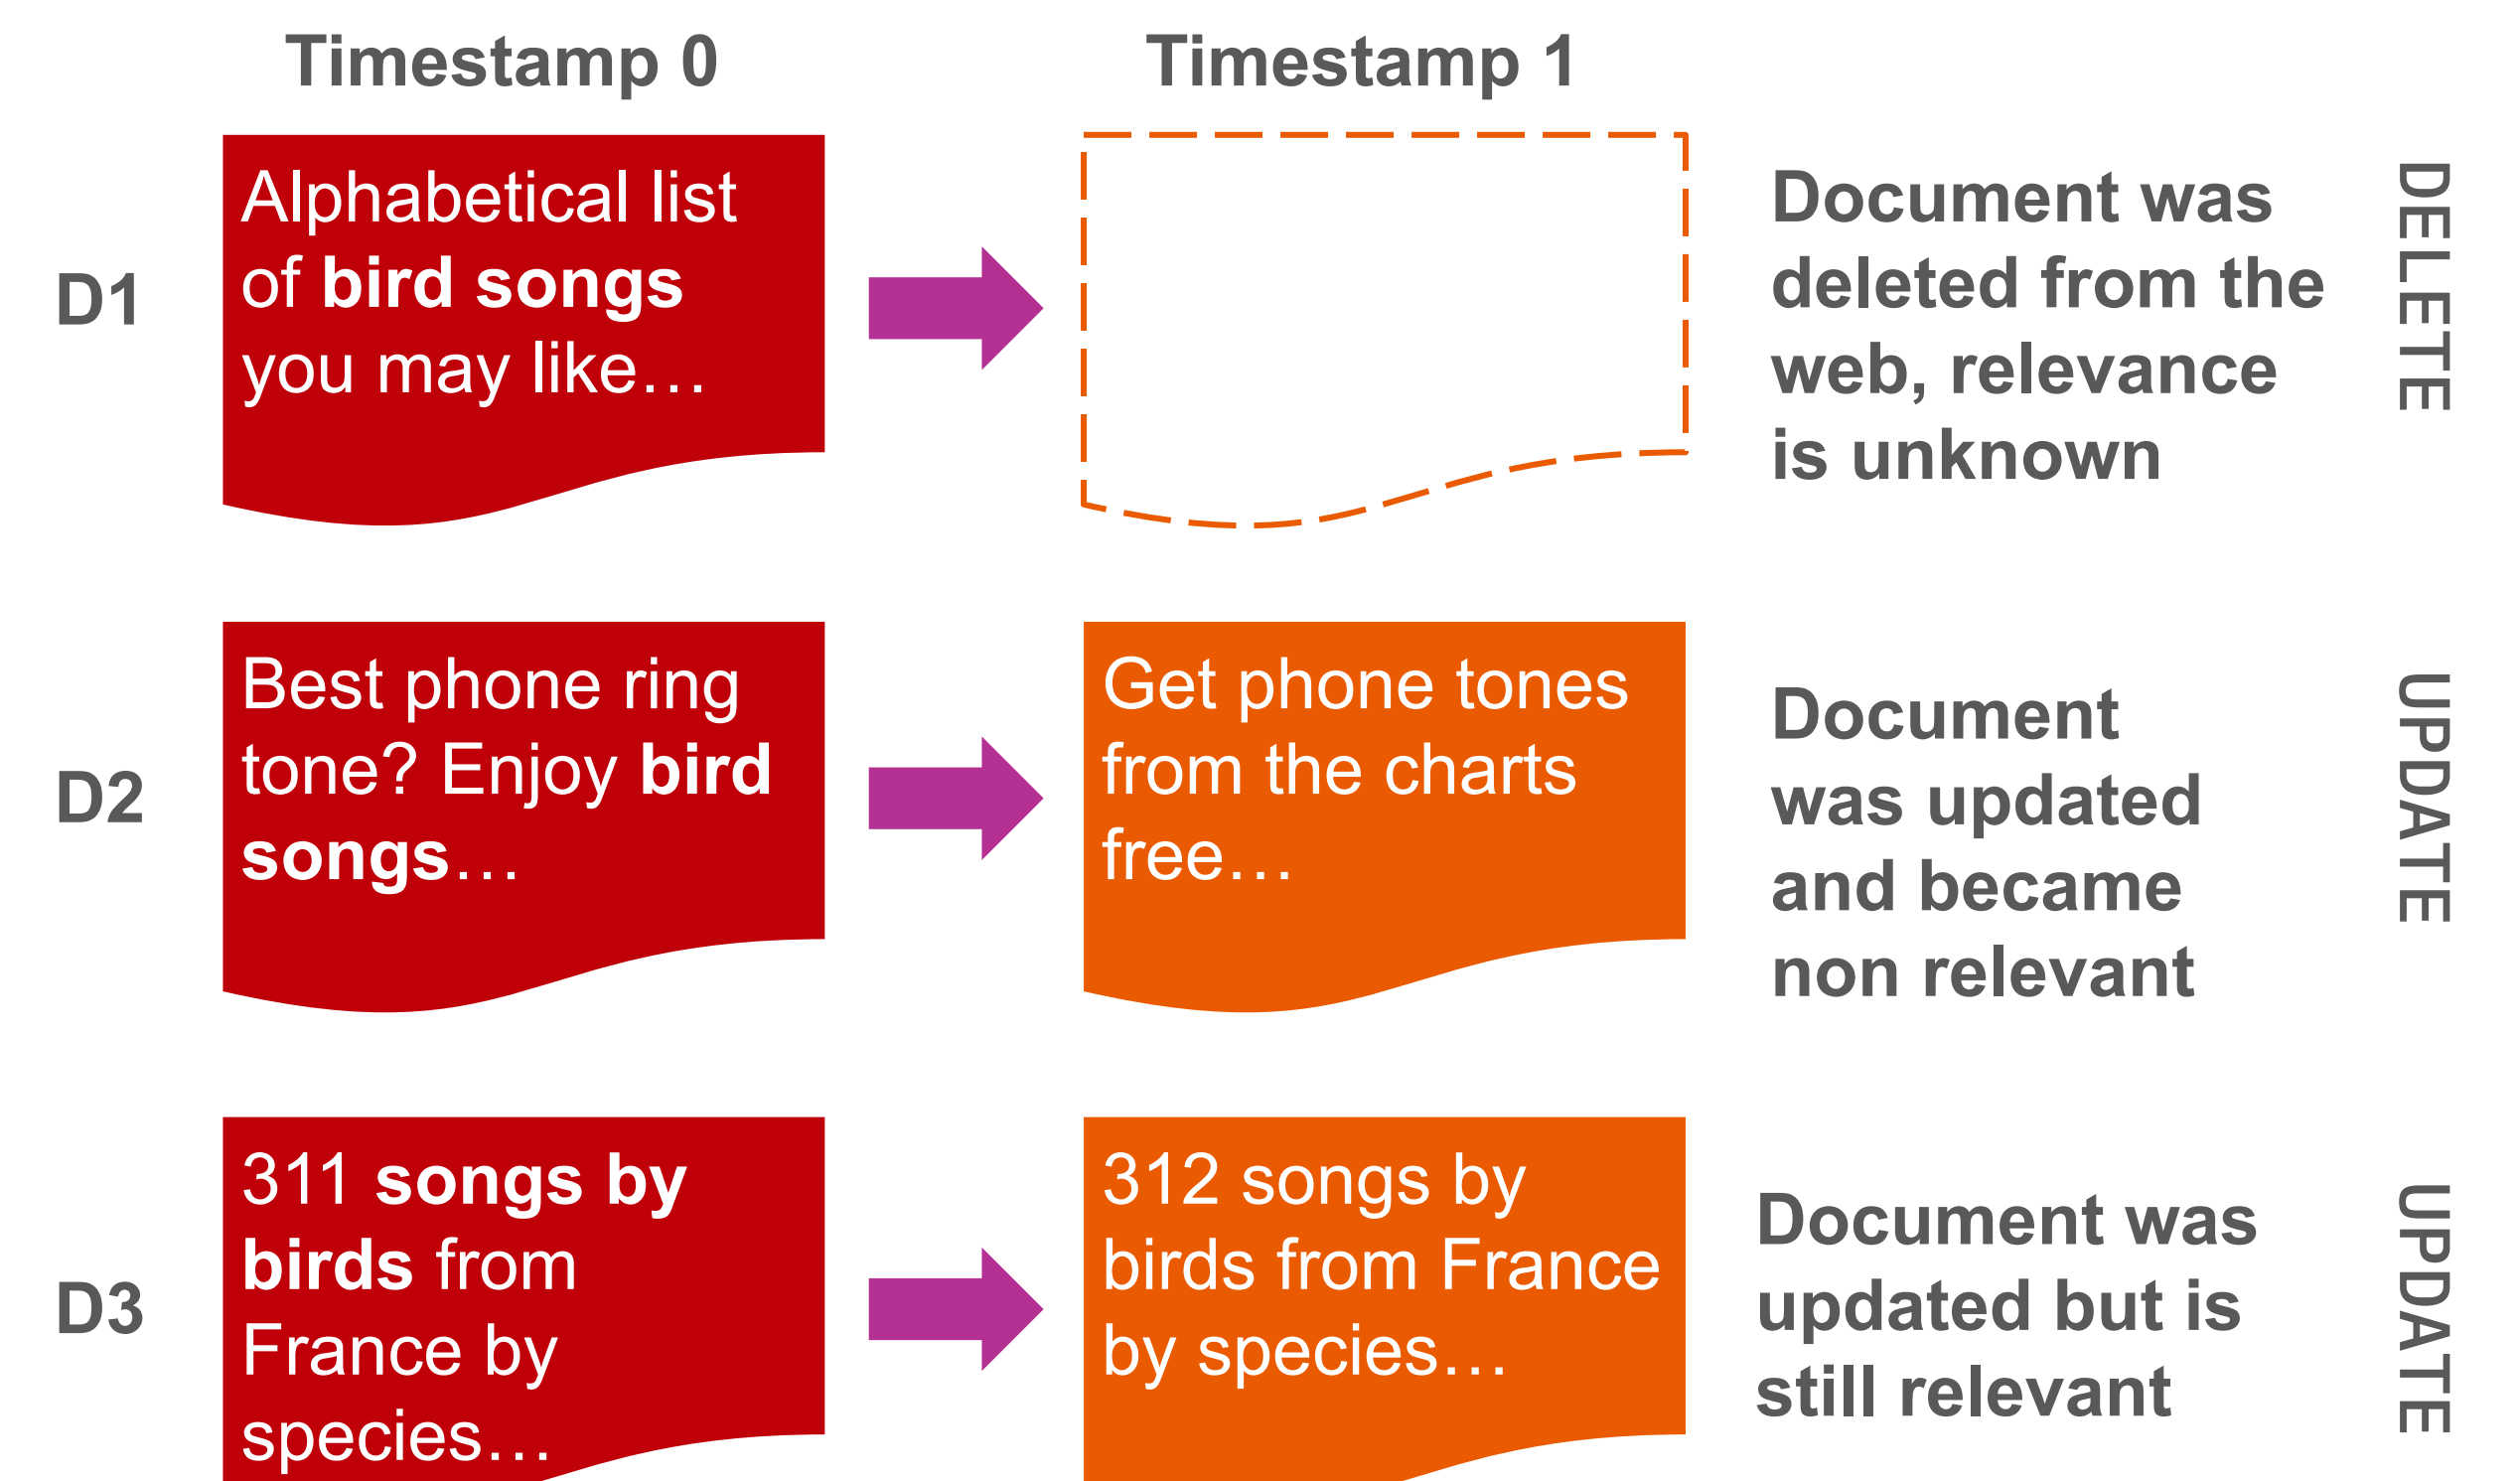

Many queries a search engine  
receives are not new!

How should this change the  
behaviour of the search engine?

- User interactions as relevance indicators
- We **counterfactually** assume that these pseudo-relevance labels are still valid, even if the documents **changed**
- These pseudo-relevance labels can be used to rewrite users' queries

## Historic Relevance Feedback

## 1 Boosting

- Boost known documents based on their historic relevance feedback
- Can be repeated over time

$$\text{score}(q, d) = \text{score}_0 \times \prod_{t=t_1}^{t_k} \begin{cases} (1-\lambda)^2, & \text{if } \text{rel}(q, d, t) = 0 \\ \lambda^2, & \text{if } \text{rel}(q, d, t) = 1 \\ \lambda^2 \mu, & \text{if } \text{rel}(q, d, t) = 2 \end{cases}$$

