Android

am

Android activity manager.

More information: https://developer.android.com/tools/adb#am.

- Start the activity with a specific component and package [n]ame:

```
am start -n {{com.android.settings/.Settings}}
```

- Start an intent [a]ction and pass [d]ata to it:

```
am start -a {{android.intent.action.VIEW}} -d {{tel:123}}
```

- Start an activity matching a specific [a]ction and [c]ategory:

```
am start -a {{android.intent.action.MAIN}} -c
{{android.intent.category.HOME}}
```

- Convert an intent to a URI:

```
am to-uri -a {{android.intent.action.VIEW}} -d {{tel:123}}
```

bugreport

Show an Android bug report.

This command can only be used through **`adb shell`**.

More information: https://cs.android.com/android/platform/superproject/+/main:frameworks/native/cmds/bugreport.

- Display a complete bug report of an Android device:

```
bugreport
```

bugreportz

Generate a zipped Android bug report.

This command can only be used through **`adb shell`**.

More information: https://cs.android.com/android/platform/superproject/+/main:frameworks/native/cmds/bugreportz.

- Generate a complete zipped bug report of an Android device:

  `bugreportz`

- Show the progress of a running `bugreportz` operation:

  `bugreportz -p`

- Write the content of an Android bug report to `stdout`:

  `bugreportz -s`

- Display help:

  `bugreportz -h`

- Display version:

  `bugreportz -v`

cmd

Android service manager.

More information: https://cs.android.com/android/platform/superproject/+/main:frameworks/native/cmds/cmd/.

- [l]ist all running services:

```
cmd -l
```

- Call a specific service:

```
cmd {{service}}
```

- Call a service with specific arguments:

```
cmd {{service}} {{argument1 argument2 ...}}
```

dalvikvm

Android Java virtual machine.

More information: https://source.android.com/docs/core/runtime.

- Start a specific Java program:

```
dalvikvm -classpath {{path/to/file.jar}} {{classname}}
```

dumpsys

Get information about Android system services.

This command can only be used through **`adb shell`**.

More information: https://developer.android.com/tools/dumpsys.

- Get diagnostic output for all system services:

```
dumpsys
```

- Get diagnostic output for a specific system service:

```
dumpsys {{service}}
```

- List all services `dumpsys` can give information about:

```
dumpsys -l
```

- List service-specific arguments for a service:

```
dumpsys {{service}} -h
```

- Exclude a specific service from the diagnostic output:

```
dumpsys --skip {{service}}
```

- Specify a [t]imeout period in seconds (defaults to 10s):

```
dumpsys -t {{8}}
```

getprop

Show information about Android system properties.

More information: https://manned.org/getprop.

- Display information about Android system properties:

```
getprop
```

- Display information about a specific property:

```
getprop {{property}}
```

- Display the SDK API level:

```
getprop {{ro.build.version.sdk}}
```

- Display the Android version:

```
getprop {{ro.build.version.release}}
```

- Display the Android device model:

```
getprop {{ro.vendor.product.model}}
```

- Display the OEM unlock status:

```
getprop {{ro.oem_unlock_supported}}
```

- Display the MAC address of the Android's Wi-Fi card:

```
getprop {{ro.boot.wifimacaddr}}
```

input

Send event codes or touchscreen gestures to an Android device.

This command can only be used through **`adb shell`**.

More information: https://developer.android.com/reference/android/view/KeyEvent.html#constants_1.

- Send an event code for a single character to an Android device:

```
input keyevent {{event_code}}
```

- Send a text to an Android device (`%s` represents spaces):

```
input text "{{text}}"
```

- Send a single tap to an Android device:

```
input tap {{x_position}} {{y_position}}
```

- Send a swipe gesture to an Android device:

```
input swipe {{x_start}} {{y_start}} {{x_end}} {{y_end}} {{duration_in_ms}}
```

- Send a long press to an Android device using a swipe gesture:

```
input swipe {{x_position}} {{y_position}} {{x_position}} {{y_position}} {{duration_in_ms}}
```

logcat

Dump a log of system messages, including stack traces when an error occurred, and information messages logged by applications.

More information: https://developer.android.com/tools/logcat.

- Display system logs:

```
logcat
```

- Write system logs to a [f]ile:

```
logcat -f {{path/to/file}}
```

- Display lines that match a `regex`:

```
logcat --regex {{regex}}
```

- Display logs for a specific PID:

```
logcat --pid {{pid}}
```

- Display logs for the process of a specific package:

```
logcat --pid $(pidof -s {{package}})
```

pkg

Package management utility for Termux.

More information: https://wiki.termux.com/wiki/Package_Management.

- Upgrade all installed packages:

```
pkg {{[up|upgrade]}}
```

- List currently installed packages:

```
pkg {{[list-i|list-installed]}}
```

- Install a package:

```
pkg {{[i|install]}} {{package}}
```

- Uninstall a package:

```
pkg {{[un|uninstall]}} {{package}}
```

- Reinstall a package:

```
pkg {{[rei|reinstall]}} {{package}}
```

- Search for a package:

```
pkg {{[se|search]}} {{package}}
```

- Show information about specific package:

```
pkg {{[sh|show]}} {{package}}
```

- Display help:

```
pkg {{[h|help]}}
```

pm

Display information about apps on an Android device.

More information: https://developer.android.com/tools/adb#pm.

- List all installed apps:

```
pm list packages
```

- List all installed [s]ystem apps:

```
pm list packages -s
```

- List all installed [3]rd-party apps:

```
pm list packages -3
```

- List apps matching specific keywords:

```
pm list packages {{keyword1 keyword2 ...}}
```

- Display a path of the APK of a specific app:

```
pm path {{app}}
```

screencap

Take a screenshot of a mobile display.

This command can only be used through **`adb shell`**.

More information: https://developer.android.com/tools/adb#screencap.

- Take a screenshot:

```
screencap {{path/to/file}}
```

settings

Get information about the Android OS.

More information: https://web.archive.org/web/20240525010124/https://adbinstaller.com/commands/adb-shell-settings-5b670d5ee7958178a2955536.

- List the settings in the `global` namespace:

```
settings list {{global}}
```

- Get a value of a specific setting:

```
settings get {{global}} {{airplane_mode_on}}
```

- Set a specific value of a setting:

```
settings put {{system}} {{screen_brightness}} {{42}}
```

- Delete a specific setting:

```
settings delete {{secure}} {{screensaver_enabled}}
```

wm

Show information about the screen of an Android device.

This command can only be used through **`adb shell`**.

More information: https://web.archive.org/web/20240420064706/https://adbinstaller.com/commands/adb-shell-wm-5b672b17e7958178a2955538.

- Display the physical size of an Android device's screen:

```
wm size
```

- Display the physical density of an Android device's screen:

```
wm density
```

Cisco-ios

clock

Set the system clock.

More information: https://www.cisco.com/c/en/us/td/docs/ios/fundamentals/command/reference/cf_book/cf_c1.html#clock.

- Enter privileged execution mode:

```
clock set {{23}}:{{59}}:{{59}} {{31}} {{april}} {{2000}}
```

- Auto negotiate with the far end of the link, defaulting to active-clock:

```
clock active prefer
```

- Auto negotiate with the far end of the link, defaulting to passive-clock:

```
clock passive prefer
```

- Show the current clock mode negotiated by the firmware:

```
clock show interfaces
```

configure

Enter configuration mode.

More information: https://www.cisco.com/c/en/us/td/docs/ios/fundamentals/command/reference/cf_book/cf_c1.html#configure_check_syntax.

- Configure from the terminal:

  ```
  {{[conf|configure]}} {{[t|terminal]}}
  ```

- Back out one level in configuration mode:

  ```
  exit
  ```

- Exit out of configuration mode:

  ```
  end
  ```

crypto

Manage cryptography.

Accessed in configuration mode.

More information: https://www.cisco.com/c/en/us/td/docs/security/asa/asa-cli-reference/A-H/asa-command-ref-A-H/crypto-is-cz-commands.html.

- Generate an `rsa` key:

  ```
  crypto key generate rsa
  ```

- Define a modulus for a key:

  ```
  crypto key generate rsa modulus {{1024}}
  ```

- Remove all keys:

  ```
  crypto key zeroize
  ```

delete

Delete individual files.

More information: https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus5000/sw/command/reference/fund/n5k-fund-cr/n5k-fund_cmds_d.html#delete.

- Delete a file from flash memory:

```
delete {{vlan.dat}}
```

dir

List files.

More information: https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus5000/sw/command/reference/fund/n5k-fund-cr/n5k-fund_cmds_d.html#dir.

- List files in the current working directory:

```
dir
```

- List files in a specific filesystem:

```
dir {{flash}}:
```

- List available filesystems:

```
dir ?
```

enable

Enter privileged execution mode.

More information: https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/security/d1/sec-d1-cr-book/sec-cr-e1.html#wp3307186499.

- Enter privileged execution mode:

```
enable
```

erase

Delete preset things.

More information: https://www.cisco.com/c/en/us/td/docs/ios/ios_xe/fundamentals/configuration/guide/2_xe/cf_xe_book/cf_config-files_xe.html.

- Erase the startup configuration:

```
erase startup-config
```

- Erase a filesystem:

```
erase {{flash}}:
```

interface

Manage interfaces.

Accessed in configuration mode.

More information: https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/interface/command/ir-cr-book/ir-i1.html.

- Configure a VLAN:

  ```
  interface vlan {{1}}
  ```

- Set an interface to be active or inactive (this is run inside the interface command):

  ```
  {{no shutdown|shutdown}}
  ```

ip

Manage IP configurations.

Accessed in configuration mode.

More information: https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/ipaddr/command/ipaddr-cr-book.html.

- Set the SSH version:

```
ip ssh version {{2}}
```

- Set the address of the device (This is done under `interface command`):

```
ip address {{10.0.0.1}} {{255.255.255.0}}
```

- Set the address to be determined with DHCP (This is done under `interface command`):

```
ip address dhcp
```

- Define a domain name:

```
ip domain-name {{example.com}}
```

line

Manage lines.

Accessed in configuration mode.

More information: https://www.cisco.com/c/en/us/td/docs/routers/sdwan/command/iosxe/qualified-cli-command-reference-guide/m-line-commands.pdf.

- Configure lines from 0 to 15:

```
line vty 0 15
```

login

Manage console and virtual line authentication.

Accessed in configuration mode under **`line`**.

More information: https://www.cisco.com/c/en/us/td/docs/routers/sdwan/command/iosxe/qualified-cli-command-reference-guide/m-line-commands.pdf.

- Use local username and password for authentication:

```
login local
```

?

Get context sensitive.

More information: https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/fundamentals/configuration/15mt/fundamentals-15-mt-book/cf-cli-basics.html#GUID-223128D2-FB6D-418D-86C6-06D1D0DA51B3.

- Get available commands:

```
?
```

- Get storages that are listable:

```
dir ?
```

- Show what IP information is viewable:

```
ip show ?
```

reload

Control reboot behavior.

More information: https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus5000/sw/command/reference/fund/n5k-fund-cr/n5k-fund_cmds_r.html#reload.

- Reboot the system:

```
reload
```

- Reboot after n seconds:

```
reload in {{n}}
```

- Cancel pending reboots:

```
reload cancel
```

show

Show various system information.

More information: https://www.cisco.com/c/en/us/td/docs/switches/datacenter/nexus5000/sw/command/reference/fund/n5k-fund-cr/n5k-fund_cmds_show.html.

- Show switch IP addresses:

```
{{[sh|show]}} ip interface brief
```

- Show specific interface configuration:

```
{{[sh|show]}} ip interface {{vlan1}}
```

- Show vlan configuration:

```
{{[sh|show]}} vlan
```

- Show currently running configuration:

```
{{[sh|show]}} running-config
```

- Show SSH configuration:

```
{{[sh|show]}} ip ssh
```

transport

Manage line transport protocols.

Accessed in configuration mode under **`line`**.

More information: https://www.cisco.com/c/en/us/td/docs/routers/sdwan/command/iosxe/qualified-cli-command-reference-guide/m-line-commands.pdf.

- Restrict line protocols to `ssh`:

  ```
  transport input ssh
  ```

- Restrict line protocols to `telnet`:

  ```
  transport input telnet
  ```

username

Manage users.

Accessed in configuration mode.

More information: https://www.cisco.com/c/en/us/td/docs/ios-xml/ios/security/s1/sec-s1-xe-3se-3850-cr-book/sec-s1-xe-3se-3850-cr-book_chapter_0110.html.

- Set up an admin account:

```
username {{admin}} privilege 15 secret {{password}}
```

write

Write data to memory.

More information: https://www.oreilly.com/library/view/cisco-ios-in/0596008694/re869.html#book-content.

- Write current configuration to memory:

```
write memory
```

- Delete the configuration in memory:

```
write erase
```

- Display help:

```
write ?
```

Common

!

Reuse and expand the shell history in **sh**, Bash, Zsh, **rbash**, and **ksh**.

See also: **^**.

More information: https://gnu.org/software/bash/manual/bash.html#Event-Designators.

- Substitute with the previous command and run it with `sudo`:

```
sudo !!
```

- Substitute with a command based on its line number found with `history`:

```
!{{number}}
```

- Substitute with a command that was used a specified number of lines back:

```
!-{{number}}
```

- Substitute with the most recent command that starts with a string:

```
!{{string}}
```

- Substitute with all of the arguments of the latest command:

```
{{command}} !*
```

- Substitute with the last argument of the latest command:

```
{{command}} !$
```

- Substitute with the last command but without the last argument:

```
!:-
```

- Print last command that starts with a string without executing it:

```
!{{string}}:p
```

$

Expand a Bash variable.

More information: https://gnu.org/software/bash/manual/bash.html#Shell-Variables.

- Print a variable:

```
echo ${{VARIABLE}}
```

- Run variable contents as a command:

```
${{VARIABLE}}
```

- Print the exit status of the previous command:

```
echo $?
```

- Print a random number between 0 and 32767:

```
echo $RANDOM
```

- Print one of the prompt strings:

```
echo ${{PS0|PS1|PS2|PS3|PS4}}
```

- Expand with the output of `command` and run it. Same as enclosing `command` in backticks:

```
$({{command}})
```

- List how many arguments the current context has:

```
echo $#
```

- Print out a Bash array:

```
echo ${{{array_name[@]}}}
```

%

Manage jobs.

More information: https://www.gnu.org/software/bash/manual/bash.html#Job-Control-Basics.

- Bring the current job to front:

```
%
```

- Bring the previous job to front:

```
%-
```

- Bring the job number `n` to front:

```
%{{n}}
```

- Bring a job whose command starts with `string` to front:

```
%{{string}}
```

- Bring a job whose command contains `string` to front:

```
%?{{string}}
```

- Resume a suspended job:

```
%{{1}} &
```

,

Run commands without installing them.

More information: https://github.com/nix-community/comma.

- Run a command:

```
, {{command -with -flags}}
```

- Add a command to a child shell:

```
, {{[-s|--shell]}} {{command}}
```

- Clear the cache:

```
, {{[-e|--empty-cache]}}
```

2to3

Automated Python 2 to 3 code conversion.

This module has been deprecated since 3.11 and has been removed since 3.13.

For reference, see: https://github.com/python/cpython/blob/8d42e2d915c3096e7eac1c649751d1da567bb7c3/Doc/whatsnew/3.13.rst?plain=1#L188.

More information: https://manned.org/2to3.

- Display the changes that would be performed without performing them (dry-run):

```
2to3 {{path/to/file.py}}
```

- Convert a Python 2 file to Python 3:

```
2to3 {{[-w|--write]}} {{path/to/file.py}}
```

- Convert specific Python 2 language features to Python 3:

```
2to3 {{[-w|--write]}} {{path/to/file.py}} {{[-f|--fix]}} {{raw_input}} {{[-f|--fix]}} {{print}}
```

- Convert all Python 2 language features except the specified ones to Python 3:

```
2to3 {{[-w|--write]}} {{path/to/file.py}} {{[-x|--nofix]}} {{has_key}} {{[-x|--nofix]}} {{isinstance}}
```

- List all available language features that can be converted from Python 2 to Python 3:

```
2to3 {{[-l|--list-fixes]}}
```

- Convert all Python 2 files in a directory to Python 3:

```
2to3 {{[-o|--output-dir]}} {{path/to/python3_directory}} {{[-W|--write-unchanged-files]}} {{[-n|--nobackups]}} {{path/to/python2_directory}}
```

- Run 2to3 with multiple threads:

```
2to3 {{[-j|--processes]}} {{4}} {{[-o|--output-dir]}} {{path/to/python3_directory}} {{[-w|--write]}} {{[-n|--nobackups]}} --no-diffs {{path/to/python2_directory}}
```

3d-ascii-viewer

View 3D `.obj` models as animated ASCII in the terminal.

More information: https://github.com/autopawn/3d-ascii-viewer.

- Display a model:

```
3d-ascii-viewer {{path/to/model}}.obj
```

- Set width and height:

```
3d-ascii-viewer -w {{width}} -h {{height}} {{path/to/model}}.obj
```

- Enable color:

```
3d-ascii-viewer --color {{path/to/model}}.obj
```

- Set frames per second:

```
3d-ascii-viewer -f {{fps}} {{path/to/model}}.obj
```

- Interactive mode:

```
3d-ascii-viewer --interactive {{path/to/model}}.obj
```

- Display help:

```
3d-ascii-viewer --help
```

7z

File archiver with a high compression ratio.

More information: https://manned.org/7z.

- [a]dd a file or directory to a new or existing archive:

```
7z a {{path/to/archive.7z}} {{path/to/file_or_directory}}
```

- Encrypt an existing archive (including filenames):

```
7z a {{path/to/encrypted.7z}} -p{{password}} -mhe=on {{path/to/archive.7z}}
```

- E[x]tract an archive preserving the original directory structure:

```
7z x {{path/to/archive.7z}}
```

- E[x]tract an archive to a specific directory:

```
7z x {{path/to/archive.7z}} -o{{path/to/output}}
```

- E[x]tract an archive to `stdout`:

```
7z x {{path/to/archive.7z}} -so
```

- [a]rchive using a specific archive type:

```
7z a -t{{7z|bzip2|gzip|lzip|tar|zip}} {{path/to/archive}} {{path/to/file_or_directory}}
```

- [l]ist the contents of an archive:

```
7z l {{path/to/archive.7z}}
```

- Set the level of compression (higher means more compression, but slower):

```
7z a {{path/to/archive.7z}} -mx={{0|1|3|5|7|9}} {{path/to/file_or_directory}}
```

7za

File archiver with a high compression ratio.

Similar to **7z** except that it supports fewer file types but is cross-platform.

More information: https://manned.org/7za.

- [a]rchive a file or directory:

```
7za a {{path/to/archive.7z}} {{path/to/file_or_directory}}
```

- Encrypt an existing archive (including file names):

```
7za a {{path/to/encrypted.7z}} -p{{password}} -mhe={{on}} {{path/to/archive.7z}}
```

- E[x]tract an archive preserving the original directory structure:

```
7za x {{path/to/archive.7z}}
```

- E[x]tract an archive to a specific directory:

```
7za x {{path/to/archive.7z}} -o{{path/to/output}}
```

- E[x]tract an archive to `stdout`:

```
7za x {{path/to/archive.7z}} -so
```

- [a]rchive using a specific archive type:

```
7za a -t{{7z|bzip2|gzip|lzip|tar|...}} {{path/to/archive.7z}} {{path/to/file_or_directory}}
```

- [l]ist the contents of an archive:

```
7za l {{path/to/archive.7z}}
```

- Set the level of compression (higher means more compression, but slower):

```
7za a {{path/to/archive.7z}} -mx={{0|1|3|5|7|9}} {{path/to/file_or_directory}}
```

7zr

File archiver with a high compression ratio.

Similar to **`7z`** except that it only supports 7z files.

More information: https://manned.org/7zr.

- [a]rchive a file or directory:

```
7zr a {{path/to/archive.7z}} {{path/to/file_or_directory}}
```

- Encrypt an existing archive (including file names):

```
7zr a {{path/to/encrypted.7z}} -p{{password}} -mhe={{on}}
{{path/to/archive.7z}}
```

- E[x]tract an archive preserving the original directory structure:

```
7zr x {{path/to/archive.7z}}
```

- E[x]tract an archive to a specific directory:

```
7zr x {{path/to/archive.7z}} -o{{path/to/output}}
```

- E[x]tract an archive to `stdout`:

```
7zr x {{path/to/archive.7z}} -so
```

- [l]ist the contents of an archive:

```
7zr l {{path/to/archive.7z}}
```

- Set the level of compression (higher means more compression, but slower):

```
7zr a {{path/to/archive.7z}} -mx={{0|1|3|5|7|9}} {{path/to/
file_or_directory}}
```

[

Check file types and compare values.

Returns a status of 0 if the condition evaluates to true, 1 if it evaluates to false.

See also: **`test`**.

More information: https://gnu.org/software/bash/manual/bash.html#index-test.

- Test if a given variable is equal to the specified string:

```
[ "${{variable}}" = "{{string}}" ]
```

- Test if a given variable is not equal to the specified string:

```
[ "${{variable}}" != "{{string}}" ]
```

- Test if a given variable is [eq]ual/[n]ot [e]qual/[g]reater [t]han/[l]ess [t]han/[g]reater than or [e]qual/[l]ess than or [e]qual to the specified number:

```
[ "${{variable}}" -{{eq|ne|gt|lt|ge|le}} {{integer}} ]
```

- Test if the specified variable has a [n]on-empty value:

```
[ -n "${{variable}}" ]
```

- Test if the specified variable has an empty value ([z]ero length):

```
[ -z "${{variable}}" ]
```

- Test if the specified [f]ile exists:

```
[ -f {{path/to/file}} ]
```

- Test if the specified [d]irectory exists:

```
[ -d {{path/to/directory}} ]
```

- Test if the specified file or directory [e]xists:

```
[ -e {{path/to/file_or_directory}} ]
```

[[

Check file types and compare values.

Returns a status of 0 if the condition evaluates to true, 1 if it evaluates to false.

More information: https://gnu.org/software/bash/manual/bash.html#index-_005b_005b.

- Test if a given variable is equal to the specified string or glob:

```
[[ ${{variable}} == "{{string}}" ]]
```

- Test if a given string conforms the specified `regex`:

```
[[ ${{variable}} =~ {{pattern}} ]]
```

- Test if a given variable is [eq]ual/[n]ot [e]qual/[g]reater [t]han/[l]ess [t]han/[g]reater than or [e]qual/[l]ess than or [e]qual to the specified number:

```
[[ ${{variable}} -{{eq|ne|gt|lt|ge|le}} {{integer}} ]]
```

- Test if the specified variable has a [n]on-empty value:

```
[[ -n ${{variable}} ]]
```

- Test if the specified variable has an empty value ([z]ero length):

```
[[ -z ${{variable}} ]]
```

- Test if the specified [f]ile exists:

```
[[ -f {{path/to/file}} ]]
```

- Test if the specified [d]irectory exists:

```
[[ -d {{path/to/directory}} ]]
```

- Test if the specified file or directory [e]xists:

```
[[ -e {{path/to/file_or_directory}} ]]
```

]

This shell keyword is used to close out **[**.

- View documentation for the `[` keyword:

  ```
  tldr [
  ```

]]

This shell keyword is used to close out **[[**.

- View documentation for the `[[` keyword:

  ```
  tldr [[
  ```

^

Bash builtin to quick substitute a string in the previous command and run the result.

Equivalent to **`!!:s^string1^string2`**.

See also: `!`.

More information: https://gnu.org/software/bash/manual/bash.html#Event-Designators.

- Run the previous command replacing `string1` with `string2`:

```
^{{string1}}^{{string2}}
```

- Remove `string1` from the previous command:

```
^{{string1}}^
```

- Replace `string1` with `string2` in the previous command and add `string3` to its end:

```
^{{string1}}^{{string2}}^{{string3}}
```

- Replace all occurrences of `string1`:

```
^{{string1}}^{{string2}}^:g&
```

- Print the substituted command without running it:

```
^{{string1}}^{{string2}}^:p
```

a2ping

Convert images into EPS or PDF files.

More information: https://manned.org/a2ping.

- Convert an image to PDF (Note: Specifying an output filename is optional):

```
a2ping {{path/to/image.ext}} {{path/to/output.pdf}}
```

- Compress the document using the specified method:

```
a2ping --nocompress {{none|zip|best|flate}} {{path/to/file}}
```

- Scan HiResBoundingBox if present (defaults to yes):

```
a2ping --nohires {{path/to/file}}
```

- Allow page content below and left of the origin (defaults to no):

```
a2ping --below {{path/to/file}}
```

- Pass extra arguments to `gs`:

```
a2ping --gsextra {{arguments}} {{path/to/file}}
```

- Pass extra arguments to external program (i.e `pdftops`):

```
a2ping --extra {{arguments}} {{path/to/file}}
```

- Display help:

```
a2ping {{[-h|--help]}}
```

aapt

Android Asset Packaging Tool: compile and package an Android app's resources.

More information: https://manned.org/aapt.

- List files contained in an APK archive:

```
aapt list {{path/to/app.apk}}
```

- Display an app's metadata (version, permissions, etc.):

```
aapt dump badging {{path/to/app.apk}}
```

- Create a new APK archive with files from the specified directory:

```
aapt package -F {{path/to/app.apk}} {{path/to/directory}}
```

ab

Apache HTTP server benchmarking tool.

More information: https://httpd.apache.org/docs/current/programs/ab.html.

- Execute 100 HTTP GET requests to a given URL:

```
ab -n 100 {{url}}
```

- Execute 100 HTTP GET requests, in concurrent batches of 10, to a URL:

```
ab -n 100 -c 10 {{url}}
```

- Execute 100 HTTP POST requests to a URL, using a JSON payload from a file:

```
ab -n 100 -T {{application/json}} -p {{path/to/file.json}} {{url}}
```

- Use HTTP [k]eep-Alive, i.e. perform multiple requests within one HTTP session:

```
ab -k {{url}}
```

- Set the maximum number of seconds ([t]imeout) to spend for benchmarking (30 by default):

```
ab -t {{60}} {{url}}
```

- Write the results to a CSV file:

```
ab -e {{path/to/file.csv}}
```

abduco

Terminal session manager.

More information: https://manned.org/abduco.

- List sessions:

```
abduco
```

- [A]ttach to a session, creating it if it doesn't exist:

```
abduco -A {{name}} {{bash}}
```

- [A]ttach to a session with `dvtm`, creating it if it doesn't exist:

```
abduco -A {{name}}
```

- Detach from a session:

```
<Ctrl \>
```

- [A]ttach to a session in [r]ead-only mode:

```
abduco -Ar {{name}}
```

ac

Print statistics on how long users have been connected.

More information: https://manned.org/ac.8.

- Print how long the current user has been connected in hours:

```
ac
```

- Print how long users have been connected in hours:

```
ac -p
```

- Print how long a particular user has been connected in hours:

```
ac -p {{username}}
```

- Print how long a particular user has been connected in hours per [d]ay (with total):

```
ac -dp {{username}}
```

accelerate

A library that enables the same PyTorch code to be run across any distributed configuration.

More information: https://huggingface.co/docs/accelerate/index.

- Print environment information:

  ```
  accelerate env
  ```

- Interactively create a configuration file:

  ```
  accelerate config
  ```

- Print the estimated GPU memory cost of running a Hugging Face model with different data types:

  ```
  accelerate estimate-memory {{name/model}}
  ```

- Test an Accelerate configuration file:

  ```
  accelerate test --config_file {{path/to/config.yaml}}
  ```

- Run a model on CPU with Accelerate:

  ```
  accelerate launch {{path/to/script.py}} {{--cpu}}
  ```

- Run a model on multi-GPU with Accelerate, with 2 machines:

  ```
  accelerate launch {{path/to/script.py}} --multi_gpu --
  num_machines 2
  ```

ack

A search tool like **`grep`**, optimized for developers.

See also: **`rg`**, which is much faster.

More information: https://beyondgrep.com/documentation/.

- Search for files containing a string or `regex` in the current directory recursively:

```
ack "{{search_pattern}}"
```

- Search for a case-insensitive pattern:

```
ack {{[-i|--ignore-case]}} "{{search_pattern}}"
```

- Search for lines matching a pattern, printing only the matched text and not the rest of the line:

```
ack {{[-o|--output '$&']}} "{{search_pattern}}"
```

- Limit search to files of a specific type:

```
ack {{[-t|--type]}} {{ruby}} "{{search_pattern}}"
```

- Do not search in files of a specific type:

```
ack {{[-t|--type]}} no{{ruby}} "{{search_pattern}}"
```

- Count the total number of matches found:

```
ack {{[-c|--count]}} {{[-h|--no-filename]}}
"{{search_pattern}}"
```

- Print the file names and the number of matches for each file only:

```
ack {{[-c|--count]}} {{[-l|--files-with-matches]}}
"{{search_pattern}}"
```

- List all the values that can be used with `--type`:

```
ack --help-types
```

acme.sh --dns

Use a DNS-01 challenge to issue a TLS certificate.

More information: https://github.com/acmesh-official/acme.sh/wiki.

- Issue a certificate using an automatic DNS API mode:

```
acme.sh --issue --dns {{gnd_gd}} --domain {{example.com}}
```

- Issue a wildcard certificate (denoted by an asterisk) using an automatic DNS API mode:

```
acme.sh --issue --dns {{dns_namesilo}} --domain
{{example.com}} --domain {{*.example.com}}
```

- Issue a certificate using a DNS alias mode:

```
acme.sh --issue --dns {{dns_cf}} --domain {{example.com}} --
challenge-alias {{alias-for-example-validation.com}}
```

- Issue a certificate while disabling automatic Cloudflare/Google DNS polling after the DNS record is added by specifying a custom wait time in seconds:

```
acme.sh --issue --dns {{dns_namecheap}} --domain
{{example.com}} --dnssleep {{300}}
```

- Issue a certificate using a manual DNS mode:

```
acme.sh --issue --dns --domain {{example.com}} --yes-I-know-
dns-manual-mode-enough-go-ahead-please
```

acme.sh

Shell script implementing ACME client protocol, an alternative to **`certbot`**.

See also: **`acme.sh dns`**.

More information: https://github.com/acmesh-official/acme.sh#2-just-issue-a-cert.

- Issue a certificate using webroot mode:

```
acme.sh --issue {{[-d|--domain]}} {{example.com}} {{[-w|--webroot]}} /{{path/to/webroot}}
```

- Issue a certificate for multiple domains using standalone mode using port 80:

```
acme.sh --issue --standalone {{[-d|--domain]}} {{example.com}} {{[-d|--domain]}} {{www.example.com}}
```

- Issue a certificate using standalone TLS mode using port 443:

```
acme.sh --issue --alpn {{[-d|--domain]}} {{example.com}}
```

- Issue a certificate using a working Nginx configuration:

```
acme.sh --issue --nginx {{[-d|--domain]}} {{example.com}}
```

- Issue a certificate using a working Apache configuration:

```
acme.sh --issue --apache {{[-d|--domain]}} {{example.com}}
```

- Issue a wildcard (*) certificate using an automatic DNS API mode:

```
acme.sh --issue --dns {{dns_cf}} {{[-d|--domain]}} {{*.example.com}}
```

- Install certificate files into the specified locations (useful for automatic certificate renewal):

```
acme.sh {{[-i|--install-cert]}} {{[-d|--domain]}} {{example.com}} --key-file /{{path/to/example.com.key}} --fullchain-file /{{path/to/example.com.cer}} --reloadcmd "{{systemctl force-reload nginx}}"
```

act

Execute GitHub Actions locally using Docker.

More information: https://manned.org/act.

- List the available jobs:

```
act {{[-l|--list]}}
```

- Run the default event:

```
act
```

- Run a specific event:

```
act {{event_type}}
```

- Run a specific job:

```
act {{[-j|--job]}} {{job_id}}
```

- Do [n]ot actually run the actions (i.e. a dry run):

```
act {{[-n|--dryrun]}}
```

- Show verbose logs:

```
act {{[-v|--verbose]}}
```

- Run a specific workflow with the push event:

```
act push {{[-W|--workflows]}} {{path/to/workflow}}
```

acyclic

Make a directed graph acyclic by reversing some edges.

Graphviz filters: **`acyclic`**, **`bcomps`**, **`comps`**, **`edgepaint`**, **`gvcolor`**, **`gvpack`**, **`mingle`**, **`nop`**, **`sccmap`**, **`tred`**, & **`unflatten`**.

More information: https://graphviz.org/pdf/acyclic.1.pdf.

- Make a directed graph acyclic by reversing some edges:

```
acyclic {{path/to/input.gv}} > {{path/to/output.gv}}
```

- Print if a graph is acyclic, has a cycle, or is undirected, producing no output graph:

```
acyclic -v -n {{path/to/input.gv}}
```

- Display help:

```
acyclic -?
```

adb connect

Connect to an Android device wirelessly.

More information: https://developer.android.com/tools/adb.

- Pair with an Android device (address and pairing code can be found in developer options):

  ```
  adb pair {{ip_address}}:{{port}}
  ```

- Connect to an Android device (port will be different from pairing):

  ```
  adb connect {{ip_address}}:{{port}}
  ```

- Disconnect a device:

  ```
  adb disconnect {{ip_address}}:{{port}}
  ```

adb devices

List connected Android devices.

More information: https://manned.org/adb.

- List devices:

```
adb devices
```

- List devices and their system info:

```
adb devices -l
```

adb disconnect

This command has been moved to **`adb connect`**.

- View documentation for `adb disconnect`:

  ```
  tldr adb connect
  ```

adb forward

Forward socket connections to a connected Android device or emulator.

More information: https://developer.android.com/tools/adb.

- Forward a TCP port to the only connected emulator or device:

```
adb forward tcp:{{local_port}} tcp:{{remote_port}}
```

- Forward a TCP port to a specific emulator or device (by device ID / [s]erial number):

```
adb -s {{device_ID}} forward tcp:{{local_port}} tcp:{{remote_port}}
```

- List all forwardings:

```
adb forward --list
```

- Remove a forwarding rule:

```
adb forward --remove tcp:{{local_port}}
```

- Remove all forwarding rules:

```
adb forward --remove-all
```

adb install

Push packages to a connected Android device or emulator.

More information: https://developer.android.com/tools/adb.

- Push an Android application to an emulator/device:

```
adb install {{path/to/file.apk}}
```

- Push an Android application to a specific emulator/device (overrides `$ANDROID_SERIAL`):

```
adb -s {{serial_number}} install {{path/to/file.apk}}
```

- [r]einstall an existing app, keeping its data:

```
adb install -r {{path/to/file.apk}}
```

- Push an Android application allowing version code [d]owngrade (debuggable packages only):

```
adb install -d {{path/to/file.apk}}
```

- [g]rant all permissions listed in the app manifest:

```
adb install -g {{path/to/file.apk}}
```

- Quickly update an installed package by only updating the parts of the APK that changed:

```
adb install --fastdeploy {{path/to/file.apk}}
```

adb kill-server

Stop the Android Debug Bridge (adb) server, disconnecting devices and emulators.

More information: https://manned.org/adb#head14.

- Kill the adb server if it is running:

```
adb kill-server
```

adb logcat

Dump a log of system messages.

More information: https://developer.android.com/tools/logcat.

- Display system logs:

```
adb logcat
```

- Display lines that match a `reg[e]x`:

```
adb logcat -e {{regex}}
```

- Display logs for a tag in a specific mode ([V]erbose, [D]ebug, [I]nfo, [W]arning, [E]rror, [F]atal, [S]ilent), filtering other tags:

```
adb logcat {{tag}}:{{mode}} *:S
```

- Display logs for React Native applications in [V]erbose mode [S]ilencing other tags:

```
adb logcat ReactNative:V ReactNativeJS:V *:S
```

- Display logs for all tags with priority level [W]arning and higher:

```
adb logcat *:W
```

- Display logs for a specific PID:

```
adb logcat --pid {{pid}}
```

- Display logs for the process of a specific package:

```
adb logcat --pid $(adb shell pidof -s {{package}})
```

- Color the log (usually use with filters):

```
adb logcat -v color
```

adb pair

This command has been moved to **`adb connect`**.

- View documentation for `adb pair`:

  ```
  tldr adb connect
  ```

adb reboot

Reboot a connected Android device or emulator.

More information: https://manned.org/adb.

- Reboot the device normally:

```
adb reboot
```

- Reboot the device into bootloader mode:

```
adb reboot bootloader
```

- Reboot the device into recovery mode:

```
adb reboot recovery
```

- Reboot the device into fastboot mode:

```
adb reboot fastboot
```

adb reverse

Reverse socket connections from a connected Android device or emulator.

More information: https://developer.android.com/tools/adb.

- List all reverse socket connections from emulators and devices:

```
adb reverse --list
```

- Reverse a TCP port from the only connected emulator or device to localhost:

```
adb reverse tcp:{{remote_port}} tcp:{{local_port}}
```

- Reverse a TCP port from a specific emulator or device (by device ID / [s]erial number) to localhost:

```
adb -s {{device_ID}} reverse tcp:{{remote_port}} tcp:
{{local_port}}
```

- Remove a reverse socket connection from an emulator or device:

```
adb reverse --remove tcp:{{remote_port}}
```

- Remove all reverse socket connections from all emulators and devices:

```
adb reverse --remove-all
```

adb shell pm list packages

List installed, known, or filtered packages on an Android device.

More information: https://developer.android.com/tools/adb.

- List all installed packages:

```
adb shell pm list packages
```

- List all packages and their associated APK file paths:

```
adb shell pm list packages -f
```

- Only list disabled packages:

```
adb shell pm list packages -d
```

- Only list enabled packages:

```
adb shell pm list packages -e
```

- Only list system packages:

```
adb shell pm list packages -s
```

- Only list third-party (non-system) packages:

```
adb shell pm list packages -3
```

- Show the installer for each package:

```
adb shell pm list packages -i
```

adb shell pm list

List users, packages, permissions, instrumentation, permission groups, features, and libraries managed by the package manager.

More information: https://developer.android.com/tools/adb.

- List all installed packages:

```
adb shell pm list packages
```

- Print all users on the system:

```
adb shell pm list users
```

- Print all known permission groups:

```
adb shell pm list permission-groups
```

- Print all known permissions:

```
adb shell pm list permissions
```

- List all test packages:

```
adb shell pm list instrumentation
```

- Print all features of the system:

```
adb shell pm list features
```

- Print all the libraries supported by the current device:

```
adb shell pm list libraries
```

adb shell pm

Android Package Manager tool.

More information: https://developer.android.com/tools/adb.

- List installed packages:

```
adb shell pm list packages
```

- Install an app package from a given path:

```
adb shell pm install /{{path/to/app.apk}}
```

- Uninstall a package from the device:

```
adb shell pm uninstall {{package}}
```

- Clear all app data for a package:

```
adb shell pm clear {{package}}
```

- Enable a package or component:

```
adb shell pm enable {{package_or_class}}
```

- Disable a package or component:

```
adb shell pm disable-user {{package_or_class}}
```

- Grant a permission for an app:

```
adb shell pm grant {{package}} {{android.permission.CAMERA|
android.permission.ACCESS_FINE_LOCATION|
android.permission.READ_CONTACTS|...}}
```

- Revoke a permission for an app:

```
adb shell pm revoke {{package}} {{android.permission.CAMERA|
android.permission.ACCESS_FINE_LOCATION|
android.permission.READ_CONTACTS|...}}
```

adb shell

Run shell commands on a connected Android device or emulator.

More information: https://developer.android.com/tools/adb.

- Start a remote interactive shell on the emulator or device:

```
adb shell
```

- Get all the properties from emulator or device:

```
adb shell getprop
```

- Revert all runtime permissions to their default:

```
adb shell pm reset-permissions
```

- Revoke a dangerous permission for an application:

```
adb shell pm revoke {{package}} {{permission}}
```

- Trigger a key event:

```
adb shell input keyevent {{keycode}}
```

- Clear the data of an application on an emulator or device:

```
adb shell pm clear {{package}}
```

- Start an activity on emulator or device:

```
adb shell am start -n {{package}}/{{activity}}
```

- Start the home activity on an emulator or device:

```
adb shell am start -W -c android.intent.category.HOME -a
android.intent.action.MAIN
```

adb start-server

Start the Android Debug Bridge (adb) server to allow adb connections from devices or emulators.

More information: https://manned.org/adb#head14.

- Start the adb server if it is not running:

```
adb start-server
```

adb uninstall

Uninstall a package.

More information: https://manned.org/adb.

- Uninstall a package:

```
adb uninstall {{com.example.app}}
```

- Uninstall a package, but keep user data:

```
adb uninstall -k {{com.example.app}}
```

adb

Android Debug Bridge: communicate with an Android emulator instance or connected Android devices.

Some subcommands such as **`shell`** have their own usage documentation.

More information: https://developer.android.com/tools/adb.

- Check whether the adb server process is running and start it:

```
adb start-server
```

- Terminate the adb server process:

```
adb kill-server
```

- Start a remote shell in the target emulator/device instance:

```
adb shell
```

- Push an Android application to an emulator/device:

```
adb install -r {{path/to/file.apk}}
```

- Copy a file/directory from the target device:

```
adb pull {{path/to/device_file_or_directory}} {{path/to/local_destination_directory}}
```

- Copy a file/directory to the target device:

```
adb push {{path/to/local_file_or_directory}} {{path/to/device_destination_directory}}
```

- List all connected devices:

```
adb devices
```

- Specify which device to send commands to if there are multiple devices:

```
adb -s {{device_ID}} {{shell}}
```

addcomputer.py

Add a computer account to domain.

More information: https://github.com/fortra/impacket.

- Add a computer with a specific name and password:

```
addcomputer.py -computer-name {{COMPUTER_NAME$}} -computer-
pass {{computer_password}} {{domain}}/{{username}}:
{{password}}
```

- Only set a new password on an existing computer:

```
addcomputer.py -no-add -computer-name {{COMPUTER_NAME$}} -
computer-pass {{computer_password}} {{domain}}/{{username}}:
{{password}}
```

- Delete an existing computer account:

```
addcomputer.py -delete -computer-name {{COMPUTER_NAME$}}
{{domain}}/{{username}}:{{password}}
```

- Add computer using Kerberos authentication:

```
addcomputer.py -k -no-pass {{domain}}/{{username}}
@{{hostname}}
```

- Add computer via LDAPS (port 636) instead of SAMR (port 445):

```
addcomputer.py -method LDAPS -port 636 {{domain}}/
{{username}}:{{password}}
```

- Specify exact domain controller when multiple DCs exist:

```
addcomputer.py -dc-host {{hostname}} {{domain}}/{{username}}:
{{password}}
```

AdGuardHome

A network-wide software for blocking ads & tracking.

More information: https://github.com/AdguardTeam/AdGuardHome.

- Run AdGuard Home:

  ```
  AdGuardHome
  ```

- Specify a configuration file:

  ```
  AdGuardHome --config {{path/to/AdGuardHome.yaml}}
  ```

- Store the data in a specific work directory:

  ```
  AdGuardHome --work-dir {{path/to/directory}}
  ```

- Install or uninstall AdGuard Home as a service:

  ```
  AdGuardHome --service {{install|uninstall}}
  ```

- Start the AdGuard Home service:

  ```
  AdGuardHome --service start
  ```

- Reload the configuration for the AdGuard Home service:

  ```
  AdGuardHome --service reload
  ```

- Stop or restart the AdGuard Home service:

  ```
  AdGuardHome --service {{stop|restart}}
  ```

adscript

Compiler for Adscript files.

More information: https://github.com/Amplus2/Adscript.

- Compile a file to an object file:

```
adscript --output {{path/to/file.o}} {{path/to/
input_file.adscript}}
```

- Compile and link a file to a standalone executable:

```
adscript --executable --output {{path/to/file}} {{path/to/
input_file.adscript}}
```

- Compile a file to LLVM IR instead of native machine code:

```
adscript --llvm-ir --output {{path/to/file.ll}} {{path/to/
input_file.adscript}}
```

- Cross-compile a file to an object file for a foreign CPU architecture or operating system:

```
adscript --target-triple {{i386-linux-elf}} --output {{path/
to/file.o}} {{path/to/input_file.adscript}}
```

afconvert

Convert between AFF and raw file formats.

More information: https://manned.org/afconvert.

- Use a specific extension (default: `aff`):

```
afconvert -a {{extension}} {{path/to/input_file}} {{path/to/
output_file1 path/to/output_file2 ...}}
```

- Use a specific compression level (default: 7):

```
afconvert -X{{0..7}} {{path/to/input_file}} {{path/to/
output_file1 path/to/output_file2 ...}}
```

ag

The Silver Searcher. Like **ack**, but aims to be faster.

More information: https://manned.org/ag.

- Find files containing `string`, and print the line matches in context:

```
ag string
```

- Find files containing `string` in a specific directory:

```
ag string {{path/to/directory}}
```

- Find files containing `string`, but only list the filenames:

```
ag {{[-l|--files-with-matches]}} string
```

- Find files containing `STRING` case-insensitively, and print only the match, rather than the whole line:

```
ag {{[-i|--ignore-case]}} {{[-o|--only-matching]}} STRING
```

- Find `string` in files with a name matching `file_name`:

```
ag string {{[-G|--file-search-regex]}} file_name
```

- Find files whose contents match a `regex`:

```
ag '{{^ca(t|r)$}}'
```

- Find files with a name matching `string`:

```
ag {{[-g|--filename-pattern]}} string
```

agate

A simple server for the Gemini network protocol.

More information: https://github.com/mbrubeck/agate.

- Run and generate a private key and certificate:

```
agate --content {{path/to/content}}/ --addr {{[::]:1965}} --addr {{0.0.0.0:1965}} --hostname {{example.com}} --lang {{en-US}}
```

- Run server:

```
agate {{path/to/file}}
```

- Display help:

```
agate {{[-h|--help]}}
```

age-keygen

Generate **age** key pairs.

See also: **age** for encrypting/decrypting files.

More information: https://manned.org/age-keygen.

- Generate a key pair, save it to an unencrypted file, and print the public key to `stdout`:

```
age-keygen {{[-o|--output]}} {{path/to/file}}
```

- Convert an identit[y] to a recipient and print the public key to `stdout`:

```
age-keygen -y {{path/to/file}}
```

age

A simple, modern, and secure file encryption tool.

See also: **age-keygen** for generating key pairs.

More information: https://github.com/FiloSottile/age#usage.

- Generate an encrypted file that can be decrypted with a passphrase:

```
age {{[-p|--passphrase]}} {{[-o|--output]}} {{path/to/encrypted_file}} {{path/to/unencrypted_file}}
```

- Encrypt a file with one or more public keys entered as literals (repeat the `--recipient` flag to specify multiple public keys):

```
age {{[-r|--recipient]}} {{public_key}} {{[-o|--output]}} {{path/to/encrypted_file}} {{path/to/unencrypted_file}}
```

- Encrypt a file to one or more recipients with their public keys specified in a file (one per line):

```
age {{[-R|--recipients-file]}} {{path/to/recipients_file}} {{[-o|--output]}} {{path/to/encrypted_file}} {{path/to/unencrypted_file}}
```

- Decrypt a file with a passphrase:

```
age {{[-d|--decrypt]}} {{[-o|--output]}} {{path/to/decrypted_file}} {{path/to/encrypted_file}}
```

- Decrypt a file with a private key file:

```
age {{[-d|--decrypt]}} {{[-i|--identity]}} {{path/to/private_key_file}} {{[-o|--output]}} {{path/to/decrypted_file}} {{path/to/encrypted_file}}
```

agg

Create a GIF from an **asciinema** terminal session recording.

More information: https://docs.asciinema.org/manual/agg/usage/.

- Create a GIF:

```
agg {{path/to/demo.cast}} {{path/to/demo.gif}}
```

- Create a GIF that is 80 columns wide and 25 rows in height:

```
agg --cols 80 --rows 25 {{path/to/demo.cast}} {{path/to/
demo.gif}}
```

- Create a GIF with a font size of 24 pixels:

```
agg --font-size 24 {{path/to/demo.cast}} {{path/to/demo.gif}}
```

- Display help:

```
agg {{[-h|--help]}}
```

aider

Pair program with the LLM of your choice.

More information: https://github.com/Aider-AI/aider.

- Start a new project or work with an existing code base:

```
aider --model {{model_name}} --api-key {{your_api_key}}
```

- Add new features or test cases to specific files:

```
aider {{path/to/file1 path/to/file2 ...}}
```

- Describe a bug and let `aider` fix it:

```
aider {{path/to/file}} --describe "{{bug_description}}"
```

- Refactor code in a specific file:

```
aider {{path/to/file}} --refactor
```

- Update documentation:

```
aider {{path/to/file}} --update-docs
```

- Display help:

```
aider --help
```

aircrack-ng

Crack WEP and WPA/WPA2 keys from handshake in captured packets.

Part of Aircrack-ng network software suite.

More information: https://www.aircrack-ng.org/doku.php?id=aircrack-ng.

- Crack key from capture file using [w]ordlist:

```
aircrack-ng -w {{path/to/wordlist.txt}} {{path/to/
capture.cap}}
```

- Crack key using multiple CPU threads from capture file using [w]ordlist:

```
aircrack-ng -p {{number}} -w {{path/to/wordlist.txt}} {{path/
to/capture.cap}}
```

- Crack key from capture file using [w]ordlist and the access point's [e]ssid:

```
aircrack-ng -w {{path/to/wordlist.txt}} -e {{essid}} {{path/
to/capture.cap}}
```

- Crack key from capture file using [w]ordlist and the access point's MAC address:

```
aircrack-ng -w {{path/to/wordlist.txt}} --bssid {{mac}}
{{path/to/capture.cap}}
```

airdecap-ng

Decrypt a WEP, WPA, or WPA2 encrypted capture file.

Part of Aircrack-ng network software suite.

More information: https://www.aircrack-ng.org/doku.php?id=airdecap-ng.

- Remove wireless headers from an open network capture file and use the access point's MAC address to filter:

```
airdecap-ng -b {{ap_mac}} {{path/to/capture.cap}}
```

- Decrypt a [w]EP encrypted capture file using the key in hex format:

```
airdecap-ng -w {{hex_key}} {{path/to/capture.cap}}
```

- Decrypt a WPA/WPA2 encrypted capture file using the access point's [e]ssid and [p]assword:

```
airdecap-ng -e {{essid}} -p {{password}} {{path/to/
capture.cap}}
```

- Decrypt a WPA/WPA2 encrypted capture file preserving the headers using the access point's [e]ssid and [p]assword:

```
airdecap-ng -l -e {{essid}} -p {{password}} {{path/to/
capture.cap}}
```

- Decrypt a WPA/WPA2 encrypted capture file using the access point's [e]ssid and [p]assword and use its MAC address to filter:

```
airdecap-ng -b {{ap_mac}} -e {{essid}} -p {{password}}
{{path/to/capture.cap}}
```

aireplay-ng

Inject packets into a wireless network.

Part of Aircrack-ng network software suite.

More information: https://www.aircrack-ng.org/doku.php?id=aireplay-ng.

- Send a specific number of disassociate packets given an access point's MAC address, a client's MAC address, and an interface:

```
sudo aireplay-ng --deauth {{count}} --bssid {{ap_mac}} --dmac {{client_mac}} {{interface}}
```

airmon-ng

Activate monitor mode on wireless network devices.

Part of Aircrack-ng network software suite.

More information: https://www.aircrack-ng.org/doku.php?id=airmon-ng.

- List wireless devices and their statuses:

```
sudo airmon-ng
```

- Turn on monitor mode for a specific device:

```
sudo airmon-ng start {{wlan0}}
```

- Kill disturbing processes that use wireless devices:

```
sudo airmon-ng check kill
```

- Turn off monitor mode for a specific network interface:

```
sudo airmon-ng stop {{wlan0mon}}
```

airodump-ng

Capture packets and display information about wireless networks.

Part of Aircrack-ng network software suite.

More information: https://www.aircrack-ng.org/doku.php?id=airodump-ng.

- Capture packets and display information about wireless network(s) on the 2.4GHz band:

```
sudo airodump-ng {{interface}}
```

- Capture packets and display information about wireless network(s) on the 5GHz band:

```
sudo airodump-ng {{interface}} --band a
```

- Capture packets and display information about wireless network(s) on both 2.4GHz and 5GHz bands:

```
sudo airodump-ng {{interface}} --band abg
```

- Capture packets and display information about a wireless network given the MAC address and channel, and save the output to a file:

```
sudo airodump-ng --channel {{channel}} --write {{path/to/file}} --bssid {{mac}} {{interface}}
```

airpaste

Share messages and files on the same network using mDNS.

More information: https://github.com/mafintosh/airpaste.

- Wait for a message and display it when received:

```
airpaste
```

- Send text:

```
echo {{text}} | airpaste
```

- Send a file:

```
airpaste < {{path/to/file}}
```

- Receive a file:

```
airpaste > {{path/to/file}}
```

- Create or join a channel:

```
airpaste {{channel_name}}
```

airshare

Transfer data between two machines in a local network.

More information: https://airshare.readthedocs.io/en/latest/cli.html.

- Share files or directories:

```
airshare {{code}} {{path/to/file_or_directory1 path/to/file_or_directory2 ...}}
```

- Receive a file:

```
airshare {{code}}
```

- Host a receiving server (use this to be able to upload files using the web interface):

```
airshare --upload {{code}}
```

- Send files or directories to a receiving server:

```
airshare --upload {{code}} {{path/to/file_or_directory1 path/to/file_or_directory2 ...}}
```

- Send files whose paths have been copied to the clipboard:

```
airshare --file-path {{code}}
```

- Receive a file and copy it to the clipboard:

```
airshare --clip-receive {{code}}
```

ajson

Execute JSONPath on JSON objects.

More information: https://github.com/spyzhov/ajson#console-application.

- Read JSON from a file and execute a specified JSONPath expression:

```
ajson '{{$..json[?(@.path)]}}' {{path/to/file.json}}
```

- Read JSON from `stdin` and execute a specified JSONPath expression:

```
cat {{path/to/file.json}} | ajson '{{$..json[?(@.path)]}}'
```

- Read JSON from a URL and evaluate a specified JSONPath expression:

```
ajson '{{avg($..price)}}' '{{https://example.com/api/}}'
```

- Read some simple JSON and calculate a value:

```
echo '{{3}}' | ajson '{{2 * pi * $}}'
```

alacritty

Cross-platform, GPU-accelerated terminal emulator.

More information: https://manned.org/alacritty.

- Start a new Alacritty process and create a window:

```
alacritty
```

- Start the Alacritty daemon (without creating a window):

```
alacritty --daemon
```

- Create a new window using the already running Alacritty process:

```
alacritty msg create-window
```

- Start the shell in a specific directory (also works with `alacritty msg create-window`):

```
alacritty --working-directory {{path/to/directory}}
```

- Execute a command in a new Alacritty window (also works with `alacritty msg create-window`):

```
alacritty {{[-e|--command]}} {{command}}
```

- Use an alternative configuration file (defaults to `$XDG_CONFIG_HOME/alacritty/alacritty.toml`):

```
alacritty --config-file {{path/to/config.toml}}
```

alex

Catch insensitive, inconsiderate writing.

It helps you find gender favouring, polarising, race related, religion inconsiderate, or other unequal phrasing in text.

More information: https://github.com/get-alex/alex.

- Analyze text from `stdin`:

```
echo {{His network looks good}} | alex --stdin
```

- Analyze all files in the current directory:

```
alex
```

- Analyze a specific file:

```
alex {{path/to/file.md}}
```

- Analyze all Markdown files except `example.md`:

```
alex *.md !{{example.md}}
```

alias

Create aliases - words that are replaced by a command string.

Aliases expire with the current shell session unless defined in the shell's configuration file, e.g. **`~/.bashrc`** for Bash or **`~/.zshrc`** for Zsh.

See also: **`unalias`**.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-alias.

- List all aliases:

```
alias
```

- Create a generic alias:

```
alias {{word}}="{{command}}"
```

- View the command associated to a given alias:

```
alias {{word}}
```

- Remove an aliased command:

```
unalias {{word}}
```

- Turn `rm` into an interactive command:

```
alias {{rm}}="{{rm --interactive}}"
```

- Create `la` as a shortcut for `ls --all`:

```
alias {{la}}="{{ls --all}}"
```

alr

Ada package manager.

Manage Ada toolchains, dependencies, tools, and libraries.

More information: https://alire.ada.dev/docs/#first-steps.

- Create a binary or library project:

```
alr init {{--bin|--lib}} {{project_name}}
```

- Add a dependency to the project:

```
alr add {{crate}}
```

- Run the compiled binary (no need to do `build` before):

```
alr run
```

- Compile the project:

```
alr build {{--release|--development|--validation}}
```

amass enum

Find subdomains of a domain.

More information: https://github.com/owasp-amass/amass/blob/master/doc/user_guide.md#the-enum-subcommand.

- Find (passively) subdomains of a [d]omain:

```
amass enum -d {{domain_name}}
```

- Find subdomains of a [d]omain and actively verify them attempting to resolve the found subdomains:

```
amass enum -active -d {{domain_name}} -p {{80,443,8080}}
```

- Do a brute force search for sub[d]omains:

```
amass enum -brute -d {{domain_name}}
```

- Save the results to a text file:

```
amass enum -o {{output_file}} -d {{domain_name}}
```

- Save terminal output to a file and other detailed output to a directory:

```
amass enum -o {{output_file}} -dir {{path/to/directory}} -d {{domain_name}}
```

- List all available data sources:

```
amass enum -list
```

amass intel

Collect open source intel on an organisation like root domains and ASNs.

More information: https://github.com/owasp-amass/amass/blob/master/doc/user_guide.md#the-intel-subcommand.

- Find root domains in an IP [addr]ess range:

```
amass intel -addr {{192.168.0.1-254}}
```

- Use active recon methods:

```
amass intel -active -addr {{192.168.0.1-254}}
```

- Find root domains related to a [d]omain:

```
amass intel -whois -d {{domain_name}}
```

- Find ASNs belonging to an [org]anisation:

```
amass intel -org {{organisation_name}}
```

- Find root domains belonging to a given Autonomous System Number:

```
amass intel -asn {{asn}}
```

- Save results to a text file:

```
amass intel -o {{output_file}} -whois -d {{domain_name}}
```

- List all available data sources:

```
amass intel -list
```

amass

In-depth Attack Surface Mapping and Asset Discovery tool.

Some subcommands such as **`intel`** have their own usage documentation.

More information: https://github.com/owasp-amass/amass.

- Execute an Amass subcommand:

```
amass {{intel|enum}} {{options}}
```

- Display help:

```
amass -help
```

- Display help on an Amass subcommand:

```
amass {{intel|enum}} -help
```

- Display version:

```
amass -version
```

androguard

Reverse engineer Android applications. Written in Python.

More information: https://github.com/androguard/androguard.

- Display Android app manifest:

```
androguard axml {{path/to/app.apk}}
```

- Display app metadata (version and app ID):

```
androguard apkid {{path/to/app.apk}}
```

- Decompile Java code from an app:

```
androguard decompile {{path/to/app.apk}} --output {{path/to/directory}}
```

ani-cli

Browse and watch anime.

See also: **`animdl`**.

More information: https://manned.org/ani-cli.

- Search anime by name:

```
ani-cli "{{anime_title}}"
```

- Download an episode:

```
ani-cli {{[-d|--download]}} "{{anime_title}}"
```

- Download a range of episodes:

```
ani-cli {{[-d|--download]}} {{[-r|--range]}} "{{1 6}}"
"{{anime_title}}"
```

- Download the entire series (a range of all episodes):

```
ani-cli {{[-d|--download]}} {{[-r|--range]}} "1 -1"
"{{anime_title}}"
```

- Use VLC as the media player:

```
ani-cli {{[-v|--vlc]}} "{{anime_title}}"
```

- Watch a specific episode:

```
ani-cli {{[-e|--episode]}} {{episode_number}}
"{{anime_title}}"
```

- Continue watching anime from history:

```
ani-cli {{[-c|--continue]}}
```

- Update `ani-cli`:

```
ani-cli {{[-U|--update]}}
```

animdl

A highly efficient, powerful, and fast anime scraper.

See also: **`ani-cli`**.

More information: https://github.com/justfoolingaround/animdl#usage.

- Download a specific anime:

```
animdl download {{anime_title}}
```

- Download a specific anime by specifying an episode range:

```
animdl download {{anime_title}} {{[-r|--range]}}
{{start_episode}}-{{end_episode}}
```

- Download a specific anime by specifying a download directory:

```
animdl download {{anime_title}} {{[-d|--download-dir]}}
{{path/to/download_directory}}
```

- Grab the stream URL for a specific anime:

```
animdl grab {{anime_title}}
```

- Display the upcoming anime schedule for the next week:

```
animdl schedule
```

- Search a specific anime:

```
animdl search {{anime_title}}
```

- Stream a specific anime:

```
animdl stream {{anime_title}}
```

- Stream the latest episode of a specific anime:

```
animdl stream {{anime_title}} {{[-s|--special]}} latest
```

anki

Powerful, intelligent flashcard program.

More information: https://manned.org/anki.

- Launch the GUI:

  ```
  anki
  ```

- Use a specific profile:

  ```
  anki {{[-p|--profile]}} {{profile_name}}
  ```

- Use a specific language:

  ```
  anki {{[-l|--lang]}} {{language}}
  ```

- Use a non-default directory (`~/Anki` for default):

  ```
  anki {{[-b|--base]}} {{path/to/directory}}
  ```

ansible-doc

Display information on modules installed in Ansible libraries.

Display a terse listing of plugins and their short descriptions.

More information: https://docs.ansible.com/projects/ansible/latest/cli/ansible-doc.html.

- List available action plugins (modules):

```
ansible-doc {{[-l|--list]}}
```

- List available plugins of a specific type:

```
ansible-doc {{[-t|--type]}} {{become|cache|callback|cliconf|connection|...}} {{[-l|--list]}}
```

- Show information about a specific action plugin (module):

```
ansible-doc {{plugin_name}}
```

- Show information about a plugin with a specific type:

```
ansible-doc {{[-t|--type]}} {{become|cache|callback|cliconf|connection|...}} {{plugin_name}}
```

- Show the playbook snippet for action plugin (modules):

```
ansible-doc {{[-s|--snippet]}} {{plugin_name}}
```

- Show information about an action plugin (module) as JSON:

```
ansible-doc {{[-j|--json]}} {{plugin_name}}
```

ansible-galaxy

Perform various Ansible Role and Collection related operations.

More information: https://docs.ansible.com/projects/ansible/latest/cli/ansible-galaxy.html.

- List installed roles or collections:

```
ansible-galaxy {{role|collection}} list
```

- Search for a role with various levels of verbosely (`-v` should be specified at the end):

```
ansible-galaxy role search {{keyword}} -v{{vvvvv}}
```

- Install or remove role(s):

```
ansible-galaxy role {{install|remove}} {{role_name1 role_name2 ...}}
```

- Create a new role:

```
ansible-galaxy role init {{role_name}}
```

- Get information about a role:

```
ansible-galaxy role info {{role_name}}
```

- Install or remove collection(s):

```
ansible-galaxy collection {{install|remove}} {{collection_name1 collection_name2 ...}}
```

- Display help about roles or collections:

```
ansible-galaxy {{role|collection}} {{[-h|--help]}}
```

ansible-inventory

Display or dump an Ansible inventory.

See also: **`ansible`**.

More information: https://docs.ansible.com/projects/ansible/latest/cli/ansible-inventory.html.

- Display the default inventory:

```
ansible-inventory --list
```

- Display a custom inventory:

```
ansible-inventory --list {{[-i|--inventory-file]}} {{path/to/file_or_script_or_directory}}
```

- Display the default inventory in YAML:

```
ansible-inventory --list {{[-y|--yaml]}}
```

- Dump the default inventory to a file:

```
ansible-inventory --list --output {{path/to/file}}
```

ansible-lint

Apply rules and follow best practices with your automation content.

More information: https://docs.ansible.com/projects/lint/.

- Lint a specific playbook and a role directory:

```
ansible-lint {{path/to/playbook_file}} {{path/to/
role_directory}}
```

- Lint a playbook while excluding specific rules:

```
ansible-lint {{[-x|--exclude-rules]}} {{rule1,rule2,...}}
{{path/to/playbook_file}}
```

- Lint a playbook in offline mode and format output as PEP8:

```
ansible-lint {{[-o|--offline]}} {{[-p|--parseable]}} {{path/
to/playbook_file}}
```

- Lint a playbook using a custom rules directory:

```
ansible-lint {{[-r|--rules]}} {{path/to/
custom_rules_directory}} {{path/to/playbook_file}}
```

- Lint all Ansible content recursively in a given directory:

```
ansible-lint {{path/to/project_directory}}
```

ansible-playbook

Execute tasks defined in playbook on remote machines over SSH.

More information: https://docs.ansible.com/projects/ansible/latest/cli/ansible-playbook.html.

- Run tasks in playbook:

```
ansible-playbook {{playbook}}
```

- Run tasks in playbook with custom host inventory:

```
ansible-playbook {{playbook}} {{[-i|--inventory]}} {{inventory_file}}
```

- Run tasks in playbook with extra variables defined via the command-line:

```
ansible-playbook {{playbook}} {{[-e|--extra-vars]}} "{{variable1}}={{value1}} {{variable2}}={{value2}}"
```

- Run tasks in playbook with extra variables defined in a JSON file:

```
ansible-playbook {{playbook}} {{[-e|--extra-vars]}} "@{{variables.json}}"
```

- Run tasks in playbook for the given tags:

```
ansible-playbook {{playbook}} {{[-t|--tags]}} {{tag1,tag2}}
```

- Run tasks in a playbook starting at a specific task:

```
ansible-playbook {{playbook}} --start-at {{task_name}}
```

- Run tasks in a playbook without making any changes (dry-run):

```
ansible-playbook {{playbook}} {{[-C|--check]}} {{[-D|--diff]}}
```

ansible-pull

Pull ansible playbooks from a VCS repo and executes them for the local host.

More information: https://docs.ansible.com/projects/ansible/latest/cli/ansible-pull.html.

- Pull a playbook from a VCS and execute a default `local.yml` playbook:

```
ansible-pull {{[-U|--url]}} {{repository_url}}
```

- Pull a playbook from a VCS and execute a specific playbook:

```
ansible-pull {{[-U|--url]}} {{repository_url}} {{playbook}}
```

- Pull a playbook from a VCS at a specific branch and execute a specific playbook:

```
ansible-pull {{[-U|--url]}} {{repository_url}} {{[-C|--checkout]}} {{branch}} {{playbook}}
```

- Pull a playbook from a VCS, specify hosts file and execute a specific playbook:

```
ansible-pull {{[-U|--url]}} {{repository_url}} {{[-i|--inventory-file]}} {{hosts_file}} {{playbook}}
```

ansible-vault

Encrypt and decrypt values, data structures, and files within Ansible projects.

More information: https://docs.ansible.com/projects/ansible/latest/vault_guide/index.html.

- Create a new encrypted vault file with a prompt for a password:

```
ansible-vault create {{vault_file}}
```

- Create a new encrypted vault file using a vault key file to encrypt it:

```
ansible-vault create --vault-password-file {{password_file}} {{vault_file}}
```

- Encrypt an existing file using an optional password file:

```
ansible-vault encrypt --vault-password-file {{password_file}} {{vault_file}}
```

- Encrypt a string using Ansible's encrypted string format, displaying interactive prompts:

```
ansible-vault encrypt_string
```

- View an encrypted file, using a password file to decrypt:

```
ansible-vault view --vault-password-file {{password_file}} {{vault_file}}
```

- Re-key already encrypted vault file with a new password file:

```
ansible-vault rekey --vault-password-file {{old_password_file}} --new-vault-password-file {{new_password_file}} {{vault_file}}
```

ansible

Manage groups of computers remotely over SSH. (use the **`/etc/ansible/hosts`** file to add new groups/hosts).

Some subcommands such as **`galaxy`** have their own usage documentation.

More information: https://docs.ansible.com/projects/ansible/latest/cli/ansible.html.

- List hosts belonging to a group:

```
ansible {{group}} --list-hosts
```

- Ping a group of hosts by invoking the ping module:

```
ansible {{group}} {{[-m|--module-name]}} ping
```

- Display facts about a group of hosts by invoking the setup module:

```
ansible {{group}} {{[-m|--module-name]}} setup
```

- Execute a command on a group of hosts by invoking command module with arguments:

```
ansible {{group}} {{[-m|--module-name]}} command {{[-a|--
args]}} '{{my_command}}'
```

- Execute a command with administrative privileges:

```
ansible {{group}} {{[-b|--become]}} --ask-become-pass {{[-
m|--module-name]}} command {{[-a|--args]}} '{{my_command}}'
```

- Execute a command using a custom inventory file:

```
ansible {{group}} {{[-i|--inventory]}} {{inventory_file}}
{{[-m|--module-name]}} command {{[-a|--args]}}
'{{my_command}}'
```

- List the groups in an inventory:

```
ansible localhost {{[-m|--module-name]}} debug {{[-a|--
args]}} '{{var=groups.keys()}}'
```

ansiweather

Display the current weather conditions in your terminal.

More information: https://github.com/fcambus/ansiweather#usage.

- Display a [f]orecast for the next seven days using metric [u]nits for a specific [l]ocation:

```
ansiweather -u metric -f 7 -l {{Rzeszow,PL}}
```

- Display a [F]orecast for the next five days showing [s]ymbols and [d]aylight data for your current location:

```
ansiweather -F -s true -d true
```

- Display today's [w]ind and [h]umidity data for your current location:

```
ansiweather -w true -h true
```

ant

Apache Ant: build and manage Java-based projects.

More information: https://ant.apache.org/manual/index.html.

- Build a project with default build file `build.xml`:

  `ant`

- Build a project using build file other than `build.xml`:

  `ant {{[-f|-buildfile]}} {{buildfile.xml}}`

- Print information on possible targets for this project:

  `ant {{[-p|-projecthelp]}}`

- Print debugging information:

  `ant {{[-d|-debug]}}`

- Execute all targets that do not depend on fail target(s):

  `ant {{[-k|-keep-going]}}`

antibody

"The fastest" shell plugin manager.

More information: https://getantibody.github.io/#Usage.

- Bundle all plugins for static loading:

```
antibody < {{~/.zsh_plugins.txt}} bundle >
{{~/.zsh_plugins.sh}}
```

- Update all bundles:

```
antibody update
```

- List all installed plugins:

```
antibody list
```

anytopnm

Convert an arbitrary type of image file to common image formats.

More information: https://netpbm.sourceforge.net/doc/anytopnm.html.

- Convert an input image to PBM, PGM, or PPM format irrespective of the input type:

```
anytopnm {{path/to/input}} > {{path/to/output.pnm}}
```

- Display version:

```
anytopnm {{[-v|-version]}}
```

apg

Create arbitrarily complex random passwords.

More information: https://manned.org/apg.

- Create random passwords (default password length is 8):

```
apg
```

- Create a password with at least 1 symbol (S), 1 number (N), 1 uppercase (C), 1 lowercase (L):

```
apg -M SNCL
```

- Create a password with 16 characters:

```
apg -m {{16}}
```

- Create a password with maximum length of 16:

```
apg -x {{16}}
```

- Create a password that doesn't appear in a dictionary (the dictionary file has to be provided):

```
apg -r {{path/to/dictionary_file}}
```

apkeep

Download APK files from various sources.

More information: https://github.com/EFForg/apkeep/blob/master/USAGE.

- Download an APK file to the specified directory:

```
apkeep {{[-a|--app]}} {{com.example.application}} {{path/to/directory}}
```

- List all available versions for download:

```
apkeep {{[-a|--app]}} {{com.example.application}} {{[-l|--list-versions]}} {{path/to/directory}}
```

- Specify a store to download from:

```
apkeep {{[-a|--app]}} {{com.example.application}} {{[-d|--download-source]}} {{apk-pure|google-play|f-droid|huawei-app-gallery}} {{path/to/directory}}
```

apkleaks

Expose URIs, endpoints, and secrets from APK files.

Note: APKLeaks utilizes the **`jadx`** disassembler to decompile APK files.

More information: https://github.com/dwisiswant0/apkleaks.

- Scan an APK file for URIs, endpoints, and secrets:

```
apkleaks {{[-f|--file]}} {{path/to/file.apk}}
```

- Scan and save the output to a specific file:

```
apkleaks {{[-f|--file]}} {{path/to/file.apk}} {{[-o|--
output]}} {{path/to/output.txt}}
```

- Pass `jadx` disassembler arguments:

```
apkleaks {{[-f|--file]}} {{path/to/file.apk}} {{[-a|--args]}}
"{{--threads-count 5 --deobf}}"
```

apktool

Reverse engineer APK files.

More information: https://ibotpeaches.github.io/Apktool/.

- Decode an APK file:

```
apktool d {{path/to/file.apk}}
```

- Build an APK file from a directory:

```
apktool b {{path/to/directory}}
```

- Install and store a framework:

```
apktool if {{path/to/framework.apk}}
```

apm

Atom editor Package Manager.

See also: **atom**.

More information: https://github.com/atom/apm.

- Install a package from http://atom.io/packages or a theme from http://atom.io/themes:

```
apm install {{package}}
```

- Remove a package/theme:

```
apm remove {{package}}
```

- Upgrade a package/theme:

```
apm upgrade {{package}}
```

apropos

Search the manual pages for names and descriptions.

See also: **man**.

More information: https://manned.org/apropos.

- Search for a keyword using a regex:

```
apropos {{regex}}
```

- Search without restricting the output to the terminal width (long output):

```
apropos {{[-l|--long]}} {{regex}}
```

- Search for pages that match all the regex given:

```
apropos {{regex_1}} {{[-a|--and]}} {{regex_2}} {{[-a|--and]}}
{{regex_3}}
```

ar

Create, modify, and extract from Unix archives. Typically used for static libraries (**`.a`**) and Debian packages (**`.deb`**).

See also: **`tar`**.

More information: https://manned.org/ar.

- E[x]tract all members from an archive:

```
ar x {{path/to/file.a}}
```

- Lis[t] contents in a specific archive:

```
ar t {{path/to/file.ar}}
```

- [r]eplace or add specific files to an archive:

```
ar r {{path/to/file.deb}} {{path/to/debian-binary path/to/
control.tar.gz path/to/data.tar.xz ...}}
```

- In[s]ert an object file index (equivalent to using `ranlib`):

```
ar s {{path/to/file.a}}
```

- Create an archive with specific files and an accompanying object file index:

```
ar rs {{path/to/file.a}} {{path/to/file1.o path/to/
file2.o ...}}
```

arc

Arcanist: a CLI for Phabricator.

More information: https://secure.phabricator.com/book/phabricator/article/arcanist/.

- Send the changes to Differential for review:

```
arc diff
```

- Show pending revision information:

```
arc list
```

- Update Git commit messages after review:

```
arc amend
```

- Push Git changes:

```
arc land
```

arch

This command is an alias of **`uname --machine`**.

- View documentation for the original command:

  ```
  tldr uname
  ```

archwiki-rs

Read, search, and download pages from the ArchWiki.

More information: https://gitlab.com/lucifayr/archwiki-rs.

- Read a page from the ArchWiki:

```
archwiki-rs read-page {{page_title}}
```

- Read a page from the ArchWiki in the specified format:

```
archwiki-rs read-page {{page_title}} --format {{plain-text|markdown|html}}
```

- Search the ArchWiki for pages containing the provided text:

```
archwiki-rs search "{{search_text}}" --text-search
```

- Download a local copy of all ArchWiki pages into a specific directory:

```
archwiki-rs local-wiki /{{path/to/local_wiki}} --format {{plain-text|markdown|html}}
```

arduino-builder

Compile arduino sketches.

DEPRECATION WARNING: this tool is being phased out in favor of **`arduino`**.

More information: https://github.com/arduino/arduino-builder.

- Compile a sketch:

  ```
  arduino-builder -compile {{path/to/sketch.ino}}
  ```

- Specify the debug level (default: 5):

  ```
  arduino-builder -debug-level {{1..10}}
  ```

- Specify a custom build directory:

  ```
  arduino-builder -build-path {{path/to/build_directory}}
  ```

- Use a build option file, instead of specifying `-hardware`, `-tools`, etc. manually every time:

  ```
  arduino-builder -build-options-file {{path/to/
  build.options.json}}
  ```

- Enable verbose mode:

  ```
  arduino-builder -verbose {{true}}
  ```

arduino

Arduino Studio - Integrated Development Environment for the Arduino platform.

More information: https://github.com/arduino/Arduino/blob/master/build/shared/manpage.adoc.

- Build a sketch:

```
arduino --verify {{path/to/file.ino}}
```

- Build and upload a sketch:

```
arduino --upload {{path/to/file.ino}}
```

- Build and upload a sketch to an Arduino Nano with an Atmega328p CPU, connected on port `/dev/ttyACM0`:

```
arduino --board {{arduino:avr:nano:cpu=atmega328p}} --port {{/dev/ttyACM0}} --upload {{path/to/file.ino}}
```

- Set the preference `name` to a given `value`:

```
arduino --pref {{name}}={{value}}
```

- Build a sketch, put the build results in the build directory, and reuse any previous build results in that directory:

```
arduino --pref build.path={{path/to/build_directory}} --verify {{path/to/file.ino}}
```

- Save any (changed) preferences to `preferences.txt`:

```
arduino --save-prefs
```

- Install the latest SAM board:

```
arduino --install-boards "{{arduino:sam}}"
```

- Install Bridge and Servo libraries:

```
arduino --install-library "{{Bridge:1.0.0,Servo:1.2.0}}"
```

argocd app

Interface to manage applications by Argo CD.

More information: https://argo-cd.readthedocs.io/en/stable/user-guide/commands/argocd_app/.

- List applications:

```
argocd app list --output {{json|yaml|wide}}
```

- Get application details:

```
argocd app get {{app_name}} --output {{json|yaml|wide}}
```

- Deploy application internally (to the same cluster that Argo CD is running in):

```
argocd app create {{app_name}} --repo {{git_repo_url}} --path
{{path/to/repo}} --dest-server https://kubernetes.default.svc
--dest-namespace {{ns}}
```

- Delete an application:

```
argocd app delete {{app_name}}
```

- Enable application auto-sync:

```
argocd app set {{app_name}} --sync-policy auto --auto-prune
--self-heal
```

- Preview app synchronization without affecting cluster:

```
argocd app sync {{app_name}} --dry-run --prune
```

- Show application deployment history:

```
argocd app history {{app_name}} --output {{wide|id}}
```

- Rollback application to a previous deployed version by history ID (deleting unexpected resources):

```
argocd app rollback {{app_name}} {{history_id}} --prune
```

argocd

Interface to control an Argo CD server.

Some subcommands such as **app** have their own usage documentation.

More information: https://argo-cd.readthedocs.io/en/stable/user-guide/commands/argocd/.

- Login to Argo CD server:

```
argocd login --insecure --username {{user}} --password {{password}} {{argocd_server:port}}
```

- List applications:

```
argocd app list
```

argon2

Calculate Argon2 cryptographic hashes.

More information: https://github.com/P-H-C/phc-winner-argon2#command-line-utility.

- Calculate a hash with a password and a salt with the default parameters:

```
echo "{{password}}" | argon2 "{{salt_text}}"
```

- Calculate a hash with the specified algorithm:

```
echo "{{password}}" | argon2 "{{salt_text}}" -{{d|i|id}}
```

- Display the output [e]ncoded hash without additional information:

```
echo "{{password}}" | argon2 "{{salt_text}}" -e
```

- Calculate a hash with given iteration [t]imes, [m]emory usage, and [p]arallelism parameters:

```
echo "{{password}}" | argon2 "{{salt_text}}" -t {{5}} -m {{20}} -p {{7}}
```

argos-translate

An open-source offline translation library and CLI tool written in Python.

More information: https://argos-translate.readthedocs.io/en/latest/source/cli.html.

- Install translation pairs for Spanish to English translation:

```
argospm install translate-es_en
```

- Translate some text from Spanish (`es`) to English (`en`) (Note: Only two letter language codes are supported):

```
argos-translate --from-lang es --to-lang en {{un texto corto}}
```

- Translate a text file from English to Hindi:

```
cat {{path/to/file.txt}} | argos-translate --from-lang en --to-lang hi
```

- List all installed translation pairs:

```
argospm list
```

- Show translation pairs from English that are available to be installed:

```
argospm search --from-lang en
```

- Update installed language package pairs:

```
argospm update
```

- Translate from `ar` to `ru` (Note: This requires the translation pairs `translate-ar_en` and `translate-en_ru` to be installed):

```
argos-translate --from-lang ar --to-lang ru {{صورة تساوي أكثر من ألف كلمة}}
```

aria2

This command is an alias of **`aria2c`**.

- View documentation for the updated command:

```
tldr aria2c
```

aria2c

Fast download utility.

Supports HTTP(S), FTP, SFTP, BitTorrent, and Metalink.

More information: https://aria2.github.io/manual/en/html/aria2c.html.

- Download a specific URI to a file:

```
aria2c "{{url}}"
```

- Download a file from a URI with a specific output name:

```
aria2c {{[-o|--out]}} {{path/to/file}} "{{url}}"
```

- Download multiple different files in parallel:

```
aria2c {{[-Z|--force-sequential]}} {{false}} "{{url1
url2 ...}}"
```

- Download the same file from different mirrors and verify the checksum of the downloaded file:

```
aria2c --checksum {{sha-256}}={{hash}} {{"url1" "url2" ...}}
```

- Download the URIs listed in a file with a specific number of parallel downloads:

```
aria2c {{[-i|--input-file]}} {{path/to/file}} {{[-j|--max-
concurrent-downloads]}} {{number_of_downloads}}
```

- Download with multiple connections:

```
aria2c {{[-s|--split]}} {{number_of_connections}} "{{url}}"
```

- FTP download with username and password:

```
aria2c --ftp-user {{username}} --ftp-passwd {{password}}
"{{url}}"
```

- Limit download speed in bytes/s:

```
aria2c --max-download-limit {{speed}} "{{url}}"
```

arp-scan

Send ARP packets to hosts (specified as IP addresses or hostnames) to scan the local network.

More information: https://github.com/royhills/arp-scan.

- Scan the current local network:

```
arp-scan {{[-l|--localnet]}}
```

- Scan an IP network with a custom bitmask:

```
arp-scan {{192.168.1.1}}/{{24}}
```

- Scan an IP network within a custom range:

```
arp-scan {{127.0.0.0}}-{{127.0.0.31}}
```

- Scan an IP network with a custom net mask:

```
arp-scan {{10.0.0.0}}:{{255.255.255.0}}
```

arp

Show and manipulate your system's ARP cache.

More information: https://manned.org/arp.8.

- Show the current ARP table:

```
arp
```

- Show [a]lternative BSD style output format with on fixed columns:

```
arp -a
```

- [d]elete a specific entry:

```
sudo arp -d {{address}}
```

- [s]et up a new entry in the ARP table:

```
sudo arp -s {{address}} {{mac_address}}
```

arping

Discover and probe hosts in a network using the ARP protocol.

Useful for MAC address discovery.

More information: https://manned.org/arping.

- Ping a host by ARP request packets:

```
arping {{host_ip}}
```

- Ping a host on a specific [I]nterface:

```
arping -I {{interface}} {{host_ip}}
```

- Ping a host and [f]inish after the first reply:

```
arping -f {{host_ip}}
```

- Ping a host a specific number ([c]ount) of times:

```
arping -c {{count}} {{host_ip}}
```

- Broadcast ARP request packets to update neighbours' ARP caches ([U]nsolicited ARP mode):

```
arping -U {{ip_to_broadcast}}
```

- [D]etect duplicated IP addresses in the network by sending ARP requests with a 3 second timeout:

```
arping -D -w {{3}} {{ip_to_check}}
```

arthas-trace

Trace method invoke chain, and output the time cost for each node in the path.

See also: **`arthas`**, **`arthas-watch`**.

More information: https://arthas.aliyun.com/en/doc/trace.html.

- Trace method invoke chain:

```
trace {{class-pattern}} {{method-pattern}}
```

- Trace method invoke chains and only display invoke information longer than 10 ms:

```
trace {{class-pattern}} {{method-pattern}} '#cost > {{10}}'
```

- Trace the invoke chain of multiple classes or multiple methods:

```
trace -E {{class-pattern1}}|{{class-patter2}} {{method-pattern1}}|{{method-pattern2}}|{{method-pattern3}}
```

- Track method invoke chains, only display invoke information that exceeds 10 ms, and exit after 5 times:

```
trace {{class-pattern}} {{method-pattern}} '#cost > {{10}}' -n 5
```

arthas-watch

Method invoke data observation.

See also: **`arthas`**, **`arthas-trace`**.

More information: https://arthas.aliyun.com/en/doc/watch.html.

- Observe the first parameter and return value of method, and expand the nested attributes of the object to 4 levels:

```
watch {{class-pattern}} {{method-pattern}}
'{{{ params[0],returnObj }}}' -x 4
```

- When the value of the first parameter of the method is 5, the second parameter and return value are output, and the object is expanded 4 layers:

```
watch {{class-pattern}} {{method-pattern}}
'{{{ params[1],returnObj }}}' '{{"5".equals(params[0])}}' -x
4
```

- When the method returns or an exception occurs, observe the count property of the second parameter:

```
watch {{class-pattern}} {{method-pattern}}
'{{{ params[1].count }}}' -e -s
```

arthas

Java diagnostic tool.

See also: **`arthas-watch`**, **`arthas-trace`**.

More information: https://arthas.aliyun.com/en/.

- Start Arthas:

  ```
  java -jar {{path/to/arthas-boot.jar}}
  ```

- Reconnect Arthas (default port used by Arthas is 3658):

  ```
  telnet localhost {{port_number}}
  ```

- Exit the current Arthas client without affecting other clients. equals `exit`、`logout`、`q` command:

  ```
  {{exit|quit|logout|q}}
  ```

- Terminate the Arthas server, all the Arthas clients connecting to this server will be disconnected:

  ```
  stop
  ```

asar

A file archiver for the Electron platform.

More information: https://github.com/electron/asar#usage.

- Archive a file or directory:

```
asar {{[p|pack]}} {{path/to/input_file_or_directory}} {{path/to/output_archive.asar}}
```

- Extract an archive:

```
asar {{[e|extract]}} {{path/to/archive.asar}}
```

- Extract a specific file from an archive:

```
asar {{[ef|extract-file]}} {{path/to/archive.asar}} {{file}}
```

- List the contents of an archive file:

```
asar {{[l|list]}} {{path/to/archive.asar}}
```

ascii-image-converter

Convert an image into ASCII.

More information: https://github.com/TheZoraiz/ascii-image-converter#cli-usage.

- Convert an image into ASCII:

```
ascii-image-converter {{path/to/image|URL}}
```

- Colorize the output:

```
ascii-image-converter {{[-C|--color]}} {{path/to/image|URL}}
```

- Create a tresholded image using braille (if the image is barely visible, try changing the terminal font):

```
ascii-image-converter {{[-b|--braille]}} {{path/to/image|URL}}
```

- Create a dithered image using braille (if the image is barely visible, try changing the terminal font):

```
ascii-image-converter {{[-b|--braille]}} --dither {{path/to/image|URL}}
```

- Display the image with negative colors:

```
ascii-image-converter {{[-Cn|--color --negative]}} {{path/to/image|URL}}
```

- Use a wider range of characters to display an image (may improve image accuracy):

```
ascii-image-converter {{[-c|--complex]}} {{path/to/image|URL}}
```

asciidoctor

Convert AsciiDoc files to a publishable format.

More information: https://docs.asciidoctor.org/asciidoctor/latest/cli/man1/asciidoctor/.

- Convert a specific `.adoc` file to HTML (the default output format):

```
asciidoctor {{path/to/file.adoc}}
```

- Convert a specific `.adoc` file to HTML and link a CSS stylesheet:

```
asciidoctor {{[-a|--attribute]}} stylesheet={{path/to/stylesheet.css}} {{path/to/file.adoc}}
```

- Convert a specific `.adoc` file to embeddable HTML, removing everything except the body:

```
asciidoctor {{[-e|--embedded]}} {{path/to/file.adoc}}
```

- Convert a specific `.adoc` file to a PDF using the `asciidoctor-pdf` library:

```
asciidoctor {{[-b|--backend]}} pdf {{[-r|--require]}} asciidoctor-pdf {{path/to/file.adoc}}
```

asciinema

Record and replay terminal sessions, and optionally share them on https://asciinema.org.

See also: **`terminalizer`**.

More information: https://docs.asciinema.org/manual/cli/.

- Associate the local install of `asciinema` with an asciinema.org account:

```
asciinema {{[a|auth]}}
```

- Make a new recording and save it to a local file (finish it with `<Ctrl d>` or type `exit`):

```
asciinema {{[r|record]}} {{path/to/recording.cast}}
```

- Replay a terminal recording from a local file:

```
asciinema {{[p|play]}} {{path/to/recording.cast}}
```

- Replay a terminal recording hosted on https://asciinema.org:

```
asciinema {{[p|play]}} https://asciinema.org/a/{{cast_id}}
```

- Make a new recording, limiting any idle time to at most 2.5 seconds:

```
asciinema {{[r|record]}} {{[-i|--idle-time-limit]}} 2.5
```

- Print the full output of a locally saved recording:

```
asciinema {{[ca|cat]}} {{path/to/recording.cast}}
```

- Upload a locally saved terminal session to asciinema.org:

```
asciinema {{[u|upload]}} {{path/to/recording.cast}}
```

- Stream the current terminal on a local webpage:

```
asciinema {{[st|stream]}} --local
```

asciiquarium

Display an animated aquarium in ASCII art inside the terminal.

See also: **`cmatrix`**, **`cbonsai`**, **`pipes.sh`**.

More information: https://robobunny.com/projects/asciiquarium/html/?page=2.

- Start `asciiquarium`:

  ```
  asciiquarium
  ```

- Pipe the output through `lolcat` for rainbow colors:

  ```
  asciiquarium | lolcat
  ```

- Toggle [p]ause:

  ```
  <p>
  ```

- [r]edraw aquarium and all entities:

  ```
  <r>
  ```

- Exit `asciiquarium`:

  ```
  <q>
  ```

asciitopgm

Convert ASCII graphics into a PGM file.

More information: https://netpbm.sourceforge.net/doc/asciitopgm.html.

- Read ASCII data as input and produce a PGM image with pixel values that are an approximation of the "brightness" of the ASCII characters:

```
asciitopgm {{path/to/input_file}} > {{path/to/
output_file.pgm}}
```

- Display version:

```
asciitopgm {{[-v|-version]}}
```

asdf

Manage versions of different packages.

More information: https://asdf-vm.com/manage/commands.html.

- List all available plugins:

```
asdf plugin list all
```

- Install a plugin:

```
asdf plugin add {{name}}
```

- List all available versions for a package:

```
asdf list all {{name}}
```

- Install a specific version of a package:

```
asdf install {{name}} {{version}}
```

- Set global version for a package:

```
asdf set -u {{name}} {{version}}
```

- Set local version for a package:

```
asdf set {{name}} {{version}}
```

- See the current version used for a package:

```
asdf current {{name}}
```

asnmap

A Go CLI tool for mapping organization network ranges using ASN information.

Note: An API key is required from ProjectDiscovery Cloud Platform for the tool to work.

More information: https://github.com/projectdiscovery/asnmap#usage.

- Lookup CIDR ranges for an ASN:

```
asnmap {{[-a|-asn]}} {{AS5650}} -silent
```

- Lookup CIDR ranges for an IP address:

```
asnmap {{[-i|-ip]}} {{100.19.12.21}} -silent
```

- Lookup CIDR ranges for a domain:

```
asnmap {{[-d|-domain]}} {{example.com}} -silent
```

- Lookup CIDR ranges for an organization:

```
asnmap -org {{GOOGLE}} -silent
```

- Lookup CIDR ranges from a file of targets:

```
asnmap {{[-f|-file]}} {{targets.txt}} -silent
```

- Output results in JSON format:

```
asnmap {{[-d|-domain]}} {{facebook.com}} {{[-j|-json]}} -silent
```

- Output results in CSV format:

```
asnmap {{[-a|-asn]}} {{AS394161}} {{[-c|-csv]}} -silent
```

- Update asnmap to the latest version:

```
asnmap {{[-up|-update]}}
```

aspell

Interactive spell checker.

More information: http://aspell.net/man-html/index.html.

- Spell check a single file:

```
aspell check {{path/to/file}}
```

- List misspelled words from `stdin`:

```
cat {{path/to/file}} | aspell list
```

- Show available dictionary languages:

```
aspell dicts
```

- Run `aspell` with a different language (takes two-letter ISO 639 language code):

```
aspell --lang {{cs}}
```

- List misspelled words from `stdin` and ignore words from personal word list:

```
cat {{path/to/file}} | aspell --personal {{personal-word-list.pws}} list
```

assimp

Client for the Open Asset Import Library.

Supports loading of 40+ 3D file formats, and exporting to several popular 3D formats.

More information: https://manned.org/assimp.

- List all supported import formats:

```
assimp listext
```

- List all supported export formats:

```
assimp listexport
```

- Convert a file to one of the supported output formats, using the default parameters:

```
assimp export {{input_file.stl}} {{output_file.obj}}
```

- Convert a file using custom parameters (the dox_cmd.h file in assimp's source code lists available parameters):

```
assimp export {{input_file.stl}} {{output_file.obj}} {{parameters}}
```

- Display a summary of a 3D file's contents:

```
assimp info {{path/to/file}}
```

- Display help:

```
assimp help
```

- Display help for a specific subcommand:

```
assimp {{subcommand}} --help
```

astronomer

Detect illegitimate stars from bot accounts on GitHub projects.

More information: https://github.com/Ullaakut/astronomer#arguments-and-options.

- Scan a repository:

```
astronomer {{tldr-pages/tldr-node-client}}
```

- Scan the maximum amount of stars in the repository:

```
astronomer {{tldr-pages/tldr-node-client}} {{[-s|--stars]}} {{50}}
```

- Scan a repository including comparative reports:

```
astronomer {{tldr-pages/tldr-node-client}} {{[-v|--verbose]}}
```

astroterm

A terminal-based star map.

More information: https://github.com/da-luce/astroterm#usage.

- Display real-time positions of stars and planets based on your current location:

```
astroterm
```

- Display constellations, use color, and render the simulation at the given frame rate:

```
astroterm {{[-C|--constellations]}} {{[-c|--color]}} {{[-f|--fps]}} {{60}}
```

- Use unicode characters instead of the basic ASCII characters and only render stars brighter than the given magnitude:

```
astroterm {{[-u|--unicode]}} {{[-t|--threshold]}} {{2.0}}
```

- Use a given latitude, longitude, and datetime:

```
astroterm {{[-a|--latitude]}} {{90.0}} {{[-o|--longitude]}} {{-180.0}} {{[-d|--datetime]}} {{2025-08-04T12:00:00}}
```

- Use the longitude and latitude of a given city and set the speed of the simulation to a given factor:

```
astroterm {{[-i|--city]}} {{Singapore}} {{[-s|--speed]}} {{1000.0}}
```

astyle

Source code indenter, formatter, and beautifier for the C, C++, C#, and Java programming languages.

Upon running, a copy of the original file is created with an ".orig" appended to the original file name.

More information: https://manned.org/astyle.

- Apply the default style of 4 spaces per indent and no formatting changes:

```
astyle {{source_file}}
```

- Apply the Java style with attached braces:

```
astyle {{[-A2|--style=java]}} {{path/to/file}}
```

- Apply the allman style with broken braces:

```
astyle {{[-A1|--style=allman]}} {{path/to/file}}
```

- Apply a custom indent using spaces. Choose between 2 and 20 spaces:

```
astyle {{[-s|--indent=spaces=]}}{{number_of_spaces}} {{path/to/file}}
```

- Apply a custom indent using tabs. Choose between 2 and 20 tabs:

```
astyle {{[-t|--indent=tab=]}}{{number_of_tabs}} {{path/to/file}}
```

at

Execute commands once at a later time.

Results will be sent to the users mail.

More information: https://manned.org/at.

- Create commands interactively and execute them in 5 minutes (press `<Ctrl d>` when done):

```
at now + 5 minutes
```

- Create commands interactively and execute them at a specific time:

```
at {{hh:mm}}
```

- Execute a command from `stdin` at 10:00 AM today:

```
echo "{{command}}" | at 1000
```

- Execute commands from a given file next Tuesday:

```
at -f {{path/to/file}} 9:30 PM Tue
```

- List all queued jobs for the current user (same as `atq`):

```
at -l
```

- View a specied job:

```
at -c {{job_number}}
```

atktopbm

Convert a Andrew Toolkit raster object to a PBM image.

See also: **pbmtoatk**.

More information: https://netpbm.sourceforge.net/doc/atktopbm.html.

- Convert a Andrew Toolkit raster object to a PBM image:

```
atktopbm {{path/to/image.atk}} > {{path/to/output.pbm}}
```

atom

A cross-platform pluggable text editor.