- **Can not generalize** beyond known query-document pairs

## 2 Relevance Feedback

- Expand users' queries with terms from previously relevant docs
- Terms with top-k tf-idf scores
- Can be calculated offline as soon as relevance feedback exists
- RM3 as equivalent for new queries
- Generalizes to new and updated documents

## 3 Keyqueries

*Perfect query for target docs*

- Rewrite user query into a **keyquery**
- Based on the previously relevant documents as **target documents**

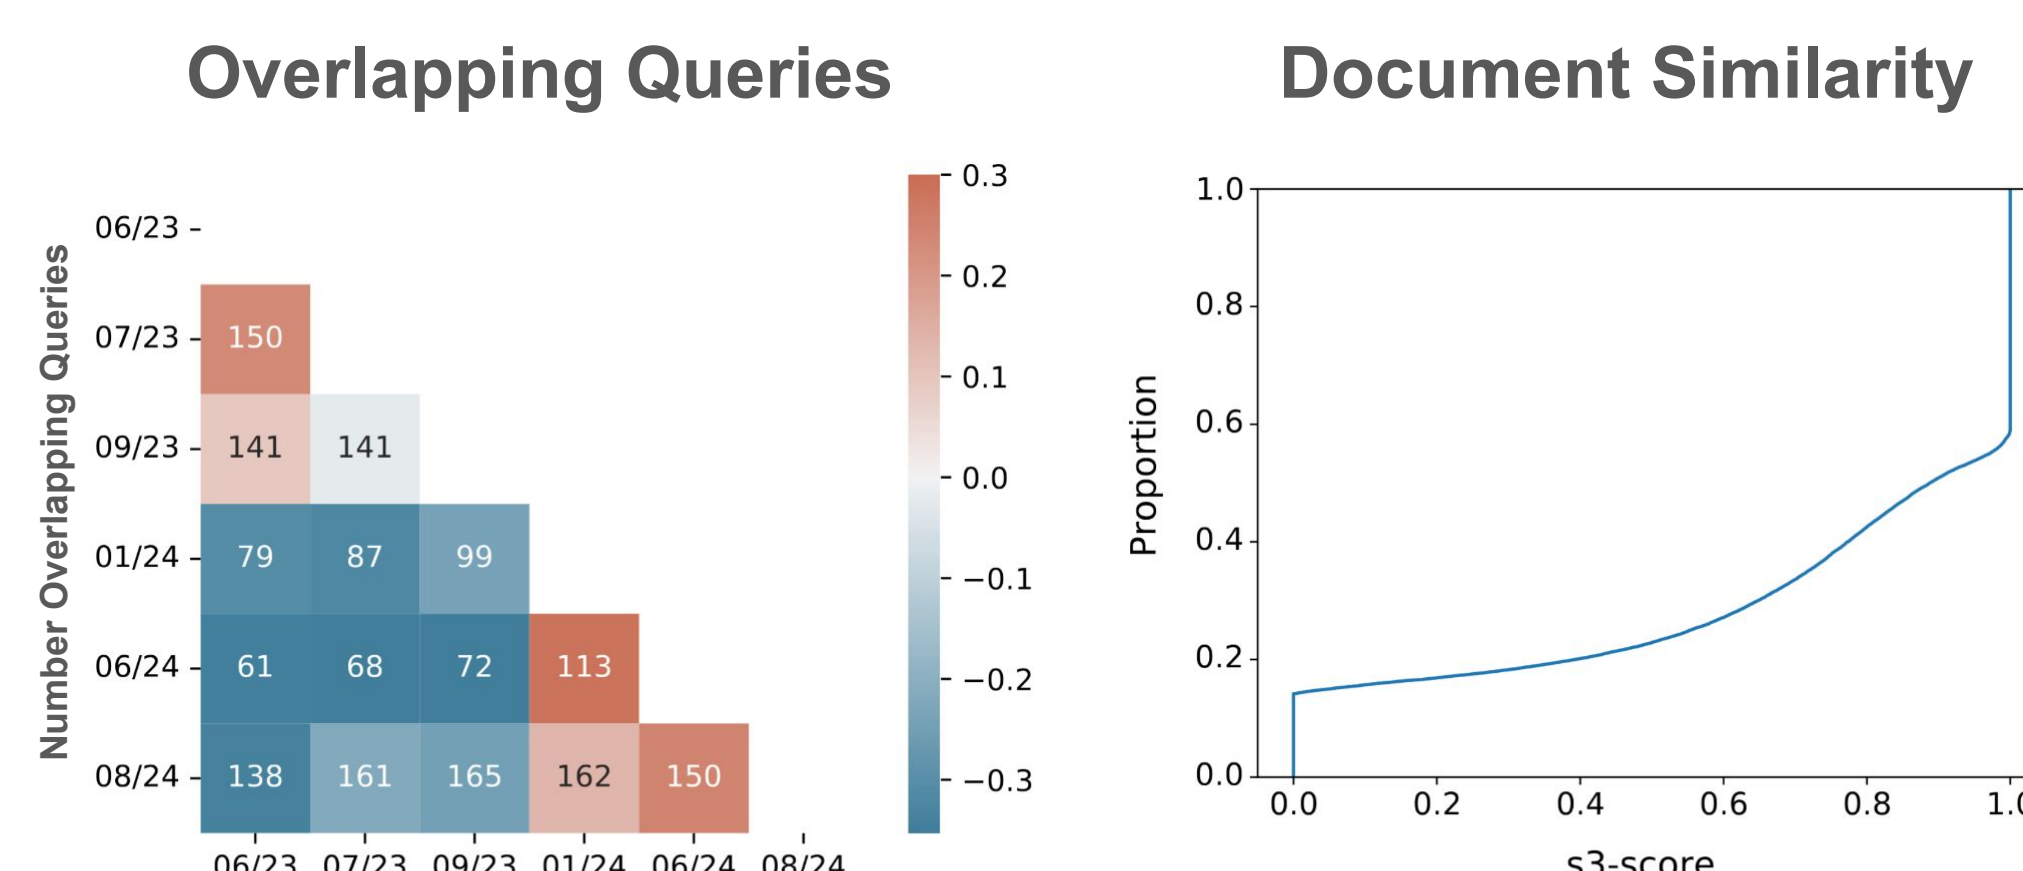

Query  $q$  is a **keyquery** for a set  $D$  of **target documents** against a search engine iff:

1. Every  $d \in D$  is in the top-k results. (specificity)
2. Query  $q$  has at least  $l$  results. (generality)
3. No subquery  $q' \subset q$  satisfies the above. (minimality)

- Prevents over and under fitting of the ranking to the target documents

## Experiments

- Evaluated on six sub-collections between June 2023 and August 2024 of the LongEval Web collection
- Ablation study investigates how the systems generalize to new documents

## Results

- ColBERT, List-in-T5, and monoT5 outperform the BM25 (+RM3) baselines