Plugins are managed by **apm**.

Note: Atom has been sunsetted and is no longer actively maintained. Use **zed** instead.

More information: https://atom.io/.

- Open a file or directory:

```
atom {{path/to/file_or_directory}}
```

- Open a file or directory in a new window:

```
atom {{[-n|--new-window]}} {{path/to/file_or_directory}}
```

- Open a file or directory in an existing window:

```
atom {{[-a|--add]}} {{path/to/file_or_directory}}
```

- Open Atom in safe mode (does not load any additional packages):

```
atom --safe
```

- Prevent Atom from forking into the background, keeping Atom attached to the terminal:

```
atom {{[-f|--foreground]}}
```

- Wait for Atom window to close before returning (useful for Git commit editor):

```
atom {{[-w|--wait]}}
```

atool

A script for managing file archives of various types.

`atool` uses external archiver programs but provides a consistent command-line interface for listing, extracting, creating, and managing archives.

More information: https://manned.org/atool.

- List files in an archive:

```
atool {{[-l|--list]}} {{path/to/archive.zip}}
```

- Extract an archive (safely creates a subdirectory if needed):

```
atool {{[-x|--extract]}} {{archive.tar.gz}}
```

- Extract an archive to a specific directory:

```
atool {{[-X|--extract-to]}} {{path/to/output_directory}}
{{archive.rar}}
```

- Display a specific file's content from an archive to `stdout` (like `cat`):

```
atool {{[-c|--cat]}} {{archive.tar}} {{path/to/
file_in_archive.txt}}
```

- Create a new archive from specified files and/or directories:

```
atool {{[-a|--add]}} {{new_archive.zip}} {{path/to/file1
path/to/file2 ...}}
```

- List files in an archive and send the output through a pager:

```
atool {{[-l|--list]}} {{[-p|--pager]}}
{{large_archive.tar.bz2}}
```

- Extract multiple archives at once (each to its own subdirectory if needed):

```
atool {{[-x|--extract]}} {{[-e|--each]}} {{archive1.zip}}
{{archive2.tar.gz}} {{*.rar}}
```

- Repack an archive from one format to another (e.g., `.tar.gz` to `.tar.7z`):

```
atool {{[-r|--repack]}} {{old_archive.tar.gz}}
{{new_archive.tar.7z}}
```

atoum

A simple, modern, and intuitive unit testing framework for PHP.

More information: https://atoum.readthedocs.io/en/latest/option_cli.html.

- Initialize a configuration file:

  ```
  atoum --init
  ```

- Run all tests:

  ```
  atoum
  ```

- Run tests using the specified configuration file:

  ```
  atoum {{[-c|--configuration]}} {{path/to/file}}
  ```

- Run a specific test file:

  ```
  atoum {{[-f|--files]}} {{path/to/file}}
  ```

- Run a specific directory of tests:

  ```
  atoum {{[-d|--directories]}} {{path/to/directory}}
  ```

- Run all tests under a specific namespace:

  ```
  atoum {{[-ns|--namespaces]}} {{namespace}}
  ```

- Run all tests with a specific tag:

  ```
  atoum {{[-t|--tags]}} {{tag}}
  ```

- Load a custom bootstrap file before running tests:

  ```
  atoum {{[-bf|--bootstrap-file]}} {{path/to/file}}
  ```

atq

Show jobs scheduled by **`at`** or **`batch`** commands.

More information: https://manned.org/atq.

- Show the current user's scheduled jobs:

```
atq
```

- Show jobs from the `a` [q]ueue (queues have single-character names):

```
atq -q {{a}}
```

- Show jobs of all users (run as superuser):

```
sudo atq
```

atrm

Remove jobs scheduled by **`at`** or **`batch`** commands.

To find job numbers use **`atq`**.

More information: https://manned.org/atrm.

- Remove job number 10:

```
atrm {{10}}
```

- Remove many jobs, separated by spaces:

```
atrm {{15}} {{17}} {{22}}
```

atuin

Store your shell history in a searchable database.

Optionally sync your encrypted history between machines.

More information: https://docs.atuin.sh/.

- Install atuin into your shell:

```
eval "$(atuin init {{bash|zsh|fish}})"
```

- Import history from the shell default history file:

```
atuin import auto
```

- Search shell history for a specific command:

```
atuin search {{command}}
```

- Register an account on the default sync server using the specified username, email, and password:

```
atuin register {{[-u|--username]}} {{username}} {{[-e|--email]}} {{email}} {{[-p|--password]}} {{password}}
```

- Login to the default sync server:

```
atuin login {{[-u|--username]}} {{username}} {{[-p|--password]}} {{password}}
```

- Sync history with the sync server:

```
atuin sync
```

audacious

An open-source audio player. Indirectly based on XMMS.

See also: **`audtool`**, **`clementine`**, **`mpc`**, **`ncmpcpp`**.

More information: https://manned.org/audacious.

- Launch the GUI:

```
audacious
```

- Start a new instance and play an audio:

```
audacious {{[-N|--new-instance]}} {{path/to/audio}}
```

- Enqueue a specific directory of audio files:

```
audacious {{[-e|--enqueue]}} {{path/to/directory}}
```

- Start or stop playback:

```
audacious {{[-t|--play-pause]}}
```

- Skip forwards ([fwd]) or backwards ([rew]) in the playlist:

```
audacious --{{fwd|rew}}
```

- Stop playback:

```
audacious {{[-s|--stop]}}
```

- Start in CLI mode (headless):

```
audacious {{[-H|--headless]}}
```

- Exit as soon as playback stops or there is nothing to playback:

```
audacious {{[-q|--quit-after-play]}}
```

auditd

This responds to requests from the audit utility and notifications from the kernel.

It should not be invoked manually.

More information: https://manned.org/auditd.

- Start the daemon:

```
auditd
```

- Start the daemon in debug mode:

```
auditd -d
```

- Start the daemon on-demand from launchd:

```
auditd -l
```

audtool

Control Audacious using commands.

See also: **audacious**.

More information: https://manned.org/audtool.

- Play/pause audio playback:

```
audtool playback-playpause
```

- Print artist, album, and song name of currently playing song:

```
audtool current-song
```

- Set volume of audio playback:

```
audtool set-volume {{100}}
```

- Skip to the next song:

```
audtool playlist-advance
```

- Print the bitrate of the current song in kilobits:

```
audtool current-song-bitrate-kbps
```

- Open Audacious in full-screen if hidden:

```
audtool mainwin-show
```

- Display help:

```
audtool help
```

- Display settings:

```
audtool preferences-show
```

autoconf

Generate configuration scripts to automatically configure software source code packages.

More information: https://manned.org/autoconf.

- Generate a configuration script from `configure.ac` (if present) or `configure.in` and save this script to `configure`:

```
autoconf
```

- Generate a configuration script from the specified template; output to `stdout`:

```
autoconf {{template-file}}
```

- Generate a configuration script from the specified template (even if the input file has not changed) and write the output to a file:

```
autoconf {{[-f|--force]}} {{[-o|--output]}} {{outfile}} {{template-file}}
```

autoflake

Remove unused imports and variables from Python code.

More information: https://github.com/PyCQA/autoflake#advanced-usage.

- Remove unused variables from a single file and display the diff:

```
autoflake --remove-unused-variables {{path/to/file.py}}
```

- Remove unused imports from multiple files and display the diffs:

```
autoflake --remove-all-unused-imports {{path/to/file1.py
path/to/file2.py ...}}
```

- Remove unused variables from a file, overwriting the file:

```
autoflake --remove-unused-variables --in-place {{path/to/
file.py}}
```

- Remove unused variables recursively from all files in a directory, overwriting each file:

```
autoflake --remove-unused-variables --in-place --recursive
{{path/to/directory}}
```

autojump

Quickly jump among the directories you visit the most.

Aliases like **`j`** or **`jc`** are provided for even less typing.

See also: **`bashmarks`**.

More information: https://github.com/wting/autojump#name.

- Add the `autojump` aliases to your shell:

```
source /usr/share/autojump/autojump.{{bash|fish|zsh}}
```

- Jump to a directory that contains the given pattern:

```
j {{pattern}}
```

- Jump to a sub-directory (child) of the current directory that contains the given pattern:

```
jc {{pattern}}
```

- Open a directory that contains the given pattern in the operating system file manager:

```
jo {{pattern}}
```

- Remove non-existing directories from the `autojump` database:

```
j --purge
```

- Show the entries in the `autojump` database:

```
j {{[-s|--stat]}}
```

automake

Automated Makefile generation for software projects using GNU standards.

More information: https://www.gnu.org/software/automake/manual/automake.html#automake-Invocation.

- Run automake to regenerate Makefiles after editing `Makefile.am`:

```
automake
```

- Generate `Makefile.in` for a non-GNU project (foreign mode):

```
automake --foreign
```

- Add verbose output for debugging:

```
automake {{[-v|--verbose]}}
```

- Add missing standard files (INSTALL, COPYING, depcomp, etc.):

```
automake {{[-a|--add-missing]}}
```

- Display help:

```
automake --help
```

autopep8

Format Python code according to the PEP 8 style guide.

More information: https://github.com/hhatto/autopep8.

- Format a file to `stdout`, with a custom maximum line length:

```
autopep8 {{path/to/file.py}} --max-line-length {{length}}
```

- Format a file, displaying a diff of the changes:

```
autopep8 --diff {{path/to/file}}
```

- Format a file in-place and save the changes:

```
autopep8 --in-place {{path/to/file.py}}
```

- Recursively format all files in a directory in-place and save changes:

```
autopep8 --in-place --recursive {{path/to/directory}}
```

autossh

Run, monitor, and restart SSH connections.

Auto-reconnects to keep port forwarding tunnels up. Accepts all SSH flags.

More information: https://manned.org/autossh.

- Start an SSH session, restarting when the [M]onitoring port fails to return data:

```
autossh -M {{monitor_port}} "{{ssh_command}}"
```

- Forward a [L]ocal port to a remote one, restarting when necessary:

```
autossh -M {{monitor_port}} -L {{local_port}}:localhost:
{{remote_port}} {{user}}@{{host}}
```

- Fork `autossh` into the background before executing SSH and do [N]ot open a remote shell:

```
autossh -f -M {{monitor_port}} -N "{{ssh_command}}"
```

- Run in the background, with no monitoring port, and instead send SSH keep-alive packets every 10 seconds to detect failure:

```
autossh -f -M 0 -N -o "ServerAliveInterval 10" -o
"ServerAliveCountMax 3" "{{ssh_command}}"
```

- Run in the background, with no monitoring port and no remote shell, exiting if the port forward fails:

```
autossh -f -M 0 -N -o "ServerAliveInterval 10" -o
"ServerAliveCountMax 3" -o ExitOnForwardFailure=yes -L
{{local_port}}:localhost:{{remote_port}} {{user}}@{{host}}
```

- Run in the background, logging `autossh` debug output and SSH verbose output to files:

```
AUTOSSH_DEBUG=1 AUTOSSH_LOGFILE={{path/to/
autossh_log_file.log}} autossh -f -M {{monitor_port}} -v -E
{{path/to/ssh_log_file.log}} {{ssh_command}}
```

avo

The official interface for Avo.

More information: https://www.avo.app/docs/implementation/cli.

- Initialize a workspace in the current directory:

```
avo init
```

- Log into the Avo platform:

```
avo login
```

- Switch to an existing Avo branch:

```
avo checkout {{branch_name}}
```

- Pull analytics wrappers for the current path:

```
avo pull
```

- Display the status of the Avo implementation:

```
avo status
```

- Resolve Git conflicts in Avo files:

```
avo conflict
```

- Open the current Avo workspace in the default web browser:

```
avo edit
```

- Display help for a subcommand:

```
avo {{subcommand}} --help
```

avrdude

Driver program for Atmel AVR microcontrollers programming.

More information: https://www.nongnu.org/avrdude/user-manual/avrdude_3.html#Option-Descriptions.

- [r]ead the flash ROM of a AVR microcontroller with a specific [p]art ID:

```
avrdude -p {{part_no}} -c {{programmer_id}} -U flash:r:{{file.hex}}:i
```

- [w]rite to the flash ROM AVR microcontroller:

```
avrdude -p {{part_no}} -c {{programmer}} -U flash:w:{{file.hex}}
```

- List available AVR devices:

```
avrdude -p \?
```

- List available AVR programmers:

```
avrdude -c \?
```

awk

A versatile programming language for working on files.

Note: Different implementations of AWK often make this a symlink of their binary.

See also: **gawk**.

More information: https://github.com/onetrueawk/awk.

- Print the fifth column (a.k.a. field) in a space-separated file:

```
awk '{print $5}' {{path/to/file}}
```

- Print the second column of the lines containing "foo" in a space-separated file:

```
awk '/{{foo}}/ {print $2}' {{path/to/file}}
```

- Print the last column of each line in a file, using a comma (instead of space) as a field separator:

```
awk -F ',' '{print $NF}' {{path/to/file}}
```

- Sum the values in the first column of a file and print the total:

```
awk '{s+=$1} END {print s}' {{path/to/file}}
```

- Print every third line starting from the first line:

```
awk 'NR%3==1' {{path/to/file}}
```

- Print different values based on conditions:

```
awk '{if ($1 == "foo") print "Exact match foo"; else if ($1 ~
"bar") print "Partial match bar"; else print "Baz"}' {{path/
to/file}}
```

- Print all the lines which the 10th column value is between a min and a max:

```
awk '($10 >= {{min_value}} && $10 <= {{max_value}})'
```

- Print table of users with UID >=1000 with header and formatted output, using colon as separator (`%-20s` mean: 20 left-align string characters, `%6s` means: 6 right-align string characters):

```
awk 'BEGIN {FS=":";printf "%-20s %6s %25s\n", "Name", "UID",
"Shell"} $4 >= 1000 {printf "%-20s %6d %25s\n", $1, $4,
$7}' /etc/passwd
```

aws accessanalyzer

Analyze and review resource policies to identify potential security risks.

More information: https://docs.aws.amazon.com/cli/latest/reference/accessanalyzer/.

- Create a new Access Analyzer:

```
aws accessanalyzer create-analyzer --analyzer-name
{{analyzer_name}} --type {{type}} --tags {{tags}}
```

- Delete an existing Access Analyzer:

```
aws accessanalyzer delete-analyzer --analyzer-arn
{{analyzer_arn}}
```

- Get details of a specific Access Analyzer:

```
aws accessanalyzer get-analyzer --analyzer-arn
{{analyzer_arn}}
```

- List all Access Analyzers:

```
aws accessanalyzer list-analyzers
```

- Update settings of an Access Analyzer:

```
aws accessanalyzer update-analyzer --analyzer-arn
{{analyzer_arn}} --tags {{new_tags}}
```

- Create a new Access Analyzer archive rule:

```
aws accessanalyzer create-archive-rule --analyzer-arn
{{analyzer_arn}} --rule-name {{rule_name}} --filter
{{filter}}
```

- Delete an Access Analyzer archive rule:

```
aws accessanalyzer delete-archive-rule --analyzer-arn
{{analyzer_arn}} --rule-name {{rule_name}}
```

- List all Access Analyzer archive rules:

```
aws accessanalyzer list-archive-rules --analyzer-arn
{{analyzer_arn}}
```

aws acm-pca

AWS Certificate Manager Private Certificate Authority.

More information: https://docs.aws.amazon.com/cli/latest/reference/acm-pca/.

- Create a private certificate authority:

```
aws acm-pca create-certificate-authority --certificate-authority-configuration {{ca_config}} --idempotency-token {{token}} --permanent-deletion-time-in-days {{number}}
```

- Describe a private certificate authority:

```
aws acm-pca describe-certificate-authority --certificate-authority-arn {{ca_arn}}
```

- List private certificate authorities:

```
aws acm-pca list-certificate-authorities
```

- Update a certificate authority:

```
aws acm-pca update-certificate-authority --certificate-authority-arn {{ca_arn}} --certificate-authority-configuration {{ca_config}} --status {{status}}
```

- Delete a private certificate authority:

```
aws acm-pca delete-certificate-authority --certificate-authority-arn {{ca_arn}}
```

- Issue a certificate:

```
aws acm-pca issue-certificate --certificate-authority-arn {{ca_arn}} --certificate-signing-request {{cert_signing_request}} --signing-algorithm {{algorithm}} --validity {{validity}}
```

- Revoke a certificate:

```
aws acm-pca revoke-certificate --certificate-authority-arn {{ca_arn}} --certificate-serial {{serial}} --reason {{reason}}
```

- Get certificate details:

```
aws acm-pca get-certificate --certificate-authority-arn {{ca_arn}} --certificate-arn {{cert_arn}}
```

aws acm

AWS Certificate Manager.

More information: https://docs.aws.amazon.com/cli/latest/reference/acm/.

- Import a certificate:

```
aws acm import-certificate --certificate-arn
{{certificate_arn}} --certificate {{certificate}} --private-
key {{private_key}} --certificate-chain {{certificate_chain}}
```

- List certificates:

```
aws acm list-certificates
```

- Describe a certificate:

```
aws acm describe-certificate --certificate-arn
{{certificate_arn}}
```

- Request a certificate:

```
aws acm request-certificate --domain-name {{domain_name}} --
validation-method {{validation_method}}
```

- Delete a certificate:

```
aws acm delete-certificate --certificate-arn
{{certificate_arn}}
```

- List certificate validations:

```
aws acm list-certificates --certificate-statuses {{status}}
```

- Get certificate details:

```
aws acm get-certificate --certificate-arn {{certificate_arn}}
```

- Update certificate options:

```
aws acm update-certificate-options --certificate-arn
{{certificate_arn}} --options {{options}}
```

aws amplify

Development platform for building secure, scalable mobile and web applications.

More information: https://docs.aws.amazon.com/cli/latest/reference/amplify/.

- Create a new Amplify app:

```
aws amplify create-app --name {{app_name}} --description
{{description}} --repository {{repo_url}} --platform
{{platform}} --environment-variables {{env_vars}} --tags
{{tags}}
```

- Delete an existing Amplify app:

```
aws amplify delete-app --app-id {{app_id}}
```

- Get details of a specific Amplify app:

```
aws amplify get-app --app-id {{app_id}}
```

- List all Amplify apps:

```
aws amplify list-apps
```

- Update settings of an Amplify app:

```
aws amplify update-app --app-id {{app_id}} --name
{{new_name}} --description {{new_description}} --repository
{{new_repo_url}} --environment-variables {{new_env_vars}} --
tags {{new_tags}}
```

- Add a new backend environment to an Amplify app:

```
aws amplify create-backend-environment --app-id {{app_id}} --
environment-name {{env_name}} --deployment-artifacts
{{artifacts}}
```

- Remove a backend environment from an Amplify app:

```
aws amplify delete-backend-environment --app-id {{app_id}} --
environment-name {{env_name}}
```

- List all backend environments in an Amplify app:

```
aws amplify list-backend-environments --app-id {{app_id}}
```

aws backup

Unified backup service designed to protect Amazon Web Services services and their associated data.

More information: https://docs.aws.amazon.com/cli/latest/reference/backup/.

- Return BackupPlan details for a specific BackupPlanId:

```
aws backup get-backup-plan --backup-plan-id {{id}}
```

- Create a backup plan using a specific backup plan name and backup rules:

```
aws backup create-backup-plan --backup-plan {{plan}}
```

- Delete a specific backup plan:

```
aws backup delete-backup-plan --backup-plan-id {{id}}
```

- List all active backup plans for the current account:

```
aws backup list-backup-plans
```

- Display details about your report jobs:

```
aws backup list-report-jobs
```

aws batch

Run batch computing workloads through the AWS Batch service.

More information: https://docs.aws.amazon.com/cli/latest/reference/batch/.

- List running batch jobs:

```
aws batch list-jobs --job-queue {{queue_name}}
```

- Create compute environment:

```
aws batch create-compute-environment --compute-environment-name {{compute_environment_name}} --type {{type}}
```

- Create batch job queue:

```
aws batch create-job-queue --job-queue-name {{queue_name}} --priority {{priority}} --compute-environment-order {{compute_environment}}
```

- Submit job:

```
aws batch submit-job --job-name {{job_name}} --job-queue {{job_queue}} --job-definition {{job_definition}}
```

- Describe the list of batch jobs:

```
aws batch describe-jobs --jobs {{jobs}}
```

- Cancel job:

```
aws batch cancel-job --job-id {{job_id}} --reason {{reason}}
```

aws ce

Run cost management operations through the AWS Cost Explorer service.

More information: https://docs.aws.amazon.com/cli/latest/reference/ce/.

- Create anomaly monitor:

```
aws ce create-anomaly-monitor --monitor {{monitor_name}} --
monitor-type {{monitor_type}}
```

- Create anomaly subscription:

```
aws ce create-anomaly-subscription --subscription
{{subscription_name}} --monitor-arn {{monitor_arn}} --
subscribers {{subscribers}}
```

- Get anomalies:

```
aws ce get-anomalies --monitor-arn {{monitor_arn}} --start-
time {{start_time}} --end-time {{end_time}}
```

- Get cost and usage:

```
aws ce get-cost-and-usage --time-period {{start_date}}/
{{end_date}} --granularity {{granularity}} --metrics
{{metrics}}
```

- Get cost forecast:

```
aws ce get-cost-forecast --time-period {{start_date}}/
{{end_date}} --granularity {{granularity}} --metric
{{metric}}
```

- Get reservation utilization:

```
aws ce get-reservation-utilization --time-period
{{start_date}}/{{end_date}} --granularity {{granularity}}
```

- List cost category definitions:

```
aws ce list-cost-category-definitions
```

- Tag resource:

```
aws ce tag-resource --resource-arn {{resource_arn}} --tags
{{tags}}
```

aws cloud9

Manage Cloud9 - a collection of tools to code, build, run, test, debug, and release software in the cloud.

More information: https://docs.aws.amazon.com/cli/latest/reference/cloud9/.

- List all Cloud9 development environment identifiers:

```
aws cloud9 list-environments
```

- Create a Cloud9 development environment:

```
aws cloud9 create-environment-ec2 --name {{name}} --instance-type {{instance_type}}
```

- Display information about Cloud9 development environments:

```
aws cloud9 describe-environments --environment-ids {{environment_ids}}
```

- Add an environment member to a Cloud9 development environment:

```
aws cloud9 create-environment-membership --environment-id {{environment_id}} --user-arn {{user_arn}} --permissions {{permissions}}
```

- Display status information for a Cloud9 development environment:

```
aws cloud9 describe-environment-status --environment-id {{environment_id}}
```

- Delete a Cloud9 environment:

```
aws cloud9 delete-environment --environment-id {{environment_id}}
```

- Delete an environment member from a development environment:

```
aws cloud9 delete-environment-membership --environment-id {{environment_id}} --user-arn {{user_arn}}
```

aws cloudformation

Model, provision, and manage AWS and third-party resources by treating infrastructure as code.

More information: https://docs.aws.amazon.com/cli/latest/reference/cloudformation/.

- Create a stack from a template file:

```
aws cloudformation create-stack --stack-name {{stack-name}} --region {{region}} --template-body {{file://path/to/file.yml}} --profile {{profile}}
```

- Delete a stack:

```
aws cloudformation delete-stack --stack-name {{stack-name}} --profile {{profile}}
```

- List all stacks:

```
aws cloudformation list-stacks --profile {{profile}}
```

- List all running stacks:

```
aws cloudformation list-stacks --stack-status-filter CREATE_COMPLETE --profile {{profile}}
```

- Check the status of a stack:

```
aws cloudformation describe-stacks --stack-name {{stack-id}} --profile {{profile}}
```

- Initiate drift detection for a stack:

```
aws cloudformation detect-stack-drift --stack-name {{stack-id}} --profile {{profile}}
```

- Check the drift status output of a stack using `StackDriftDetectionId` from the previous command output:

```
aws cloudformation describe-stack-resource-drifts --stack-name {{stack-drift-detection-id}} --profile {{profile}}
```

aws cloudwatch

Monitor AWS resources to gain system-wide visibility into resource utilization, application performance, and operational health.

More information: https://docs.aws.amazon.com/cli/latest/reference/cloudwatch/.

- List dashboards for your account:

```
aws cloudwatch list-dashboards
```

- Display details for the specified dashboard:

```
aws cloudwatch get-dashboard --dashboard-name
{{dashboard_name}}
```

- List metrics:

```
aws cloudwatch list-metrics
```

- List alarms:

```
aws cloudwatch describe-alarms
```

- Create or update an alarm and associate it with a metric:

```
aws cloudwatch put-metric-alarm --alarm-name {{alarm_name}}
--evaluation-periods {{evaluation_periods}} --comparison-
operator {{comparison_operator}}
```

- Delete the specified alarms:

```
aws cloudwatch delete-alarms --alarm-names {{alarm_names}}
```

- Delete the specified dashboards:

```
aws cloudwatch delete-dashboards --dashboard-names
{{dashboard_names}}
```

aws codeartifact

Manage CodeArtifact repositories, domains, packages, package versions, and assets.

CodeArtifact is an artifact repository compatible with popular package managers and build tools like Maven, Gradle, npm, Yarn, Twine, pip, NuGet, and SwiftPM.

More information: https://docs.aws.amazon.com/cli/latest/reference/codeartifact/.

- List available domains for your AWS account:

```
aws codeartifact list-domains
```

- Generate credentials for a specific package manager:

```
aws codeartifact login --tool {{npm|pip|twine}} --domain
{{your_domain}} --repository {{repository_name}}
```

- Get the endpoint URL of a CodeArtifact repository:

```
aws codeartifact get-repository-endpoint --domain
{{your_domain}} --repository {{repository_name}} --format
{{npm|pypi|maven|nuget|generic}}
```

- Display help:

```
aws codeartifact help
```

- Display help for a specific subcommand:

```
aws codeartifact {{subcommand}} help
```

aws codecommit

A managed source control service that hosts private Git repositories.

More information: https://docs.aws.amazon.com/cli/latest/reference/codecommit/.

- Display help:

```
aws codecommit help
```

- Display help for a specific command:

```
aws codecommit {{command}} help
```

aws cognito-idp

Configure an Amazon Cognito user pool and its users and groups and authenticate them.

More information: https://docs.aws.amazon.com/cli/latest/reference/cognito-idp/.

- Create a new Cognito user pool:

```
aws cognito-idp create-user-pool --pool-name {{name}}
```

- List all user pools:

```
aws cognito-idp list-user-pools --max-results {{10}}
```

- Delete a specific user pool:

```
aws cognito-idp delete-user-pool --user-pool-id
{{user_pool_id}}
```

- Create a user in a specific pool:

```
aws cognito-idp admin-create-user --username {{username}} --
user-pool-id {{user_pool_id}}
```

- List the users of a specific pool:

```
aws cognito-idp list-users --user-pool-id {{user_pool_id}}
```

- Delete a user from a specific pool:

```
aws cognito-idp admin-delete-user --username {{username}} --
user-pool-id {{user_pool_id}}
```

aws configure

Manage configuration for the AWS CLI.

More information: https://docs.aws.amazon.com/cli/latest/reference/configure/.

- Configure AWS CLI interactively (creates a new configuration or updates the default):

```
aws configure
```

- Configure a named profile for AWS CLI interactively (creates a new profile or updates an existing one):

```
aws configure --profile {{profile_name}}
```

- Display the value from a specific configuration variable:

```
aws configure get {{name}}
```

- Display the value for a configuration variable in a specific profile:

```
aws configure get {{name}} --profile {{profile_name}}
```

- Set the value of a specific configuration variable:

```
aws configure set {{name}} {{value}}
```

- Set the value of a configuration variable in a specific profile:

```
aws configure set {{name}} {{value}} --profile
{{profile_name}}
```

- List the configuration entries:

```
aws configure list
```

- List the configuration entries for a specific profile:

```
aws configure list --profile {{profile_name}}
```

aws cur

Create, query, and delete AWS usage report definitions.

More information: https://docs.aws.amazon.com/cli/latest/reference/cur/.

- Create an AWS cost and usage report definition from a JSON file:

```
aws cur put-report-definition --report-definition file://
{{path/to/report_definition.json}}
```

- List usage report definitions defined for the logged in account:

```
aws cur describe-report-definitions
```

- Delete a usage report definition:

```
aws cur --region {{aws_region}} delete-report-definition --
report-name {{report}}
```

aws dynamodb

Manipulate an AWS Dynamodb database, a fast NoSQL database with predictable performance and seamless scalability.

More information: https://docs.aws.amazon.com/cli/latest/reference/dynamodb/.

- Create a table:

```
aws dynamodb create-table --table-name {{table_name}} --
attribute-definitions {{AttributeName=S,AttributeType=S}} --
key-schema {{AttributeName=S,KeyType=HASH}} --provisioned-
throughput {{ReadCapacityUnits=5,WriteCapacityUnits=5}}
```

- List all tables in the DynamoDB:

```
aws dynamodb list-tables
```

- Get details about a specific table:

```
aws dynamodb describe-table --table-name {{table_name}}
```

- Add an item to a table:

```
aws dynamodb put-item --table-name {{table_name}} --item
'{{{"AttributeName": {"S": "value"}}}}'
```

- Retrieve an item from a table:

```
aws dynamodb get-item --table-name {{table_name}} --key
'{{{"ID": {"N": "1"}}}}'
```

- Update an item in the table:

```
aws dynamodb update-item --table-name {{table_name}} --key
'{{{"ID": {"N": "1"}}}}' --update-expression "{{SET Name
= :n}}" --expression-attribute-values '{{{":n": {"S":
"Jane"}}}}'
```

- Scan items in the table:

```
aws dynamodb scan --table-name {{table_name}}
```

- Delete an item from the table:

```
aws dynamodb delete-item --table-name {{table_name}} --key
'{{{"ID": {"N": "1"}}}}'
```

aws ec2

Manage AWS EC2 instances and volumes.

AWS EC2 provides secure and resizable computing capacity in the AWS cloud for faster development and deployment of applications.

More information: https://docs.aws.amazon.com/cli/latest/reference/ec2/.

- Display information about a specific instance:

```
aws ec2 describe-instances --instance-ids {{instance_id}}
```

- Display information about all instances:

```
aws ec2 describe-instances
```

- Display information about all EC2 volumes:

```
aws ec2 describe-volumes
```

- Delete an EC2 volume:

```
aws ec2 delete-volume --volume-id {{volume_id}}
```

- Create a snapshot from an EC2 volume:

```
aws ec2 create-snapshot --volume-id {{volume_id}}
```

- List available AMIs (Amazon Machine Images):

```
aws ec2 describe-images
```

- Show list of all available EC2 commands:

```
aws ec2 help
```

- Display help for specific EC2 subcommand:

```
aws ec2 {{subcommand}} help
```

aws ecr

Push, pull, and manage container images.

More information: https://docs.aws.amazon.com/cli/latest/reference/ecr/.

- Authenticate Docker with the default registry (username is AWS):

```
aws ecr get-login-password --region {{region}} | {{docker login}} --username AWS --password-stdin {{aws_account_id}}.dkr.ecr.{{region}}.amazonaws.com
```

- Create a repository:

```
aws ecr create-repository --repository-name {{repository}} --image-scanning-configuration scanOnPush={{true|false}} --region {{region}}
```

- Tag a local image for ECR:

```
docker tag {{container_name}}:{{tag}} {{aws_account_id}}.dkr.ecr.{{region}}.amazonaws.com/{{container_name}}:{{tag}}
```

- Push an image to a repository:

```
docker push {{aws_account_id}}.dkr.ecr.{{region}}.amazonaws.com/{{container_name}}:{{tag}}
```

- Pull an image from a repository:

```
docker pull {{aws_account_id}}.dkr.ecr.{{region}}.amazonaws.com/{{container_name}}:{{tag}}
```

- Delete an image from a repository:

```
aws ecr batch-delete-image --repository-name {{repository}} --image-ids imageTag={{latest}}
```

- Delete a repository:

```
aws ecr delete-repository --repository-name {{repository}} --force
```

- List images within a repository:

```
aws ecr list-images --repository-name {{repository}}
```

aws eks

Manage Amazon Elastic Kubernetes Service (EKS) addons, clusters, and node groups.

Amazon EKS is a service for easily running Kubernetes on AWS.

More information: https://docs.aws.amazon.com/cli/latest/reference/eks/.

- Create an EKS Cluster:

```
aws eks create-cluster --name {{cluster_name}} --role-arn
{{eks_service_role_arn}} --resources-vpc-config
subnetIds={{subnet_ids}},securityGroupIds={{security_group_ids}}
```

- Update kubeconfig to connect to the EKS Cluster:

```
aws eks update-kubeconfig --name {{cluster_name}}
```

- List available EKS clusters:

```
aws eks list-clusters
```

- Describe EKS cluster details:

```
aws eks describe-cluster --name {{cluster_name}}
```

- Delete an EKS Cluster:

```
aws eks delete-cluster --name {{cluster_name}}
```

- List nodegroups in an EKS cluster:

```
aws eks list-nodegroups --cluster-name {{cluster_name}}
```

- Describe nodegroup details:

```
aws eks describe-nodegroup --cluster-name {{cluster_name}} --
nodegroup-name {{nodegroup_name}}
```

aws glue

CLI for AWS Glue.

Define the public endpoint for the AWS Glue service.

More information: https://docs.aws.amazon.com/cli/latest/reference/glue/.

- List jobs:

```
aws glue list-jobs
```

- Start a job:

```
aws glue start-job-run --job-name {{job_name}}
```

- Start running a workflow:

```
aws glue start-workflow-run --name {{workflow_name}}
```

- List triggers:

```
aws glue list-triggers
```

- Start a trigger:

```
aws glue start-trigger --name {{trigger_name}}
```

- Create a dev endpoint:

```
aws glue create-dev-endpoint --endpoint-name {{name}} --role-
arn {{role_arn_used_by_endpoint}}
```

aws-google-auth

Acquire AWS temporary (STS) credentials using Google Apps as a federated (Single Sign-On) provider.

More information: https://github.com/cevoaustralia/aws-google-auth.

- Log in with Google SSO using the specified username IDP and SP identifiers and set the credentials duration to one hour:

```
aws-google-auth {{[-u|--username]}} {{example@example.com}} {{[-I|--idp-id]}} {{$GOOGLE_IDP_ID}} {{[-S|--sp-id]}} {{$GOOGLE_SP_ID}} {{[-d|--duration]}} {{3600}}
```

- Log in asking which role to use (in case of several available SAML roles):

```
aws-google-auth {{[-u|--username]}} {{example@example.com}} {{[-I|--idp-id]}} {{$GOOGLE_IDP_ID}} {{[-S|--sp-id]}} {{$GOOGLE_SP_ID}} {{[-d|--duration]}} {{3600}} {{[-a|--ask-role]}}
```

- Resolve aliases for AWS accounts:

```
aws-google-auth {{[-u|--username]}} {{example@example.com}} {{[-I|--idp-id]}} {{$GOOGLE_IDP_ID}} {{[-S|--sp-id]}} {{$GOOGLE_SP_ID}} {{[-d|--duration]}} {{3600}} {{[-a|--ask-role]}} --resolve-aliases
```

- Display help:

```
aws-google-auth {{[-h|--help]}}
```

aws help

Display help information about the AWS CLI.

More information: https://docs.aws.amazon.com/cli/latest/userguide/cli-usage-help.html.

- Display help:

```
aws help
```

- List all available topics:

```
aws help topics
```

- Display help about a specific topic:

```
aws help {{topic_name}}
```

aws history

Print the command-line history for AWS CLI commands (the record of history of AWS CLI commands must be enabled).

More information: https://docs.aws.amazon.com/cli/latest/reference/history/.

- List commands history with command IDs:

```
aws history list
```

- Display events related to a specific command given a command ID:

```
aws history show {{command_id}}
```

aws iam

Interact with Identity and Access Management (IAM), a web service for securely controlling access to AWS services.

More information: https://docs.aws.amazon.com/cli/latest/reference/iam/.

- List users:

```
aws iam list-users
```

- List policies:

```
aws iam list-policies
```

- List groups:

```
aws iam list-groups
```

- Get users in a group:

```
aws iam get-group --group-name {{group_name}}
```

- Describe an IAM policy:

```
aws iam get-policy --policy-arn arn:aws:iam::aws:policy/
{{policy_name}}
```

- List access keys:

```
aws iam list-access-keys
```

- List access keys for a specific user:

```
aws iam list-access-keys --user-name {{user_name}}
```

- Display help:

```
aws iam help
```

aws kafka

Manage an Amazon MSK (Managed Streaming for Apache Kafka) cluster.

See also: **aws**.

More information: https://docs.aws.amazon.com/cli/latest/reference/kafka/.

- Create a new MSK cluster:

```
aws kafka create-cluster --cluster-name {{cluster_name}} --
broker-node-group-info
instanceType={{instance_type}},clientSubnets={{subnet_id1
subnet_id2 ...}} --kafka-version {{version}} --number-of-
broker-nodes {{number}}
```

- Describe a MSK cluster:

```
aws kafka describe-cluster --cluster-arn {{cluster_arn}}
```

- List all MSK clusters in the current region:

```
aws kafka list-clusters
```

- Create a new MSK configuration:

```
aws kafka create-configuration --name {{configuration_name}}
--server-properties file://{{path/to/configuration_file.txt}}
```

- Describe a MSK configuration:

```
aws kafka describe-configuration --arn {{configuration_arn}}
```

- List all MSK configurations in the current region:

```
aws kafka list-configurations
```

- Update the MSK cluster configuration:

```
aws kafka update-cluster-configuration --cluster-arn
{{cluster_arn}} --configuration-info
arn={{configuration_arn}},revision={{configuration_revision}}
```

- Delete the MSK cluster:

```
aws kafka delete-cluster --cluster-arn {{cluster_arn}}
```

aws kendra

CLI for AWS Kendra.

More information: https://docs.aws.amazon.com/cli/latest/reference/kendra/.

- Create an index:

```
aws kendra create-index --name {{name}} --role-arn
{{role_arn}}
```

- List indexes:

```
aws kendra list-indexes
```

- Describe an index:

```
aws kendra describe-index --id {{index_id}}
```

- List data sources:

```
aws kendra list-data-sources
```

- Describe a data source:

```
aws kendra describe-data-source --id {{data_source_id}}
```

- List search queries:

```
aws kendra list-query-suggestions --index-id {{index_id}} --
query-text {{query_text}}
```

aws kinesis

Interact with the Amazon Kinesis Data Streams, a service that scales elastically for real-time processing of streaming big data.

More information: https://docs.aws.amazon.com/cli/latest/reference/kinesis/index.html#cli-aws-kinesis.

- Show all streams in the account:

```
aws kinesis list-streams
```

- Write one record to a Kinesis stream:

```
aws kinesis put-record --stream-name {{name}} --partition-key {{key}} --data {{base64_encoded_message}}
```

- Write a record to a Kinesis stream with inline base64 encoding:

```
aws kinesis put-record --stream-name {{name}} --partition-key {{key}} --data "$( echo "{{my raw message}}" | base64 )"
```

- List the shards available on a stream:

```
aws kinesis list-shards --stream-name {{name}}
```

- Get a shard iterator for reading from the oldest message in a stream's shard:

```
aws kinesis get-shard-iterator --shard-iterator-type TRIM_HORIZON --stream-name {{name}} --shard-id {{id}}
```

- Read records from a shard, using a shard iterator:

```
aws kinesis get-records --shard-iterator {{iterator}}
```

aws lambda

Use AWS Lambda, a compute service for running code without provisioning or managing servers.

More information: https://docs.aws.amazon.com/cli/latest/reference/lambda/.

- Run a function:

```
aws lambda invoke --function-name {{name}} {{path/to/response.json}}
```

- Run a function with an input payload in JSON format:

```
aws lambda invoke --function-name {{name}} --payload {{json}} {{path/to/response.json}}
```

- List functions:

```
aws lambda list-functions
```

- Display the configuration of a function:

```
aws lambda get-function-configuration --function-name {{name}}
```

- List function aliases:

```
aws lambda list-aliases --function-name {{name}}
```

- Display the reserved concurrency configuration for a function:

```
aws lambda get-function-concurrency --function-name {{name}}
```

- List which AWS services can invoke the function:

```
aws lambda get-policy --function-name {{name}}
```

aws lightsail

Manage Amazon Lightsail resources.

More information: https://docs.aws.amazon.com/cli/latest/reference/lightsail/.

- List all virtual private servers, or instances:

```
aws lightsail get-instances
```

- List all bundles (instance plans):

```
aws lightsail list-bundles
```

- List all available instance images, or blueprints:

```
aws lightsail list-blueprints
```

- Create an instance:

```
aws lightsail create-instances --instance-names {{name}} --
availability-zone {{region}} --bundle-id {{nano_2_0}} --
blueprint-id {{blueprint_id}}
```

- Print the state of a specific instance:

```
aws lightsail get-instance-state --instance-name {{name}}
```

- Stop a specific instance:

```
aws lightsail stop-instance --instance-name {{name}}
```

- Delete a specific instance:

```
aws lightsail delete-instance --instance-name {{name}}
```

aws pricing

Query services, products, and pricing information from Amazon Web Services.

More information: https://docs.aws.amazon.com/cli/latest/reference/pricing/.

- List service codes of a specific region:

```
aws pricing describe-services --region {{us-east-1}}
```

- List attributes for a given service code in a specific region:

```
aws pricing describe-services --service-code {{AmazonEC2}} --
region {{us-east-1}}
```

- Print pricing information for a service code in a specific region:

```
aws pricing get-products --service-code {{AmazonEC2}} --
region {{us-east-1}}
```

- List values for a specific attribute for a service code in a specific region:

```
aws pricing get-attribute-values --service-code {{AmazonEC2}}
--attribute-name {{instanceType}} --region {{us-east-1}}
```

- Print pricing information for a service code using filters for instance type and location:

```
aws pricing get-products --service-code {{AmazonEC2}} --
filters
"{{Type=TERM_MATCH,Field=instanceType,Value=m5.xlarge}}"
"{{Type=TERM_MATCH,Field=location,Value=US East (N.
Virginia)}}" --region {{us-east-1}}
```

aws quicksight

Create, delete, list, search, and update AWS QuickSight entities.

More information: https://docs.aws.amazon.com/cli/latest/reference/quicksight/.

- List datasets:

```
aws quicksight list-data-sets --aws-account-id
{{aws_account_id}}
```

- List users:

```
aws quicksight list-users --aws-account-id {{aws_account_id}}
--namespace default
```

- List groups:

```
aws quicksight list-groups --aws-account-id
{{aws_account_id}} --namespace default
```

- List dashboards:

```
aws quicksight list-dashboards --aws-account-id
{{aws_account_id}}
```

- Display detailed information about a dataset:

```
aws quicksight describe-data-set --aws-account-id
{{aws_account_id}} --data-set-id {{data_set_id}}
```

- Display who has access to the dataset and what kind of actions they can perform on the dataset:

```
aws quicksight describe-data-set-permissions --aws-account-id
{{aws_account_id}} --data-set-id {{data_set_id}}
```

aws rds

Use AWS Relational Database Service, a web service for setting up, operating, and scaling relational databases.

More information: https://docs.aws.amazon.com/cli/latest/reference/rds/.

- Display help for a specific RDS subcommand:

```
aws rds {{subcommand}} help
```

- Stop instance:

```
aws rds stop-db-instance --db-instance-identifier
{{instance_identifier}}
```

- Start instance:

```
aws rds start-db-instance --db-instance-identifier
{{instance_identifier}}
```

- Modify an RDS instance:

```
aws rds modify-db-instance --db-instance-identifier
{{instance_identifier}} {{parameters}} --apply-immediately
```

- Apply updates to an RDS instance:

```
aws rds apply-pending-maintenance-action --resource-
identifier {{database_arn}} --apply-action {{system-update}}
--opt-in-type {{immediate}}
```

- Change an instance identifier:

```
aws rds modify-db-instance --db-instance-identifier
{{old_instance_identifier}} --new-db-instance-identifier
{{new_instance_identifier}}
```

- Reboot an instance:

```
aws rds reboot-db-instance --db-instance-identifier
{{instance_identifier}}
```

- Delete an instance:

```
aws rds delete-db-instance --db-instance-identifier
{{instance_identifier}} --final-db-snapshot-identifier
{{snapshot_identifier}} --delete-automated-backups
```

aws route53

CLI for AWS Route53 - Route 53 is a highly available and scalable Domain Name System (DNS) web service.

More information: https://docs.aws.amazon.com/cli/latest/reference/route53/.

- List all hosted zones, private and public:

```
aws route53 list-hosted-zones
```

- Show all records in a zone:

```
aws route53 list-resource-record-sets --hosted-zone-id {{zone_id}}
```

- Create a new, public zone using a request identifier to retry the operation safely:

```
aws route53 create-hosted-zone --name {{name}} --caller-reference {{request_identifier}}
```

- Delete a zone (if the zone has non-defaults SOA and NS records the command will fail):

```
aws route53 delete-hosted-zone --id {{zone_id}}
```

- Test DNS resolving by Amazon servers of a given zone:

```
aws route53 test-dns-answer --hosted-zone-id {{zone_id}} --record-name {{name}} --record-type {{type}}
```

aws s3 cp

Copy local files or S3 objects to another location locally or in S3.

More information: https://docs.aws.amazon.com/cli/latest/reference/s3/cp.html.

- Copy a file from local to a specific bucket:

```
aws s3 cp {{path/to/file}} s3://{{bucket_name}}/{{path/to/remote_file}}
```

- Copy a specific S3 object into another bucket:

```
aws s3 cp s3://{{bucket_name1}}/{{path/to/file}} s3://{{bucket_name2}}/{{path/to/target}}
```

- Copy a specific S3 object into another bucket keeping the original name:

```
aws s3 cp s3://{{bucket_name1}}/{{path/to/file}} s3://{{bucket_name2}}
```

- Copy S3 objects to a local directory recursively:

```
aws s3 cp s3://{{bucket_name}} . --recursive
```

- Display help:

```
aws s3 cp help
```

aws s3 ls

List AWS S3 buckets, folders (prefixes), and files (objects).

More information: https://docs.aws.amazon.com/cli/latest/reference/s3/ls.html.

- List all buckets:

```
aws s3 ls
```

- List files and folders in the root of a bucket (`s3://` is optional):

```
aws s3 ls s3://{{bucket_name}}
```

- List files and folders directly inside a directory:

```
aws s3 ls {{bucket_name}}/{{path/to/directory}}/
```

- List all files in a bucket:

```
aws s3 ls --recursive {{bucket_name}}
```

- List all files in a path with a given prefix:

```
aws s3 ls --recursive {{bucket_name}}/{{path/to/directory}}/
{{prefix}}
```

- Display help:

```
aws s3 ls help
```

aws s3 mb

Create S3 buckets.

More information: https://docs.aws.amazon.com/cli/latest/reference/s3/mb.html.

- Create an S3 bucket:

```
aws s3 mb s3://{{bucket_name}}
```

- Create an S3 bucket in a specific region:

```
aws s3 mb s3://{{bucket_name}} --region {{region}}
```

- Display help:

```
aws s3 mb help
```

aws s3 mv

Move local files or S3 objects to another location locally or in S3.

More information: https://docs.aws.amazon.com/cli/latest/reference/s3/mv.html.

- Move a file from local to a specified bucket:

```
aws s3 mv {{path/to/local_file}} s3://{{bucket_name}}/{{path/to/remote_file}}
```

- Move a specific S3 object into another bucket:

```
aws s3 mv s3://{{bucket_name1}}/{{path/to/file}} s3://{{bucket_name2}}/{{path/to/target}}
```

- Move a specific S3 object into another bucket keeping the original name:

```
aws s3 mv s3://{{bucket_name1}}/{{path/to/file}} s3://{{bucket_name2}}
```

- Display help:

```
aws s3 mv help
```

aws s3 presign

Generate pre-signed URLs for Amazon S3 objects.

More information: https://docs.aws.amazon.com/cli/latest/reference/s3/presign.html.

- Generate a pre-signed URL for a specific S3 object that is valid for one hour:

```
aws s3 presign s3://{{bucket_name}}/{{path/to/file}}
```

- Generate a pre-signed URL valid for a specific lifetime:

```
aws s3 presign s3://{{bucket_name}}/{{path/to/file}} --expires-in {{duration_in_seconds}}
```

- Display help:

```
aws s3 presign help
```

aws s3 rb

Delete an empty S3 bucket.

More information: https://docs.aws.amazon.com/cli/latest/reference/s3/rb.html.

- Delete an empty S3 bucket:

```
aws s3 rb s3://{{bucket_name}}
```

- Force delete an S3 bucket and its non-versioned objects (will crash if versioned objects are present):

```
aws s3 rb s3://{{bucket_name}} --force
```

aws s3 rm

Delete S3 objects.

More information: https://docs.aws.amazon.com/cli/latest/reference/s3/rm.html.

- Delete a specific S3 object:

```
aws s3 rm s3://{{bucket_name}}/{{path/to/file}}
```

- Preview the deletion of a specific S3 object without deleting it (dry-run):

```
aws s3 rm s3://{{bucket_name}}/{{path/to/file}} --dryrun
```

- Delete an object from a specific S3 access point:

```
aws s3 rm s3://arn:aws:s3:{{region}}:{{account_id}}:
{{access_point}}/{{access_point_name}}/{{object_key}}
```

- Remove all objects from a bucket (empty the bucket):

```
aws s3 rm s3://{{bucket_name}} --recursive
```

- Display help:

```
aws s3 rm help
```

aws s3 sync

Recursively sync files and directories between your local system and an S3 bucket, or between S3 buckets.

More information: https://docs.aws.amazon.com/cli/latest/reference/s3/sync.html.

- Sync files in a directory from local to a bucket:

```
aws s3 sync {{path/to/directory}} s3://{{bucket_name}}/
{{path/to/remote_location}}
```

- Sync files in a directory from a bucket to local:

```
aws s3 sync s3://{{bucket_name}}/{{path/to/remote_location}}
{{path/to/directory}}
```

- Sync objects between two buckets:

```
aws s3 sync s3://{{bucket_source_name}}/{{path/to/
remote_location}} s3://{{bucket_target_name}}/{{path/to/
remote_location}}
```

- Sync local files to S3 while excluding specific files or directories:

```
aws s3 sync {{path/to/directory}} s3://{{bucket_name}}/
{{path/to/remote_location}} --exclude {{path/to/file}} --
exclude {{path/to/directory}}/*
```

- Sync objects between buckets and delete destination files not in source:

```
aws s3 sync s3://{{bucket_source_name}}/{{path/to/
remote_location}} s3://{{bucket_target_name}}/{{path/to/
remote_location}} --delete
```

- Sync to S3 with advanced options (set ACL and storage class):

```
aws s3 sync {{path/to/local_directory}} s3://{{bucket_name}}/
{{path/to/remote_location}} --acl {{private|public-read}} --
storage-class {{STANDARD_IA|GLACIER}}
```

- Sync files to S3 and skip unchanged ones (compare size and modification time):

```
aws s3 sync {{path/to/directory}} s3://{{bucket_name}}/
{{path/to/remote_location}} --size-only
```

- Display help:

```
aws s3 sync help
```

aws s3 website

Set the website configuration for a bucket.

See also: **`aws s3`**.

More information: https://docs.aws.amazon.com/cli/latest/reference/s3/website.html.

- Configure a bucket as a static website:

```
aws s3 website {{s3://bucket-name}} --index-document {{index.html}}
```

- Configure an error page for the website:

```
aws s3 website {{s3://bucket-name}} --index-document {{index.html}} --error-document {{error.html}}
```

aws s3

CLI for AWS S3 - provides storage through web services interfaces.

Some subcommands such as **cp** have their own usage documentation.

More information: https://docs.aws.amazon.com/cli/latest/reference/s3/.

- Show files in a bucket:

```
aws s3 ls {{bucket_name}}
```

- Sync files in a directory from local to bucket:

```
aws s3 sync {{path/to/directory}} s3://{{bucket_name}}
```

- Sync files and directories from bucket to local:

```
aws s3 sync s3://{{bucket_name}} {{path/to/target}}
```

- Sync files in a directory with exclusions:

```
aws s3 sync {{path/to/directory}} s3://{{bucket_name}} --
exclude {{path/to/file}} --exclude {{path/to/directory}}/*
```

- Remove file from bucket:

```
aws s3 rm s3://{{bucket}}/{{path/to/file}}
```

- Preview changes only:

```
aws s3 {{any_command}} --dryrun
```

aws s3api

Create and delete Amazon S3 buckets and edit bucket properties.

More information: https://docs.aws.amazon.com/cli/latest/reference/s3api/.

- Create bucket in a specific region:

```
aws s3api create-bucket --bucket {{bucket_name}} --region {{region}} --create-bucket-configuration LocationConstraint={{region}}
```

- Delete a bucket:

```
aws s3api delete-bucket --bucket {{bucket_name}}
```

- List buckets:

```
aws s3api list-buckets
```

- List the objects inside of a bucket and only show each object's key and size:

```
aws s3api list-objects --bucket {{bucket_name}} --query '{{Contents[].{Key: Key, Size: Size}}}'
```

- Add an object to a bucket:

```
aws s3api put-object --bucket {{bucket_name}} --key {{object_key}} --body {{path/to/file}}
```

- Download object from a bucket (The output file is always the last argument):

```
aws s3api get-object --bucket {{bucket_name}} --key {{object_key}} {{path/to/output_file}}
```

- Apply an Amazon S3 bucket policy to a specified bucket:

```
aws s3api put-bucket-policy --bucket {{bucket_name}} --policy file://{{path/to/bucket_policy.json}}
```

- Download the Amazon S3 bucket policy from a specified bucket:

```
aws s3api get-bucket-policy --bucket {{bucket_name}} --query Policy --output {{json|table|text|yaml|yaml-stream}} > {{path/to/bucket_policy}}
```

aws secretsmanager

Store, manage, and retrieve secrets.

More information: https://docs.aws.amazon.com/cli/latest/reference/secretsmanager/.

- Show secrets stored by the secrets manager in the current account:

```
aws secretsmanager list-secrets
```

- List all secrets but only show the secret names and ARNs (easy to view):

```
aws secretsmanager list-secrets --query 'SecretList[*].{Name: Name, ARN: ARN}'
```

- Create a secret:

```
aws secretsmanager create-secret --name {{name}} --description "{{secret_description}}" --secret-string '{{secret}}'
```

- Delete a secret (append `--force-delete-without-recovery` to delete immediately without any recovery period):

```
aws secretsmanager delete-secret --secret-id {{name|arn}}
```

- View details of a secret except for secret text:

```
aws secretsmanager describe-secret --secret-id {{name|arn}}
```

- Retrieve the value of a secret (to get the latest version of the secret omit `--version-stage`):

```
aws secretsmanager get-secret-value --secret-id {{name|arn}} --version-stage {{version_of_secret}}
```

- Rotate the secret immediately using a Lambda function:

```
aws secretsmanager rotate-secret --secret-id {{name|arn}} --rotation-lambda-arn {{arn_of_lambda_function}}
```

- Rotate the secret automatically every 30 days using a Lambda function:

```
aws secretsmanager rotate-secret --secret-id {{name|arn}} --rotation-lambda-arn {{arn_of_lambda_function}} --rotation-rules AutomaticallyAfterDays={{30}}
```

aws ses

CLI for AWS Simple Email Service.

High-scale inbound and outbound cloud email service.

More information: https://docs.aws.amazon.com/cli/latest/reference/ses/.

- Create a new receipt rule set:

```
aws ses create-receipt-rule-set --rule-set-name
{{rule_set_name}} --generate-cli-skeleton
```

- Describe the active receipt rule set:

```
aws ses describe-active-receipt-rule-set --generate-cli-
skeleton
```

- Describe a specific receipt rule:

```
aws ses describe-receipt-rule --rule-set-name
{{rule_set_name}} --rule-name {{rule_name}} --generate-cli-
skeleton
```

- List all receipt rule sets:

```
aws ses list-receipt-rule-sets --starting-token
{{token_string}} --max-items {{integer}} --generate-cli-
skeleton
```

- Delete a specific receipt rule set (the currently active rule set cannot be deleted):

```
aws ses delete-receipt-rule-set --rule-set-name
{{rule_set_name}} --generate-cli-skeleton
```

- Delete a specific receipt rule:

```
aws ses delete-receipt-rule --rule-set-name {{rule_set_name}}
--rule-name {{rule_name}} --generate-cli-skeleton
```

- Send an email:

```
aws ses send-email --from {{from_address}} --destination
"ToAddresses={{addresses}}" --message
"Subject={Data={{subject_text}},Charset=utf8},Body={Text={Data={{body_
```

- Display help for a specific SES subcommand:

```
aws ses {{subcommand}} help
```

aws sns

Create topics and subscriptions, send and receive messages, and monitor events and logs for the Amazon Simple Notification Service.

More information: https://docs.aws.amazon.com/cli/latest/reference/sns/.

- List all objects of a specific type:

```
aws sns list-{{origination-numbers|phone-numbers-opted-out|
platform-applications|sms-sandbox-phone-numbers|
subscriptions|topics}}
```

- Create a topic with a specific name and show its Amazon Resource Name (ARN):

```
aws sns create-topic --name {{name}}
```

- Subscribe an email address to the topic with a specific ARN and show the subscription ARN:

```
aws sns subscribe --topic-arn {{topic_ARN}} --protocol email
--notification-endpoint {{email}}
```

- Publish a message to a specific topic or phone number and show the message ID:

```
aws sns publish {{--topic-arn "arn:aws:sns:us-
west-2:123456789012:topic-name"||--phone-number
+1-555-555-0100}} --message file://{{path/to/file}}
```

- Delete the subscription with a specific ARN from its topic:

```
aws sns unsubscribe --subscription-arn {{subscription_ARN}}
```

- Create a platform endpoint:

```
aws sns create-platform-endpoint --platform-application-arn
{{platform_application_ARN}} --token {{token}}
```

- Add a statement to a topic's access control policy:

```
aws sns add-permission --topic-arn {{topic_ARN}} --label
{{topic_label}} --aws-account-id {{account_id}} --action-name
{{AddPermission|CreatePlatformApplication|DeleteEndpoint|
GetDataProtectionPolicy|GetEndpointAttributes|Subscribe|...}}
```

- Add a tag to the topic with a specific ARN:

```
aws sns tag-resource --resource-arn {{topic_ARN}} --tags
{{Key=tag1_key Key=tag2_key,Value=tag2_value ...}}
```

aws sqs

Create, delete, and send messages to queues for the AWS SQS service.

More information: https://docs.aws.amazon.com/cli/latest/reference/sqs/.

- List all availables queues:

```
aws sqs list-queues
```

- Display the URL of a specific queue:

```
aws sqs get-queue-url --queue-name {{queue_name}}
```

- Create a queue with specific attributes from a file in JSON format:

```
aws sqs create-queue --queue-name {{queue_name}} --attributes
{{file://path/to/attributes_file.json}}
```

- Send a specific message to a queue:

```
aws sqs send-message --queue-url https://sqs.
{{region}}.amazonaws.com/{{queue_name}} --message-body
"{{message_body}}" --delay-seconds {{delay}} --message-
attributes {{file://path/to/attributes_file.json}}
```

- Delete the specified message from a queue:

```
aws sqs delete-message --queue-url {{https://queue_url}} --
receipt-handle {{receipt_handle}}
```

- Delete a specific queue:

```
aws sqs delete-queue --queue-url https://sqs.
{{region}}.amazonaws.com/{{queue_name}}
```

- Delete all messages from the specified queue:

```
aws sqs purge-queue --queue-url https://sqs.
{{region}}.amazonaws.com/{{queue_name}}
```

- Enable a specific AWS account to send messages to queue:

```
aws sqs add-permission --queue-url https://sqs.
{{region}}.amazonaws.com/{{queue_name}} --label
{{permission_name}} --aws-account-ids {{account_id}} --
actions SendMessage
```

aws sso

Manage access to AWS resources using Single Sign-On (SSO) credentials.

More information: https://docs.aws.amazon.com/cli/latest/reference/sso/.

- Start SSO session and refresh access tokens. Requires setup using `aws configure sso`:

  ```
  aws sso login
  ```

- End SSO session and clear cached access tokens:

  ```
  aws sso logout
  ```

- List all AWS accounts accessible to the user:

  ```
  aws sso list-accounts
  ```

- List all roles accessible to the user for a given AWS account:

  ```
  aws sso list-account-roles --account-id {{account}} --access-token {{token}}
  ```

- Retrieve short-term credentials for a specific account:

  ```
  aws sso get-role-credentials --account-id {{account}} --role-name {{role}} --access-token {{token}}
  ```

aws sts

Security Token Service (STS) allows to request temporary credentials for (IAM) users or federated users.

More information: https://docs.aws.amazon.com/cli/latest/reference/sts/.

- Get temporary security credentials to access specific AWS resources:

  ```
  aws sts assume-role --role-arn {{aws_role_arn}}
  ```

- Get an IAM user or role whose credentials are used to call the operation:

  ```
  aws sts get-caller-identity
  ```

aws-vault

A vault for securely storing and accessing AWS credentials in development environments.

More information: https://github.com/99designs/aws-vault.

- Add credentials to the secure keystore:

  ```
  aws-vault add {{profile}}
  ```

- Execute a command with AWS credentials in the environment:

  ```
  aws-vault exec {{profile}} -- {{aws s3 ls}}
  ```

- Open a browser window and login to the AWS Console:

  ```
  aws-vault login {{profile}}
  ```

- List profiles, along with their credentials and sessions:

  ```
  aws-vault list
  ```

- Rotate AWS credentials:

  ```
  aws-vault rotate {{profile}}
  ```

- Remove credentials from the secure keystore:

  ```
  aws-vault remove {{profile}}
  ```

aws workmail

Manage Amazon WorkMail.

More information: https://docs.aws.amazon.com/cli/latest/reference/workmail/.

- List all WorkMail organizations:

```
aws workmail list-organizations
```

- List all users of a specific organization:

```
aws workmail list-users --organization-id {{organization_id}}
```

- Create a WorkMail user in a specific organization:

```
aws workmail create-user --name {{username}} --display-name
{{name}} --password {{password}} --organization-id
{{organization_id}}
```

- Register and enable a group/user to WorkMail:

```
aws workmail register-to-work-mail --entity-id {{entity_id}}
--email {{email}} --organization-id {{organization_id}}
```

- Create a WorkMail group in a specific organization:

```
aws workmail create-group --name {{group_name}} --
organization-id {{organization_id}}
```

- Associate a member to a specific group:

```
aws workmail associate-member-to-group --group-id
{{group_id}} --member-id {{member_id}} --organization-id
{{organization_id}}
```

- Deregister and disable a user/group from WorkMail:

```
aws workmail deregister-from-work-mail --entity-id
{{entity_id}} --organization-id {{organization_id}}
```

- Delete a user from an organization:

```
aws workmail delete-user --user-id {{user_id}} --
organization-id {{organization_id}}
```

aws

The official CLI tool for Amazon Web Services.

Some subcommands such as **s3** have their own usage documentation.

More information: https://docs.aws.amazon.com/cli/latest/reference/.

- Configure the AWS Command-line:

```
aws configure wizard
```

- Configure the AWS Command-line using SSO:

```
aws configure sso
```

- Get the caller identity (used to troubleshoot permissions):

```
aws sts get-caller-identity
```

- List AWS resources in a region and output in YAML:

```
aws dynamodb list-tables --region {{us-east-1}} --output yaml
```

- Use auto prompt to help with a command:

```
aws iam create-user --cli-auto-prompt
```

- Get an interactive wizard for an AWS resource:

```
aws dynamodb wizard {{new_table}}
```

- Generate a JSON CLI Skeleton (useful for infrastructure as code):

```
aws dynamodb update-table --generate-cli-skeleton
```

- Display help for a specific command:

```
aws {{command}} help
```

awslogs

Query groups, streams, and events from Amazon CloudWatch logs.

More information: https://github.com/jorgebastida/awslogs#options.

- List log groups:

```
awslogs groups
```

- List existing streams for the specified group:

```
awslogs streams {{/var/log/syslog}}
```

- Get logs for any streams in the specified group between 1 and 2 hours ago:

```
awslogs get {{/var/log/syslog}} {{[-s|--start]}} '{{2h ago}}' {{[-e|--end]}} '{{1h ago}}'
```

- Get logs that match a specific CloudWatch Logs Filter pattern:

```
awslogs get {{/aws/lambda/my_lambda_group}} --filter-pattern '{{ERROR}}'
```

- Watch logs for any streams in the specified group:

```
awslogs get {{/var/log/syslog}} ALL --watch
```

axel

Download accelerator.

Supports HTTP, HTTPS, and FTP.

More information: https://manned.org/axel.

- Download a URL to a file:

```
axel {{url}}
```

- Download and specify an output file:

```
axel {{url}} {{[-o|--output]}} {{path/to/file}}
```

- Download with a specific number connections:

```
axel {{[-n|--num-connections]}} {{connections_num}} {{url}}
```

- Search for mirrors:

```
axel {{[-S|--search]}} {{mirrors_num}} {{url}}
```

- Limit download speed (bytes per second):

```
axel {{[-s|--max-speed]}} {{speed}} {{url}}
```

az account

Manage Azure subscription information.

Part of **`azure-cli`** (also known as **`az`**).

More information: https://learn.microsoft.com/cli/azure/account.

- List all subscriptions for the logged in account:

```
az account list
```

- Set a `subscription` to be the currently active subscription:

```
az account set {{[-s|--subscription]}} {{subscription_id}}
```

- List supported regions for the currently active subscription:

```
az account list-locations
```

- Print an access token to be used with `MS Graph API`:

```
az account get-access-token --resource-type {{ms-graph}}
```

- Print details of the currently active subscription in a specific format:

```
az account show {{[-o|--output]}} {{json|tsv|table|yaml}}
```

az acr

Manage private registries with Azure Container Registries.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/acr.

- Create a managed container registry:

```
az acr create {{[-n|--name]}} {{registry_name}} {{[-g|--resource-group]}} {{resource_group}} --sku {{sku}}
```

- Login to a registry:

```
az acr login {{[-n|--name]}} {{registry_name}}
```

- Tag a local image for ACR:

```
docker tag {{image_name}} {{registry_name}}.azurecr.io/{{image_name}}:{{tag}}
```

- Push an image to a registry:

```
docker push {{registry_name}}.azurecr.io/{{image_name}}:{{tag}}
```

- Pull an image from a registry:

```
docker pull {{registry_name}}.azurecr.io/{{image_name}}:{{tag}}
```

- Delete an image from a registry:

```
az acr repository delete {{[-n|--name]}} {{registry_name}} --repository {{image_name}}:{{tag}}
```

- Delete a managed container registry:

```
az acr delete {{[-n|--name]}} {{registry_name}} {{[-g|--resource-group]}} {{resource_group}} {{[-y|--yes]}}
```

- List images within a registry:

```
az acr repository list {{[-n|--name]}} {{registry_name}} --output table
```

az advisor

Manage Azure subscription information.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/advisor.

- List Azure Advisor configuration for the entire subscription:

  ```
  az advisor configuration list
  ```

- Show Azure Advisor configuration for the given subscription or resource group:

  ```
  az advisor configuration show {{[-g|--resource-group]}} {{resource_group}}
  ```

- List Azure Advisor recommendations:

  ```
  az advisor recommendation list
  ```

- Enable Azure Advisor recommendations:

  ```
  az advisor recommendation enable {{[-g|--resource-group]}} {{resource_group}}
  ```

- Disable Azure Advisor recommendations:

  ```
  az advisor recommendation disable {{[-g|--resource-group]}} {{resource_group}}
  ```

az aks

Manage Azure Kubernetes Service (AKS) clusters.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/aks.

- List AKS clusters:

```
az aks list {{[-g|--resource-group]}} {{resource_group}}
```

- Create a new AKS cluster:

```
az aks create {{[-g|--resource-group]}} {{resource_group}}
{{[-n|--name]}} {{name}} {{[-c|--node-count]}} {{count}} --
node-vm-size {{size}}
```

- Delete an AKS cluster:

```
az aks delete {{[-g|--resource-group]}} {{resource_group}}
{{[-n|--name]}} {{name}}
```

- Get the access credentials for an AKS cluster:

```
az aks get-credentials {{[-g|--resource-group]}}
{{resource_group}} {{[-n|--name]}} {{name}}
```

- Get the upgrade versions available for an AKS cluster:

```
az aks get-upgrades {{[-g|--resource-group]}}
{{resource_group}} {{[-n|--name]}} {{name}}
```

az apim

Manage Azure API Management services.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/apim.

- List API Management services within a resource group:

```
az apim list {{[-g|--resource-group]}} {{resource_group}}
```

- Create an API Management service instance:

```
az apim create {{[-n|--name]}} {{name}} {{[-g|--resource-
group]}} {{resource_group}} --publisher-email {{email}} --
publisher-name {{name}}
```

- Delete an API Management service:

```
az apim delete {{[-n|--name]}} {{name}} {{[-g|--resource-
group]}} {{resource_group}}
```

- Show details of an API Management service instance:

```
az apim show {{[-n|--name]}} {{name}} {{[-g|--resource-
group]}} {{resource_group}}
```

- Update an API Management service instance:

```
az apim update {{[-n|--name]}} {{name}} {{[-g|--resource-
group]}} {{resource_group}}
```

az appconfig

Manage App configurations on Azure.

Part of **`azure-cli`** (also known as **`az`**).

More information: https://learn.microsoft.com/cli/azure/appconfig.

- Create an App Configuration:

```
az appconfig create {{[-n|--name]}} {{name}} {{[-g|--
resource-group]}} {{group_name}} {{[-l|--location]}}
{{location}}
```

- Delete a specific App Configuration:

```
az appconfig delete {{[-g|--resource-group]}} {{rg_name}}
{{[-n|--name]}} {{appconfig_name}}
```

- List all App Configurations under the current subscription:

```
az appconfig list
```

- List all App Configurations under a specific resource group:

```
az appconfig list {{[-g|--resource-group]}} {{rg_name}}
```

- Show properties of an App Configuration:

```
az appconfig show {{[-n|--name]}} {{appconfig_name}}
```

- Update a specific App Configuration:

```
az appconfig update {{[-g|--resource-group]}} {{rg_name}}
{{[-n|--name]}} {{appconfig_name}}
```

az bicep

Bicep CLI command group.

Part of **`azure-cli`** (also known as **`az`**).

More information: https://learn.microsoft.com/cli/azure/bicep.

- Install Bicep CLI:

```
az bicep install
```

- Build a Bicep file:

```
az bicep build {{[-f|--file]}} {{path/to/file.bicep}}
```

- Attempt to decompile an ARM template file to a Bicep file:

```
az bicep decompile {{[-f|--file]}} {{path/to/
template_file.json}}
```

- Upgrade Bicep CLI to the latest version:

```
az bicep upgrade
```

- Display the installed version of Bicep CLI:

```
az bicep version
```

- List all available versions of Bicep CLI:

```
az bicep list-versions
```

- Uninstall Bicep CLI:

```
az bicep uninstall
```

az cognitiveservices

Manage Azure Cognitive Services accounts.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/cognitiveservices.

- Create an API Cognitive Services account in a specific location without confirmation required:

```
az cognitiveservices account create {{[-n|--name]}} {{account_name}} {{[-g|--resource-group]}} {{resource_group}} --kind {{API_name}} {{[-l|--location]}} {{location}} --sku {{sku_name}} --yes
```

- List usages for Azure Cognitive Services account:

```
az cognitiveservices account list-usage {{[-n|--name]}} {{account_name}} {{[-g|--resource-group]}} {{resource_group}}
```

- Create a deployment for Azure Cognitive Services account:

```
az cognitiveservices account deployment create {{[-n|--name]}} {{account_name}} {{[-g|--resource-group]}} {{resource_group}} --deployment-name {{deploy_name}} --model-name {{model_name}} --model-version "{{model_version}}" --model-format {{format_name}}
```

- Create a commitment plan for Azure Cognitive Services account:

```
az cognitiveservices account commitment-plan create {{[-n|--name]}} {{account_name}} {{[-g|--resource-group]}} {{resource_group}} --commitment-plan-name "{{plan_name}}" --hosting-model "{{hosting_model}}" --plan-type "{{plan_type}}" --auto-renew {{false|true}}
```

- Delete a commitment plan from Azure Cognitive Services account:

```
az cognitiveservices account commitment-plan delete {{[-g|--resource-group]}} {{resource_group}} {{[-n|--name]}} {{account_name}} --commitment-plan-name "{{plan_name}}"
```

az config

Manage Azure CLI configuration.

Part of **`azure-cli`** (also known as **`az`**).

More information: https://learn.microsoft.com/cli/azure/config.

- Print all configurations:

```
az config get
```

- Print configurations for a specific section:

```
az config get {{section_name}}
```

- Set a configuration:

```
az config set {{configuration_name}}={{value}}
```

- Unset a configuration:

```
az config unset {{configuration_name}}
```

az container

Manage Azure Container Instances.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/container.

- Create a container in a container group:

```
az container create {{[-g|--resource-group]}}
{{resource_group}} {{[-n|--name]}} {{name}} --image
{{image_name}} {{[-os|--os-type]}} {{windows|linux}} --cpu
{{number_of_CPU_cores}} --memory {{memory_in_GB}}
```

- Execute a command from within a running container of a container group:

```
az container exec {{[-g|--resource-group]}}
{{resource_group}} {{[-n|--name]}} {{container_group_name}}
--exec-command "{{command}}"
```

- Examine the logs of a container in a container group:

```
az container logs {{[-n|--name]}} {{name}} {{[-g|--resource-
group]}} {{resource_group}}
```

- Get the details of a container group:

```
az container show {{[-n|--name]}} {{name}} {{[-g|--resource-
group]}} {{resource_group}}
```

- Start all containers in a container group:

```
az container start {{[-n|--name]}} {{name}} {{[-g|--resource-
group]}} {{resource_group}}
```

- Stop all containers in a container group:

```
az container stop {{[-n|--name]}} {{name}} {{[-g|--resource-
group]}} {{resource_group}}
```

- Delete a container group:

```
az container delete {{[-n|--name]}} {{name}} {{[-g|--
resource-group]}} {{resource_group}}
```

az devops

Manage Azure DevOps organizations.

Part of **`azure-cli`** (also known as **`az`**).

More information: https://learn.microsoft.com/cli/azure/devops.

- Set the Personal Access Token (PAT) to login to a particular organization:

```
az devops login {{[--org|--organization]}}
{{organization_url}}
```

- Open a project in the browser:

```
az devops project show {{[-p|--project]}} {{project_name}} --
open
```

- List members of a specific team working on a particular project:

```
az devops team list-member {{[-p|--project]}}
{{project_name}} --team {{team_name}}
```

- Check the Azure DevOps CLI current configuration:

```
az devops configure {{[-l|--list]}}
```

- Configure the Azure DevOps CLI behavior by setting a default project and a default organization:

```
az devops configure {{[-d|--defaults]}}
project={{project_name}} organization={{organization_url}}
```

az disk

Manage Azure Managed Disks.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/disk.

- Create a managed disk:

```
az disk create {{[-g|--resource-group]}} {{resource_group}}
{{[-n|--name]}} {{disk_name}} {{[-z|--size-gb]}}
{{size_in_gb}}
```

- List managed disks in a resource group:

```
az disk list {{[-g|--resource-group]}} {{resource_group}}
```

- Delete a managed disk:

```
az disk delete {{[-g|--resource-group]}} {{resource_group}}
{{[-n|--name]}} {{disk_name}}
```

- Grant read or write access to a managed disk (for export):

```
az disk grant-access {{[-g|--resource-group]}}
{{resource_group}} {{[-n|--name]}} {{disk_name}} {{[--
access|--access-level]}} {{Read|Write}} --duration-in-seconds
{{seconds}}
```

- Update disk size:

```
az disk update {{[-g|--resource-group]}} {{resource_group}}
{{[-n|--name]}} {{disk_name}} {{[-z|--size-gb]}}
{{new_size_in_gb}}
```

az feedback

Send feedback to the Azure CLI Team.

Part of **`azure-cli`** (also known as **`az`**).

More information: https://learn.microsoft.com/cli/azure/reference-index#az-feedback.

- Send feedback to the Azure CLI Team:

```
az feedback
```

az group

Manage resource groups and template deployments.

Part of **`azure-cli`** (also known as **`az`**).

More information: https://learn.microsoft.com/cli/azure/group.

- Create a new resource group:

```
az group create {{[-n|--name]}} {{name}} {{[-l|--location]}} {{location}}
```

- Check if a resource group exists:

```
az group exists {{[-n|--name]}} {{name}}
```

- Delete a resource group:

```
az group delete {{[-n|--name]}} {{name}}
```

- Wait until a condition of the resource group is met:

```
az group wait {{[-n|--name]}} {{name}} --{{created|deleted|exists|updated}}
```

az image

Manage custom Virtual Machine Images in Azure.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/image.

- List the custom images under a resource group:

```
az image list {{[-g|--resource-group]}} {{resource_group}}
```

- Create a custom image from managed disks or snapshots:

```
az image create {{[-g|--resource-group]}} {{resource_group}}
{{[-n|--name]}} {{name}} --os-type {{windows|linux}} --source
{{os_disk_source}}
```

- Delete a custom image:

```
az image delete {{[-n|--name]}} {{name}} {{[-g|--resource-
group]}} {{resource_group}}
```

- Show details of a custom image:

```
az image show {{[-n|--name]}} {{name}} {{[-g|--resource-
group]}} {{resource_group}}
```

- Update custom images:

```
az image update {{[-n|--name]}} {{name}} {{[-g|--resource-
group]}} {{resource_group}} --set {{property=value}}
```

az lock

Manage Azure locks.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/lock.

- Create a read-only subscription level lock:

```
az lock create {{[-n|--name]}} {{lock_name}} {{[-t|--lock-type]}} ReadOnly
```

- Create a read-only resource group level lock:

```
az lock create {{[-n|--name]}} {{lock_name}} {{[-g|--resource-group]}} {{group_name}} {{[-t|--lock-type]}} ReadOnly
```

- Delete a subscription level lock:

```
az lock delete {{[-n|--name]}} {{lock_name}}
```

- Delete a resource group level lock:

```
az lock delete {{[-n|--name]}} {{lock_name}} {{[-g|--resource-group]}} {{group_name}}
```

- List out all locks on the subscription level:

```
az lock list
```

- Show a subscription level lock with a specific name:

```
az lock show {{[-n|--name]}} {{lock_name}}
```

az logicapp

Manage Logic Apps in Azure Cloud Services.

Part of **`azure-cli`** (also known as **`az`**).

More information: https://learn.microsoft.com/cli/azure/logicapp.

- Create a logic app:

```
az logicapp create {{[-n|--name]}} {{name}} {{[-g|--resource-group]}} {{resource_group}} {{[-s|--storage-account]}} {{storage_account}}
```

- Delete a logic app:

```
az logicapp delete {{[-n|--name]}} {{name}} {{[-g|--resource-group]}} {{resource_group}}
```

- List logic apps:

```
az logicapp list {{[-g|--resource-group]}} {{resource_group}}
```

- Restart a logic app:

```
az logicapp restart {{[-n|--name]}} {{name}} {{[-g|--resource-group]}} {{resource_group}}
```

- Start a logic app:

```
az logicapp start {{[-n|--name]}} {{name}} {{[-g|--resource-group]}} {{resource_group}}
```

- Stop a logic app:

```
az logicapp stop {{[-n|--name]}} {{name}} {{[-g|--resource-group]}} {{resource_group}}
```

az login

Log in to Azure.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/reference-index#az-login.

- Log in interactively:

```
az login
```

- Log in with a service principal using a client secret:

```
az login --service-principal {{[-u|--username]}} {{http://
azure-cli-service-principal}} {{[-p|--password]}} {{secret}}
{{[-t|--tenant]}} {{someone.onmicrosoft.com}}
```

- Log in with a service principal using a client certificate:

```
az login --service-principal {{[-u|--username]}} {{http://
azure-cli-service-principal}} {{[-p|--password]}} {{path/to/
cert.pem}} {{[-t|--tenant]}} {{someone.onmicrosoft.com}}
```

- Log in using a VM's system assigned identity:

```
az login {{[-i|--identity]}}
```

- Log in using a VM's user assigned identity:

```
az login {{[-i|--identity]}} {{[-u|--username]}} /
subscriptions/{{subscription_id}}/resourcegroups/{{my_rg}}/
providers/Microsoft.ManagedIdentity/userAssignedIdentities/
{{my_id}}
```

az logout

Log out from an Azure subscription.

Part of **`azure-cli`** (also known as **`az`**).

More information: https://learn.microsoft.com/cli/azure/reference-index#az-logout.

- Log out from the active account:

```
az logout
```

- Log out a specific username:

```
az logout --username {{alias@example.com}}
```

az network

Manage Azure Network resources.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/network.

- List network resources in a region that are used against a subscription quota:

```
az network list-usages
```

- List all virtual networks in a subscription:

```
az network vnet list
```

- Create a virtual network:

```
az network vnet create --address-prefixes {{10.0.0.0/16}}
{{[-n|--name]}} {{vnet}} {{[-g|--resource-group]}}
{{group_name}} --subnet-name {{subnet}} --subnet-prefixes
{{10.0.0.0/24}}
```

- Enable accelerated networking for a network interface card:

```
az network nic update --accelerated-networking true {{[-n|--
name]}} {{nic}} {{[-g|--resource-group]}} {{resource_group}}
```

az pipelines

Manage Azure Pipelines resources.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/pipelines.

- Create a new Azure Pipeline (YAML based):

```
az pipelines create {{[--org|--organization]}}
{{organization_url}} {{[-p|--project]}} {{project_name}} --
name {{pipeline_name}} --description {{description}} --
repository {{repository_name}} --branch {{branch_name}}
```

- Delete a specific pipeline:

```
az pipelines delete {{[--org|--organization]}}
{{organization_url}} {{[-p|--project]}} {{project_name}} --id
{{pipeline_id}}
```

- List pipelines:

```
az pipelines list {{[--org|--organization]}}
{{organization_url}} {{[-p|--project]}} {{project_name}}
```

- Enqueue a specific pipeline to run:

```
az pipelines run {{[--org|--organization]}}
{{organization_url}} {{[-p|--project]}} {{project_name}} --
name {{pipeline_name}}
```

- Get the details of a specific pipeline:

```
az pipelines show {{[--org|--organization]}}
{{organization_url}} {{[-p|--project]}} {{project_name}} --
name {{pipeline_name}}
```

- Update a specific pipeline:

```
az pipelines update {{[--org|--organization]}}
{{organization_url}} {{[-p|--project]}} {{project_name}} --
name {{pipeline_name}} --new-name {{pipeline_new_name}} --
new-folder-path {{user1/production_pipelines}}
```

- List all agents in a pool:

```
az pipelines agent list {{[--org|--organization]}}
{{organization_url}} --pool-id {{agent_pool}}
```

az provider

Manage resource providers.

Part of **`azure-cli`** (also known as **`az`**).

More information: https://learn.microsoft.com/cli/azure/provider.

- Register a provider:

```
az provider register {{[-n|--namespace]}}
{{Microsoft.PolicyInsights}}
```

- Unregister a provider:

```
az provider unregister {{[-n|--namespace]}}
{{Microsoft.Automation}}
```

- List all providers for a subscription:

```
az provider list
```

- Show information about a specific provider:

```
az provider show {{[-n|--namespace]}} {{Microsoft.Storage}}
```

- List all resource types for a specific provider:

```
az provider list --query "[?
namespace=='{{Microsoft.Network}}'].resourceTypes[].resourceType"
```

az quantum

Manage Azure Quantum workspaces and submit quantum jobs to providers (preview, requires quantum extension).

More information: https://learn.microsoft.com/cli/azure/quantum.

- Create a new Azure Quantum workspace:

```
az quantum workspace create {{[-g|--resource-group]}} {{ResourceGroup}} {{[-l|--location]}} {{Location}} {{[-w|--workspace-name]}} {{Workspace}} {{[-a|--storage-account]}} {{MyStorageAccountName}}
```

- List all Azure Quantum workspaces:

```
az quantum workspace list
```

- Set a default Azure Quantum workspace:

```
az quantum workspace set {{[-g|--resource-group]}} {{ResourceGroup}} {{[-w|--workspace-name]}} {{Workspace}}
```

- Submit a QIR quantum job to a target:

```
az quantum job submit {{[-g|--resource-group]}} {{ResourceGroup}} {{[-w|--workspace-name]}} {{Workspace}} {{[-l|--location]}} {{Location}} {{[-t|--target-id]}} {{Id}} --job-name {{Job}} --job-input-file {{QirBitcode.bc}} --job-input-format {{qir.v1}}
```

- List all jobs in a Quantum Workspace:

```
az quantum job list {{[-g|--resource-group]}} {{ResourceGroup}} {{[-l|--location]}} {{Location}} {{[-w|--workspace-name]}} {{Workspace}}
```

- Get the output of a quantum job:

```
az quantum job output {{[-g|--resource-group]}} {{ResourceGroup}} {{[-w|--workspace-name]}} {{Workspace}} --job-id {{Job}}
```

- List available provider offerings in a location:

```
az quantum offerings list {{[-l|--location]}} {{Location}}
```

- Set a default target for job submissions:

```
az quantum target set {{[-t|--target-id]}} {{Id}}
```

az redis

Manage Redis caches.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/redis.

- Create a new Redis cache instance:

```
az redis create --location {{location}} {{[-n|--name]}} {{name}} {{[-g|--resource-group]}} {{resource_group}} --sku {{Basic|Premium|Standard}} --vm-size {{c0|c1|c2|c3|c4|c5|c6|p1|p2|p3|p4|p5}}
```

- Update a Redis cache:

```
az redis update {{[-n|--name]}} {{name}} {{[-g|--resource-group]}} {{resource_group}} --sku {{Basic|Premium|Standard}} --vm-size {{c0|c1|c2|c3|c4|c5|c6|p1|p2|p3|p4|p5}}
```

- Export data stored in a Redis cache:

```
az redis export --container {{container}} --file-format {{file-format}} {{[-n|--name]}} {{name}} --prefix {{prefix}} {{[-g|--resource-group]}} {{resource_group}}
```

- Delete a Redis cache:

```
az redis delete {{[-n|--name]}} {{name}} {{[-g|--resource-group]}} {{resource_group}} {{[-y|--yes]}}
```

az repos

Manage Azure DevOps repos.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/repos.

- List all repos in a specific project:

```
az repos list {{[-p|--project]}} {{project_name}}
```

- Add policy on a specific branch of a specific repository to restrict basic merge:

```
az repos policy merge-strategy create --repository-id
{{repository_id_in_repos_list}} --branch {{branch_name}} --
blocking --enabled --allow-no-fast-forward false --allow-
rebase true --allow-rebase-merge true --allow-squash true
```

- Add build validation on a specific repository, using an existing build pipeline, to be triggered automatically on source update:

```
az repos policy build create --repository-id
{{repository_id}} --build-definition-id {{build_pipeline_id}}
--branch main --blocking --enabled --queue-on-source-update-
only true --display-name {{name}} --valid-duration
{{minutes}}
```

- List all active Pull Requests on a specific repository within a specific project:

```
az repos pr list {{[-p|--project]}} {{project_name}} {{[-r|--
repository]}} {{repository_name}} --status active
```

az serial-console

Connect to the serial console of a Virtual Machine.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/serial-console.

- Connect to a serial console:

```
az serial-console connect {{[-g|--resource-group]}}
{{Resource_Group_Name}} {{[-n|--name]}}
{{Virtual_Machine_Name}}
```

- Terminate the connection:

```
<Ctrl ]>
```

az sshkey

Manage SSH public keys with virtual machines.

Part of **`azure-cli`** (also known as **`az`**).

More information: https://learn.microsoft.com/cli/azure/sshkey.

- Create a new SSH key:

```
az sshkey create --name {{name}} {{[-g|--resource-group]}}
{{resource_group}}
```

- Upload an existing SSH key:

```
az sshkey create --name {{name}} {{[-g|--resource-group]}}
{{resource_group}} --public-key "{{@path/to/key.pub}}"
```

- List all SSH public keys:

```
az sshkey list
```

- Show information about an SSH public key:

```
az sshkey show --name {{name}} {{[-g|--resource-group]}}
{{resource_group}}
```

az storage account

Manage storage accounts in Azure.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/storage/account.

- Create an storage account:

```
az storage account create {{[-n|--name]}}
{{storage_account_name}} {{[-g|--resource-group]}}
{{azure_resource_group}} --location {{azure_location}} --sku
{{storage_account_sku}}
```

- Generate a shared access signature for a specific storage account:

```
az storage account generate-sas --account-name
{{storage_account_name}} {{[-n|--name]}} {{account_name}} --
permissions {{sas_permissions}} --expiry {{expiry_date}} --
services {{storage_services}} --resource-types
{{resource_types}}
```

- List storage accounts:

```
az storage account list {{[-g|--resource-group]}}
{{azure_resource_group}}
```

- Delete a specific storage account:

```
az storage account delete {{[-n|--name]}}
{{storage_account_name}} {{[-g|--resource-group]}}
{{azure_resource_group}}
```

az storage blob

Manage blob storage containers and objects in Azure.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/storage/blob.

- Download a blob to a file path specifying a source container:

```
az storage blob download --account-name {{account_name}} --
account-key {{account_key}} {{[-c|--container-name]}}
{{container_name}} {{[-n|--name]}} {{blob_name}} {{[-f|--
file]}} {{path/to/file}}
```

- Download blobs from a blob container recursively:

```
az storage blob download-batch --account-name
{{account_name}} --account-key {{account_key}} {{[-s|--
source]}} {{container_name}} --pattern {{filename_regex}}
{{[-d|--destination]}} {{path/to/destination}}
```

- Upload a local file to blob storage:

```
az storage blob upload --account-name {{account_name}} --
account-key {{account_key}} {{[-c|--container-name]}}
{{container_name}} {{[-n|--name]}} {{blob_name}} {{[-f|--
file]}} {{path/to/file}}
```

- Delete a blob object:

```
az storage blob delete --account-name {{account_name}} --
account-key {{account_key}} {{[-c|--container-name]}}
{{container_name}} {{[-n|--name]}} {{blob_name}}
```

- Generate a shared access signature for a blob:

```
az storage blob generate-sas --account-name {{account_name}}
--account-key {{account_key}} {{[-c|--container-name]}}
{{container_name}} {{[-n|--name]}} {{blob_name}} --
permissions {{permission_set}} --expiry {{Y-m-d'T'H:M'Z'}} --
https-only
```

az storage container

Manage blob storage containers in Azure.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/storage/container.

- Create a container in a storage account:

```
az storage container create --account-name
{{storage_account_name}} {{[-n|--name]}} {{container_name}}
--public-access {{access_level}} --fail-on-exist
```

- Generate a shared access signature for the container:

```
az storage container generate-sas --account-name
{{storage_account_name}} {{[-n|--name]}} {{container_name}}
--permissions {{sas_permissions}} --expiry {{expiry_date}} --
https-only
```

- List containers in a storage account:

```
az storage container list --account-name
{{storage_account_name}} --prefix {{filter_prefix}}
```

- Mark the specified container for deletion:

```
az storage container delete --account-name
{{storage_account_name}} {{[-n|--name]}} {{container_name}}
--fail-not-exist
```

az storage entity

Manage Azure Table storage entities.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/storage/entity.

- Insert an entity into a table:

```
az storage entity insert {{[-e|--entity]}}
{{space_separated_key_value_pairs}} {{[-t|--table-name]}}
{{table_name}} --account-name {{storage_account_name}} --
account-key {{storage_account_key}}
```

- Delete an existing entity from a table:

```
az storage entity delete --partition-key {{partition_key}} --
row-key {{row_key}} {{[-t|--table-name]}} {{table_name}} --
account-name {{storage_account_name}} --account-key
{{storage_account_key}}
```

- Update an existing entity by merging its properties:

```
az storage entity merge {{[-e|--entity]}}
{{space_separated_key_value_pairs}} {{[-t|--table-name]}}
{{table_name}} --account-name {{storage_account_name}} --
account-key {{storage_account_key}}
```

- List entities which satisfy a query:

```
az storage entity query --filter {{query_filter}} {{[-t|--
table-name]}} {{table_name}} --account-name
{{storage_account_name}} --account-key
{{storage_account_key}}
```

- Get an entity from the specified table:

```
az storage entity show --partition-key {{partition_key}} --
row-key {{row_key}} {{[-t|--table-name]}} {{table_name}} --
account-name {{storage_account_name}} --account-key
{{storage_account_key}}
```

az storage queue

Manage storage queues in Azure.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/storage/queue.

- Create a queue:

```
az storage queue create --account-name
{{storage_account_name}} {{[-n|--name]}} {{queue_name}} --
metadata {{queue_metadata}}
```

- Generate a shared access signature for the queue:

```
az storage queue generate-sas --account-name
{{storage_account_name}} {{[-n|--name]}} {{queue_name}} --
permissions {{queue_permissions}} --expiry {{expiry_date}} --
https-only
```

- List queues in a storage account:

```
az storage queue list --prefix {{filter_prefix}} --account-
name {{storage_account_name}}
```

- Delete the specified queue and any messages it contains:

```
az storage queue delete --account-name
{{storage_account_name}} {{[-n|--name]}} {{queue_name}} --
fail-not-exist
```

az storage table

Manage NoSQL key-value storage in Azure.

Part of **`azure-cli`** (also known as **`az`**).

More information: https://learn.microsoft.com/cli/azure/storage/table.

- Create a new table in the storage account:

```
az storage table create --account-name
{{storage_account_name}} {{[-n|--name]}} {{table_name}} --
fail-on-exist
```

- Generate a shared access signature for the table:

```
az storage table generate-sas --account-name
{{storage_account_name}} {{[-n|--name]}} {{table_name}} --
permissions {{sas_permissions}} --expiry {{expiry_date}} --
https-only
```

- List tables in a storage account:

```
az storage table list --account-name {{storage_account_name}}
```

- Delete the specified table and any data it contains:

```
az storage table delete --account-name
{{storage_account_name}} {{[-n|--name]}} {{table_name}} --
fail-not-exist
```

az storage

Manage Azure Cloud Storage resources.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/storage.

- Create a storage account specifying a location:

```
az storage account create {{[-g|--resource-group]}} {{group_name}} {{[-n|--name]}} {{account_name}} {{[-l|--location]}} {{location}} --sku {{account_sku}}
```

- List all storage accounts in a resource group:

```
az storage account list {{[-g|--resource-group]}} {{group_name}}
```

- List the access keys for a storage account:

```
az storage account keys list {{[-g|--resource-group]}} {{group_name}} {{[-n|--name]}} {{account_name}}
```

- Delete a storage account:

```
az storage account delete {{[-g|--resource-group]}} {{group_name}} {{[-n|--name]}} {{account_name}}
```

- Update the minimum tls version setting for a storage account:

```
az storage account update --min-tls-version {{TLS1_0|TLS1_1|TLS1_2}} {{[-g|--resource-group]}} {{group_name}} {{[-n|--name]}} {{account_name}}
```

az tag

Manage tags on a resource.

Part of **`azure-cli`** (also known as **`az`**).

More information: https://learn.microsoft.com/cli/azure/tag.

- Create a tag value:

```
az tag add-value {{[-n|--name]}} {{tag_name}} --value {{tag_value}}
```

- Create a tag in the subscription:

```
az tag create {{[-n|--name]}} {{tag_name}}
```

- Delete a tag from the subscription:

```
az tag delete {{[-n|--name]}} {{tag_name}}
```

- List all tags on a subscription:

```
az tag list --resource-id /subscriptions/{{subscription_id}}
```

- Delete a tag value for a specific tag name:

```
az tag remove-value {{[-n|--name]}} {{tag_name}} --value {{tag_value}}
```

az term

Manage marketplace agreement with marketplaceordering.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/term.

- Print marketplace terms:

```
az term show --product "{{product_identifier}}" --plan
"{{plan_identifier}}" --publisher "{{publisher_identifier}}"
```

- Accept marketplace terms:

```
az term accept --product "{{product_identifier}}" --plan
"{{plan_identifier}}" --publisher "{{publisher_identifier}}"
```

az upgrade

Upgrade Azure CLI and Extensions.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/reference-index?view=azure-cli-latest#az-upgrade.

- Upgrade Azure CLI:

```
az upgrade
```

- Upgrade Azure CLI and Extensions:

```
az upgrade --all
```

- Upgrade Azure CLI and Extensions without prompting for confirmation:

```
az upgrade --all {{[-y|--yes]}}
```

az version

Show the current version of Azure CLI modules and extensions.

Part of **`azure-cli`** (also known as **`az`**).

More information: https://learn.microsoft.com/cli/azure/reference-index?view=azure-cli-latest#az-version.

- Show the current version of Azure CLI modules and extensions in JSON format:

  ```
  az version
  ```

- Show the current version of Azure CLI modules and extensions in a given format:

  ```
  az version {{[-o|--output]}} {{json|table|tsv}}
  ```

az vm

Manage virtual machines in Azure.