- Our three approaches substantially outperform all five baselines!
- Keyqueries perform the best and generalize well to new documents

System	nDCG@10					nDCG@10'				
	Normalized Discounted Cumulative Gain (nDCG)					nDCG on judged documents only				
	07/22	09/22	01/23	06/23	08/23	07/22	09/22	01/23	06/23	08/23

1 BM25 <sub>Boost</sub>	.355 <sup>†‡</sup>	.372 <sup>†‡</sup>	.287 <sup>†‡</sup>	.364 <sup>†‡</sup>	.271 <sup>†‡</sup>	.529 <sup>‡</sup>	.546 <sup>‡</sup>	.541 <sup>‡</sup>	.540 <sup>‡</sup>	.412 <sup>‡</sup>
2 BM25 <sub>RF</sub>	.303 <sup>†‡</sup>	.332 <sup>†‡</sup>	.241 <sup>†</sup>	.262 <sup>†‡</sup>	.191 <sup>†‡</sup>	.606 <sup>†‡</sup>	.611 <sup>†‡</sup>	.590 <sup>†‡</sup>	.552 <sup>†‡</sup>	.426 <sup>†‡</sup>
3 BM25 <sub>keyquery</sub>	.350 <sup>†‡</sup>	.391 <sup>†‡</sup>	.233	.262	.185	.642	.655 <sup>‡</sup>	.574 <sup>†</sup>	.554	.422 <sup>‡</sup>

## Conclusion

1. The advanced approaches **generalize** beyond known documents
2. Few feedback docs already substantially **improve** the retrieval effectiveness
3. Systems outperform expensive transformer-based models at a much **lower cost**