Part of **azure-cli** (also known as **az**).

More information: https://learn.microsoft.com/cli/azure/vm.

- Display a table of available Virtual Machines:

```
az vm list --output table
```

- Create a virtual machine using the default Ubuntu image and generate SSH keys:

```
az vm create {{[-g|--resource-group]}} {{rg}} {{[-n|--name]}} {{vm_name}} --image {{UbuntuLTS}} --admin-user {{azureuser}} --generate-ssh-keys
```

- Stop a Virtual Machine:

```
az vm stop {{[-g|--resource-group]}} {{rg}} {{[-n|--name]}} {{vm_name}}
```

- Deallocate a Virtual Machine:

```
az vm deallocate {{[-g|--resource-group]}} {{rg}} {{[-n|--name]}} {{vm_name}}
```

- Start a Virtual Machine:

```
az vm start {{[-g|--resource-group]}} {{rg}} {{[-n|--name]}} {{vm_name}}
```

- Restart a Virtual Machine:

```
az vm restart {{[-g|--resource-group]}} {{rg}} {{[-n|--name]}} {{vm_name}}
```

- List VM images available in the Azure Marketplace:

```
az vm image list
```

az webapp

Manage Web Applications hosted in Azure Cloud Services.

Part of **`azure-cli`** (also known as **`az`**).

More information: https://learn.microsoft.com/cli/azure/webapp.

- List available runtimes for a web application:

```
az webapp list-runtimes {{[-os|--os-type]}} {{windows|linux}}
```

- Create a web application:

```
az webapp up {{[-n|--name]}} {{name}} {{[-l|--location]}} {{location}} {{[-r|--runtime]}} {{runtime}}
```

- List all web applications:

```
az webapp list
```

- Delete a specific web application:

```
az webapp delete {{[-n|--name]}} {{name}} {{[-g|--resource-group]}} {{resource_group}}
```

az

The official CLI tool for Microsoft Azure.

Some subcommands such as **`login`** have their own usage documentation.

More information: https://learn.microsoft.com/cli/azure/reference-index.

- Log in to Azure:

```
az login
```

- Manage azure subscription information:

```
az account
```

- List all Azure Managed Disks:

```
az disk list
```

- List all Azure virtual machines:

```
az vm list
```

- Manage Azure Kubernetes Services:

```
az aks
```

- Manage Azure Network resources:

```
az network
```

- Start in interactive mode:

```
az interactive
```

- Display help:

```
az --help
```

azure-cli

This command is an alias of **az**.

- View documentation for the original command:

```
tldr az
```

azurite

Azure Storage API compatible server (emulator) in local environment.

More information: https://www.npmjs.com/package/azurite.

- Use an existing location as workspace path:

  ```
  azurite {{[-l|--location]}} {{path/to/directory}}
  ```

- Disable access log displayed in console:

  ```
  azurite {{[-s|--silent]}}
  ```

- Enable debug log by providing a file path as log destination:

  ```
  azurite {{[-d|--debug]}} {{path/to/debug.log}}
  ```

- Customize the listening address of Blob/Queue/Table service:

  ```
  azurite {{--blobHost|--queueHost|--tableHost}} {{0.0.0.0}}
  ```

- Customize the listening port of Blob/Queue/Table service:

  ```
  azurite {{--blobPort|--queuePort|--tablePort}} {{8888}}
  ```

b2

Access all features of Backblaze B2 Cloud Storage easily.

More information: https://www.backblaze.com/docs/cloud-storage-command-line-tools.

- Access your account:

```
b2 authorize_account {{key_id}}
```

- List the existing buckets in your account:

```
b2 list_buckets
```

- Create a bucket, provide the bucket name, and access type (e.g. allPublic or allPrivate):

```
b2 create_bucket {{bucket_name}} {{allPublic|allPrivate}}
```

- Upload a file. Choose a file, bucket, and a folder:

```
b2 upload_file {{bucket_name}} {{path/to/file}}
{{folder_name}}
```

- Upload a source directory to a Backblaze B2 bucket destination:

```
b2 sync {{path/to/source_file}} {{bucket_name}}
```

- Copy a file from one bucket to another bucket:

```
b2 copy-file-by-id {{path/to/source_file_id}}
{{destination_bucket_name}} {{path/to/b2_file}}
```

- Show the files in your bucket:

```
b2 ls {{bucket_name}}
```

- Remove a "folder" or a set of files matching a pattern:

```
b2 rm {{path/to/folder|pattern}}
```

b2sum

Calculate BLAKE2 cryptographic checksums.

More information: https://www.gnu.org/software/coreutils/manual/html_node/b2sum-invocation.html.

- Calculate the BLAKE2 checksum for one or more files:

```
b2sum {{path/to/file1 path/to/file2 ...}}
```

- Calculate and save the list of BLAKE2 checksums to a file:

```
b2sum {{path/to/file1 path/to/file2 ...}} > {{path/to/file.b2}}
```

- Calculate a BLAKE2 checksum from `stdin`:

```
{{command}} | b2sum
```

- Read a file of BLAKE2 checksums and filenames and verify all files have matching checksums:

```
b2sum {{[-c|--check]}} {{path/to/file.b2}}
```

- Only show a message for missing files or when verification fails:

```
b2sum {{[-c|--check]}} --quiet {{path/to/file.b2}}
```

- Only show a message when verification fails, ignoring missing files:

```
b2sum --ignore-missing {{[-c|--check]}} --quiet {{path/to/file.b2}}
```

- Check a known BLAKE2 checksum of a file:

```
echo {{known_blake2_checksum_of_the_file}} {{path/to/file}} | b2sum {{[-c|--check]}}
```

b3sum

Calculate BLAKE3 cryptographic checksums.

More information: https://github.com/BLAKE3-team/BLAKE3/tree/master/b3sum.

- Calculate the BLAKE3 checksum for one or more files:

```
b3sum {{path/to/file1 path/to/file2 ...}}
```

- Calculate and save the list of BLAKE3 checksums to a file:

```
b3sum {{path/to/file1 path/to/file2 ...}} > {{path/to/file.b3}}
```

- Calculate a BLAKE3 checksum from `stdin`:

```
{{command}} | b3sum
```

- Read a file of BLAKE3 checksums and filenames and verify all files have matching checksums:

```
b3sum {{[-c|--check]}} {{path/to/file.b3}}
```

- Only show a message for missing files or when verification fails:

```
b3sum {{[-c|--check]}} --quiet {{path/to/file.b3}}
```

- Check a known BLAKE3 checksum of a file:

```
echo {{known_blake3_checksum_of_the_file}} {{path/to/file}} | b3sum {{[-c|--check]}}
```

babel

A transpiler which converts code from JavaScript ES6/ES7 syntax to ES5 syntax.

More information: https://babeljs.io/docs/babel-cli.

- Transpile a specified input file and output to `stdout`:

```
babel {{path/to/file}}
```

- Transpile a specified input file and output to a specific file:

```
babel {{path/to/input_file}} --out-file {{path/to/
output_file}}
```

- Transpile the input file every time it is changed:

```
babel {{path/to/input_file}} --watch
```

- Transpile a whole directory of files:

```
babel {{path/to/input_directory}}
```

- Ignore specified comma-separated files in a directory:

```
babel {{path/to/input_directory}} --ignore
{{ignored_file1,ignored_file2,...}}
```

- Transpile and output as minified JavaScript:

```
babel {{path/to/input_file}} --minified
```

- Choose a set of presets for output formatting:

```
babel {{path/to/input_file}} --presets
{{preset1,preset2,...}}
```

- Display help:

```
babel --help
```

babeld

Routing daemon for Babel which uses firewall-style filters.

More information: https://www.irif.fr/~jch/software/babel/babeld.html.

- Start the daemon with one or more [c]onfiguration files (read in order):

```
babeld -c {{path/to/ports.conf}} -c {{path/to/filters.conf}}
-c {{path/to/interfaces.conf}}
```

- [D]eamonize after startup:

```
babeld -D
```

- Specify a [C]onfiguration command:

```
babeld -C '{{redistribute metric 256}}'
```

- Specify on which interfaces to operate:

```
babeld {{eth0}} {{eth1}} {{wlan0}}
```

bacon

A background code checker for Rust.

More information: https://github.com/Canop/bacon.

- Run `cargo check` whenever a change is detected in the current directory:

  ```
  bacon
  ```

- Run `cargo test` whenever a change is detected in the given directory:

  ```
  bacon test {{path/to/directory}}
  ```

- Run `cargo check` against all targets whenever a change is detected in the current directory:

  ```
  bacon check-all
  ```

- Run a specific job whenever a change is detected in the current directory:

  ```
  bacon {{run|test|clippy|doc|...}}
  ```

- List all currently available jobs:

  ```
  bacon --list-jobs
  ```

- Initialize a `bacon.toml` configuration file in the current directory:

  ```
  bacon --init
  ```

badblocks

Search a device for bad blocks.

Some usages of badblocks can cause destructive actions, such as erasing all data on a disk, including the partition table.

More information: https://manned.org/badblocks.

- Search a disk for bad blocks by using a non-destructive read-only test:

```
sudo badblocks {{/dev/sdX}}
```

- Search an unmounted disk for bad blocks with a [n]on-destructive read-write test:

```
sudo badblocks -n {{/dev/sdX}}
```

- Search an unmounted disk for bad blocks with a destructive [w]rite test:

```
sudo badblocks -w {{/dev/sdX}}
```

- Use the destructive [w]rite test and [s]how [v]erbose progress:

```
sudo badblocks -svw {{/dev/sdX}}
```

- In destructive mode, [o]utput found blocks to a file:

```
sudo badblocks -o {{path/to/file}} -w {{/dev/sdX}}
```

- Use the destructive mode with improved speed using 4K [b]lock size and 64K block [c]ount:

```
sudo badblocks -w -b {{4096}} -c {{65536}} {{/dev/sdX}}
```

balena

Interact with the balenaCloud, openBalena, and the balena API.

More information: https://docs.balena.io/reference/balena-cli/latest/.

- Log in to the balenaCloud account:

  ```
  balena login
  ```

- Create a balenaCloud or openBalena application:

  ```
  balena app create {{app_name}}
  ```

- List all balenaCloud or openBalena applications within the account:

  ```
  balena apps
  ```

- List all devices associated with the balenaCloud or openBalena account:

  ```
  balena devices
  ```

- Flash a balenaOS image to a local drive:

  ```
  balena local flash {{path/to/balenaos.img}} --drive
  {{drive_location}}
  ```

bandwhich

Display the current network utilization by process, connection, or remote IP/hostname.

More information: https://github.com/imsnif/bandwhich#usage.

- Show the remote addresses table only:

```
bandwhich {{[-a|--addresses]}}
```

- Show DNS queries:

```
bandwhich {{[-s|--show-dns]}}
```

- Show total (cumulative) usage:

```
bandwhich {{[-t|--total-utilization]}}
```

- Show the network utilization for a specific network interface:

```
bandwhich {{[-i|--interface]}} {{eth0}}
```

- Show DNS queries with a given DNS server:

```
bandwhich {{[-s|--show-dns]}} {{[-d|--dns-server]}} {{dns_server_ip}}
```

banner

Print the argument as a large ASCII art.

More information: https://manned.org/banner.

- Print the text message as a large banner (quotes are optional):

```
banner "{{Hello World}}"
```

- Use a banner width of 50 characters:

```
banner {{[-w|--width]}} 50 "{{Hello World}}"
```

- Read text from `stdin`:

```
banner
```

base32

Encode or decode file or **`stdin`** to/from Base32, to **`stdout`**.

More information: https://manned.org/base32.

- Encode a file:

```
base32 {{path/to/file}}
```

- Wrap encoded output at a specific width (`0` disables wrapping):

```
base32 {{[-w|--wrap]}} {{0|76|...}} {{path/to/file}}
```

- Decode a file:

```
base32 {{[-d|--decode]}} {{path/to/file}}
```

- Encode from `stdin`:

```
{{command}} | base32
```

- Decode from `stdin`:

```
{{command}} | base32 {{[-d|--decode]}}
```

base64

Encode or decode file or **`stdin`** to/from base64, to **`stdout`**.

More information: https://manned.org/base64.

- Encode a file:

```
base64 {{path/to/file}}
```

- Wrap encoded output at a specific width (`0` disables wrapping):

```
base64 {{[-w|--wrap]}} {{0|76|...}} {{path/to/file}}
```

- Decode a file:

```
base64 {{[-d|--decode]}} {{path/to/file}}
```

- Encode from `stdin`:

```
{{command}} | base64
```

- Decode from `stdin`:

```
{{command}} | base64 {{[-d|--decode]}}
```

basename

Remove leading directory portions from a path.

More information: https://www.gnu.org/software/coreutils/manual/html_node/basename-invocation.html.

- Show only the file name from a path:

```
basename {{path/to/file}}
```

- Show only the rightmost directory name from a path:

```
basename {{path/to/directory}}
```

- Show only the file name from a path, with a suffix removed:

```
basename {{path/to/file}} {{suffix}}
```

basenc

Encode or decode file or **`stdin`** using a specified encoding, to **`stdout`**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/basenc-invocation.html.

- Encode a file with base64 encoding:

```
basenc --base64 {{path/to/file}}
```

- Decode a file with base64 encoding:

```
basenc {{[-d|--decode]}} --base64 {{path/to/file}}
```

- Encode from `stdin` with base32 encoding with 42 columns:

```
{{command}} | basenc --base32 {{[-w|--wrap]}} 42
```

- Encode from `stdin` with base32 encoding:

```
{{command}} | basenc --base32
```

bash-it

A collection of community contributed Bash commands and scripts for Bash 3.2+.

More information: https://bash-it.readthedocs.io/en/latest/.

- Update Bash-it to the latest stable/development version:

```
bash-it update {{stable|dev}}
```

- Reload Bash profile (set `$BASH_IT_AUTOMATIC_RELOAD_AFTER_CONFIG_CHANGE` to non-empty value for an automatic reload):

```
bash-it reload
```

- Restart Bash:

```
bash-it restart
```

- Reload Bash profile with enabled error and warning logging:

```
bash-it doctor
```

- Reload Bash profile with enabled error/warning/entire logging:

```
bash-it doctor {{errors|warnings|all}}
```

- Search for Bash-it aliases/plugins/completions:

```
bash-it search {{alias|plugin|completion}}
```

- Search for Bash-it aliases/plugins/completions and enable/disable all found items:

```
bash-it search --{{enable|disable}} {{alias|plugin|
completion}}
```

bash

Bourne-Again SHell, an **sh**-compatible command-line interpreter.

See also: **zsh**, **!** (history expansion).

More information: https://www.gnu.org/software/bash/manual/bash.html#Invoking-Bash.

- Start an interactive shell session:

```
bash
```

- Start an interactive shell session without loading startup configs:

```
bash --norc
```

- Execute specific [c]ommands:

```
bash -c "{{echo 'bash is executed'}}"
```

- Execute a specific script:

```
bash {{path/to/script.sh}}
```

- E[x]ecute a specific script, printing each command before executing it:

```
bash -x {{path/to/script.sh}}
```

- Execute a specific script and stop at the first [e]rror:

```
bash -e {{path/to/script.sh}}
```

- Execute specific commands from `stdin`:

```
{{echo "echo 'bash is executed'"}} | bash
```

- Start a [r]estricted shell session:

```
bash {{[-r|--restricted]}}
```

bashmarks

Save and jump to commonly used directories using 1 character commands.

See also: **`autojump`**.

More information: https://github.com/huyng/bashmarks#shell-commands.

- Add the bashmark aliases to your shell:

```
source /usr/share/bashmarks/bashmarks.sh
```

- List available bookmarks:

```
l
```

- Save the current directory as "bookmark_name":

```
s {{bookmark_name}}
```

- Go to a bookmarked directory:

```
g {{bookmark_name}}
```

- Print a bookmarked directory's contents:

```
p {{bookmark_name}}
```

- Delete a bookmark:

```
d {{bookmark_name}}
```

bastet

Clone of the game Tetris in the terminal.

More information: https://fph.altervista.org/prog/bastet.html.

- Start a Tetris game:

  `bastet`

- Navigate the piece horizontally:

  `{{<ArrowLeft>|<ArrowRight>}}`

- Rotate the piece clockwise or counterclockwise:

  `{{<Space>|<ArrowUp>}}`

- Soft drop the piece:

  `<ArrowDown>`

- Hard drop the piece:

  `<Enter>`

- Pause the game:

  `<p>`

- Quit the game:

  `<Ctrl c>`

bat

Print and concatenate files.

A **cat** clone with syntax highlighting and Git integration.

More information: https://manned.org/bat.

- Pretty print the contents of one or more files to `stdout`:

```
bat {{path/to/file1 path/to/file2 ...}}
```

- Concatenate several files into the target file:

```
bat {{path/to/file1 path/to/file2 ...}} > {{path/to/target_file}}
```

- Remove decorations and disable paging (`--style plain` can be replaced with `-p`, or both options with `-pp`):

```
bat --style plain --pager never {{path/to/file}}
```

- Highlight a specific line or a range of lines with a different background color:

```
bat {{[-H|--highlight-line]}} {{10|5:10|:10|10:|10:+5}} {{path/to/file}}
```

- Show non-printable characters like space, tab, or newline:

```
bat {{[-A|--show-all]}} {{path/to/file}}
```

- Remove all decorations except line numbers in the output:

```
bat {{[-n|--number]}} {{path/to/file}}
```

- Syntax highlight a JSON file by explicitly setting the language:

```
bat {{[-l|--language]}} json {{path/to/file.json}}
```

- Display all supported languages:

```
bat {{[-L|--list-languages]}}
```

batch

Execute commands at a later time when the system load levels permit.

Results will be sent to the user's mail.

See also: **`at`**, **`atq`**, **`atrm`**, **`mail`**.

More information: https://manned.org/batch.

- Execute commands from `stdin` (press `<Ctrl d>` when done):

```
batch
```

- Execute a command from `stdin`:

```
echo "{{./make_db_backup.sh}}" | batch
```

bats

Bash Automated Testing System: a TAP (https://testanything.org/) compliant testing framework for Bash.

More information: https://bats-core.readthedocs.io/en/stable/usage.html.

- Run a BATS test script and output results in the TAP (Test Anything Protocol) format:

```
bats {{[-t|--tap]}} {{path/to/test.bats}}
```

- Count test cases of a test script without running any tests:

```
bats {{[-c|--count]}} {{path/to/test.bats}}
```

- Run BATS test cases recursively (files with a `.bats` extension):

```
bats {{[-r|--recursive]}} {{path/to/directory}}
```

- Output results in a specific format:

```
bats {{[-F|--formatter]}} {{pretty|tap|tap13|junit}} {{path/to/test.bats}}
```

- Add timing information to tests:

```
bats {{[-T|--timing]}} {{path/to/test.bats}}
```

- Run specific number of jobs in parallel (requires GNU `parallel` to be installed):

```
bats {{[-j|--jobs]}} {{number}} {{path/to/test.bats}}
```

bazel

Open-source build and test tool similar to Make, Maven, and Gradle.

More information: https://bazel.build/reference/command-line-reference.

- Build the specified target in the workspace:

```
bazel build {{target}}
```

- Remove output files and stop the server if running:

```
bazel clean
```

- Stop the bazel server:

```
bazel shutdown
```

- Display runtime info about the bazel server:

```
bazel info
```

- Display help:

```
bazel help
```

- Display version:

```
bazel version
```

bb

Native Clojure interpreter for scripting.

More information: https://book.babashka.org/#usage.

- Evaluate an expression:

```
bb {{[-e|--eval]}} "(+ 1 2 3)"
```

- Evaluate a script file:

```
bb {{[-f|--file]}} {{path/to/script.clj}}
```

- Bind [i]nput to a sequence of lines from `stdin`:

```
printf "first\nsecond" | bb -i "(map clojure.string/
capitalize *input*)"
```

- Bind [I]nput to a sequence of EDN (Extensible Data Notation) values from `stdin`:

```
echo "{:key 'val}" | bb -I "(:key (first *input*))"
```

bc

An arbitrary precision calculator language.

See also: **`dc`**, **`qalc`**.

More information: https://manned.org/bc.

- Start an interactive session:

```
bc
```

- Start an interactive session with the standard math library enabled:

```
bc {{[-i|--interactive]}} {{[-l|--mathlib]}}
```

- Calculate an expression:

```
echo '{{5 / 3}}' | bc
```

- Execute a script:

```
bc {{path/to/script.bc}}
```

- Calculate an expression with the specified scale:

```
echo 'scale = {{10}}; {{5 / 3}}' | bc
```

- Calculate a sine/cosine/arctangent/natural logarithm/exponential function using `mathlib`:

```
echo '{{s|c|a|l|e}}({{1}})' | bc {{[-l|--mathlib]}}
```

- Execute an inline factorial script:

```
echo "define factorial(n) { if (n <= 1) return 1; return
n*factorial(n-1); }; factorial({{10}})" | bc
```

bcomps

Decompose graphs into their biconnected components.

Graphviz filters: **`acyclic`**, **`bcomps`**, **`comps`**, **`edgepaint`**, **`gvcolor`**, **`gvpack`**, **`mingle`**, **`nop`**, **`sccmap`**, **`tred`**, & **`unflatten`**.

More information: https://graphviz.org/pdf/bcomps.1.pdf.

- Decompose one or more graphs into their biconnected components:

```
bcomps {{path/to/input1.gv path/to/input2.gv ...}} > {{path/to/output.gv}}
```

- Print the number of blocks and cutvertices in one or more graphs:

```
bcomps -v -s {{path/to/input1.gv path/to/input2.gv ...}}
```

- Write each block and block-cutvertex tree to multiple numbered filenames based on `output.gv`:

```
bcomps -x -o {{path/to/output.gv}} {{path/to/input1.gv path/to/input2.gv ...}}
```

- Display help:

```
bcomps -?
```

bd

A lightweight memory system and git-backed issue tracker for AI coding agents.

More information: https://github.com/steveyegge/beads#usage.

- Initialize a project database:

```
bd init
```

- Create a new issue with description, priority, and type:

```
bd create {{issue_title}} {{[-d|--description]}}
{{description}} {{[-p|--priority]}} {{1}} {{[-t|--type]}}
{{bug|feature|task|epic|chore}}
```

- List all issues:

```
bd list
```

- Show issues ready to work on (no blockers):

```
bd ready
```

- Display details of a specific issue:

```
bd show {{issue_id}}
```

- Update an issue status:

```
bd update {{issue_id}} {{[-s|--status]}} {{open|in_progress|
blocked|closed}}
```

- Manually sync changes and import latest from git:

```
bd sync
```

- Display help:

```
bd {{[-h|--help]}}
```

bdfr

Bulk downloader for Reddit.

More information: https://github.com/Serene-Arc/bulk-downloader-for-reddit.

- Download videos/images from the specified links to URL or ID's of posts:

```
bdfr download {{path/to/output_directory}} {{[-l|--link]}}
{{post_url}}
```

- Download the maximum possible number (roughly 1000) of videos/images from a specified user:

```
bdfr download {{path/to/output_directory}} {{[-u|--user]}}
{{reddit_user}} --submitted
```

- Download submission data (text, upvotes, comments, etc.) limited to 10 submissions for each subreddit (30 total):

```
bdfr archive {{path/to/output_directory}} {{[-s|--
subreddit]}} '{{Python, all, mindustry}}' {{[-L|--limit]}} 10
```

- Download videos/images from the subreddit r/Python sorted by top (default is hot) using time filter all, limited to 10 submissions:

```
bdfr download {{path/to/output_directory}} {{[-s|--
subreddit]}} Python {{[-S|--sort]}} top {{[-t|--time]}} all
{{[-L|--limit]}} 10
```

- Download the maximum possible number of both submission data and videos/images from subreddit r/Python skipping over submissions with mp4 or gif file extensions and creating hard links for duplicate files:

```
bdfr clone {{path/to/output_directory}} {{[-s|--subreddit]}}
Python --skip mp4 --skip gif --make-hard-links
```

- Download saved posts of the authenticated user, naming each file according to a specified format. Avoid downloading duplicates and posts already present in the output directory:

```
bdfr download {{path/to/output_directory}} {{[-u|--user]}} me
--saved --authenticate --file-scheme '{{ {POSTID}_{TITLE}
_{UPVOTES} }}' --no-dupes --search-existing
```

beanstalkd

A simple and generic work-queue server.

More information: https://manned.org/beanstalkd.

- Start the server, listening on port 11300:

```
beanstalkd
```

- [l]isten on a specific [p]ort and address:

```
beanstalkd -l {{ip_address}} -p {{port_number}}
```

- Persist work queues by saving them to disk:

```
beanstalkd -b {{path/to/persistence_directory}}
```

- Sync to the persistence directory every 500 milliseconds:

```
beanstalkd -b {{path/to/persistence_directory}} -f {{500}}
```

bear

A tool to generate compilation databases for **`clang`** tooling.

More information: https://github.com/rizsotto/Bear.

- Generate `compile_commands.json` by running a build command:

```
bear -- {{make}}
```

- Generate compilation database with a custom output file name:

```
bear --output {{path/to/compile_commands.json}} -- {{make}}
```

- Append results to an existing `compile_commands.json` file:

```
bear --append -- {{make}}
```

- Run in verbose mode to get detailed output:

```
bear --verbose -- {{make}}
```

- Force `bear` to use the preload method for command interception:

```
bear --force-preload -- {{make}}
```

bedtools

A swiss-army knife of tools for genomic-analysis tasks.

Used to intersect, group, convert, and count data in BAM, BED, GFF/GTF, VCF format.

More information: https://bedtools.readthedocs.io/en/latest/content/overview.html#summary-of-available-tools.

- Intersect file [a] and file(s) [b] regarding the sequences' [s]trand and save the result to a specific file:

```
bedtools intersect -a {{path/to/file_A}} -b {{path/to/file_B1 path/to/file_B2 ...}} -s > {{path/to/output_file}}
```

- Intersect two files with a [l]eft [o]uter [j]oin, i.e. report each feature from `file1` and NULL if no overlap with `file2`:

```
bedtools intersect -a {{path/to/file1}} -b {{path/to/file2}} -loj > {{path/to/output_file}}
```

- Using more efficient algorithm to intersect two pre-sorted files:

```
bedtools intersect -a {{path/to/file1}} -b {{path/to/file2}} -sorted > {{path/to/output_file}}
```

- [g]roup a file based on the first three and the fifth [c]olumn and apply the sum [o]peration on the sixth column:

```
bedtools groupby -i {{path/to/file}} -c 1-3,5 -g 6 -o sum
```

- Convert bam-formatted [i]nput file to a bed-formatted one:

```
bedtools bamtobed -i {{path/to/file.bam}} > {{path/to/file.bed}}
```

- Find for all features in `file1.bed` the closest one in `file2.bed` and write their [d]istance in an extra column (input files must be sorted):

```
bedtools closest -a {{path/to/file1.bed}} -b {{path/to/file2.bed}} -d
```

behat

A PHP framework for Behaviour-Driven Development.

More information: https://docs.behat.org/en/latest/user_guide/command_line_tool.html.

- Initialize a new Behat project:

  ```
  behat --init
  ```

- Run all tests:

  ```
  behat
  ```

- Run all tests from the specified suite:

  ```
  behat --suite {{suite_name}}
  ```

- Run tests with a specific output formatter:

  ```
  behat --format {{pretty|progress}}
  ```

- Run tests and output results to a file:

  ```
  behat --out {{path/to/file}}
  ```

- List the definitions in your test suites:

  ```
  behat --definitions
  ```

berks

Chef cookbook dependency manager.

More information: https://docs.chef.io/workstation/berkshelf/.

- Install cookbook dependencies into a local repo:

```
berks install
```

- Update a specific cookbook and its dependencies:

```
berks update {{cookbook}}
```

- Upload a cookbook to the Chef server:

```
berks upload {{cookbook}}
```

- View the dependencies of a cookbook:

```
berks contingent {{cookbook}}
```

betty

Use natural language to execute commands.

More information: https://github.com/pickhardt/betty.

- Ask Betty something:

```
betty {{what time is it}}
```

- Download a file:

```
betty download {{https://example.com/file.ext}} to {{path/to/output_file.ext}}
```

- Compress a file or directory to one of the support archive formats:

```
betty {{zip}} {{path/to/file_or_directory}}
```

- Extract an archive into the current directory:

```
betty {{unzip}} {{archive.tar.gz}}
```

- Extract an archive into a specific directory:

```
betty unarchive {{archive.tar.gz}} to {{path/to/directory}}
```

- Play Spotify:

```
betty play {{Spotify}}
```

- Drive Betty to madness:

```
betty go crazy
```

- Display version:

```
betty version
```

bfg

Remove large files or passwords from Git history like git-filter-branch.

Note: If your repository is connected to a remote, you will need to force push to it.

More information: https://rtyley.github.io/bfg-repo-cleaner/.

- Remove a file with sensitive data but leave the latest commit untouched:

```
bfg --delete-files {{file_with_sensitive_data}}
```

- Remove all text mentioned in the specified file wherever it can be found in the repository's history:

```
bfg --replace-text {{path/to/file.txt}}
```

bfs

Breadth-first search for your files.

More information: https://manned.org/bfs.

- Find files by extension:

```
bfs {{root_path}} -name '{{*.ext}}'
```

- Find files matching multiple path/name patterns:

```
bfs {{root_path}} -path '{{**/path/**/*.ext}}' -or -name
'{{*pattern*}}'
```

- Find directories matching a given name, in case-insensitive mode:

```
bfs {{root_path}} -type d -iname '{{*lib*}}'
```

- Find files matching a given pattern, excluding specific paths:

```
bfs {{root_path}} -name '{{*.py}}' -not -path '{{*/site-
packages/*}}'
```

- Find files matching a given size range, limiting the recursive depth to "1":

```
bfs {{root_path}} -maxdepth 1 -size {{+500k}} -size {{-10M}}
```

- Run a command for each file (use `{}` within the command to access the filename):

```
bfs {{root_path}} -name '{{*.ext}}' -exec {{wc -l}} {} \;
```

- Find all files modified today and pass the results to a single command as arguments:

```
bfs {{root_path}} -daystart -mtime {{-1}} -exec {{tar -cvf
archive.tar}} {} \+
```

- Find empty files (0 byte) or directories and delete them verbosely:

```
bfs {{root_path}} -type {{f|d}} -empty -delete -print
```

bg

Resume suspended jobs (e.g. using **<Ctrl z>**), and keep them running in the background.

See also: **jobs**, **fg**, **disown**.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-bg.

- Resume the most recently suspended job and run it in the background:

```
bg
```

- Resume a specific job and run it in the background (run `jobs` to find the job number):

```
bg %{{job_number}}
```

bgpgrep

Filter and print BGP data within MRT dumps.

Can read files compressed with **`gzip`**, **`bzip2`**, and **`xz`**.

More information: https://codeberg.org/1414codeforge/ubgpsuite.

- List all routes:

```
bgpgrep {{master6.mrt}}
```

- List routes received from a specific peer, determined by the peer's AS number:

```
bgpgrep {{master4.mrt}} -peer {{64498}}
```

- List routes received from a specific peer, determined by the peer's IP address:

```
bgpgrep {{master4.mrt.bz2}} -peer {{2001:db8:dead:cafe:acd::19e}}
```

- List routes which have certain ASNs in their AS path:

```
bgpgrep {{master6.mrt.bz2}} -aspath '{{64498 64510}}'
```

- List routes that lead to a specific address:

```
bgpgrep {{master6.mrt.bz2}} -supernet '{{2001:db8:dead:cafe:aef::5}}'
```

- List routes that have communities from a specific AS:

```
bgpgrep {{master4.mrt}} -communities \( '{{64497}}:*' \)
```

biber

A backend bibliography processor for the **`biblatex`** package.

See also: **`latexmk`**.

More information: https://texdoc.org/serve/biber.pdf/0#section.3.

- Generate bibliography data using a BibLaTeX Control File:

```
biber {{path/to/file.bcf}}
```

- Generate bibliography data using a configuration file:

```
biber {{path/to/file.bcf}} {{[-g|--configfile]}} {{path/to/config_file}}
```

- Enable debugging:

```
biber {{path/to/file.bcf}} {{[-D|--debug]}}
```

biff

A simple utility for doing datetime arithmetic, parsing, and formatting.

More information: https://github.com/burntsushi/biff.

- Print the current time in a format of your choosing:

```
biff time fmt {{[-f|--format]}} rfc3339 now
```

- Print multiple relative times in one command:

```
biff time fmt {{[-f|--format]}} '%c' now -1d 'next sat' 'last monday' '9pm last mon'
```

- Print the current time in another time zone and round it the nearest 15 minute increment:

```
biff time in Asia/Bangkok now | biff time round {{[-i|--increment]}} 15 {{[-s|--smallest]}} minute
```

- Convert a time between two different time zone:

```
TZ='Japan' biff time in America/New_York 02:30
```

- Print a past or future time relative to current time:

```
biff time add {{-1d|1d|1w|-1m|1y|...}} now
```

- Add a complex duration to the current time:

```
biff time add '1 week, 12 hours ago' now
```

- Find the duration since a date in the past and round it to the desired precision:

```
biff span since 2025-01-20T12:00 {{[-l|--largest]}} year
```

- Find timestamps in a log file and reformat them into your local time in place:

```
biff tag lines /tmp/access.log | biff time in system | biff time fmt {{[-f|--format]}} '%c' | head {{[-n|--lines]}} 3 | biff untag {{[-s|--substitute]}}
```

bind

Bash builtin to manage bash hotkeys and variables.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-bind.

- List all bound commands and their hotkeys:

```
bind {{-p|-P}}
```

- Query a command for its hotkey:

```
bind -q {{command}}
```

- Bind a key:

```
bind -x '"{{key_sequence}}":{{command}}'
```

- List user defined bindings:

```
bind -X
```

- Display help:

```
help bind
```

bindkey

Add keybindings to Z-Shell.

More information: https://zsh.sourceforge.io/Guide/zshguide04.html.

- Bind a hotkey to a specific command:

```
bindkey "{{^k}}" {{kill-line}}
```

- Bind a hotkey to a specific key [s]equence:

```
bindkey -s '^o' 'cd ..\n'
```

- [l]ist keymaps:

```
bindkey -l
```

- View the hotkey in a key[M]ap:

```
bindkey -M main
```

bing-rewards

Automate daily Bing Rewards points.

More information: https://github.com/jack-mil/bing-rewards.

- Complete both desktop and mobile searches:

```
bing-rewards
```

- Run 10 searches with mobile user-agent:

```
bing-rewards {{[-m|--mobile]}} {{[-c|--count]}} 10
```

- Complete mobile and desktop searches using specified Chrome profile "Profile 1":

```
bing-rewards --profile "Profile 1"
```

- Run searches sequentially across multiple Chrome profiles:

```
bing-rewards --profile "Default" "Profile 1" "Profile 2"
```

- Display help:

```
bing-rewards {{[-h|--help]}}
```

binwalk

Firmware Analysis Tool.

More information: https://manned.org/binwalk.

- Scan a binary file:

```
binwalk {{path/to/binary}}
```

- Extract files from a binary, specifying the output directory:

```
binwalk {{[-e|--extract]}} {{[-C|--directory]}} {{output_directory}} {{path/to/binary}}
```

- Recursively extract files from a binary limiting the recursion depth to 2:

```
binwalk {{[-e|--extract]}} {{[-M|--matryoshka]}} {{[-d|--depth]}} {{2}} {{path/to/binary}}
```

- Extract files from a binary with the specified file signature:

```
binwalk {{[-D|--dd]}} '{{png image:png}}' {{path/to/binary}}
```

- Analyze the entropy of a binary, saving the plot with the same name as the binary and `.png` extension appended:

```
binwalk {{[-E|--entropy]}} {{[-J|--save]}} {{path/to/binary}}
```

- Combine entropy, signature, and opcodes analysis in a single command:

```
binwalk {{[-E|--entropy]}} {{[-B|--signature]}} {{[-A|--opcodes]}} {{path/to/binary}}
```

bioradtopgm

Convert a Biorad confocal file into a PGM file.

More information: https://netpbm.sourceforge.net/doc/bioradtopgm.html.

- Read a Biorad confocal file and store the n'th image contained in it to as a PGM file:

```
bioradtopgm -{{n}} {{path/to/file.pic}} > {{path/to/file.pgm}}
```

- Read a Biorad confocal file and print the number of images it contains:

```
bioradtopgm {{path/to/file.pic}}
```

- Display version:

```
bioradtopgm {{[-v|-version]}}
```

bird

BIRD Internet Routing Daemon.

Routing daemon with support for BGP, OSPF, Babel, and others.

More information: https://bird.network.cz/?get_doc&v=30&f=bird-1.html#ss1.3.

- Start Bird with a specific configuration file:

```
bird -c {{path/to/bird.conf}}
```

- Start Bird as a specific user and group:

```
bird -u {{username}} -g {{group}}
```

birdc

BIRD remote control.

Retrieve information like routes from bird and perform configurations during runtime.

More information: https://bird.network.cz/?get_doc&v=30&f=bird-4.html.

- Open the remote control console:

```
birdc
```

- Reload the configuration without restarting BIRD:

```
birdc configure
```

- Show the current status of BIRD:

```
birdc show status
```

- Show all configured protocols:

```
birdc show protocols
```

- Show all details about a protocol:

```
birdc show protocols {{upstream1}} all
```

- Show all routes that contain a specific AS number:

```
birdc "show route where bgp_path ~ [{{4242120045}}]"
```

- Show all best routes:

```
birdc show route primary
```

- Show all details of all routes from a given prefix:

```
birdc show route for {{fd00:/8}} all
```

bison

GNU parser generator.

More information: https://manned.org/bison.

- Compile a bison definition file:

```
bison {{path/to/file.y}}
```

- Compile in debug mode, which causes the resulting parser to write additional information to `stdout`:

```
bison {{[-t|--debug]}} {{path/to/file.y}}
```

- Specify the output filename:

```
bison {{[-o|--output]}} {{path/to/output.c}} {{path/to/file.y}}
```

- Be verbose when compiling:

```
bison {{[-v|--verbose]}}
```

bitcoin-cli

Client to interact with the Bitcoin Core daemon via RPC calls.

Uses the configuration defined in **`bitcoin.conf`**.

More information: https://en.bitcoin.it/wiki/Running_Bitcoin#Command-line_arguments.

- Send a transaction to a given address:

```
bitcoin-cli sendtoaddress "{{address}}" {{amount}}
```

- Generate one or more blocks:

```
bitcoin-cli generate {{num_blocks}}
```

- Print high-level information about the wallet:

```
bitcoin-cli getwalletinfo
```

- List all outputs from previous transactions available to fund outgoing transactions:

```
bitcoin-cli listunspent
```

- Export the wallet information to a text file:

```
bitcoin-cli dumpwallet "{{path/to/file}}"
```

- Get blockchain information:

```
bitcoin-cli getblockchaininfo
```

- Get network information:

```
bitcoin-cli getnetworkinfo
```

- Stop the Bitcoin Core daemon:

```
bitcoin-cli stop
```

bitcoind

Bitcoin Core daemon.

Uses the configuration defined in **`bitcoin.conf`**.

More information: https://manned.org/bitcoind.

- Start the Bitcoin Core daemon (in the foreground):

```
bitcoind
```

- Start the Bitcoin Core daemon in the background (use `bitcoin-cli stop` to stop):

```
bitcoind -daemon
```

- Start the Bitcoin Core daemon on a specific network:

```
bitcoind -chain={{main|test|signet|regtest}}
```

- Start the Bitcoin Core daemon using specific configuration file and data directory:

```
bitcoind -conf={{path/to/bitcoin.conf}} -datadir={{path/to/directory}}
```

bk

Manage Buildkite builds, pipelines, and agents.

More information: https://github.com/buildkite/cli#usage.

- Configure the API token and organization:

```
bk configure
```

- Select an organization to use:

```
bk use {{organization_slug}}
```

- Initialize a `pipeline.yaml` file:

```
bk init
```

- List all pipelines in the current organization:

```
bk pipeline list
```

- Trigger a build for a pipeline:

```
bk build create {{pipeline_slug}}
```

- View the status of a specific build:

```
bk build view {{build_number}}
```

- List all agents in the current organization:

```
bk agent list
```

- Display help:

```
bk {{[-h|--help]}}
```

black

Format Python code automatically.

See also: **`ruff`**.

More information: https://black.readthedocs.io/en/stable/usage_and_configuration/the_basics.html.

- Auto-format a file or entire directory:

```
black {{path/to/file_or_directory}}
```

- Format the code passed in as a string:

```
black {{[-c|--code]}} "{{code}}"
```

- Show whether a file or a directory would have changes made to them if they were to be formatted:

```
black --check {{path/to/file_or_directory}}
```

- Show changes that would be made to a file or a directory without performing them (dry-run):

```
black --diff {{path/to/file_or_directory}}
```

- Auto-format a file or directory, emitting exclusively error messages to `stderr`:

```
black {{[-q|--quiet]}} {{path/to/file_or_directory}}
```

- Auto-format a file or directory without replacing single quotes with double quotes (adoption helper, avoid using this for new projects):

```
black {{[-S|--skip-string-normalization]}} {{path/to/file_or_directory}}
```

blackfire

Monitor, profile, and test a PHP application.

More information: https://www.blackfire.io/.

- Initialize and configure the Blackfire client:

```
blackfire config
```

- Launch the Blackfire agent:

```
blackfire agent
```

- Launch the Blackfire agent on a specific socket:

```
blackfire agent --socket="{{tcp://127.0.0.1:8307}}"
```

- Run the profiler on a specific program:

```
blackfire run {{php path/to/file.php}}
```

- Run the profiler and collect 10 samples:

```
blackfire --samples 10 run {{php path/to/file.php}}
```

- Run the profiler and output results as JSON:

```
blackfire --json run {{php path/to/file.php}}
```

- Upload a profiler file to the Blackfire web service:

```
blackfire upload {{path/to/file}}
```

- View the status of profiles on the Blackfire web service:

```
blackfire status
```

blahaj

A lolcat-like output colorizer that also prints flags and colorful sharks.

More information: https://codeberg.org/GeopJr/BLAHAJ.

- Get a list of possible flags/colors:

```
blahaj --flags
```

- Print a shark (blahaj) with default trans colors:

```
blahaj {{[-s|--shark]}}
```

- Print a random flag with a 2x size multiplier:

```
blahaj {{[-f|--flag]}} {{[-r|--random]}} {{[-m|--
multiplier]}} 2
```

- Print the result of a text-producing command with lesbian colors:

```
{{cowsay "Hello, world"}} | blahaj {{[-c|--colors]}} lesbian
```

- Print text and color by individual character:

```
echo "{{Hello, world}}" | blahaj {{[-i|--individual]}}
```

- Print contents of a text document, coloring the background instead of text, by word:

```
blahaj {{[-w|--words]}} {{[-b|--background]}} {{path/to/
file}}
```

blender

Command-line interface to the Blender 3D computer graphics application.

Arguments are executed in the order they are given.

More information: https://docs.blender.org/manual/en/latest/advanced/command_line/arguments.html.

- Render all frames of an animation in the background, without loading the UI (output is saved to `/tmp`):

```
blender {{[-b|--background]}} {{path/to/file.blend}} {{[-a|--render-anim]}}
```

- Render an animation using a specific image naming pattern, in a path relative (`//`) to the `.blend` file:

```
blender {{[-b|--background]}} {{path/to/file.blend}} {{[-o|--render-output]}} //{{render/frame_###.png}} {{[-a|--render-anim]}}
```

- Render the 10th frame of an animation as a single image, saved to an existing directory (absolute path):

```
blender {{[-b|--background]}} {{path/to/file.blend}} {{[-o|--render-output]}} /{{path/to/output_directory}} {{[-f|--render-frame]}} {{10}}
```

- Render the second last frame in an animation as a JPEG image, saved to an existing directory (relative path):

```
blender {{[-b|--background]}} {{path/to/file.blend}} {{[-o|--render-output]}} //{{output_directory}} {{[-f|--render-frame]}} {{JPEG}} {{[-f|--render-frame]}} {{-2}}
```

- Render the animation of a specific scene, starting at frame 10 and ending at frame 500:

```
blender {{[-b|--background]}} {{path/to/file.blend}} {{[-S|--scene]}} {{scene_name}} {{[-s|--frame-start]}} {{10}} {{[-e|--frame-end]}} {{500}} {{[-a|--render-anim]}}
```

- Render an animation at a specific resolution, by passing a Python expression:

```
blender {{[-b|--background]}} {{path/to/file.blend}} --python-expr '{{import bpy;
```

```
bpy.data.scenes[0].render.resolution_percentage = 25}}' {{[-
a|--render-anim]}}
```

- Start an interactive Blender session in the terminal with a Python console (do `import bpy` after starting):

  ```
  blender {{[-b|--background]}} --python-console
  ```

blockout2

Tetris like game in 3D.

More information: https://www.blockout.net/blockout2/.

- Start a new game:

  ```
  blockout2
  ```

- Navigate the current piece on a 2D plane:

  ```
  {{<ArrowUp>|<ArrowDown>|<ArrowLeft>|<ArrowRight>}}
  ```

- Rotate the piece on its axis:

  ```
  {{<q>|<w>|<e>|<a>|<s>|<d>}}
  ```

- Hard drop the current piece:

  ```
  <Space>
  ```

- Pause/unpause the game:

  ```
  <p>
  ```

bloodhound-python

A Python ingestor for BloodHound, used to enumerate Active Directory relationships.

More information: https://github.com/dirkjanm/BloodHound.py#usage.

- Collect all data using default collection methods (includes groups, sessions, and trusts):

```
bloodhound-python --username {{username}} --password {{password}} --domain {{domain}}
```

- Collect data using Kerberos authentication without requiring a plaintext password:

```
bloodhound-python --collectionmethod {{All}} --kerberos --domain {{domain}}
```

- Authenticate using NTLM hashes instead of a password:

```
bloodhound-python --collectionmethod {{All}} --username {{username}} --hashes {{LM:NTLM}} --domain {{domain}}
```

- Specify a custom name server for DNS queries:

```
bloodhound-python --collectionmethod {{All}} --username {{username}} --password {{password}} --domain {{domain}} --nameserver {{nameserver}}
```

- Save the output files as a compressed ZIP archive:

```
bloodhound-python --collectionmethod {{All}} --username {{username}} --password {{password}} --domain {{domain}} --zip
```

bmaptool

Create or copy block maps intelligently (designed to be faster than **cp** or **dd**).

More information: https://manned.org/bmaptool.

- Output a blockmap file from image file:

```
bmaptool create {{[-o|--output]}} {{blockmap.bmap}} {{source.img}}
```

- Copy an image file into sdb:

```
bmaptool copy --bmap {{blockmap.bmap}} {{source.img}} {{/dev/sdb}}
```

- Copy a compressed image file into sdb:

```
bmaptool copy --bmap {{blockmap.bmap}} {{source.img.gz}} {{/dev/sdb}}
```

- Copy an image file into sdb without using a blockmap:

```
bmaptool copy --nobmap {{source.img}} {{/dev/sdb}}
```

bmptopnm

Convert a BMP file into a PBM, PGM, or PNM image.

More information: https://netpbm.sourceforge.net/doc/bmptopnm.html.

- Generate the PBM, PGM, or PNM image as output, for Windows or OS/2 BMP file as input:

```
bmptopnm {{path/to/file.bmp}}
```

- Report contents of the BMP header to `stderr`:

```
bmptopnm {{[-verb|-verbose]}} {{path/to/file.bmp}}
```

- Display version:

```
bmptopnm {{[-v|-version]}}
```

bmptoppm

This command has been superseded by **bmptopnm**.

More information: https://netpbm.sourceforge.net/doc/bmptoppm.html.

- View documentation for the current command:

```
tldr bmptopnm
```

bob

Manage and switch between Neovim versions.

More information: https://github.com/MordechaiHadad/bob#-usage.

- Install and switch to the specified version of Neovim:

```
bob use {{nightly|stable|latest|version_string|commit_hash}}
```

- List installed and currently used versions of Neovim:

```
bob list
```

- Uninstall the specified version of Neovim:

```
bob uninstall {{nightly|stable|latest|version_string|
commit_hash}}
```

- Uninstall Neovim and erase any changes `bob` has made:

```
bob erase
```

- Roll back to a previous nightly version:

```
bob rollback
```

boot

Build tooling for the Clojure programming language.

More information: https://github.com/boot-clj/boot.

- Start a REPL session either with the project or standalone:

```
boot repl
```

- Build a single `uberjar`:

```
boot jar
```

- Generate scaffolding for a new project based on a template:

```
boot --dependencies boot/new new --template {{template_name}}
--name {{project_name}}
```

- Build for development (if using the boot/new template):

```
boot dev
```

- Build for production (if using the boot/new template):

```
boot prod
```

- Display help for a specific task:

```
boot {{task}} --help
```

borg

Deduplicating backup tool.

Create local or remote backups that are mountable as filesystems.

More information: https://borgbackup.readthedocs.io/en/stable/usage/general.html.

- Initialize a (local) repository:

```
borg init {{path/to/repo_directory}}
```

- Backup a directory into the repository, creating an archive called "Monday":

```
borg create --progress {{path/to/repo_directory}}::{{Monday}}
{{path/to/source_directory}}
```

- List all archives in a repository:

```
borg list {{path/to/repo_directory}}
```

- Extract a specific directory from the "Monday" archive in a remote repository, excluding all `*.ext` files:

```
borg extract {{user}}@{{host}}:{{path/to/repo_directory}}::
{{Monday}} {{path/to/target_directory}} --exclude '{{*.ext}}'
```

- Prune a repository by deleting all archives older than 7 days, listing changes:

```
borg prune --keep-within {{7d}} --list {{path/to/
repo_directory}}
```

- Mount a repository as a FUSE filesystem:

```
borg mount {{path/to/repo_directory}}::{{Monday}} {{path/to/
mountpoint}}
```

- Display help on creating archives:

```
borg create --help
```

bosh

Deploy and manage the BOSH director.

More information: https://bosh.io/docs/cli-v2/.

- Create local alias for director in a specific environment:

```
bosh alias-env {{environment_name}} {{[-e|--environment]}} {{ip_address|URL}} --ca-cert {{ca_certificate}}
```

- List environments:

```
bosh environments
```

- Log in to the director:

```
bosh login {{[-e|--environment]}} {{environment}}
```

- List deployments:

```
bosh {{[-e|--environment]}} {{environment}} deployments
```

- List environment virtual machines in a deployment:

```
bosh {{[-e|--environment]}} {{environment}} vms {{[-d|--deployment]}} {{deployment}}
```

- SSH into virtual machine:

```
bosh {{[-e|--environment]}} {{environment}} ssh {{virtual_machine}} {{[-d|--deployment]}} {{deployment}}
```

- Upload stemcell:

```
bosh {{[-e|--environment]}} {{environment}} upload-stemcell {{stemcell_file|url}}
```

- Show current cloud config:

```
bosh {{[-e|--environment]}} {{environment}} cloud-config
```

bower

A package manager optimized for front-end web development.

A package can be a GitHub user/repo shorthand, a Git endpoint, a URL or a registered package.

More information: https://bower.io/#getting-started.

- Install a project's dependencies, listed in its bower.json:

  ```
  bower install
  ```

- Install one or more packages to the bower_components directory:

  ```
  bower install {{package}} {{package}}
  ```

- Uninstall packages locally from the bower_components directory:

  ```
  bower uninstall {{package}} {{package}}
  ```

- List local packages and possible updates:

  ```
  bower list
  ```

- Create a `bower.json` file for your package:

  ```
  bower init
  ```

- Install a specific dependency version, and add it to `bower.json`:

  ```
  bower install {{local_name}}={{package}}#{{version}} --save
  ```

- Display help for a specific command:

  ```
  bower help {{command}}
  ```

box

A PHP application for building and managing Phars.

More information: https://github.com/box-project/box.

- Compile a new Phar file:

  ```
  box compile
  ```

- Compile a new Phar file using a specific configuration file:

  ```
  box compile {{[-c|--config]}} {{path/to/config}}
  ```

- Display information about the PHAR PHP extension:

  ```
  box info
  ```

- Display information about a specific Phar file:

  ```
  box info {{path/to/phar_file}}
  ```

- Validate the first found configuration file in the working directory:

  ```
  box validate
  ```

- Verify the signature of a specific Phar file:

  ```
  box verify {{path/to/phar_file}}
  ```

- Display help:

  ```
  box help
  ```

boxes

Draw, remove, and repair ASCII art boxes.

More information: https://boxes.thomasjensen.com/boxes-man-1.html.

- Draw a box around a string:

```
echo "{{string}}" | boxes
```

- Remove a box from a string:

```
echo "{{string}}" | boxes {{[-r|--remove]}}
```

- Specify the box design:

```
echo "{{string}}" | boxes {{[-d|--design]}} {{parchment}}
```

- Specify the box size (in columns by lines):

```
echo "{{string}}" | boxes {{[-s|--size]}} {{10}}x{{5}}
```

- Align the box text [h]orizonally (at [l]eft, [c]enter, or [r]ight):

```
echo "{{string}}" | boxes {{[-a|--align]}} h{{l|c|r}}
```

- Align the box text [v]ertically (at [t]op, [c]enter, or [b]ottom):

```
echo "{{string}}" | boxes {{[-a|--align]}} v{{t|c|b}}
```

- [j]ustify the box text (at [l]eft, [c]enter, or [r]ight):

```
echo "{{string}}" | boxes {{[-a|--align]}} j{{l|c|r}}{{vt}}
```

boxxy

Redirect file locations for programs that don't respect the XDG standards.

More information: https://github.com/queer/boxxy.

- Run a program with file redirections defined in `~/.config/boxxy/boxxy.yaml`:

```
boxxy {{program}}
```

- Scan your home directory for rule suggestions:

```
boxxy scan
```

- Trace what files a program touches and save a report in `boxxy-report.txt` in the current directory:

```
boxxy {{[-t|--trace]}} {{program}}
```

- Pass a redirection rule directly on the terminal:

```
boxxy {{[-r|--rule]}} {{path/to/file_or_directory}}:{{path/to/redirection}}:{{file|directory}} {{program}}
```

- View the config file:

```
boxxy config
```

- Display help:

```
boxxy -h
```

bpkg

A package manager for Bash scripts.

More information: https://github.com/bpkg/bpkg.

- Update the local index:

```
bpkg update
```

- Install a package globally:

```
bpkg install --global {{package}}
```

- Install a package in a subdirectory of the current directory:

```
bpkg install {{package}}
```

- Install a specific version of a package globally:

```
bpkg install {{package}}@{{version}} -g
```

- Show details about a specific package:

```
bpkg show {{package}}
```

- Run a command, optionally specifying its arguments:

```
bpkg run {{command}} {{argument1 argument2 ...}}
```

bpython

A fancy interface to the Python interpreter.

Provides syntax highlighting and many other nice-to-haves in REPL mode.

More information: https://manned.org/bpython.

- Start a REPL (interactive shell):

```
bpython
```

- Execute a specific Python file:

```
bpython {{path/to/file.py}}
```

- Execute a specific Python file and start a REPL:

```
bpython {{[-i|--interactive]}} {{path/to/file.py}}
```

- Use the specified configuration file instead of the default configuration:

```
bpython --config {{path/to/file.conf}}
```

bpytop

A resource monitor that shows information about the CPU, memory, disks, network, and processes.

A Python version of **`bashtop`**.

More information: https://github.com/aristocratos/bpytop#command-line-options.

- Start `bpytop`:

  `bpytop`

- Start in minimal mode without memory and networking boxes:

  `bpytop -m`

- Toggle minimal mode:

  `<m>`

- Search for running programs or processes:

  `<f>`

- Change settings:

  `<M>`

- Display version:

  `bpytop -v`

bq

A Python-based tool for BigQuery, Google Cloud's fully managed and completely serverless enterprise data warehouse.

More information: https://docs.cloud.google.com/bigquery/docs/reference/bq-cli-reference.

- Run query against a BigQuery table using standard SQL, add `--dry_run` flag to estimate the number of bytes read by the query:

```
bq query --nouse_legacy_sql 'SELECT COUNT(*) FROM
{{DATASET_NAME}}.{{TABLE_NAME}}'
```

- Run a parameterized query:

```
bq query --use_legacy_sql=false --
parameter='ts_value:TIMESTAMP:2016-12-07 08:00:00' 'SELECT
TIMESTAMP_ADD(@ts_value, INTERVAL 1 HOUR)'
```

- Create a new dataset or table in the US location:

```
bq mk --location=US {{dataset_name}}.{{table_name}}
```

- List all datasets in a project:

```
bq ls --filter labels.{{key}}:{{value}} --max_results
{{integer}} --format=prettyjson --project_id {{project_id}}
```

- Batch load data from a specific file in formats such as CSV, JSON, Parquet, and Avro to a table:

```
bq load --location {{location}} --source_format {{CSV|JSON|
PARQUET|AVRO}} {{dataset}}.{{table}} {{path/to/source}}
```

- Copy one table to another:

```
bq cp {{dataset}}.{{OLD_TABLE}} {{dataset}}.{{new_table}}
```

- Display help:

```
bq help
```

brave

This command is an alias of **`chromium`**.

More information: https://support.brave.app/hc/en-us/articles/360044860011-How-Do-I-Use-Command-Line-Flags-in-Brave.

- View documentation for the original command:

```
tldr chromium
```

break

Break out of a **`for`**, **`while`**, **`until`**, or **`select`** loop.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-break.

- Break out of a single loop:

```
while :; do break; done
```

- Break out of nested loops:

```
while :; do while :; do break 2; done; done
```

brew abv

This command is an alias of **`brew info`**.

- View documentation for the original command:

```
tldr brew info
```

brew autoremove

Remove unused formulae previously installed as dependencies.

More information: https://docs.brew.sh/Manpage#autoremove---dry-run.

- Remove all unused formulae:

```
brew autoremove
```

- Print what would be removed, but don't actually remove anything:

```
brew autoremove {{[-n|--dry-run]}}
```

brew bundle

Bundler for Homebrew, Homebrew Cask and the Mac App Store.

More information: https://docs.brew.sh/Manpage#bundle-subcommand.

- Install packages from a Brewfile at the current path:

```
brew bundle
```

- Install packages from a specific Brewfile at a specific path:

```
brew bundle --file {{path/to/file}}
```

- Create a Brewfile from all installed packages:

```
brew bundle dump
```

- Uninstall all formulae not listed in the Brewfile:

```
brew bundle cleanup --force
```

- Check if there is anything to install or upgrade in the Brewfile:

```
brew bundle check
```

- List all entries in the Brewfile:

```
brew bundle list --all
```

brew cleanup

Remove stale lock files and outdated downloads for all formulas and casks.

More information: https://docs.brew.sh/Manpage#cleanup-options-formulacask-.

- Remove stale lock files and outdated downloads for all formulas/casks:

```
brew cleanup
```

- Remove stale lock files and outdated downloads for a specific formula/cask:

```
brew cleanup {{formula|cask}}
```

- Show what would be removed, but do not actually remove anything:

```
brew cleanup {{[-n|--dry-run]}}
```

- Display help:

```
brew cleanup {{[-h|--help]}}
```

brew info

Display information for Homebrew installation and formulae.

More information: https://docs.brew.sh/Manpage#info-abv-options-formulacask-.

- Display statistics for Homebrew installation:

```
brew info
```

- Display more information about a formula or cask:

```
brew info {{formula|cask}}
```

- Display verbose information about a formula or cask:

```
brew info {{[-v|--verbose]}} {{formula|cask}}
```

- Display information about a formula or cask in JSON format:

```
brew info --json {{formula|cask}}
```

- Print JSON of currently installed formulae:

```
brew info --json --installed
```

- Display help:

```
brew info {{[-h|--help]}}
```

brew install

Install a Homebrew formula or cask.

More information: https://docs.brew.sh/Manpage#install-options-formulacask-.

- Install a formula/cask:

```
brew install {{formula|cask}}
```

- Build and install a formula from source (dependencies will still be installed from bottles):

```
brew install {{[-s|--build-from-source]}} {{formula}}
```

- Download the manifest, print what would be installed but don't actually install anything:

```
brew install {{[-n|--dry-run]}} {{formula|cask}}
```

brew leaves

List installed formulas that are not dependencies of another installed formula or cask.

More information: https://docs.brew.sh/Manpage#leaves---installed-on-request---installed-as-dependency.

- List installed formulas that are not dependent on other installed formulas or casks:

```
brew leaves
```

- Only list leaves that were manually installed:

```
brew leaves {{[-r|--installed-on-request]}}
```

- Only list leaves that were installed as dependencies:

```
brew leaves {{[-p|--installed-as-dependency]}}
```

- Display help:

```
brew leaves {{[-h|--help]}}
```

brew list

List installed formulae/casks or their files.

More information: https://docs.brew.sh/Manpage#list-ls-options-installed_formulainstalled_cask-.

- List all installed formulae and casks:

```
brew {{[ls|list]}}
```

- List files belonging to an installed formula:

```
brew {{[ls|list]}} {{formula}}
```

- List artifacts of a cask:

```
brew {{[ls|list]}} {{cask}}
```

- List only formulae:

```
brew {{[ls|list]}} --formula
```

- List only casks:

```
brew {{[ls|list]}} --cask
```

- List only pinned formulae:

```
brew {{[ls|list]}} --pinned
```

brew outdated

List outdated casks and formulae.

To upgrade everything, use **`brew upgrade`**.

More information: https://docs.brew.sh/Manpage#outdated-options-formulacask-.

- List all outdated casks and formulae:

```
brew outdated
```

- List only outdated formulae:

```
brew outdated --formula
```

- List only outdated casks:

```
brew outdated --cask
```

brew reinstall

Uninstall and then reinstall a formula or cask using the same options it was originally installed with.

More information: https://docs.brew.sh/Manpage#reinstall-options-formulacask-.

- Reinstall a formula/cask:

```
brew reinstall {{formula|cask}}
```

- Reinstall a formula/cask and show verification and post-install steps:

```
brew reinstall {{[-v|--verbose]}} {{formula|cask}}
```

- Make some output more quiet:

```
brew reinstall {{[-q|--quiet]}} {{formula|cask}}
```

- Display help:

```
brew reinstall {{[-h|--help]}}
```

brew remove

This command is an alias of **`brew uninstall`**.

- View documentation for the original command:

  ```
  tldr brew uninstall
  ```

brew rm

This command is an alias of **`brew uninstall`**.

- View documentation for the original command:

  ```
  tldr brew uninstall
  ```

brew search

Search for casks and formulae.

More information: https://docs.brew.sh/Manpage#search--s-options-textregex-.

- Search for casks and formulae using a keyword:

```
brew search {{keyword}}
```

- Search for casks and formulae using a `regex`:

```
brew search /{{regex}}/
```

- Enable searching through descriptions:

```
brew search --desc {{keyword}}
```

- Only search for formulae:

```
brew search --formula {{keyword}}
```

- Only search for casks:

```
brew search --cask {{keyword}}
```

brew services

Manage background services with **`launchctl`** on macOS or **`systemctl`** on Linux.

More information: https://docs.brew.sh/Manpage#services-subcommand.

- List all managed services for the current user:

```
brew services
```

- List more information about all managed services:

```
brew services info --all
```

- Start a service immediately and register it to launch at login (or boot):

```
brew services start {{formula}}
```

- Stop the service immediately and unregister it from launching at login (or boot):

```
brew services stop {{formula}}
```

- Stop (if necessary) and start the service immediately and register it to launch at login (or boot):

```
brew services restart {{formula}}
```

- Remove all unused services:

```
brew services cleanup
```

brew tap

Tap a Homebrew formula repository. If no arguments are provided, list all installed Homebrew taps.

More information: https://docs.brew.sh/Manpage#tap-options-userrepo-url.

- List installed Homebrew taps:

```
brew tap
```

- Tap a Git repository hosted on GitHub:

```
brew tap {{github_username}}/{{github_repository_name}}
```

- Tap a Git repository hosted outside of GitHub:

```
brew tap {{username}}/{{repository_name}} {{git_clone_url}}
```

- Tap a repository hosted on GitLab:

```
brew tap {{username}}/{{repository_name}} https://gitlab.com/{{username}}/{{repository_name}}.git
```

- Display help:

```
brew tap {{[-h|--help]}}
```

brew uninstall

Uninstall a Homebrew formula/cask.

Use **`brew autoremove`** to remove unused dependencies afterwards.

More information: https://docs.brew.sh/Manpage#uninstall-remove-rm-options-installed_formulainstalled_cask-.

- Uninstall a formula/cask:

```
brew {{[rm|uninstall]}} {{formula|cask}}
```

- Uninstall a cask and remove all associated files:

```
brew {{[rm|uninstall]}} --zap {{cask}}
```

brew update

Fetch the newest version of Homebrew and all formulae from GitHub using **`git`** and perform any necessary migrations.

To upgrade all installed formulae, use **`brew upgrade`**.

More information: https://docs.brew.sh/Manpage#update-up-options.

- Fetch the newest version of Homebrew and all formulae:

```
brew {{[up|update]}}
```

brew upgrade

Upgrade outdated formulae and casks.

More information: https://docs.brew.sh/Manpage#upgrade-options-installed_formulainstalled_cask-.

- Upgrade all outdated casks and formulae:

```
brew upgrade
```

- Upgrade a specific formula/cask:

```
brew upgrade {{formula|cask}}
```

- Print what would be upgraded, but don't actually upgrade anything:

```
brew upgrade {{[-n|--dry-run]}}
```

brew

Homebrew - a package manager for macOS and Linux.

Some subcommands such as **`install`** have their own usage documentation.

More information: https://docs.brew.sh/Manpage.

- Install the latest stable version of a formula or cask:

```
brew install {{formula|cask}}
```

- List all installed formulae and casks:

```
brew list
```

- Upgrade an installed formula or cask (if none is given, all installed formulae/casks are upgraded):

```
brew upgrade {{formula|cask}}
```

- Fetch the newest version of Homebrew and of all formulae and casks from the Homebrew source repository:

```
brew update
```

- Show formulae and casks that have a more recent version available:

```
brew outdated
```

- Search for available formulae (i.e. packages) and casks (i.e. native macOS `.app` packages):

```
brew search {{text}}
```

- Display information about a formula or a cask (version, installation path, dependencies, etc.):

```
brew info {{formula|cask}}
```

- Check the local Homebrew installation for potential problems:

```
brew doctor
```

brittany

Pretty-print Haskell source files.

More information: https://github.com/lspitzner/brittany#readme.

- Format a Haskell source file and print the result to `stdout`:

```
brittany {{path/to/file.hs}}
```

- Format all Haskell source files in the current directory in-place:

```
brittany --write-mode=inplace {{*.hs}}
```

- Check whether a Haskell source file needs changes and indicate the result through the program's exit code:

```
brittany --check-mode {{path/to/file.hs}}
```

- Format a Haskell source file using the specified amount of spaces per indentation level and line length:

```
brittany --indent {{4}} --columns {{100}} {{path/to/file.hs}}
```

- Format a Haskell source file according to the style defined in the specified configuration file:

```
brittany --config-file {{path/to/config.yaml}} {{path/to/file.hs}}
```

brotli

Compress/uncompress files with Brotli compression.

More information: https://manned.org/brotli.

- Compress a file, creating a compressed version next to the file:

```
brotli {{path/to/file}}
```

- Decompress a file, creating an uncompressed version next to the file:

```
brotli {{[-d|--decompress]}} {{path/to/file.br}}
```

- Compress a file specifying the output filename:

```
brotli {{path/to/file}} {{[-o|--output]}} {{path/to/
compressed_output_file.br}}
```

- Decompress a Brotli file specifying the output filename:

```
brotli {{[-d|--decompress]}} {{path/to/compressed_file.br}}
{{[-o|--output]}} {{path/to/output_file}}
```

- Specify the compression quality (1=fastest (worst), 11=slowest (best)):

```
brotli {{[-q|--quality]}} {{11}} {{path/to/file}} {{[-o|--
output]}} {{path/to/compressed_output_file.br}}
```

browser-sync

A local web server that updates browser on file changes.

More information: https://browsersync.io/docs/command-line.

- Start a server from a specific directory:

```
browser-sync start --server {{path/to/directory}} --files {{path/to/directory}}
```

- Start a server from local directory, watching all CSS files in a directory:

```
browser-sync start --server --files '{{path/to/directory/*.css}}'
```

- Create configuration file:

```
browser-sync init
```

- Start Browsersync from configuration file:

```
browser-sync start --config {{config_file}}
```

browsh

View webpages on the terminal using a Firefox backend.

See also: **`carbonyl`**.

More information: https://www.brow.sh/docs/keybindings/.

- Start browsh:

```
browsh
```

- Start browsh in a specific webpage:

```
browsh --startup-url {{URL}}
```

- Focus URL bar:

```
<Ctrl l>
```

- Exit browsh:

```
<Ctrl q>
```

- Display help:

```
browsh {{[-h|--help]}}
```

bru

CLI for Bruno, an Opensource IDE for exploring and testing APIs.

More information: https://docs.usebruno.com/bru-cli/overview.

- Run all request files from the current directory:

```
bru run
```

- Run a single request from the current directory by specifying its filename:

```
bru run {{file.bru}}
```

- Run requests using an environment:

```
bru run --env {{environment_name}}
```

- Run requests using an environment with a variable:

```
bru run --env {{environment_name}} --env-var
{{variable_name}}={{variable_value}}
```

- Run request and collect the results in an output file:

```
bru run --output {{path/to/output.json}}
```

- Display help:

```
bru run --help
```

brushtopbm

Convert a Xerox doodle brush file into a PBM image.

More information: https://netpbm.sourceforge.net/doc/brushtopbm.html.

- Generate a PBM file as output for a Xerox doodle brush file as input:

```
brushtopbm {{path/to/file.brush}}
```

- Display version:

```
brushtopbm {{[-v|-version]}}
```

bshell

A GUI for browsing for SSH/VNC servers on the local network.

See also: **`bssh`**, **`bvnc`**.

More information: https://manned.org/bshell.

- Browse for both SSH and VNC servers:

```
bshell
```

- Browse for SSH servers only:

```
bshell --ssh
```

- Browse for VNC servers only:

```
bshell --vnc
```

- Browse for both SSH and VNC servers in a specified domain:

```
bshell --domain {{domain}}
```

bssh

A GUI tool for browsing for SSH/VNC servers on the local network.

See also: **`bvnc`**, **`bshell`**.

More information: https://manned.org/bssh.

- Browse for SSH servers:

```
bssh
```

- Browse for VNC servers:

```
bssh --vnc
```

- Browse for both SSH and VNC servers:

```
bssh --shell
```

- Browse for SSH servers in a specified domain:

```
bssh --domain {{domain}}
```

btm

Display system information about the CPU, memory, disks, network, and processes.

An enhanced alternative to **`top`**.

See also: **`btop`**, **`glances`**, **`atop`**, **`htop`**, **`top`**.

More information: https://clementtsang.github.io/bottom/nightly/#usage-and-configuration.

- Show the default layout (CPU, memory, temperatures, disk, network, and processes):

```
btm
```

- Enable basic mode, removing charts and condensing data (similar to `top`):

```
btm {{[-b|--basic]}}
```

- Use big dots instead of small ones in charts:

```
btm {{[-m|--dot_marker]}}
```

- Show also battery charge and health status:

```
btm --battery
```

- Refresh every 250 milliseconds and show the last 30 seconds in the charts:

```
btm {{[-r|--rate]}} 250 {{[-t|--default_time_value]}} 30000
```

btop

A resource monitor that shows information about the CPU, memory, disks, network, and processes.

A C++ version of **`bpytop`**.

See also: **`btm`**, **`glances`**, **`atop`**, **`htop`**, **`top`**.

More information: https://github.com/aristocratos/btop#command-line-options.

- Start `btop`:

```
btop
```

- Start `btop` with the specified settings preset:

```
btop {{[-p|--preset]}} {{0..9}}
```

- Start `btop` in TTY mode using 16 colors and TTY-friendly graph symbols:

```
btop {{[-t|--tty]}}
```

- Start `btop` in 256-color mode instead of 24-bit color mode:

```
btop {{[-l|--low-color]}}
```

- Set the update rate to 500 milliseconds:

```
btop {{[-u|--update]}} 500
```

- Exit `btop`:

```
<q>
```

- Display help:

```
btop {{[-h|--help]}}
```

builtin

Execute shell builtins.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-builtin.

- Run a shell builtin:

```
builtin {{command}}
```

buku

Browser-independent bookmark manager.

More information: https://github.com/jarun/Buku#usage.

- Display all bookmarks matching "keyword" and with "privacy" tag:

```
buku {{keyword}} {{[-t|--stag]}} {{privacy}}
```

- Add bookmark with tags "search engine" and "privacy":

```
buku {{[-a|--add]}} {{https://example.com}} {{search engine}}, {{privacy}}
```

- Delete a bookmark:

```
buku {{[-d|--delete]}} {{bookmark_id}}
```

- Open editor to edit a bookmark:

```
buku {{[-w|--write]}} {{bookmark_id}}
```

- Remove "search engine" tag from a bookmark:

```
buku {{[-u|--update]}} {{bookmark_id}} --tag - {{search engine}}
```

bun add

Modern JavaScript runtime, package manager, bundler, and test runner.

Note: **a** can be used as an alias for **add**.

More information: https://bun.com/docs.

- Install a single package:

  ```
  bun add {{package}}
  ```

- Install multiple packages:

  ```
  bun add {{package1 package2 ...}}
  ```

- Install from a Git repository:

  ```
  bun add {{git_url}}
  ```

- Install a specific version:

  ```
  bun add {{package}}@{{version}}
  ```

- Install from local file or directory:

  ```
  bun add file:{{path/to/file_or_directory}}
  ```

- Add a dev dependency:

  ```
  bun add {{[-d|--dev]}} {{package}}
  ```

- Add a package globally:

  ```
  bun add {{[-g|--global]}} {{package}}
  ```

bun-audit

Check installed packages for known security vulnerabilities.

More information: https://bun.com/docs/pm/cli/audit.

- Audit all dependencies in a project with a `bun.lock` file:

```
bun audit
```

- Show only vulnerabilities at or above a specific severity level:

```
bun audit --audit-level {{low|moderate|high|critical}}
```

- Audit only production dependencies:

```
bun audit --prod
```

- Ignore a specific CVE ID:

```
bun audit --ignore {{CVE-XXXX-YYYY}}
```

- Output the raw JSON report:

```
bun audit --json
```

bun build

Bundle JavaScript and TypeScript files with Bun's fast native bundler.

More information: https://bun.com/docs/bundler.

- Bundle an entry point to a single output file:

```
bun build {{path/to/entry.ts}} --outfile {{path/to/output.js}}
```

- Bundle multiple entry points to an output directory:

```
bun build {{path/to/entry1.ts path/to/entry2.ts ...}} --outdir {{path/to/dist}}
```

- Bundle with source maps for debugging:

```
bun build {{path/to/entry.ts}} --outfile {{path/to/output.js}} --sourcemap
```

- Bundle with minification for production:

```
bun build {{path/to/entry.ts}} --outfile {{path/to/output.js}} --minify
```

- Bundle with a specific target environment:

```
bun build {{path/to/entry.ts}} --outfile {{path/to/output.js}} --target {{browser|bun|node}}
```

- Bundle to a standalone executable:

```
bun build {{path/to/entry.ts}} --compile --outfile {{path/to/executable}}
```

- Watch for file changes and rebuild automatically:

```
bun build {{path/to/entry.ts}} --outfile {{path/to/output.js}} --watch
```

- Bundle with external dependencies not included in the output:

```
bun build {{path/to/entry.ts}} --outfile {{path/to/output.js}} --external {{react react-dom}}
```

bun c

This command is an alias of **`bun create`**.

- View documentation for the original command:

```
tldr bun create
```

bun create

Create a new project from a template.

Note: **`c`** can be used as an alias for **`create`**.

More information: https://bun.com/docs/runtime/templating/create.

- Create a new project from an official template interactively:

```
bun create {{template}}
```

- Create a new project from an official template in a new directory:

```
bun create {{template}} {{path/to/destination}}
```

- Create a new project from a GitHub repository template:

```
bun create {{https://github.com/username/repo}} {{path/to/destination}}
```

- Create a new project from a local template:

```
bun create {{path/to/template}} {{path/to/destination}}
```

- Create a new project, overwriting the destination directory if it exists:

```
bun create {{template}} {{path/to/destination}} --force
```

- Create a new project without initializing a Git repository automatically:

```
bun create {{template}} {{path/to/destination}} --no-git
```

- Create a new project without installing dependencies automatically:

```
bun create {{template}} {{path/to/destination}} --no-install
```

bun exec

Execute shell commands or script files using Bun's runtime.

Note: When running from a shell, remember to escape quotes.

More information: https://bun.com/docs/runtime/shell.

- Run a simple command:

```
bun exec "echo hello"
```

- Run a command with flags:

```
bun exec "ls -la"
```

- Run a command containing quotes:

```
bun exec "echo \"hello friends\""
```

- Run a combined shell command:

```
bun exec "mkdir test && cd test"
```

- Run a script file:

```
bun exec {{path/to/script}}
```

bun feedback

Send feedback to **Bun**.

More information: https://bun.com/docs/feedback#use-bun-feedback.

- Send text as feedback:

```
bun feedback "{{Feedback text!}}"
```

- Send one or more files as feedback:

```
bun feedback {{path/to/file1 path/to/file2 ...}}
```

- Send feedback with email address attached:

```
bun feedback {{path/to/file|text}} {{[-e|--email]}}
{{email@address}}
```

bun i

This command is an alias of **`bun install`**.

- View documentation for the original command:

```
tldr bun install
```

bun-info

Display package metadata from the npm registry.

More information: https://bun.com/docs/pm/cli/info.

- Display the package metadata:

```
bun info {{package_name}}
```

- Display the specific version metadata:

```
bun info {{package_name}}@{{version}}
```

- Show a specific property of a package:

```
bun info {{package_name}} {{property}}
```

- Output results in JSON format:

```
bun info {{package_name}} --json
```

bun init

Scaffold an empty Bun project.

More information: https://bun.com/docs/runtime/templating/init.

- Initialize a Bun project in the current directory:

```
bun init
```

- Initialize in a specific directory:

```
bun init {{path/to/directory}}
```

- Initialize with a specific project name:

```
bun init {{[-n|--name]}} {{project_name}}
```

- Initialize a project with default prompts:

```
bun init {{[-y|--yes]}}
```

- Initialize a minimal project:

```
bun init {{[-m|--minimal]}}
```

- Initialize a React project:

```
bun init {{[-r|--react]}}
```

- Initialize a React project with Tailwind CSS:

```
bun init --react=tailwind
```

bun install

Install JavaScript dependencies for a project from **`package.json`**.

More information: https://bun.com/docs/pm/cli/install.

- Install all dependencies listed in `package.json`:

  ```
  bun {{[i|install]}}
  ```

- Install a single package (this is an alias for `bun add`):

  ```
  bun {{[i|install]}} {{package_name}}@{{version}}
  ```

- Install a package globally:

  ```
  bun {{[i|install]}} {{[-g|--global]}} {{package_name}}
  ```

- Install only production dependencies (skips `devDependencies`):

  ```
  bun {{[i|install]}} --production
  ```

- Install dependencies exactly from the `bun.lockb` lockfile (frozen lockfile):

  ```
  bun {{[i|install]}} --frozen-lockfile
  ```

- Force re-download all packages from the registry, ignoring the cache:

  ```
  bun {{[i|install]}} {{[-f|--force]}}
  ```

bun link

Register a local package as linkable or link a registered package into a project.

See also: **`bun unlink`**.

More information: https://bun.com/docs/pm/cli/link.

- Link the current package globally:

  ```
  bun link
  ```

- Link a package locally to a project:

  ```
  bun link {{package_name}}
  ```

- Link a package in a specific directory:

  ```
  bun link --cwd {{path/to/package}}
  ```

- Perform a dry run without actually linking:

  ```
  bun link --dry-run
  ```

- Display help:

  ```
  bun link {{[-h|--help]}}
  ```

bun list

This command is an alias of **`bun pm ls`**.

- View documentation for the original command:

```
tldr bun pm ls
```

bun outdated

List dependencies in your project that have newer versions available.

More information: https://bun.com/docs/pm/cli/outdated.

- List all outdated dependencies in the current project:

```
bun outdated
```

- Check if a specific package is outdated:

```
bun outdated {{package}}
```

- List outdated dependencies matching a glob pattern:

```
bun outdated "{{pattern}}"
```

- Show outdated dependencies for specific workspaces:

```
bun outdated --filter "{{workspace_pattern}}"
```

- Recursively check all workspaces in a monorepo:

```
bun outdated --recursive
```

bun patch

Prepare a package for patching or generate a patch file.

More information: https://bun.com/docs/pm/cli/patch.

- Prepare a package for patching:

```
bun patch {{package}}
```

- Prepare a specific version of a package:

```
bun patch {{package}}@{{version}}
```

- Prepare a package located at a specific path:

```
bun patch {{path/to/package}}
```

- Generate a patch file for changes made to a package:

```
bun patch --commit {{path/to/package}}
```

- Generate a patch file and store it in a custom directory:

```
bun patch --commit {{path/to/package}} --patches-dir {{path/to/directory}}
```

bun pm bin

Display the path to **`bin`** directories.

More information: https://bun.com/docs/pm/cli/pm#bin.

- Get the path to the local project's `bin` directory:

```
bun pm bin
```

- Get the path to the global `bin` directory:

```
bun pm bin {{[-g|--global]}}
```

bun pm ls

List installed dependencies and their versions.

More information: https://bun.com/docs/pm/cli/pm#ls.

- List dependencies in the current project:

```
bun pm {{[ls|list]}}
```

- List all transitive dependencies:

```
bun pm {{[ls|list]}} {{[-a|--all]}}
```

bun pm migrate

Convert another package manager's lockfile to a Bun-compatible lockfile without installing anything.

More information: https://bun.com/docs/pm/cli/pm#migrate.

- Migrate the lockfile in the current project:

```
bun pm migrate
```

bun pm pkg

Manage package.json data with **`get`**, **`set`**, **`delete`**, and **`fix`** operations.

More information: https://bun.com/docs/pm/cli/pm#pkg.

- Get all properties from `package.json`:

```
bun pm pkg get
```

- Get a single property:

```
bun pm pkg get {{property}}
```

- Get multiple properties:

```
bun pm pkg get {{property1 property2 property3 ...}}
```

- Set a property:

```
bun pm pkg set {{property}}="{{value}}"
```

- Delete a property:

```
bun pm pkg delete {{property}}
```

- Automatically fix common issues in `package.json`:

```
bun pm pkg fix
```

bun pm version

Manage the **`version`** field in **`package.json`**.

More information: https://bun.com/docs/pm/cli/pm#version.

- Display the current package version:

```
bun pm version
```

- Set a specific version:

```
bun pm version {{9.0.1}}
```

- Bump the version using a semantic version type (`major`, `minor`, `patch`, etc.):

```
bun pm version {{major|minor|patch|premajor|preminor|
prepatch|prerelease}}
```

- Set the version based on Git tags:

```
bun pm version from-git
```

bun pm

A set of utilities for working with Bun's package manager.

Some subcommands such as **`pack`**, **`pkg`** have their own usage documentation.

More information: https://bun.com/docs/pm/cli/pm.

- Create a tarball of the current workspace:

```
bun pm pack
```

- Print the path to the `bin` directory:

```
bun pm bin
```

- List installed dependencies:

```
bun pm ls
```

- Print the npm registry username:

```
bun pm whoami
```

- Generate and print the hash of the current lockfile:

```
bun pm hash
```

- Print the path to Bun's global module cache:

```
bun pm cache
```

- Migrate another package manager's lockfile without installing anything:

```
bun pm migrate
```

- Get a property from `package.json`:

```
bun pm pkg get {{property}}
```

bun remove

Remove a dependency from **`package.json`**.

Note: **`rm`** can be used as an alias for **`remove`**.

More information: https://bun.com/docs/pm/cli/remove.

- Remove a dependency:

```
bun remove {{package_name}}
```

- Remove multiple dependencies:

```
bun remove {{package_name1 package_name2 ...}}
```

- Remove a globally installed package:

```
bun remove {{[-g|--global]}} {{package_name}}
```

- Remove a dependency without updating the `package.json` file:

```
bun remove --no-save {{package_name}}
```

- Run the command without actually removing packages (simulate the removal):

```
bun remove --dry-run {{package_name}}
```

bun rm

This command is an alias of **`bun remove`**.

- View documentation for the original command:

```
tldr bun remove
```

bun run

Execute a JavaScript/TypeScript file, or a script from **`package.json`**.

More information: https://bun.com/docs/runtime.

- Run a script defined in `package.json`:

  ```
  bun run {{script_name}}
  ```

- Run a JavaScript or TypeScript file directly:

  ```
  bun run {{path/to/file.ts}}
  ```

- Run a file in "watch" mode (restarts automatically when the file changes):

  ```
  bun run --watch {{path/to/file.ts}}
  ```

- Run a file using a specific configuration file:

  ```
  bun run --config {{path/to/bunfig.toml}} {{path/to/file.ts}}
  ```

bun test

Run tests using Bun's built-in test runner.

It is a fast, Jest-compatible test runner that looks for **`*.test.ts`** (and similar) files.

More information: https://bun.com/docs/test.

- Run all test files found in the project:

  ```
  bun test
  ```

- Run a specific test file or directory:

  ```
  bun test {{path/to/file.test.ts}}
  ```

- Run tests in "watch" mode (re-runs automatically on file changes):

  ```
  bun test --watch
  ```

- Run tests and generate a code coverage report:

  ```
  bun test --coverage
  ```

bun unlink

Unregister the current directory as a linkable package.

See also: **`bun link`**.

More information: https://bun.com/docs/pm/cli/link#unlinking.

- Unregister the current package globally:

```
bun unlink
```

- Unregister a package in a specific directory:

```
bun unlink --cwd {{path/to/package}}
```

- Perform a dry run without actually unregistering:

```
bun unlink --dry-run
```

- Display help:

```
bun unlink {{[-h|--help]}}
```

bun update

Update dependencies in a Bun project.

More information: https://bun.com/docs/pm/cli/update.

- Update all dependencies:

```
bun update
```

- Update to the latest version, regardless of its compatibility:

```
bun update --latest
```

- Update a specific dependency:

```
bun update {{package_name}}
```

- Update a dependency to a specific version:

```
bun update {{package_name}}@{{version}}
```

- Update packages interactively:

```
bun update {{[-i|--interactive]}}
```

- Update dependencies recursively across all workspaces:

```
bun update {{[-r|--recursive]}}
```

- Update dependencies interactively and recursively:

```
bun update {{[-i|--interactive]}} {{[-r|--recursive]}}
```

bun upgrade

Upgrade Bun to the latest version.

More information: https://bun.com/docs/installation#upgrading.

- Upgrade to the latest stable version:

```
bun upgrade
```

- Upgrade to the latest canary build:

```
bun upgrade --canary
```

- Switch back to the latest stable version:

```
bun upgrade --stable
```

bun why

Explain why a package is installed by showing its dependency chain.

More information: https://bun.com/docs/pm/cli/why.

- Explain why a specific package is installed:

```
bun why {{package_name}}
```

- Explain why all packages matching a pattern are installed:

```
bun why "{{pattern}}"
```

- Explain why packages from a specific organization are installed:

```
bun why "@{{organization}}/*"
```

- Show only top-level dependencies:

```
bun why {{package_name}} --top
```

- Limit the dependency tree depth:

```
bun why {{package_name}} --depth {{number}}
```

bun x

This command is an alias of **bunx**.

- View documentation for the original command:

```
tldr bunx
```

bun

JavaScript runtime and toolkit.

Includes a bundler, a test runner, and a package manager.

More information: https://bun.com/docs.

- Create a new Bun project in the current directory:

```
bun init
```

- Run a JavaScript file or a `package.json` script:

```
bun run {{path/to/file|script_name}}
```

- Run unit tests:

```
bun test
```

- Download and install all the packages listed as dependencies in `package.json`:

```
bun {{[i|install]}}
```

- Add a dependency to `package.json`:

```
bun {{[a|add]}} {{module_name}}
```

- Remove a dependency from `package.json`:

```
bun {{[rm|remove]}} {{module_name}}
```

- Start a REPL (interactive shell):

```
bun repl
```

- Upgrade Bun to the latest version:

```
bun upgrade
```

bundle

Dependency manager for the Ruby programming language.

More information: https://bundler.io/man/bundle.1.html.

- Install all gems defined in the `Gemfile` expected in the working directory:

```
bundle install
```

- Execute a command in the context of the current bundle:

```
bundle exec {{command}} {{arguments}}
```

- Update all gems by the rules defined in the `Gemfile` and regenerate `Gemfile.lock`:

```
bundle update
```

- Update one or more specific gem(s) defined in the `Gemfile`:

```
bundle update {{gem_name1}} {{gem_name2}}
```

- Update one or more specific gems(s) defined in the `Gemfile` but only to the next patch version:

```
bundle update --patch {{gem_name1}} {{gem_name2}}
```

- Update all gems within the given group in the `Gemfile`:

```
bundle update --group {{development}}
```

- List installed gems in the `Gemfile` with newer versions available:

```
bundle outdated
```

- Create a new gem skeleton:

```
bundle gem {{gem_name}}
```

bundler

Dependency manager for the Ruby programming language.

`bundler` is a common name for the command **`bundle`**, but not a command itself.

More information: https://bundler.io/man/bundle.1.html.

- View documentation for the original command:

```
tldr bundle
```

bundletool dump

Manipulate Android Application Bundles.

More information: https://developer.android.com/tools/bundletool.

- Display the `AndroidManifest.xml` of the base module:

```
bundletool dump manifest --bundle {{path/to/bundle.aab}}
```

- Display a specific value from the `AndroidManifest.xml` using XPath:

```
bundletool dump manifest --bundle {{path/to/bundle.aab}} --
xpath {{/manifest/@android:versionCode}}
```

- Display the `AndroidManifest.xml` of a specific module:

```
bundletool dump manifest --bundle {{path/to/bundle.aab}} --
module {{name}}
```

- Display all the resources in the application bundle:

```
bundletool dump resources --bundle {{path/to/bundle.aab}}
```

- Display the configuration for a specific resource:

```
bundletool dump resources --bundle {{path/to/bundle.aab}} --
resource {{type/name}}
```

- Display the configuration and values for a specific resource using the ID:

```
bundletool dump resources --bundle {{path/to/bundle.aab}} --
resource {{0x7f0e013a}} --values
```

- Display the contents of the bundle configuration file:

```
bundletool dump config --bundle {{path/to/bundle.aab}}
```

bundletool validate

Manipulate Android Application Bundles.

More information: https://developer.android.com/tools/bundletool.

- Verify a bundle and display detailed information about it:

```
bundletool validate --bundle {{path/to/bundle.aab}}
```

bundletool

Manipulate Android Application Bundles.

Some subcommands such as **`validate`** have their own usage documentation.

More information: https://developer.android.com/tools/bundletool.

- Display help for a subcommand:

```
bundletool help {{subcommand}}
```

- Generate APKs from an application bundle (prompts for keystore password):

```
bundletool build-apks --bundle {{path/to/bundle.aab}} --ks
{{path/to/key.keystore}} --ks-key-alias {{key_alias}} --
output {{path/to/file.apks}}
```

- Generate APKs from an application bundle giving the keystore password:

```
bundletool build-apks --bundle {{path/to/bundle.aab}} --ks
{{path/to/key.keystore}} --ks-key-alias {{key_alias}} --ks-
pass {{pass:the_password}} --output {{path/to/file.apks}}
```

- Generate APKs including only one single APK for universal usage:

```
bundletool build-apks --bundle {{path/to/bundle.aab}} --mode
{{universal}} --ks {{path/to/key.keystore}} --ks-key-alias
{{key_alias}} --output {{path/to/file.apks}}
```

- Install the right combination of APKs to an emulator or device:

```
bundletool install-apks --apks {{path/to/file.apks}}
```

- Estimate the download size of an application:

```
bundletool get-size total --apks {{path/to/file.apks}}
```

- Generate a device specification JSON file for an emulator or device:

```
bundletool get-device-spec --output {{path/to/file.json}}
```

- Verify a bundle and display detailed information about it:

```
bundletool validate --bundle {{path/to/bundle.aab}}
```

bunx

Execute a package binary (installed locally or fetched remotely).

Note: **`bun x`** can be used as an alias for **`bunx`**.

More information: https://bun.com/docs/pm/bunx.

- Download and execute a package from the registry:

```
bunx {{package_name}} "{{command_argument}}"
```

- Check the version of a locally installed package (if found):

```
bunx {{package_name}} --version
```

- Force an executable to run with the Bun runtime (instead of Node):

```
bunx --bun {{package_name}}
```

- Execute a binary that has a different name than its package:

```
bunx {{[-p|--package]}} {{package_name}} {{command}}
```

- Download and execute a specific version of a package:

```
bunx {{package_name@version}} "{{command_argument}}"
```

bunzip2

This command is an alias of **`bzip2 --decompress`**.

- View documentation for the original command:

  ```
  tldr bzip2
  ```

bup

Backup system based on the Git packfile format, providing incremental saves and global deduplication.

More information: https://manned.org/bup.

- Initialize a backup repository in a given local directory:

```
bup {{[-d|--bup-dir]}} {{path/to/repository}} init
```

- Prepare a given directory before taking a backup:

```
bup {{[-d|--bup-dir]}} {{path/to/repository}} index {{path/to/directory}}
```

- Backup a directory to the repository specifying its name:

```
bup {{[-d|--bup-dir]}} {{path/to/repository}} save {{[-n|--name]}} {{backup_name}} {{path/to/directory}}
```

- Show the backup snapshots currently stored in the repository:

```
bup {{[-d|--bup-dir]}} {{path/to/repository}} ls
```

- Restore a specific backup snapshot to a target directory:

```
bup {{[-d|--bup-dir]}} {{path/to/repository}} restore {{[-C|--outdir]}} {{path/to/target_directory}} {{backup_name}}
```

busybox

A collection of small system utilities in a single executable.

Executing **`busybox`** via a symlink is equivalent to running **`busybox symlink_name`**.

Linux distributions that use BusyBox will usually provide symlinks for all programs.

More information: https://www.busybox.net/downloads/BusyBox.

- Execute a BusyBox function:

```
busybox {{ls|rm|mkdir|cat|...}} {{args}}
```

- Display help and a list of functions:

```
busybox --help
```

buzzphrase

Output a random buzzphrase. Written in Node.js.

More information: https://github.com/atomantic/buzzphrase#usage.

- Generate a string of three random phrases containing an adjective, a past tense verb, and a plural noun:

  ```
  buzzphrase
  ```

- Print a phrase formatted as [i]mperative verb + past tense [v]erb + [a]djective + plural [N]oun:

  ```
  buzzphrase '{{{i} {v} {a} {N}}}'
  ```

- Print k phrases formatted as present participle [V]erb + [a]djective + singular [n]oun + [f]inal:

  ```
  buzzphrase {{k}} '{{{V} {a} {n} {f}}}'
  ```

bvnc

A GUI tool for browsing for SSH/VNC servers on the local network.

See also: **`bssh`**, **`bshell`**.

More information: https://manned.org/bvnc.

- Browse for VNC servers:

```
bvnc
```

- Browse for SSH servers:

```
bvnc --ssh
```

- Browse for both VNC and SSH servers:

```
bvnc --shell
```

- Browse for VNC servers in a specified domain:

```
bvnc --domain {{domain}}
```

bw

Access and manage a Bitwarden vault.

More information: https://bitwarden.com/help/cli/.

- Log in to a Bitwarden user account:

```
bw login
```

- Log out of a Bitwarden user account:

```
bw logout
```

- Search and display items from Bitwarden vault:

```
bw list items --search {{github}}
```

- Display a particular item from Bitwarden vault:

```
bw get item {{github}}
```

- Create a folder in Bitwarden vault:

```
{{echo -n '{"name":"My Folder1"}' | base64}} | bw create
folder
```

byobu

Window manager and terminal multiplexer.

See also: **`tmux`**, **`screen`**.

More information: https://www.byobu.org/documentation.

- Start a new session:

  `byobu`

- Configuration and help:

  `byobu-config`

- Select tmux (default) or screen backend:

  `byobu-select-backend`

- Enable automatic startup after login into text console:

  `byobu-enable`

- Disable automatic startup after login into text console:

  `byobu-disable`

- Detach from `byobu`:

  `<F6>`

- Kill a window:

  `<Ctrl a><k>`

bzcat

This command is an alias of **`bzip2 --decompress --stdout`**.

- View documentation for the original command:

  ```
  tldr bzip2
  ```

bzegrep

This command is an alias of **`bzgrep --extended-regexp`**.

- View documentation for the original command:

  `tldr bzgrep`

bzfgrep

This command is an alias of **`bzgrep --fixed-strings`**.

- View documentation for the original command:

```
tldr bzgrep
```

bzgrep

Find patterns in **bzip2** compressed files using **grep**.

More information: https://manned.org/bzgrep.

- Search for a pattern within a compressed file:

```
bzgrep "{{search_pattern}}" {{path/to/file}}
```

- Recursively search files in a bzip2 compressed `.tar` archive for a pattern:

```
bzgrep {{[-r|--recursive]}} "{{search_pattern}}" {{path/to/tar_file}}
```

- Print 3 lines of [C]ontext around, [B]efore, or [A]fter each match:

```
bzgrep {{--context|--before-context|--after-context}} 3 "{{search_pattern}}" {{path/to/file}}
```

- Print file name and line number for each match:

```
bzgrep {{[-H|--with-filename]}} {{[-n|--line-number]}} "{{search_pattern}}" {{path/to/file}}
```

- Search for lines matching a pattern, printing only the matched text:

```
bzgrep {{[-o|--only-matching]}} "{{search_pattern}}" {{path/to/file}}
```

- Search `stdin` for lines that do not match a pattern:

```
cat {{path/to/bz_compressed_file}} | bzgrep {{[-v|--invert-match]}} "{{search_pattern}}"
```

- Use extended `regex` (supports `?`, `+`, `{}`, `()`, and `|`), in case-insensitive mode:

```
bzgrep {{[-E|--extended-regexp]}} {{[-i|--ignore-case]}} "{{search_pattern}}" {{path/to/file}}
```

bzip2

A block-sorting file compressor.

See also: **`bzcat`**, **`bunzip2`**, **`bzip2recover`**.

More information: https://manned.org/bzip2.

- Compress a file:

```
bzip2 {{path/to/file_to_compress}}
```

- Decompress a file:

```
bzip2 {{[-d|--decompress]}} {{path/to/compressed_file.bz2}}
```

- Decompress a file to `stdout`:

```
bzip2 {{[-dc|--decompress --stdout]}} {{path/to/
compressed_file.bz2}}
```

- Test the integrity of each file inside the archive file:

```
bzip2 {{[-t|--test]}} {{path/to/compressed_file.bz2}}
```

- Show the compression ratio for each file processed with detailed information:

```
bzip2 {{[-v|--verbose]}} {{path/to/compressed_files.bz2}}
```

- Decompress a file overwriting existing files:

```
bzip2 {{[-f|--force]}} {{path/to/compressed_file.bz2}}
```

- Display help:

```
bzip2 {{[-h|--help]}}
```

bzip2recover

Attempt to recover data from a damaged **`.bz2`** file.

See also: **`bzip2`**.

More information: https://manned.org/bzip2recover.

- Recover all intact blocks from a damaged `.bz2` file:

```
bzip2recover {{damaged_file.bz2}}
```

bzip3

An efficient statistical file compressor.

More information: https://manned.org/bzip3.

- Compress a file:

```
bzip3 {{path/to/file_to_compress}}
```

- Decompress a file:

```
bzip3 {{[-d|--decode]}} {{path/to/compressed_file.bz3}}
```

- Decompress a file to `stdout`:

```
bzip3 {{[-dc|--decode --stdout]}} {{path/to/
compressed_file.bz3}}
```

- Test the integrity of each file inside the archive file:

```
bzip3 {{[-t|--test]}} {{path/to/compressed_file.bz3}}
```

- Show the compression ratio for each file processed with detailed information:

```
bzip3 {{[-v|--verbose]}} {{path/to/compressed_files.bz3}}
```

- Decompress a file overwriting existing files:

```
bzip3 {{[-d|--decode]}} {{[-f|--force]}} {{path/to/
compressed_file.bz3}}
```

- Display help:

```
bzip3 {{[-h|--help]}}
```

c++

This command is an alias of **g++**.

- View documentation for the original command:

```
tldr g++
```

c99

Compile C programs according to the ISO C standard.

More information: https://manned.org/c99.

- Compile source file(s) and create an executable:

```
c99 {{file.c}}
```

- Compile source file(s) and specify the executable [o]utput filename:

```
c99 -o {{executable_name}} {{file.c}}
```

- Compile source file(s) and create object file(s):

```
c99 -c {{file.c}}
```

- Compile source file(s), link with object file(s), and create an executable:

```
c99 {{file.c}} {{file.o}}
```

cabal

Interface to the Haskell package infrastructure (Cabal).

Manage Haskell projects and Cabal packages from the Hackage package repository.

More information: https://cabal.readthedocs.io/en/latest/getting-started.html.

- Search and list packages from Hackage:

```
cabal list {{search_string}}
```

- Show information about a package:

```
cabal info {{package}}
```

- Download and install a package:

```
cabal install {{package}}
```

- Create a new Haskell project in the current directory:

```
cabal init
```

- Build the project in the current directory:

```
cabal build
```

- Run tests of the project in the current directory:

```
cabal test
```

cadaver

WebDAV client for Unix.

More information: https://manned.org/cadaver.

- Connect to the server , open the root collection:

```
cadaver {{http://dav.example.com/}}
```

- Connect to a server using a specific port and open a collection:

```
cadaver {{http://dav.example.com:8022/path/to/collection/}}
```

- Connect to a server using SSL:

```
cadaver {{https://davs.example.com/}}
```

caddy

An enterprise-ready open source web server with automatic HTTPS, written in Go.

More information: https://caddyserver.com/docs/command-line.

- Start Caddy in the foreground:

```
caddy run
```

- Start Caddy with the specified Caddyfile:

```
caddy run --config {{path/to/Caddyfile}}
```

- Start Caddy in the background:

```
caddy start
```

- Stop a background Caddy process:

```
caddy stop
```

- Run a simple file server on the specified port with a browsable interface:

```
caddy file-server --listen :{{8000}} --browse
```

- Run a reverse proxy server:

```
caddy reverse-proxy --from :{{80}} --to localhost:{{8000}}
```

cake

The processor for the CakePHP framework.

More information: https://book.cakephp.org/5/en/console-commands.html#cakephp-provided-commands.

- Display basic information about the current app and available commands:

```
cake
```

- List available routes:

```
cake routes
```

- Clear configuration caches:

```
cake cache clear_all
```

- Build the metadata cache:

```
cake schema_cache build --connection {{connection}}
```

- Clear the metadata cache:

```
cake schema_cache clear
```

- Clear a single cache table:

```
cake schema_cache clear {{table_name}}
```

- Start a development web server (defaults to port 8765):

```
cake server
```

- Start a REPL (interactive shell):

```
cake console
```

cal

Display a calendar with the current day highlighted.

See also: **`gcal`**.

More information: https://manned.org/cal.1p.

- Display a calendar for the current month:

```
cal
```

- Display a calendar for a specific year:

```
cal {{year}}
```

- Display a calendar for a specific month and year:

```
cal {{month}} {{year}}
```

calc

An interactive arbitrary-precision calculator in the terminal.

More information: https://manned.org/calc.

- Start `calc` in interactive mode:

```
calc
```

- Perform a calculation in non-interactive mode:

```
calc '{{85 * (36 / 4)}}'
```

- Don't format the output (for use with [p]ipes):

```
calc -p '{{4/3 * pi() * 5^3}}'
```

- Perform a calculation and then switch to [i]nteractive mode:

```
calc -i '{{sqrt(2)}}'
```

- Start `calc` in a specific permission [m]ode (0 to 7, defaults to 7):

```
calc -m {{mode}}
```

- View an introduction to `calc`:

```
calc help intro
```

- View an overview of `calc`:

```
calc help overview
```

- Open the `calc` manual:

```
calc help
```

calendar

Display upcoming events from a calendar file.

More information: https://manned.org/calendar.

- Show events for today and tomorrow (or the weekend on Friday) from the default calendar:

```
calendar
```

- Look [A]head, showing events for the next 30 days:

```
calendar -A {{30}}
```

- Look [B]ack, showing events for the previous 7 days:

```
calendar -B {{7}}
```

- Show events from a custom calendar [f]ile:

```
calendar -f {{path/to/file}}
```

calibre-server

A server application to distribute e-books over a network.

Note: E-books must already be imported into the library using the GUI or the **`calibredb`** CLI.

Part of the Calibre e-book library.

More information: https://manual.calibre-ebook.com/generated/en/calibre-server.html.

- Start a server to distribute e-books. Access at http://localhost:8080:

  ```
  calibre-server
  ```

- Start server on different port. Access at http://localhost:port:

  ```
  calibre-server --port {{port}}
  ```

- Password protect the server:

  ```
  calibre-server --username {{username}} --password
  {{password}}
  ```

calibredb

Manipulate an e-book database.

Part of the Calibre e-book library.

More information: https://manual.calibre-ebook.com/generated/en/calibredb.html.

- List e-books in the library with additional information:

  ```
  calibredb list
  ```

- Search for e-books displaying additional information:

  ```
  calibredb list --search {{search_term}}
  ```

- Search for just ids of e-books:

  ```
  calibredb search {{search_term}}
  ```

- Add one or more e-books to the library:

  ```
  calibredb add {{path/to/file1 path/to/file2 ...}}
  ```

- Recursively add all e-books under a directory to the library:

  ```
  calibredb add {{[-r|--recurse]}} {{path/to/directory}}
  ```

- Remove one or more e-books from the library. You need the e-book IDs (see above):

  ```
  calibredb remove {{id1 id2 ...}}
  ```

caller

Print function context.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-caller.

- Print the line and filename where the current function was called:

```
caller
```

- Print the line, function, and filename where the current function was called:

```
caller 0
```

- Print the line, the function name, and the filename of a function call n frames back:

```
caller {{n}}
```

calligraflow

Calligra's flowchart and diagram application.

See also: **`calligrastage`**, **`calligrawords`**, **`calligrasheets`**.

More information: https://manned.org/calligraflow.

- Launch the flowchart and diagram application:

```
calligraflow
```

- Open a specific file:

```
calligraflow {{path/to/file}}
```

- Display help or version:

```
calligraflow --{{help|version}}
```

calligrasheets

Calligra's spreadsheet application.

See also: **calligraflow**, **calligrastage**, **calligrawords**.

More information: https://manned.org/calligrasheets.

- Launch the spreadsheet application:

  ```
  calligrasheets
  ```

- Open a specific spreadsheet:

  ```
  calligrasheets {{path/to/spreadsheet}}
  ```

- Display help or version:

  ```
  calligrasheets --{{help|version}}
  ```

calligrastage

Calligra's presentation application.

See also: **calligraflow**, **calligrawords**, **calligrasheets**.

More information: https://manned.org/calligrastage.

- Launch the presentation application:

  ```
  calligrastage
  ```

- Open a specific presentation:

  ```
  calligrastage {{path/to/presentation}}
  ```

- Display help or version:

  ```
  calligrastage --{{help|version}}
  ```

calligrawords

Calligra's word processor application.

See also: **`calligraflow`**, **`calligrastage`**, **`calligrasheets`**.

More information: https://manned.org/calligrawords.

- Launch the word processor application:

```
calligrawords
```

- Open a specific document:

```
calligrawords {{path/to/document}}
```

- Display help or version:

```
calligrawords --{{help|version}}
```

cancel

Cancel print jobs.

See also: **`lp`**, **`lpmove`**, **`lpstat`**.

More information: https://openprinting.github.io/cups/doc/man-cancel.html.

- Cancel the current job of the default printer (set with `lpoptions -d printer_name`):

```
cancel
```

- Cancel the jobs of the default printer owned by a specific [u]ser:

```
cancel -u {{username}}
```

- Cancel the current job of a specific printer:

```
cancel {{printer}}
```

- Cancel a specific job from a specific printer:

```
cancel {{printer}}-{{job_id}}
```

- Cancel [a]ll jobs of all printers:

```
cancel -a
```

- Cancel [a]ll jobs of a specific printer:

```
cancel -a {{printer}}
```

- Cancel the current job of a specific [h]ost server and then delete ([x]) job data files:

```
cancel -h {{server}} -x
```

carbon-now

Create beautiful images of code.

More information: https://github.com/mixn/carbon-now-cli.

- Create an image from a file using default settings:

```
carbon-now {{path/to/file}}
```

- Create an image from a text in clipboard using default settings:

```
carbon-now --from-clipboard
```

- Create an image from `stdin` using default settings and copy to the clipboard:

```
{{input}} | carbon-now --to-clipboard
```

- Create images interactively for custom settings and optionally save a preset:

```
carbon-now {{[-i|--interactive]}} {{path/to/file}}
```

- Create images from a previously saved preset:

```
carbon-now {{[-p|--preset]}} {{preset}} {{path/to/file}}
```

- Start at a specified line of text:

```
carbon-now {{[-s|--start]}} {{line}} {{path/to/file}}
```

- End at a specific line of text:

```
carbon-now {{[-e|--end]}} {{line}} {{path/to/file}}
```

- Open image in a browser instead of saving:

```
carbon-now --open {{path/to/file}}
```

carbonyl

View webpages on the terminal using a Chromium backend.

See also: **`browsh`**.

More information: https://github.com/fathyb/carbonyl.

- Open an `about:blank` page:

  `carbonyl`

- Open a webpage:

  `carbonyl {{https://example.com}}`

- Exit carbonyl:

  `<Ctrl c>`

- Display help:

  `carbonyl {{[-h|--help]}}`

cargo add

Add dependencies to a Rust project's **`Cargo.toml`** manifest.

More information: https://doc.rust-lang.org/cargo/commands/cargo-add.html.

- Add the latest version of a dependency to the current project:

```
cargo add {{dependency}}
```

- Add a specific version of a dependency:

```
cargo add {{dependency}}@{{version}}
```

- Add a dependency and enable one or more specific features:

```
cargo add {{dependency}} {{[-F|--features]}}
{{feature_1,feature_2,...}}
```

- Add an optional dependency, which then gets exposed as a feature of the crate:

```
cargo add {{dependency}} --optional
```

- Add a local crate as a dependency:

```
cargo add --path {{path/to/crate_directory}}
```

- Add a development or build dependency:

```
cargo add {{dependency}} --{{dev|build}}
```

- Add a dependency with all default features disabled:

```
cargo add {{dependency}} --no-default-features
```

cargo bench

Compile and execute benchmarks.

More information: https://doc.rust-lang.org/cargo/commands/cargo-bench.html.

- Execute all benchmarks of a package:

```
cargo bench
```

- Don't stop when a benchmark fails:

```
cargo bench --no-fail-fast
```

- Compile, but don't run benchmarks:

```
cargo bench --no-run
```

- Benchmark the specified benchmark:

```
cargo bench --bench {{benchmark}}
```

- Benchmark with the given profile (default: `bench`):

```
cargo bench --profile {{profile}}
```

- Benchmark all example targets:

```
cargo bench --examples
```

- Benchmark all binary targets:

```
cargo bench --bins
```

- Benchmark the package's library:

```
cargo bench --lib
```

cargo binstall

Install Rust binaries from CI artifacts.

Falls back to **`cargo install`** (from source code) if there are no binaries available.

More information: https://github.com/cargo-bins/cargo-binstall.

- Install a package from https://crates.io:

```
cargo binstall {{package}}
```

- Install a specific version of a package (latest by default):

```
cargo binstall {{package}}@{{version}}
```

- Install a package and disable confirmation prompts:

```
cargo binstall {{[-y|--no-confirm]}} {{package}}
```

cargo build

Compile a local package and all of its dependencies.

More information: https://doc.rust-lang.org/cargo/commands/cargo-build.html.

- Build the package or packages defined by the `Cargo.toml` manifest file in the local path:

```
cargo {{[b|build]}}
```

- Build artifacts in release mode, with optimizations:

```
cargo {{[b|build]}} {{[-r|--release]}}
```

- Require that `Cargo.lock` is up to date:

```
cargo {{[b|build]}} --locked
```

- Build all packages in the workspace:

```
cargo {{[b|build]}} --workspace
```

- Build a specific package:

```
cargo {{[b|build]}} {{[-p|--package]}} {{package}}
```

- Build only the specified binary:

```
cargo {{[b|build]}} --bin {{name}}
```

- Build only the specified test target:

```
cargo {{[b|build]}} --test {{test_name}}
```

cargo check

Check a local package and all of its dependencies for errors.

More information: https://doc.rust-lang.org/cargo/commands/cargo-check.html.

- Check the current package:

```
cargo {{[c|check]}}
```

- Check all tests:

```
cargo {{[c|check]}} --tests
```

- Check the integration tests in `tests/integration_test1.rs`:

```
cargo {{[c|check]}} --test {{integration_test1}}
```

- Check the current package with the features `feature1` and `feature2`:

```
cargo {{[c|check]}} {{[-F|--features]}} {{feature1,feature2}}
```

- Check the current package with default features disabled:

```
cargo {{[c|check]}} --no-default-features
```

cargo clean

Remove generated artifacts in the **`target`** directory.

More information: https://doc.rust-lang.org/cargo/commands/cargo-clean.html.

- Remove the entire `target` directory:

  ```
  cargo clean
  ```

- Remove documentation artifacts (the `target/doc` directory):

  ```
  cargo clean --doc
  ```

- Remove release artifacts (the `target/release` directory):

  ```
  cargo clean {{[-r|--release]}}
  ```

- Remove artifacts in the directory of the given profile (in this case, `target/debug`):

  ```
  cargo clean --profile {{dev}}
  ```

cargo clippy

A collection of lints to catch common mistakes and improve your Rust code.

More information: https://github.com/rust-lang/rust-clippy.

- Run checks over the code in the current directory:

```
cargo clippy
```

- Require that `Cargo.lock` is up to date:

```
cargo clippy --locked
```

- Run checks on all packages in the workspace:

```
cargo clippy --workspace
```

- Run checks for a package:

```
cargo clippy --package {{package}}
```

- Run checks for a lint group (see https://rust-lang.github.io/rust-clippy/stable/index.html#?groups=cargo,complexity,correctness,deprecated,nursery,pedantic,perf,restriction,style,s

```
cargo clippy -- {{[-W|--warn]}} clippy::{{lint_group}}
```

- Treat warnings as errors:

```
cargo clippy -- {{[-D|--deny]}} warnings
```

- Run checks and ignore warnings:

```
cargo clippy -- {{[-A|--allow]}} warnings
```

- Apply Clippy suggestions automatically:

```
cargo clippy --fix
```

cargo deb

Create Debian packages from Cargo projects.

More information: https://github.com/kornelski/cargo-deb.

- Create a Debian package from a project:

```
cargo deb
```

- Write the `.deb` file to the specified file or directory:

```
cargo deb {{[-o|--output]}} {{path/to/file_or_directory}}
```

- Compile for the specified Rust target triple:

```
cargo deb --target {{x86_64-unknown-linux-gnu}}
```

- Select which package to use in a Cargo workspace:

```
cargo deb {{[-p|--package]}} {{package_name}}
```

- Immediately install the created package:

```
cargo deb --install
```

cargo doc

Build the documentation of Rust packages.

More information: https://doc.rust-lang.org/cargo/commands/cargo-doc.html.

- Build the documentation for the current project and all dependencies:

```
cargo {{[d|doc]}}
```

- Do not build documentation for dependencies:

```
cargo {{[d|doc]}} --no-deps
```

- Build and open the documentation in a browser:

```
cargo {{[d|doc]}} --open
```

- Build and view the documentation of a particular package:

```
cargo {{[d|doc]}} --open {{[-p|--package]}} {{package}}
```

cargo fetch

Fetch dependencies of a package from the network.

More information: https://doc.rust-lang.org/cargo/commands/cargo-fetch.html.

- Fetch dependencies specified in `Cargo.lock` (for all targets):

```
cargo fetch
```

- Fetch dependencies for the specified target:

```
cargo fetch --target {{target_triple}}
```

cargo fix

Automatically fix lint warnings reported by **`rustc`**.

More information: https://doc.rust-lang.org/cargo/commands/cargo-fix.html.

- Fix code even if it already has compiler errors:

```
cargo fix --broken-code
```

- Fix code even if the working directory has changes:

```
cargo fix --allow-dirty
```

- Migrate a package to the next Rust edition:

```
cargo fix --edition
```

- Fix the package's library:

```
cargo fix --lib
```

- Fix the specified integration test:

```
cargo fix --test {{name}}
```

- Fix all members in the workspace:

```
cargo fix --workspace
```

cargo fmt

Run **`rustfmt`** on all source files in a Rust project.

More information: https://github.com/rust-lang/rustfmt.

- Format all source files:

```
cargo fmt
```

- Check for formatting errors without writing to the files:

```
cargo fmt --check
```

- Pass arguments to each `rustfmt` call:

```
cargo fmt -- {{rustfmt_args}}
```

cargo generate-lockfile

Generate the **`Cargo.lock`** file for the current package. Similar to **`cargo update`**, but has less options.

If the lockfile already exists it will be rebuilt with latest version of every package.

More information: https://doc.rust-lang.org/stable/cargo/commands/cargo-generate-lockfile.html.

- Generate a `Cargo.lock` file with the latest version of every package:

  ```
  cargo generate-lockfile
  ```

cargo help

Display help on **`cargo`** and its subcommands.

More information: https://doc.rust-lang.org/cargo/commands/cargo-help.html.

- Display general help:

```
cargo help
```

- Display help for a subcommand:

```
cargo help {{subcommand}}
```

cargo info

Display information about a Rust package.

More information: https://doc.rust-lang.org/cargo/commands/cargo-info.html.

- Display information about a package on https://crates.io:

```
cargo info {{package}}
```

- Display information about a specific version of a package:

```
cargo info {{package}}@{{version}}
```

- Display additional information about a package:

```
cargo info {{[-v|--verbose]}} {{package}}
```

cargo init

Create a new Cargo package.

Equivalent of **`cargo new`**, but specifying a directory is optional.

More information: https://doc.rust-lang.org/cargo/commands/cargo-init.html.

- Initialize a Rust project with a binary target in the current directory:

```
cargo init
```

- Initialize a Rust project with a binary target in the specified directory:

```
cargo init {{path/to/directory}}
```

- Initialize a Rust project with a library target in the current directory:

```
cargo init --lib
```

- Initialize a version control system repository in the project directory (default: `git`):

```
cargo init --vcs {{git|hg|pijul|fossil|none}}
```

- Set the package name (default: directory name):

```
cargo init --name {{name}}
```

cargo install

Build and install a Rust binary.

More information: https://doc.rust-lang.org/cargo/commands/cargo-install.html.

- Install a package from https://crates.io (the version is optional - latest by default):

```
cargo install {{package}}@{{version}}
```

- Install a package from the specified Git repository:

```
cargo install --git {{repo_url}}
```

- Build from the specified branch/tag/commit when installing from a Git repository:

```
cargo install --git {{repo_url}} --{{branch|tag|rev}} {{branch_name|tag|commit_hash}}
```

- Install a package from a local directory:

```
cargo install --path {{path/to/package}}
```

- List all installed packages and their versions:

```
cargo install --list
```

cargo locate-project

Print the full path to the **`Cargo.toml`** manifest of a project.

If the project is part of a workspace, the manifest of the project is shown, rather than that of the workspace.

More information: https://doc.rust-lang.org/cargo/commands/cargo-locate-project.html.

- Display the JSON object with full path to the `Cargo.toml` manifest:

  ```
  cargo locate-project
  ```

- Display the project path in the specified format:

  ```
  cargo locate-project --message-format {{plain|json}}
  ```

- Display the `Cargo.toml` manifest located at the root of the workspace as opposed to the current workspace member:

  ```
  cargo locate-project --workspace
  ```

- Display the `Cargo.toml` manifest of a specific directory:

  ```
  cargo locate-project --manifest-path {{path/to/Cargo.toml}}
  ```

cargo login

Save an API token from the registry locally.

The token is used to authenticate to a package registry. You can remove it using **`cargo logout`**.

More information: https://doc.rust-lang.org/cargo/commands/cargo-login.html.

- Add an API token to the local credential storage (located in `$CARGO_HOME/credentials.toml`):

  ```
  cargo login
  ```

- Use the specified registry (registry names can be defined in the configuration - the default is https://crates.io):

  ```
  cargo login --registry {{name}}
  ```

cargo logout

Remove an API token from the registry locally.

The token is used to authenticate to a package registry. You can add it back using **`cargo login`**.

More information: https://doc.rust-lang.org/cargo/commands/cargo-logout.html.

- Remove an API token from the local credential storage (located in `$CARGO_HOME/credentials.toml`):

  ```
  cargo logout
  ```

- Use the specified registry (registry names can be defined in the configuration - the default is https://crates.io):

  ```
  cargo logout --registry {{name}}
  ```

cargo metadata

Output the workspace members and resolved dependencies of current package as JSON.

Note: The output format is subject to change in future versions of Cargo.

More information: https://doc.rust-lang.org/cargo/commands/cargo-metadata.html.

- Print the workspace members and resolved dependencies of the current package:

  ```
  cargo metadata
  ```

- Print only the workspace members and do not fetch dependencies:

  ```
  cargo metadata --no-deps
  ```

- Print metadata in a specific format based on the specified version:

  ```
  cargo metadata --format-version {{version}}
  ```

- Print metadata with the `resolve` field including dependencies only for the given target triple (Note: The `packages` array will still include the dependencies for all targets):

  ```
  cargo metadata --filter-platform {{target_triple}}
  ```

cargo msrv

Manage the Minimum Supported Rust Version (MSRV) of a project.

More information: https://gribnau.dev/cargo-msrv/.

- Display the MSRVs of dependencies (as specified in their `Cargo.toml`):

  ```
  cargo msrv list
  ```

- Find the MSRV of the project by trying to compile it with various toolchains:

  ```
  cargo msrv find
  ```

- Show the MSRV of the project as specified in `Cargo.toml`:

  ```
  cargo msrv show
  ```

- Set the MSRV in `Cargo.toml` to a given Rust version:

  ```
  cargo msrv set {{version}}
  ```

- Verify whether the MSRV is satisfiable by compiling the project using the specified version of Rust:

  ```
  cargo msrv verify
  ```

cargo new

Create a new Cargo package.

Equivalent of **`cargo init`**, but specifying a directory is required.

More information: https://doc.rust-lang.org/cargo/commands/cargo-new.html.

- Create a new Rust project with a binary target:

```
cargo new {{path/to/directory}}
```

cargo owner

Manage the owners of a crate on the registry.

More information: https://doc.rust-lang.org/cargo/commands/cargo-owner.html.

- Invite the given user or team as an owner:

```
cargo owner {{[-a|--add]}} {{username|
github:org_name:team_name}} {{crate}}
```

- Remove the given user or team as an owner:

```
cargo owner {{[-r|--remove]}} {{username|
github:org_name:team_name}} {{crate}}
```

- List owners of a crate:

```
cargo owner {{[-l|--list]}} {{crate}}
```

- Use the specified registry (registry names can be defined in the configuration - the default is https://crates.io):

```
cargo owner --registry {{name}}
```

cargo package

Assemble a local package into a distributable tarball (a **`.crate`** file).

Similar to **`cargo publish --dry-run`**, but has more options.

More information: https://doc.rust-lang.org/cargo/commands/cargo-package.html.

- Perform checks and create a `.crate` file (equivalent of `cargo publish --dry-run`):

  ```
  cargo package
  ```

- Display what files would be included in the tarball without actually creating it:

  ```
  cargo package {{[-l|--list]}}
  ```

cargo pkgid

Print the fully qualified package ID specifier for a package or dependency in the current workspace.

More information: https://doc.rust-lang.org/cargo/commands/cargo-pkgid.html.

- Print the fully qualified package specification for the current project:

```
cargo pkgid
```

- Print the fully qualified package specification for the specified package:

```
cargo pkgid {{partial_pkgspec}}
```

cargo publish

Upload a package to a registry.

Note: You have to add an authentication token using **`cargo login`** before publishing a package.

More information: https://doc.rust-lang.org/cargo/commands/cargo-publish.html.

- Perform checks, create a `.crate` file and upload it to the registry:

  ```
  cargo publish
  ```

- Perform checks, create a `.crate` file but don't upload it (equivalent of `cargo package`):

  ```
  cargo publish {{[-n|--dry-run]}}
  ```

- Use the specified registry (registry names can be defined in the configuration - the default is https://crates.io):

  ```
  cargo publish --registry {{name}}
  ```

cargo remove

Remove dependencies from a Rust project's **`Cargo.toml`** manifest.

More information: https://doc.rust-lang.org/cargo/commands/cargo-remove.html.

- Remove a dependency from the current project:

```
cargo remove {{dependency}}
```

- Remove a development or build dependency:

```
cargo remove --{{dev|build}} {{dependency}}
```

- Remove a dependency of the given target platform:

```
cargo remove --target {{target}} {{dependency}}
```

cargo report

Display various kinds of reports.

More information: https://doc.rust-lang.org/cargo/commands/cargo-report.html.

- Display a report of crates which will eventually stop compiling:

```
cargo report future-incompatibilities
```

- Display a report with the specified Cargo-generated ID:

```
cargo report future-incompatibilities --id {{id}}
```

- Display a report for the specified package:

```
cargo report future-incompatibilities {{[-p|--package]}} {{package}}
```

cargo run

Run the current Cargo package.

Note: The working directory of the executed binary will be set to the current working directory.

More information: https://doc.rust-lang.org/cargo/commands/cargo-run.html.

- Run the default binary target:

```
cargo {{[r|run]}}
```

- Run the specified binary:

```
cargo {{[r|run]}} --bin {{name}}
```

- Run the specified example:

```
cargo {{[r|run]}} --example {{name}}
```

- Activate a space or comma separated list of features:

```
cargo {{[r|run]}} {{[-F|--features]}} "{{feature1
feature2 ...}}"
```

- Disable the default features:

```
cargo {{[r|run]}} --no-default-features
```

- Activate all available features:

```
cargo {{[r|run]}} --all-features
```

- Run with the given profile:

```
cargo {{[r|run]}} --profile {{name}}
```

cargo rustc

Compile a Rust package. Similar to **`cargo build`**, but you can pass extra options to the compiler.

See **`rustc --help`** for all available options.

More information: https://doc.rust-lang.org/cargo/commands/cargo-rustc.html.

- Build the package and pass options to `rustc`:

```
cargo rustc -- {{rustc_options}}
```

- Build artifacts in release mode, with optimizations:

```
cargo rustc {{[-r|--release]}}
```

- Compile with architecture-specific optimizations for the current CPU:

```
cargo rustc {{[-r|--release]}} -- -C target-cpu=native
```

- Compile with speed optimizations:

```
cargo rustc -- -C opt-level {{1|2|3}}
```

- Compile with [s]ize optimizations (`z` also turns off loop vectorization):

```
cargo rustc -- -C opt-level {{s|z}}
```

- Check if your package uses unsafe code:

```
cargo rustc --lib -- -D unsafe-code
```

- Build a specific package:

```
cargo rustc {{[-p|--package]}} {{package}}
```

- Build only the specified binary:

```
cargo rustc --bin {{name}}
```

cargo rustdoc

Build the documentation of Rust packages.

Similar to **`cargo doc`**, but you can pass options to **`rustdoc`**. See **`rustdoc --help`** for all available options.

More information: https://doc.rust-lang.org/cargo/commands/cargo-rustdoc.html.

- Pass options to `rustdoc`:

```
cargo rustdoc -- {{rustdoc_options}}
```

- Warn about a documentation lint:

```
cargo rustdoc -- --warn rustdoc::{{lint_name}}
```

- Ignore a documentation lint:

```
cargo rustdoc -- --allow rustdoc::{{lint_name}}
```

- Document the package's library:

```
cargo rustdoc --lib
```

- Document the specified binary:

```
cargo rustdoc --bin {{name}}
```

- Document the specified example:

```
cargo rustdoc --example {{name}}
```

- Document the specified integration test:

```
cargo rustdoc --test {{name}}
```

cargo search

Search for packages on https://crates.io.

The crates are displayed along with descriptions in TOML format suitable for copying into **`Cargo.toml`**.

More information: https://doc.rust-lang.org/cargo/commands/cargo-search.html.

- Search for packages:

  ```
  cargo search {{query}}
  ```

- Show n results (default: 10, max: 100):

  ```
  cargo search --limit {{n}} {{query}}
  ```

cargo test

Execute the unit and integration tests of a Rust package.

More information: https://doc.rust-lang.org/cargo/commands/cargo-test.html.

- Only run tests containing a specific string in their names:

```
cargo {{[t|test]}} {{test_name}}
```

- Set the number of simultaneous running test cases:

```
cargo {{[t|test]}} -- --test-threads {{count}}
```

- Test artifacts in release mode, with optimizations:

```
cargo {{[t|test]}} {{[-r|--release]}}
```

- Test all packages in the workspace:

```
cargo {{[t|test]}} --workspace
```

- Run tests for a specific package:

```
cargo {{[t|test]}} {{[-p|--package]}} {{package}}
```

- Run tests without hiding output from test executions:

```
cargo {{[t|test]}} -- --nocapture
```

cargo tree

Display a tree visualization of a dependency graph.

Note: In the tree, dependencies of packages marked with `(*)` have already been shown elsewhere in the graph, and so are not repeated.

More information: https://doc.rust-lang.org/cargo/commands/cargo-tree.html.

- Show a dependency tree of the current project:

```
cargo tree
```

- Only show dependencies up to the specified depth (e.g. when n is 1, display only direct dependencies):

```
cargo tree --depth {{n}}
```

- Do not display the given package (and its dependencies) in the tree:

```
cargo tree --prune {{package_spec}}
```

- Show all occurrences of repeated dependencies:

```
cargo tree --no-dedupe
```

- Only show normal/build/development dependencies:

```
cargo tree {{[-e|--edges]}} {{normal|build|dev}}
```

cargo uninstall

Remove a Rust binary installed globally using **`cargo install`**.

More information: https://doc.rust-lang.org/cargo/commands/cargo-uninstall.html.

- Remove an installed binary:

```
cargo uninstall {{package_spec}}
```

cargo update

Update dependencies as recorded in **`Cargo.lock`**.

More information: https://doc.rust-lang.org/cargo/commands/cargo-update.html.

- Update dependencies in `Cargo.lock` to the latest possible version:

```
cargo update
```

- Display what would be updated, but don't actually write the lockfile:

```
cargo update {{[-n|--dry-run]}}
```

- Update only the specified dependencies:

```
cargo update --package {{dependency1}} --package
{{dependency2}} --package {{dependency3}}
```

- Set a specific dependency to a specific version:

```
cargo update --package {{dependency}} --precise {{1.2.3}}
```

cargo vendor

Vendor all dependencies of a project into the specified directory (default: **`vendor`**).

More information: https://doc.rust-lang.org/cargo/commands/cargo-vendor.html.

- Vendor dependencies and configure `cargo` to use the vendored sources in the current project:

```
cargo vendor {{path/to/directory}} > .cargo/config.toml
```

cargo verify-project

Check the correctness of the **`Cargo.toml`** manifest and print the result as a JSON object.

Note: this command is deprecated and may be removed in the future.

More information: https://doc.rust-lang.org/cargo/commands/deprecated-and-removed.html.

- Check the correctness of the current project's manifest:

```
cargo verify-project
```

- Check the correctness of the specified manifest file:

```
cargo verify-project --manifest-path {{path/to/Cargo.toml}}
```

cargo version

Display **cargo** version information.

More information: https://doc.rust-lang.org/cargo/commands/cargo-version.html.

- Display version:

```
cargo version
```

- Display additional build information:

```
cargo version {{[-v|--verbose]}}
```

cargo yank

Remove a pushed crate from the index. This should only be used when you accidentally release a significantly broken crate.

Note: This does not remove any data. The crate is still present after a yank - this just prevents new projects from using it.

More information: https://doc.rust-lang.org/cargo/commands/cargo-yank.html.

- Yank the specified version of a crate:

  ```
  cargo yank {{crate}}@{{version}}
  ```

- Undo a yank (i.e. allow downloading it again):

  ```
  cargo yank --undo {{crate}}@{{version}}
  ```

- Use the specified registry (registry names can be defined in the configuration - the default is https://crates.io):

  ```
  cargo yank --registry {{name}} {{crate}}@{{version}}
  ```

cargo

Manage Rust projects and their module dependencies (crates).

Some subcommands such as **`build`** have their own usage documentation.

More information: https://doc.rust-lang.org/stable/cargo/.

- Search for crates:

```
cargo search {{search_string}}
```

- Install a binary crate:

```
cargo install {{crate_name}}
```

- List installed binary crates:

```
cargo install --list
```

- Create a new binary or library Rust project in the specified directory (or the current working directory by default):

```
cargo init --{{bin|lib}} {{path/to/directory}}
```

- Add a dependency to `Cargo.toml` in the current directory:

```
cargo add {{dependency}}
```

- Build the Rust project in the current directory using the release profile:

```
cargo {{[b|build]}} {{[-r|--release]}}
```

- Build the Rust project in the current directory using the nightly compiler (requires `rustup`):

```
cargo +nightly {{[b|build]}}
```

- Build using a specific number of threads (default is the number of logical CPUs):

```
cargo {{[b|build]}} {{[-j|--jobs]}} {{number_of_threads}}
```

cariddi

Crawl URLs and scan for endpoints, secrets, api keys, file extensions, tokens, and more from a list of domains.

More information: https://github.com/edoardottt/cariddi/wiki.

- Hunt for secrets using custom `regex`es and output results in JSON:

```
cat {{path/to/urls.txt}} | cariddi -s -sf {{path/to/custom_secrets.txt}} -json
```

- Hunt for juicy endpoints with high concurrency and timeout with plain output results:

```
cat {{path/to/urls.txt}} | cariddi -e -c {{250}} -t {{15}} -plain
```

- Crawl with debug mode and store HTTP responses and output results in `txt` file:

```
cat {{path/to/urls.txt}} | cariddi -debug -sr -ot {{path/to/debug_output.txt}}
```

- Perform an intensive crawl with a proxy and random user agent and output results in `html` file:

```
cat {{path/to/urls.txt}} | cariddi -intensive -proxy {{http://127.0.0.1:8080}} -rua -oh {{path/to/intensive_crawl.html}}
```

- Hunt for errors and useful information with a custom delay and use `.cariddi_cache` folder as cache:

```
cat {{path/to/urls.txt}} | cariddi -err -info -d {{3}} -cache
```

- Show example uses:

```
cariddi -examples
```

carp

REPL and build tool for Carp.

More information: https://carp-lang.github.io/carp-docs/Manual.html.

- Start a REPL (interactive shell):

```
carp
```

- Start a REPL with a custom prompt:

```
carp --prompt "{{> }}"
```

- Build a `carp` file:

```
carp -b {{path/to/file.carp}}
```

- Build and run a file:

```
carp -x {{path/to/file.carp}}
```

- Build a file with optimizations enabled:

```
carp -b --optimize {{path/to/file.carp}}
```

- Transpile a file to C code:

```
carp --generate-only {{path/to/file.carp}}
```

case

Bash builtin construct for creating multi-choice conditional statements.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-case.

- Match a variable against string literals to decide which command to run:

```
case {{$COUNTRULE}} in {{words}}) {{wc --words README}} ;;
{{lines}}) {{wc --lines README}} ;; esac
```

- Combine patterns with |, use * as a fallback pattern:

```
case {{$COUNTRULE}} in {{[wW]|words}}) {{wc --words
README}} ;; {{[lL]|lines}}) {{wc --lines README}} ;; *)
{{echo "what?"}} ;; esac
```

- Allow matching multiple patterns:

```
case {{$ANIMAL}} in {{cat}}) {{echo "It's a cat"}} ;;& {{cat|
dog}}) {{echo "It's a cat or a dog"}} ;;& *) {{echo
"Fallback"}} ;; esac
```

- Continue to the next pattern's commands without checking the pattern:

```
case {{$ANIMAL}} in {{cat}}) {{echo "It's a cat"}} ;&
{{dog}}) {{echo "It's either a dog or cat fell through"}} ;&
*) {{echo "Fallback"}} ;; esac
```

- Display help:

```
help case
```

cat

Print and concatenate files.

More information: https://manned.org/cat.1posix.

- Print the contents of a file to `stdout`:

```
cat {{path/to/file}}
```

- Concatenate several files into an output file:

```
cat {{path/to/file1 path/to/file2 ...}} > {{path/to/output_file}}
```

- Append several files to an output file:

```
cat {{path/to/file1 path/to/file2 ...}} >> {{path/to/output_file}}
```

- Copy the contents of a file into an output file without buffering:

```
cat -u {{/dev/tty12}} > {{/dev/tty13}}
```

- Write `stdin` to a file:

```
cat - > {{path/to/file}}
```

catimg

Image printing in the terminal.

See also: **`pixterm`**, **`chafa`**.

More information: https://manned.org/catimg.

- Print a JPEG, PNG, or GIF to the terminal:

```
catimg {{path/to/file}}
```

- Double the [r]esolution of an image:

```
catimg -r 2 {{path/to/file}}
```

- Disable 24-bit color for better [t]erminal support:

```
catimg -t {{path/to/file}}
```

- Specify a custom [w]idth or [H]eight:

```
catimg {{-w|-H}} {{40}} {{path/to/file}}
```

cava

Cross-platform audio visualizer.

More information: https://github.com/karlstav/cava#usage.

- Start the visualizer:

```
cava
```

- Use the specified configuration file:

```
cava -p {{path/to/file}}
```

- Increase/Decrease sensitivity:

```
{{<ArrowUp>|<ArrowDown>}}
```

- Increase/Decrease the number of bars:

```
{{<ArrowRight>|<ArrowLeft>}}
```

- Reload the configuration file (this resets the number of bars and sensitivity):

```
<r>
```

- Reload colors from the configuration file:

```
<c>
```

- Cycle the foreground/background color:

```
{{<f>|<b>}}
```

- Quit:

```
<q>
```

cavif

Convert PNG/JPEG images to AVIF. Written in Rust.

See also: **`convert`**.

More information: https://github.com/kornelski/cavif-rs.

- Convert a JPEG file to AVIF, saving it to `file.avif`:

```
cavif {{path/to/image.jpg}}
```

- Adjust the image quality and convert a PNG file to AVIF:

```
cavif --quality {{1..100}} {{path/to/image.png}}
```

- Specify the output location:

```
cavif {{path/to/image.jpg}} --output {{path/to/output.avif}}
```

- Overwrite the destination file if it already exists:

```
cavif --overwrite {{path/to/image.jpg}}
```

cb

Cut, copy, and paste anything in the terminal.

More information: https://github.com/Slackadays/Clipboard#-7.

- Show all clipboards:

```
cb
```

- Copy a file to the clipboard:

```
cb copy {{path/to/file}}
```

- Copy some text to the clipboard:

```
cb copy "{{Some example text}}"
```

- Copy piped data to the clipboard:

```
echo "{{Some example text}}" | cb
```

- Paste clipboard content:

```
cb paste
```

- Pipe out clipboard content:

```
cb | cat
```

- Show clipboard history:

```
cb history
```

- Show clipboard information:

```
cb info
```

cbonsai

A beautifully random bonsai tree generator.

See also: **`cmatrix`**, **`asciiquarium`**, **`pipes.sh`**.

More information: https://gitlab.com/jallbrit/cbonsai.

- Generate a bonsai in live mode:

```
cbonsai {{[-l|--live]}}
```

- Generate a bonsai in infinite mode:

```
cbonsai {{[-i|--infinite]}}
```

- Set the growth factor of the tree (default: 32):

```
cbonsai {{[-L|--life]}} {{0..200}}
```

- Set the branching factor of the tree (default: 5):

```
cbonsai {{[-M|--multiplier]}} {{0..20}}
```

- Run in screensaver mode (equivalent to `--live --infinite` but any keypress exits):

```
cbonsai {{[-S|--screensaver]}}
```

- Append a message to the bonsai:

```
cbonsai {{[-m|--message]}} "{{message}}"
```

- Display extra information about the bonsai:

```
cbonsai {{[-v|--verbose]}}
```

- Display help:

```
cbonsai {{[-h|--help]}}
```

cbt

Utility for reading data from Google Cloud's Bigtable.

More information: https://docs.cloud.google.com/bigtable/docs/cbt-reference.

- List tables in the current project:

```
cbt ls
```

- Print count of rows in a specific table in the current project:

```
cbt count "{{table_name}}"
```

- Display a single row from a specific table with only 1 (most recent) cell revision per column in the current project:

```
cbt lookup "{{table_name}}" "{{row_key}}" cells-per-column={{1}}
```

- Display a single row with only specific column(s) (omit qualifier to return entire family) in the current project:

```
cbt lookup "{{table_name}}" "{{row_key}}" columns="{{family1:qualifier1,family2:qualifier2,...}}"
```

- Search up to 5 rows in the current project by a specific `regex` pattern and print them:

```
cbt read "{{table_name}}" regex="{{row_key_pattern}}" count={{5}}
```

- Read a specific range of rows and print only returned row keys in the current project:

```
cbt read {{table_name}} start={{start_row_key}} end={{end_row_key}} keys-only=true
```

ccache

C/C++ compiler cache.

Note: Packages usually provide symlinks for compilers in **`/usr/lib/ccache/bin`**. Prepend this directory to **`$PATH`** to automatically use **`ccache`** for them.

More information: https://ccache.dev/manual/latest.html.

- Show current cache statistics:

```
ccache {{[-s|--show-stats]}}
```

- Clear all cache:

```
ccache {{[-C|--clear]}}
```

- Reset statistics (but not cache itself):

```
ccache {{[-z|--zero-stats]}}
```

- Compile C code and cache compiled output (to use `ccache` on all `gcc` invocations, see the note above):

```
ccache gcc {{path/to/file.c}}
```

ccomps

Decompose graphs into their connected components.

Graphviz filters: **`acyclic`**, **`bcomps`**, **`comps`**, **`edgepaint`**, **`gvcolor`**, **`gvpack`**, **`mingle`**, **`nop`**, **`sccmap`**, **`tred`**, & **`unflatten`**.

More information: https://graphviz.org/pdf/ccomps.1.pdf.

- Decompose one or more graphs into their connected components:

```
ccomps {{path/to/input1.gv path/to/input2.gv ...}} > {{path/to/output.gv}}
```

- Print the number of nodes, edges, and connected components in one or more graphs:

```
ccomps -v -s {{path/to/input1.gv path/to/input2.gv ...}}
```

- Write each connected component to numbered filenames based on `output.gv`:

```
ccomps -x -o {{path/to/output.gv}} {{path/to/input1.gv path/to/input2.gv ...}}
```

- Display help:

```
ccomps -?
```

cd

Change the current working directory.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-cd.

- Go to the specified directory:

```
cd {{path/to/directory}}
```

- Go up to the parent of the current directory:

```
cd ..
```

- Go to the home directory of the current user:

```
cd
```

- Go to the home directory of the specified user:

```
cd ~{{username}}
```

- Go to the previously chosen directory:

```
cd -
```

- Go to the root directory:

```
cd /
```

cdecl

Compose and decode C and C++ type declarations.

More information: https://manned.org/cdecl.

- Compose English phrase into C declaration, and create [c]ompilable output (include `;` and `{}`):

```
cdecl -c {{phrase}}
```

- Explain C declaration in English:

```
cdecl explain {{C_declaration}}
```

- Cast a variable to another type:

```
cdecl cast {{variable_name}} to {{type}}
```

- Run in [i]nteractive mode:

```
cdecl -i
```

cdk

AWS Cloud Development Kit.

More information: https://docs.aws.amazon.com/cdk/latest/guide/cli.html.

- List the stacks in the app:

  ```
  cdk ls
  ```

- Synthesize and print the CloudFormation template for the specified stack(s):

  ```
  cdk synth {{stack_name}}
  ```

- Deploy one or more stacks:

  ```
  cdk deploy {{stack_name1 stack_name2 ...}}
  ```

- Destroy one or more stacks:

  ```
  cdk destroy {{stack_name1 stack_name2 ...}}
  ```

- Compare the specified stack with the deployed stack or a local CloudFormation template:

  ```
  cdk diff {{stack_name}}
  ```

- Create a new CDK project in the current directory for a specified language:

  ```
  cdk init {{[-l|--language]}} {{language}}
  ```

- Open the CDK API reference in your browser:

  ```
  cdk docs
  ```

certutil

Manage keys and certificates in both NSS databases and other NSS tokens.

More information: https://manned.org/certutil.

- Create a [N]ew certificate database in the current [d]irectory:

```
certutil -N -d .
```

- [L]ist all certificates in a database:

```
certutil -L -d .
```

- List all private [K]eys in a database specifying the password [f]ile:

```
certutil -K -d . -f {{path/to/password_file.txt}}
```

- [A]dd the signed certificate to the requesters database specifying a [n]ickname, [t]rust attributes and an [i]nput CRT file:

```
certutil -A -n "{{server_certificate}}" -t ",," -i {{path/to/file.crt}} -d .
```

- Add subject alternative names to a given [c]ertificate with a specific key size ([g]):

```
certutil -S -f {{path/to/password_file.txt}} -d . -t ",," -c "{{server_certificate}}" -n "{{server_name}}" -g {{2048}} -s "CN={{common_name}},O={{organization}}"
```

cf

Manage apps and services on Cloud Foundry.

More information: https://docs.cloudfoundry.org/cf-cli/getting-started.html.

- Log in to the Cloud Foundry API:

```
cf login -a {{api_url}}
```

- Push an app using the default settings:

```
cf push {{app_name}}
```

- View the services available from your organization:

```
cf marketplace
```

- Create a service instance:

```
cf create-service {{service}} {{plan}} {{service_name}}
```

- Connect an application to a service:

```
cf bind-service {{app_name}} {{service_name}}
```

- Run a script whose code is included in the app, but runs independently:

```
cf run-task {{app_name}} "{{script_command}}" --name
{{task_name}}
```

- Start an interactive SSH session with a VM hosting an app:

```
cf ssh {{app_name}}
```

- View a dump of recent app logs:

```
cf logs {{app_name}} --recent
```

cfssl

Cloudflare's PKI and TLS toolkit.

See also: **`openssl`**.

More information: https://github.com/cloudflare/cfssl.

- Show certificate information of a host:

```
cfssl certinfo -domain {{www.google.com}}
```

- Decode certificate information from a file:

```
cfssl certinfo -cert {{path/to/certificate.pem}}
```

- Scan host(s) for SSL/TLS issues:

```
cfssl scan {{host1 host2 ...}}
```

- Display help for a subcommand:

```
cfssl {{genkey|gencsr|certinfo|sign|gencrl|ocspdump|
ocsprefresh|ocspsign|ocspserve|scan|bundle|crl|print-
defaults|revoke|gencert|serve|version|selfsign|info}} -h
```

chafa

Image printing in the terminal.

See also: **`catimg`**, **`pixterm`**.

More information: https://hpjansson.org/chafa/man/.

- Render an image directly in the terminal:

```
chafa {{path/to/file}}
```

- Render an image with 24-bit color:

```
chafa {{[-c|--colors]}} full {{path/to/file}}
```

- Improve image rendering with small color palettes using dithering:

```
chafa {{[-c|--colors]}} 16 --dither ordered {{path/to/file}}
```

- Render an image, making it appear pixelated:

```
chafa --symbols vhalf {{path/to/file}}
```

- Render a monochrome image with only braille characters:

```
chafa {{[-c|--colors]}} none --symbols braille {{path/to/
file}}
```

chainctl

The official CLI for Chainguard.

More information: https://edu.chainguard.dev/chainguard/chainctl/chainctl-docs/chainctl/.

- Authenticate to the Chainguard Platform:

  ```
  chainctl auth login
  ```

- Logout from the Chainguard Platform:

  ```
  chainctl auth logout
  ```

- Update to the latest version:

  ```
  chainctl update
  ```

- List images available to your account:

  ```
  chainctl images list
  ```

- List image repositories available to your account:

  ```
  chainctl images repos list
  ```

- Examine the history of an image tag in chainctl (e.g., image=python tag=3):

  ```
  chainctl images history {{image}}:{{tag}}
  ```

- List package version data from repositories available to your account (e.g., package_name=go):

  ```
  chainctl packages versions list {{package_name}}
  ```

- Display version:

  ```
  chainctl version
  ```

charm

Set of tools that makes adding a backend to your terminal-based applications, without worrying about user accounts, data storage and encryption.

More information: https://manned.org/charm.

- Backup your Charm account keys:

```
charm backup-keys
```

- Backup Charm account keys to a specific location:

```
charm backup-keys {{[-o|--output]}} {{path/to/output_file.tar}}
```

- Import previously backed up Charm account keys:

```
charm import-keys "{{charm-keys-backup.tar}}"
```

- Find where your `cloud.charm.sh` folder resides on your machine:

```
charm where
```

- Start your Charm server:

```
charm serve
```

- Print linked SSH keys:

```
charm keys
```

- Print your Charm ID:

```
charm id
```

chars

Display names and codes for various ASCII and Unicode characters and code points.

More information: https://github.com/boinkor-net/chars#running.

- Look up a character by its value:

```
chars '{{ß}}'
```

- Look up a character by its Unicode code point:

```
chars {{U+1F63C}}
```

- Look up possible characters given an ambiguous code point:

```
chars {{10}}
```

- Look up a control character:

```
chars "{{^C}}"
```

chatgpt

Shell script to use OpenAI's ChatGPT and DALL-E from the terminal.

More information: https://github.com/0xacx/chatGPT-shell-cli.

- Start in chat mode:

```
chatgpt
```

- Give a prompt to answer to:

```
chatgpt {{[-p|--prompt]}} "{{What is the regex to match an email address?}}"
```

- Start in chat mode using a specific model (default is `gpt-3.5-turbo`):

```
chatgpt {{[-m|--model]}} {{gpt-4}}
```

- Start in chat mode with an initial prompt:

```
chatgpt {{[-i|--init-prompt]}} "{{You are Rick, from Rick and Morty. Respond to questions using his mannerism and include insulting jokes.}}"
```

- Pipe the result of a command to `chatgpt` as a prompt:

```
echo "{{How to view running processes on Ubuntu?}}" | chatgpt
```

- Generate an image using DALL-E:

```
chatgpt {{[-p|--prompt]}} "{{image: A white cat}}"
```

chdman

Manage and convert CHD (Compressed Hunks of Data) images.

Commonly used with MAME and retro game images.

More information: https://docs.mamedev.org/tools/chdman.html.

- Create a CHD from a BIN/CUE pair (CD-ROM image):

```
chdman createcd {{[-i|--input]}} {{path/to/file.cue}} {{[-o|--output]}} {{path/to/file.chd}}
```

- Create a CHD from a raw hard drive image:

```
chdman createhd {{[-i|--input]}} {{path/to/disk.img}} {{[-o|--output]}} {{path/to/disk.chd}}
```

- Extract (decompress) a CHD back to BIN/CUE:

```
chdman extractcd {{[-i|--input]}} {{path/to/file.chd}} {{[-o|--output]}} {{path/to/file.cue}}
```

- Verify integrity of CHD file:

```
chdman verify {{[-i|--input]}} {{path/to/file.chd}}
```

- View CHD metadata information:

```
chdman info {{[-i|--input]}} {{path/to/file.chd}}
```

- Update a CHD file to the latest format version:

```
chdman copy {{[-i|--input]}} {{path/to/old_file.chd}} {{[-o|--output]}} {{path/to/new_file.chd}}
```

- Convert a compressed hard drive image to uncompressed (for editing):

```
chdman extracthd {{[-i|--input]}} {{path/to/disk.chd}} {{[-o|--output]}} {{path/to/disk.img}}
```

cheat

Create and view interactive cheat sheets.

More information: https://github.com/cheat/cheat/blob/master/doc/cheat.1.md.

- Show example usage of a command:

```
cheat {{command}}
```

- Edit the cheat sheet for a command:

```
cheat {{[-e|--edit]}} {{command}}
```

- List the available cheat sheets:

```
cheat {{[-l|--list]}}
```

- Search available the cheat sheets for a specified command name:

```
cheat {{[-s|--search]}} {{command}}
```

- Display version:

```
cheat {{[-v|--version]}}
```

cheatshh

CLI cheatsheet with customized descriptions, tldr and groups, to look into for your reference.

Press **<Enter>** to a command to copy it to your clipboard and exit.

More information: https://github.com/AnirudhG07/cheatshh/blob/main/docs/man/cheatshh.1.

- Add a new command to the cheatshheet:

  `cheatshh {{[-a|--add]}}`

- Edit an existing command's description or group in the cheatshheet:

  `cheatshh {{[-ec|--edit-command]}}`

- Delete an existing command from the cheatshheet:

  `cheatshh {{[-dc|--delete-command]}}`

- Create a new group:

  `cheatshh {{[-g|--group]}}`

- Edit an existing group's name or description in the cheatsheet:

  `cheatshh {{[-eg|--edit-group]}}`

- Delete an existing group and it's sub commands from commands.json file:

  `cheatshh {{[-dg|--delete-group]}}`

- Display man pages after tldr in the preview:

  `cheatshh {{[-m|--man]}}`

checkov

Checkov is a static code analysis tool for Infrastructure as Code (IaC).

It is also a software composition analysis (SCA) tool for images and open source packages.

More information: https://www.checkov.io/1.Welcome/Quick%20Start.html.

- Scan a directory containing IaC (Terraform, Cloudformation, ARM, Ansible, Bicep, Dockerfile, etc):

  ```
  checkov --directory {{path/to/directory}}
  ```

- Scan an IaC file, omitting code blocks in the output:

  ```
  checkov --compact --file {{path/to/file}}
  ```

- List all checks for all IaC types:

  ```
  checkov --list
  ```

checksec

Check security properties of executables.

More information: https://manned.org/checksec.

- List security properties of an executable binary file:

```
checksec --file={{path/to/binary}}
```

- List security properties recursively of all executable files in a directory:

```
checksec --dir={{path/to/directory}}
```

- List security properties of a process:

```
checksec --proc={{pid}}
```

- List security properties of the running kernel:

```
checksec --kernel
```

chezmoi

A multi-machine dotfile manager, written in Go.

See also: **`stow`**, **`tuckr`**, **`vcsh`**, **`homeshick`**.

More information: https://www.chezmoi.io/reference/.

- Setup up `chezmoi`, creating a Git repository in `~/.local/share/chezmoi`:

```
chezmoi init
```

- Set up `chezmoi` from existing dotfiles of a Git repository:

```
chezmoi init {{repository_url}}
```

- Start tracking one or more dotfiles:

```
chezmoi add {{path/to/dotfile1 path/to/dotfile2 ...}}
```

- Update repository with local changes:

```
chezmoi re-add {{path/to/dotfile1 path/to/dotfile2 ...}}
```

- Edit the source state of a tracked dotfile:

```
chezmoi edit {{path/to/dotfile_or_symlink}}
```

- See pending changes:

```
chezmoi diff
```

- Apply the changes:

```
chezmoi -v apply
```

- Pull changes from a remote repository and apply them:

```
chezmoi update
```

chgrp

Change group ownership of files and directories.

See also: **chown**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/chgrp-invocation.html.

- Change the owner group of a file/directory:

```
chgrp {{group}} {{path/to/file_or_directory}}
```

- Recursively change the owner group of a directory and its contents:

```
chgrp {{[-R|--recursive]}} {{group}} {{path/to/directory}}
```

- Change the owner group of a symbolic link:

```
chgrp {{[-h|--no-dereference]}} {{group}} {{path/to/symlink}}
```

- Change the owner group of a file/directory to match a reference file:

```
chgrp --reference {{path/to/reference_file}} {{path/to/file_or_directory}}
```

chisel

Create TCP/UDP tunnels, transported over HTTP, secured via SSH.

Includes both client and server in the same **`chisel`** executable.

More information: https://github.com/jpillora/chisel#usage.

- Run a Chisel server:

```
chisel server
```

- Run a Chisel server listening to a specific port:

```
chisel server {{[-p|--port]}} {{server_port}}
```

- Run a chisel server that accepts authenticated connections using username and password:

```
chisel server --auth {{username}}:{{password}}
```

- Connect to a Chisel server and tunnel a specific port to a remote server and port:

```
chisel client {{server_ip}}:{{server_port}} {{local_port}}:
{{remote_server}}:{{remote_port}}
```

- Connect to a Chisel server and tunnel a specific host and port to a remote server and port:

```
chisel client {{server_ip}}:{{server_port}} {{local_host}}:
{{local_port}}:{{remote_server}}:{{remote_port}}
```

- Connect to a Chisel server using username and password authentication:

```
chisel client --auth {{username}}:{{password}} {{server_ip}}:
{{server_port}} {{local_port}}:{{remote_server}}:
{{remote_port}}
```

- Initialize a Chisel server in reverse mode on a specific port, also enabling SOCKS5 proxy (on port 1080) functionality:

```
chisel server {{[-p|--port]}} {{server_port}} --reverse --
socks5
```

- Connect to a Chisel server at specific IP and port, creating a reverse tunnel mapped to a local SOCKS proxy:

```
chisel client {{server_ip}}:{{server_port}} R:socks
```

chkfont

Verify the format of a FIGlet font file (**`.flf`**).

See also: **`figlet`**, **`figlist`**, **`showfigfonts`**.

More information: https://manned.org/chkfont.

- Check a font file for formatting errors:

```
chkfont {{path/to/font.flf}}
```

- Check all `.flf` font files in a directory:

```
chkfont {{path/to/fonts}}/*.flf
```

chkrootkit

Scan system for rootkits.

More information: https://manned.org/chkrootkit.

- Enable [q]uiet mode and suppress normal test results:

```
chkrootkit -q
```

- Enable e[x]pert mode and produce additional outputs:

```
chkrootkit -x
```

- Enable [d]ebug mode to show all output:

```
chkrootkit -d
```

- Specify [e]xcluded files for some tests:

```
chkrootkit -e "{{path/to/file}}"
```

- Specify a directory as the [r]oot for testing (e.g. mounted `ext` drives):

```
chkrootkit -r {{path/to/directory}}
```

- Ignore [n]fs-mounted directories:

```
chkrootkit -n
```

- Invoke [T]ests and ignore specific filesystem types:

```
chkrootkit -T {{filesystemtype}}
```

- Generate [l]ist of available tests:

```
chkrootkit -l
```

chmod

Change the access permissions of a file or directory.

More information: https://www.gnu.org/software/coreutils/manual/html_node/chmod-invocation.html.

- Give the [u]ser who owns a file the right to e[x]ecute it:

```
chmod u+x {{path/to/file}}
```

- Give the [u]ser rights to [r]ead and [w]rite to a file/directory:

```
chmod u+rw {{path/to/file_or_directory}}
```

- Remove e[x]ecutable rights from the [g]roup:

```
chmod g-x {{path/to/file}}
```

- Give [a]ll users rights to [r]ead and e[x]ecute:

```
chmod a+rx {{path/to/file}}
```

- Give [o]thers (not in the file owner's group) the same rights as the [g]roup:

```
chmod o=g {{path/to/file}}
```

- Remove all rights from [o]thers:

```
chmod o= {{path/to/file}}
```

- Change permissions recursively giving [g]roup and [o]thers the ability to [w]rite:

```
chmod {{[-R|--recursive]}} g+w,o+w {{path/to/directory}}
```

- Recursively give [a]ll users [r]ead permissions to files. Also give e[X]ecute permissions to files that have at least one execution permission and to all sub-directories:

```
chmod {{[-R|--recursive]}} a+rX {{path/to/directory}}
```

choose

A human-friendly and fast alternative to cut and (sometimes) awk.

More information: https://github.com/theryangeary/choose#usage.

- Print the 5th item from a line (starting from 0):

```
choose {{4}}
```

- Print the first, 3rd, and 5th item from a line, where items are separated by ':' instead of whitespace:

```
choose {{[-f|--field-separator]}} '{{:}}' {{0}} {{2}} {{4}}
```

- Print everything from the 2nd to 5th item on the line, including the 5th:

```
choose {{1}}:{{4}}
```

- Print everything from the 2nd to 5th item on the line, excluding the 5th:

```
choose {{[-x|--exclusive]}} {{1}}:{{4}}
```

- Print the beginning of the line to the 3rd item:

```
choose :{{2}}
```

- Print all items from the beginning of the line until the 3rd item (exclusive):

```
choose {{[-x|--exclusive]}} :{{2}}
```

- Print all items from the 3rd to the end of the line:

```
choose {{2}}:
```

- Print the last item from a line:

```
choose {{-1}}
```

chown

Change user and group ownership of files and directories.

See also: **chgrp**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/chown-invocation.html.

- Change the owner user of a file/directory:

```
sudo chown {{user}} {{path/to/file_or_directory}}
```

- Change the owner user and group of a file/directory:

```
sudo chown {{user}}:{{group}} {{path/to/file_or_directory}}
```

- Change the owner user and group to both have the name `user`:

```
sudo chown {{user}}: {{path/to/file_or_directory}}
```

- Change the group of a file to a group that the current user belongs to:

```
chown :{{group}} {{path/to/file_or_directory}}
```

- Recursively change the owner of a directory and its contents:

```
sudo chown {{[-R|--recursive]}} {{user}} {{path/to/directory}}
```

- Change the owner of a symbolic link:

```
sudo chown {{[-h|--no-dereference]}} {{user}} {{path/to/symlink}}
```

- Change the owner of a file/directory to match a reference file:

```
sudo chown --reference {{path/to/reference_file}} {{path/to/file_or_directory}}
```

chroma

A general-purpose syntax highlighter.

The **`--lexer`** option is usually unnecessary, as it will be automatically determined based on the file extension.

More information: https://manned.org/chroma.

- Highlight source code from a file with the Python lexer and output to `stdout`:

```
chroma {{[-l|--lexer]}} {{python}} {{path/to/source_file.py}}
```

- Highlight source code from a file with the Go lexer and output to an HTML file:

```
chroma {{[-l|--lexer]}} {{go}} {{[-f|--formatter]}} {{html}}
{{path/to/source_file.go}} > {{path/to/target_file.html}}
```

- Highlight source code from `stdin` with the C++ lexer and output to an SVG file, using the Monokai style:

```
{{command}} | chroma {{[-l|--lexer]}} {{c++}} {{[-f|--
formatter]}} {{svg}} {{[-s|--style]}} {{monokai}} > {{path/
to/target_file.svg}}
```

- List available lexers, styles, and formatters:

```
chroma --list
```

chromium

Open-source web browser principally developed and maintained by Google.

Note: You may need to replace the **`chromium`** command with your desired web browser, such as **`brave`**, **`google-chrome`**, **`opera`**, or **`vivaldi`**.

More information: https://www.chromium.org/developers/how-tos/run-chromium-with-flags/.

- Open a specific URL or file:

```
chromium {{https://example.com|path/to/file.html}}
```

- Open in incognito mode:

```
chromium --incognito {{example.com}}
```

- Open in a new window:

```
chromium --new-window {{example.com}}
```

- Open in application mode (without toolbars, URL bar, buttons, etc.):

```
chromium --app={{https://example.com}}
```

- Use a proxy server:

```
chromium --proxy-server="{{socks5://hostname:
66}}" {{example.com}}
```

- Open with a custom profile directory:

```
chromium --user-data-dir={{path/to/directory}}
```

- Open without CORS validation (useful to test an API):

```
chromium --user-data-dir={{path/to/directory}} --disable-web-
security
```

- Open with a DevTools window for each tab opened:

```
chromium --auto-open-devtools-for-tabs
```

chronic

Display **`stdout`** and **`stderr`** of a command if and only if it fails.

More information: https://manned.org/chronic.

- Display `stdout` and `stderr` of the specified command if and only if it produces a non-zero exit code or crashes:

```
chronic {{command}} {{option1 option2 ...}}
```

- Display `stdout` and `stderr` of the specified command if and only if it produces a non-empty `stderr`:

```
chronic -e {{command}} {{option1 option2 ...}}
```

- Enable [v]erbose mode:

```
chronic -v {{command}} {{option1 option2 ...}}
```

chronyc

Query the Chrony NTP daemon.

More information: https://chrony-project.org/doc/latest/chronyc.html.

- Start `chronyc` in interactive mode:

  `chronyc`

- Display tracking stats for the Chrony daemon:

  `chronyc tracking`

- Print the time sources that Chrony is currently using:

  `chronyc sources`

- Display stats for sources currently used by chrony daemon as a time source:

  `chronyc sourcestats`

- Step the system clock immediately, bypassing any slewing:

  `chronyc makestep`

- Display verbose information about each NTP source:

  `chronyc ntpdata`

chroot

Run command or interactive shell with special root directory.

More information: https://www.gnu.org/software/coreutils/manual/html_node/chroot-invocation.html.

- Run $SHELL in the new root directory:

```
sudo chroot {{path/to/new_root}}
```

- Run command as new root directory:

```
sudo chroot {{path/to/new_root}} {{command}}
```

- Use a specific user and group:

```
sudo chroot --userspec {{username_or_id}}:
{{group_name_or_id}} {{path/to/new_root}}
```

ci

Check in RCS revisions (store file changes in the Revision Control System).

See also: **`co`**, **`rcs`**, **`rcsdiff`**, **`rlog`**.

More information: https://manned.org/ci.

- Check in a file and keep the working file unlocked:

```
ci -u {{path/to/file}}
```

- Check in a file and keep the working file locked:

```
ci -l {{path/to/file}}
```

- Check in a file with a specific log message:

```
ci -m"{{log_message}}" {{path/to/file}}
```

- Check in a file, unlocking it but leaving the working file read-only:

```
ci {{path/to/file}}
```

- Force check-in even if there are no changes:

```
ci -f -u {{path/to/file}}
```

cidr

Simplifies IPv4/IPv6 CIDR network prefix management with counting, overlap checking, explanation, and subdivision.

More information: https://github.com/bschaatsbergen/cidr.

- Explain a CIDR range:

  ```
  cidr explain {{10.0.0.0/16}}
  ```

- Check whether an address belongs to a CIDR range:

  ```
  cidr contains {{10.0.0.0/16}} {{10.0.14.5}}
  ```

- Get a count of all addresses in a CIDR range:

  ```
  cidr count {{10.0.0.0/16}}
  ```

- Check whether two CIDR ranges overlap:

  ```
  cidr overlaps {{10.0.0.0/16}} {{10.0.14.0/22}}
  ```

- Divide a CIDR range into a specific number of networks:

  ```
  cidr divide {{10.0.0.0/16}} {{9}}
  ```

circo

Render an image of a **circular** network graph from a **graphviz** file.

Layouts: **dot**, **neato**, **twopi**, **circo**, **fdp**, **sfdp**, **osage** & **patchwork**.

More information: https://graphviz.org/doc/info/command.html.

- Render a PNG image with a filename based on the input filename and output format (uppercase -O):

```
circo -T {{png}} -O {{path/to/input.gv}}
```

- Render a SVG image with the specified output filename (lowercase -o):

```
circo -T {{svg}} -o {{path/to/image.svg}} {{path/to/input.gv}}
```

- Render the output in PS, PDF, SVG, Fig, PNG, GIF, JPEG, JSON, or DOT format:

```
circo -T {{format}} -O {{path/to/input.gv}}
```

- Render a GIF image using `stdin` and `stdout`:

```
echo "{{digraph {this -> that} }}" | circo -T {{gif}} > {{path/to/image.gif}}
```

- Display help:

```
circo -?
```

circup

The CircuitPython library updater.

More information: https://github.com/adafruit/circup#usage.

- Interactively update modules on a device:

  ```
  circup update
  ```

- Install a new library:

  ```
  circup install {{library_name}}
  ```

- Search for a library:

  ```
  circup show {{partial_name}}
  ```

- List all libraries on a connected device in `requirements.txt` format:

  ```
  circup freeze
  ```

- Save all libraries on a connected device in `requirements.txt` in current directory:

  ```
  circup freeze {{[-r|--requirement]}}
  ```

cjxl

Compress images to JPEG XL.

Accepted input extensions are PNG, APNG, GIF, JPEG, EXR, PPM, PFM, PAM, PGX, and JXL.

More information: https://github.com/libjxl/libjxl/blob/main/doc/man/cjxl.txt.

- Convert an image to JPEG XL:

```
cjxl {{path/to/image.ext}} {{path/to/output.jxl}}
```

- Set quality to lossless and maximize compression of the resulting image:

```
cjxl --distance 0 --effort 9 {{path/to/image.ext}} {{path/to/output.jxl}}
```

- Display an extremely detailed help:

```
cjxl {{[-h -v -v -v -v|--help --verbose --verbose --verbose --verbose]}}
```

cksum

Calculate CRC checksums and byte counts of a file.

Note: On old UNIX systems the CRC implementation may differ.

More information: https://www.gnu.org/software/coreutils/manual/html_node/cksum-invocation.html.

- Display a 32-bit checksum, size in bytes and filename:

```
cksum {{path/to/file}}
```

ClamAV

Open-source anti-virus program.

ClamAV isn't a command, but a set of commands.

More information: https://www.clamav.net/.

- View documentation for scanning files using the `clamd` daemon:

  `tldr clamdscan`

- View documentation for scanning files without the `clamd` daemon running:

  `tldr clamscan`

- View documentation for updating the virus definitions:

  `tldr freshclam`

clamdscan

Scan for viruses using the ClamAV Daemon.

More information: https://docs.clamav.net/manual/Usage/Scanning.html#clamdscan.

- Scan a file or directory for vulnerabilities:

```
clamdscan {{path/to/file_or_directory}}
```

- Scan data from `stdin`:

```
{{command}} | clamdscan -
```

- Scan the current directory and output only infected files:

```
clamdscan --infected
```

- Print the scan report to a log file:

```
clamdscan --log {{path/to/log_file}}
```

- Move infected files to a specific directory:

```
clamdscan --move {{path/to/quarantine_directory}}
```

- Remove infected files:

```
clamdscan --remove
```

- Use multiple threads to scan a directory:

```
clamdscan --multiscan
```

- Pass the file descriptor instead of streaming the file to the daemon:

```
clamdscan --fdpass
```

clamscan

A virus scanner.

More information: https://docs.clamav.net/manual/Usage/Scanning.html#clamscan.

- Scan a file for vulnerabilities:

```
clamscan {{path/to/file}}
```

- Scan all files recursively in a specific directory:

```
clamscan {{[-r|--recursive]}} {{path/to/directory}}
```

- Scan data from `stdin`:

```
{{command}} | clamscan -
```

- Specify a virus database file or directory of files:

```
clamscan {{[-d|--database]}} {{path/to/
database_file_or_directory}}
```

- Scan the current directory and output only infected files:

```
clamscan {{[-i|--infected]}}
```

- Print the scan report to a log file:

```
clamscan {{[-l|--log]}} {{path/to/log_file}}
```

- Move infected files to a specific directory:

```
clamscan --move {{path/to/quarantine_directory}}
```

- Remove infected files:

```
clamscan --remove yes
```

clang++

Compile C++ source files.

Part of LLVM.

More information: https://clang.llvm.org/docs/UsersManual.html#command-line-options.

- Compile a set of source code files into an executable binary:

```
clang++ {{path/to/source1.cpp path/to/source2.cpp ...}} {{[-o|--output]}} {{path/to/output_executable}}
```

- Activate output of all errors and warnings:

```
clang++ {{path/to/source.cpp}} -Wall {{[-o|--output]}} {{output_executable}}
```

- Show common warnings, debug symbols in output, and optimize without affecting debugging:

```
clang++ {{path/to/source.cpp}} -Wall {{[-g|--debug]}} -Og {{[-o|--output]}} {{path/to/output_executable}}
```

- Choose a language standard to compile for:

```
clang++ {{path/to/source.cpp}} -std={{c++20}} {{[-o|--output]}} {{path/to/output_executable}}
```

- Include libraries located at a different path than the source file:

```
clang++ {{path/to/source.cpp}} {{[-o|--output]}} {{path/to/output_executable}} -I{{path/to/header_path}} -L{{path/to/library_path}} -l{{path/to/library_name}}
```

- Compile source code into LLVM Intermediate Representation (IR):

```
clang++ {{[-S|--assemble]}} -emit-llvm {{path/to/source.cpp}} {{[-o|--output]}} {{path/to/output.ll}}
```

- Optimize the compiled program for performance:

```
clang++ {{path/to/source.cpp}} -O{{1|2|3|fast}} {{[-o|--output]}} {{path/to/output_executable}}
```

- Display version:

```
clang++ --version
```

clang-check

Check basic errors and work with Clang's Abstract Syntax Tree (AST).

Part of Clang's LibTooling and is useful for debugging and analyzing C/C++ code.

More information: https://manned.org/clang-check.

- Run default checks on a source file:

```
clang-check {{path/to/file.cpp}} --
```

- Dump the Abstract Syntax Tree for debugging:

```
clang-check {{path/to/file.cpp}} -ast-dump --
```

- Filter AST by Name:

```
clang-check {{path/to/file.cpp}} -ast-dump -ast-dump-filter
FunctionName
```

- Pretty-Print AST:

```
clang-check {{path/to/file.cpp}} -ast-print --
```

clang-cpp

This command is an alias of **`clang++`**.

- View documentation for the original command:

```
tldr clang++
```

clang-format

Auto-format C/C++/Java/JavaScript/Objective-C/Protobuf/C# code.

More information: https://clang.llvm.org/docs/ClangFormat.html.

- Format a file and print the result to `stdout`:

```
clang-format {{path/to/file}}
```

- Format a file in-place:

```
clang-format -i {{path/to/file}}
```

- Format a file using a predefined coding style:

```
clang-format --style {{LLVM|GNU|Google|Chromium|Microsoft|
Mozilla|WebKit}} {{path/to/file}}
```

- Format a file using the `.clang-format` file in one of the parent directories of the source file:

```
clang-format --style=file {{path/to/file}}
```

- Generate a custom `.clang-format` file:

```
clang-format --style {{LLVM|GNU|Google|Chromium|Microsoft|
Mozilla|WebKit}} --dump-config > {{.clang-format}}
```

clang-tidy

An LLVM-based C/C++ linter to find style violations, bugs, and security flaws through static analysis.

More information: https://clang.llvm.org/extra/clang-tidy/.

- Run default checks on a source file:

```
clang-tidy {{path/to/file.cpp}}
```

- Don't run any checks other than the `cppcoreguidelines` checks on a file:

```
clang-tidy {{path/to/file.cpp}} -checks={{-
*,cppcoreguidelines-*}}
```

- List all available checks:

```
clang-tidy -checks={{*}} -list-checks
```

- Specify defines and includes as compilation options (after `--`):

```
clang-tidy {{path/to/file.cpp}} -- -I{{my_project/include}} -
D{{definitions}}
```

clang

Compile C, C++, and Objective-C source files. Can be used as a drop-in replacement for GCC.

Part of LLVM.

More information: https://clang.llvm.org/docs/ClangCommandLineReference.html.

- Compile multiple source files into an executable:

```
clang {{path/to/source1.c path/to/source2.c ...}} {{[-o|--output]}} {{path/to/output_executable}}
```

- Activate output of all errors and warnings:

```
clang {{path/to/source.c}} -Wall {{[-o|--output]}} {{output_executable}}
```

- Show common warnings, debug symbols in output, and optimize without affecting debugging:

```
clang {{path/to/source.c}} -Wall {{[-g|--debug]}} -Og {{[-o|--output]}} {{path/to/output_executable}}
```

- Include libraries from a different path:

```
clang {{path/to/source.c}} {{[-o|--output]}} {{path/to/output_executable}} -I{{path/to/header}} -L{{path/to/library}} -l{{library_name}}
```

- Compile source code into LLVM Intermediate Representation (IR):

```
clang {{[-S|--assemble]}} -emit-llvm {{path/to/source.c}} {{[-o|--output]}} {{path/to/output.ll}}
```

- Compile source code into an object file without linking:

```
clang {{[-c|--compile]}} {{path/to/source.c}}
```

- Optimize the compiled program for performance:

```
clang {{path/to/source.c}} -O{{1|2|3|fast}} {{[-o|--output]}} {{path/to/output_executable}}
```

- Display version:

```
clang --version
```

clangd

Language server that provides IDE-like features to editors.

It should be used via an editor plugin rather than invoked directly.

More information: https://manpages.ubuntu.com/manpages/man1/clangd.1.

- Display available options:

```
clangd --help
```

- List of available options:

```
clangd --help-list
```

- Display version:

```
clangd --version
```

claude

An agent-based coding tool that understands your code base and helps you code faster through natural language commands.

More information: https://code.claude.com/docs/en/overview.

- Execute with prompt:

  ```
  claude prompt
  ```

- Update `claude`:

  ```
  claude update
  ```

- Get the list of specified MCP servers:

  ```
  claude mcp list
  ```

- Create commit with command:

  ```
  claude commit
  ```

- Get the list of configurations:

  ```
  claude config list
  ```

- Continue the most recent session:

  ```
  claude {{[-c|--continue]}}
  ```

- Interactively select a session to continue:

  ```
  claude {{[-r|--resume]}}
  ```

clear

Clears the screen of the terminal.

More information: https://manned.org/clear.

- Clear the screen:

```
clear
```

- Clear the screen but keep the terminal's scrollback buffer (equivalent to pressing `<Ctrl l>` in Bash):

```
clear -x
```

- Indicate the type of terminal to clean (defaults to the value of the environment variable `$TERM`):

```
clear -T {{type_of_terminal}}
```

- Display the version of `ncurses` used by `clear`:

```
clear -V
```

clementine

A modern music player and library organizer.

See also: **audacious**, **qmmp**, **cmus**, **mpv**.

More information: https://manned.org/clementine.

- Start the GUI or bring it to front:

```
clementine
```

- Start playing music:

```
clementine {{URL|path/to/music.ext}}
```

- Toggle between pausing and playing:

```
clementine {{[-t|--play-pause]}}
```

- Stop playback:

```
clementine {{[-s|--stop]}}
```

- Skip to the next or previous track:

```
clementine --{{next|previous}}
```

- Create a new playlist with one or more music files or URLs:

```
clementine {{[-c|--create]}} {{URL1|path/to/music1.ext URL2|
path/to/music2.ext ...}}
```

- Load a playlist file:

```
clementine {{[-l|--load]}} {{path/to/playlist.ext}}
```

- Play a specific track in the currently loaded playlist:

```
clementine {{[-k|--play-track]}} {{5}}
```

cli4

Python command-line interface for Cloudflare API.

More information: https://github.com/cloudflare/python-cloudflare.

- Display account information:

```
cli4 {{/user}}
```

- List all zones:

```
cli4 {{/zones}}
```

- List DNS records for a specific zone:

```
cli4 {{/zones/:example.com/dns_records}}
```

- Create a new DNS record:

```
cli4 --post {{name=example.com}} {{type=A}}
{{content=192.0.2.1}} {{/zones/:example.com/dns_records}}
```

- Update an existing DNS record:

```
cli4 --put {{name=sub.example.com}} {{type=A}}
{{content=192.0.2.2}} {{/zones/:example.com/
dns_records/:record_id}}
```

- Delete a DNS record:

```
cli4 --delete {{/zones/:example.com/dns_records/:record_id}}
```

- Purge all cache for a zone:

```
cli4 --post {{purge_everything=true}} {{/zones/:example.com/
purge_cache}}
```

cli53

Tool for Amazon Route 53.

More information: https://github.com/barnybug/cli53.

- List domains:

```
cli53 list
```

- Create a domain:

```
cli53 create {{example.com}} --comment "{{comment}}"
```

- Export a bind zone file to `stdout`:

```
cli53 export {{example.com}}
```

- Create a `www` subdomain pointing to a relative record in the same zone:

```
cli53 {{[rc|rrcreate]}} {{example.com}} '{{www 300 CNAME
lb}}'
```

- Create a `www` subdomain pointing to an external address (must end with a dot):

```
cli53 {{[rc|rrcreate]}} {{example.com}} '{{www 300 CNAME
lb.example.com.}}'
```

- Create a `www` subdomain pointing to an IP address:

```
cli53 {{[rc|rrcreate]}} {{example.com}} '{{www 300 A
150.130.110.1}}'
```

- Replace a `www` subdomain pointing to a different IP:

```
cli53 {{[rc|rrcreate]}} --replace '{{www 300 A
150.130.110.2}}'
```

- Delete a record A:

```
cli53 {{[rd|rrdelete]}} {{example.com}} {{www}} {{A}}
```

clido

Save-state TODO app for the terminal.

More information: https://gitlab.com/Oglo12/clido-legacy#how-to-use.

- Create a list:

```
clido --new {{name}}
```

- Load a list:

```
clido --load {{name}}
```

- Delete a list:

```
clido --remove {{name}}
```

- List all lists:

```
clido --lists
```

- Toggle autowrite:

```
clido toggle-autowrite
```

- Open a list in a text editor:

```
clido edit {{text_editor}}
```

- Display help:

```
clido -h
```

- Display version:

```
clido -v
```

clifm

The command-line file manager.

See also: **`vifm`**, **`ranger`**, **`mc`**, **`nautilus`**.

More information: https://github.com/leo-arch/clifm.

- Start CliFM:

  `clifm`

- Open the file or directory whose ELN (entry list number) is 12:

  `12`

- Create a new file and a new directory:

  `<n>file dir/`

- Search for PDF files in the current directory:

  `</>*.pdf`

- Select all PNG files in the current directory:

  `<s> *.png`

- Remove the previously selected files (use `<t>` to send the files to the recycle bin instead):

  `<r>sel`

- Display help:

  `<?>`

- Exit CliFM:

  `<q>`

clip-view

Command Line Interface Pages (CLIP) render.

Render for a TlDr-like project with much a more extensive syntax and several render modes.

More information: https://github.com/command-line-interface-pages/v2-tooling/tree/main/clip-view.

- Render specific local pages:

```
clip-view {{path/to/page1.clip path/to/page2.clip ...}}
```

- Render specific remote pages:

```
clip-view {{page_name1 page_name2 ...}}
```

- Render pages by a specific render:

```
clip-view --render {{tldr|tldr-colorful|docopt|docopt-
colorful}} {{page_name1 page_name2 ...}}
```

- Render pages with a specific color theme:

```
clip-view --theme {{path/to/local_theme.yaml|
remote_theme_name}} {{page_name1 page_name2 ...}}
```

- Clear a page or theme cache:

```
clip-view --clear-{{page|theme}}-cache
```

- Display help:

```
clip-view --help
```

- Display version:

```
clip-view --version
```

clj

Clojure tool to start a REPL or invoke a function with data.

All options can be defined in a **`deps.edn`** file.

More information: https://clojure.org/guides/deps_and_cli.

- Start a REPL (interactive shell):

  ```
  clj
  ```

- Execute a function:

  ```
  clj -X {{namespace/function_name}}
  ```

- Run the main function of a specified namespace:

  ```
  clj -M {{[-m|--main]}} {{namespace}} {{args}}
  ```

- Prepare a project by resolving dependencies, downloading libraries, and making/caching classpaths:

  ```
  clj -P
  ```

- Start an nREPL server with the CIDER middleware:

  ```
  clj -Sdeps '{:deps {nrepl {:mvn/version "0.7.0"} cider/cider-nrepl {:mvn/version "0.25.2"}}}' {{[-m|--main]}} nrepl.cmdline --middleware '["cider.nrepl/cider-middleware"]' --interactive
  ```

- Start a REPL for ClojureScript and open a web browser:

  ```
  clj -Sdeps '{:deps {org.clojure/clojurescript {:mvn/version "1.10.758"}}}' {{[-m|--main]}} cljs.main {{[-r|--repl]}}
  ```

cloc

Count lines of code.

More information: https://github.com/AlDanial/cloc#options-.

- Count all the lines of code in a directory:

  `cloc {{path/to/directory}}`

- Compare 2 directory structures and count the differences between them:

  `cloc --diff {{path/to/directory1}} {{path/to/directory2}}`

- Ignore files that are ignored by VCS, such as files specified in `.gitignore`:

  `cloc --vcs git {{path/to/directory}}`

- Display the results for each file instead of each language:

  `cloc --by-file {{path/to/directory}}`

clockwork-cli

Interface for the Clockwork PHP debugging framework.

More information: https://github.com/ptrofimov/clockwork-cli.

- Monitor Clockwork logs for the current project:

  ```
  clockwork-cli
  ```

- Monitor Clockwork logs for a specific project:

  ```
  clockwork-cli {{path/to/directory}}
  ```

- Monitor Clockwork logs for multiple projects:

  ```
  clockwork-cli {{path/to/directory1 path/to/directory2 ...}}
  ```

clojure

This command is an alias of **`clj`**.

- View documentation for the original command:

  ```
  tldr clj
  ```

cloudflared

Create a persistent connection to the Cloudflare network.

More information: https://developers.cloudflare.com/cloudflare-one/networks/connectors/cloudflare-tunnel/.

- Authenticate and associate the connection to a domain in the Cloudflare account:

```
cloudflared tunnel login
```

- Create a tunnel with a specific name:

```
cloudflared tunnel create {{name}}
```

- Establish a tunnel to a host in Cloudflare from the local server:

```
cloudflared tunnel --hostname {{hostname}} localhost:
{{port_number}}
```

- Establish a tunnel to a host in Cloudflare from the local server, without verifying the local server's certificate:

```
cloudflared tunnel --hostname {{hostname}} localhost:
{{port_number}} --no-tls-verify
```

- Save logs to a file:

```
cloudflared tunnel --hostname {{hostname}} http://localhost:
{{port_number}} --loglevel {{panic|fatal|error|warn|info|
debug}} --logfile {{path/to/file}}
```

- Install cloudflared as a system service:

```
cloudflared service install
```

cluster

Find clusters in a graph and augment the graph with this information.

More information: https://graphviz.org/pdf/cluster.1.pdf.

- Generate clusters that optimize modularity and print the result to `stdout`:

```
cluster {{input.gv}}
```

- Specify a target number of [C]lusters (approximate) to generate (0 by default, meaning a number that approximately optimizes the modularity):

```
cluster -C {{5}} {{input.gv}}
```

- Use a different [c]lustering method (0: modularity clustering, 1: modularity quality):

```
cluster -c {{0|1}} {{input.gv}}
```

- Save the [o]utput to a file:

```
cluster -o {{output.gv}} {{input.gv}}
```

- Enable [v]erbose mode:

```
cluster -v {{input.gv}}
```

clusterdb

Cluster (reorganize) a PostgreSQL database.

More information: https://www.postgresql.org/docs/current/app-clusterdb.html.

- Cluster a specific database:

```
clusterdb {{database_name}}
```

- Cluster all databases:

```
clusterdb {{[-a|--all]}}
```

- Cluster a specific table in a database:

```
clusterdb {{[-t|--table]}} {{table_name}} {{database_name}}
```

cmake

Cross-platform build automation system, that generates recipes for native build systems.

More information: https://cmake.org/cmake/help/latest/manual/cmake.1.html.

- Generate a build recipe in the current directory with `CMakeLists.txt` from a project directory:

```
cmake {{path/to/project_directory}}
```

- Use a generated recipe in a given directory to build artifacts:

```
cmake --build {{path/to/build_directory}}
```

- Install the build artifacts into `/usr/local/` and strip debugging symbols:

```
cmake --install {{path/to/build_directory}} --strip
```

- Generate a build recipe, with build type set to `Release` with CMake variable:

```
cmake {{path/to/project_directory}} -D
CMAKE_BUILD_TYPE=Release
```

- Generate a build recipe using `generator_name` as the underlying build system:

```
cmake -G {{generator_name}} {{path/to/project_directory}}
```

- Install the build artifacts using a custom prefix for paths:

```
cmake --install {{path/to/build_directory}} --strip --prefix
{{path/to/directory}}
```

- Run a custom build target:

```
cmake --build {{path/to/build_directory}} {{[-t|--target]}}
{{target_name}}
```

- Display help:

```
cmake {{[-h|--help]}}
```

cmark

Convert CommonMark Markdown formatted text to other formats.

More information: https://manned.org/cmark.

- Render a CommonMark Markdown file to HTML:

```
cmark --to html {{filename.md}}
```

- Convert data from `stdin` to LaTeX:

```
cmark --to latex
```

- Convert straight quotes to smart quotes:

```
cmark --smart --to html {{filename.md}}
```

- Validate UTF-8 characters:

```
cmark --validate-utf8 {{filename.md}}
```

cmatrix

Show a scrolling Matrix like screen in the terminal.

See also: **`cbonsai`**, **`asciiquarium`**, **`pipes.sh`**.

More information: https://manned.org/cmatrix.

- Enable [a]synchronous scrolling:

```
cmatrix -a
```

- Change the text [C]olor (green by default):

```
cmatrix -C {{red}}
```

- Enable [r]ainbow mode:

```
cmatrix -r
```

- Use a screen [u]pdate delay of 100 centiseconds (1 second):

```
cmatrix -u 100
```

- Use [s]creensaver mode where the first keystroke exits:

```
cmatrix -s
```

cmctl

Manage cert-manager resources inside your cluster.

Check cert signing status, approve/deny requests, and issue new certificate requests.

More information: https://cert-manager.io/docs/reference/cmctl/.

- Check if the cert-manager API is ready:

```
cmctl check api
```

- Check the status of a certificate:

```
cmctl status certificate {{cert_name}}
```

- Create a new certificate request based on an existing certificate:

```
cmctl create certificaterequest my-cr --from-certificate-file {{cert.yaml}}
```

- Create a new certificate request, fetch the signed certificate, and set a maximum wait time:

```
cmctl create certificaterequest my-cr --from-certificate-file {{cert.yaml}} --fetch-certificate --timeout {{20m}}
```

cmd-wrapped

View shell history statistics.

More information: https://crates.io/crates/cmd-wrapped.

- Fetch current statistics:

```
cmd-wrapped
```

- Fetch statistics from a specific year:

```
cmd-wrapped {{year}}
```

- Specify a shell:

```
cmd-wrapped {{[-s|--shell]}} {{shell}}
```

- Display help:

```
cmd-wrapped {{[-h|--help]}}
```

- Display version:

```
cmd-wrapped {{[-V|--version]}}
```

cmp

Compare two files byte by byte.

More information: https://www.gnu.org/software/diffutils/manual/diffutils.html#Invoking-cmp.

- Output char and line number of the first difference between two files:

```
cmp {{path/to/file1}} {{path/to/file2}}
```

- Output info of the first difference: char, line number, bytes, and values:

```
cmp {{[-b|--print-bytes]}} {{path/to/file1}} {{path/to/file2}}
```

- Output the byte numbers and values of every difference:

```
cmp {{[-l|--verbose]}} {{path/to/file1}} {{path/to/file2}}
```

- Compare files but output nothing, yield only the exit status:

```
cmp {{[-s|--quiet]}} {{path/to/file1}} {{path/to/file2}}
```

cmuwmtopbm

Convert a CMU window manager bitmap to a PBM image.

See also: **pbmtocmuwm**.

More information: https://netpbm.sourceforge.net/doc/cmuwmtopbm.html.

- Convert a CMU window manager bitmap to a PBM image:

```
cmuwmtopbm {{path/to/image.pbm}} > {{path/to/output.bmp}}
```

co

Check out RCS revisions (retrieve working files from the Revision Control System).

See also: **`ci`**, **`rcs`**, **`rcsdiff`**, **`rlog`**.

More information: https://manned.org/co.

- Check out the latest revision of a file (retrieves a read-only copy):

```
co {{path/to/file}}
```

- Check out a file with a lock for editing:

```
co -l {{path/to/file}}
```

- Check out a specific revision of a file:

```
co -r{{revision}} {{path/to/file}}
```

- Check out a file and overwrite it if it already exists:

```
co -f -l {{path/to/file}}
```

- Print a specific revision to `stdout` without creating a file:

```
co -p -r{{revision}} {{path/to/file}}
```

code

Cross platform and extensible code editor.

More information: https://code.visualstudio.com/docs/configure/command-line.

- Start Visual Studio Code:

```
code
```

- Open specific files/directories:

```
code {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}}
```

- Compare two specific files:

```
code {{[-d|--diff]}} {{path/to/file1}} {{path/to/file2}}
```

- Open specific files/directories in a new window:

```
code {{[-n|--new-window]}} {{path/to/file_or_directory1 path/
to/file_or_directory2 ...}}
```

- Install/uninstall a specific extension:

```
code --{{install|uninstall}}-extension
{{publisher.extension}}
```

- Display diagnostic and process information about the running code window:

```
code {{[-s|--status]}}
```

- Print installed extensions with their versions:

```
code --list-extensions --show-versions
```

- Start the editor as a superuser (root) while storing user data in a specific directory:

```
sudo code --user-data-dir {{path/to/directory}}
```

code2prompt

Generate AI-ready prompts from a codebase (extract, filter, and format code for LLMs).

More information: https://code2prompt.dev/docs/how_to/filter_files/.

- Generate a prompt for the current project and copy it to the clipboard (default behavior):

```
code2prompt {{path/to/project}}
```

- Include only specific files and exclude a directory:

```
code2prompt {{path/to/project}} {{[-i|--include]}} "{{**/*.rs}}" {{[-e|--exclude]}} "{{tests/**}}"
```

- Write the prompt to a file instead of the clipboard:

```
code2prompt {{path/to/project}} {{[-O|--output-file]}} {{my_prompt.txt}}
```

- Produce structured JSON output:

```
code2prompt {{path/to/project}} {{[-F|--output-format]}} json
```

- Use a custom Handlebars template when generating the prompt:

```
code2prompt {{path/to/project}} {{[-t|--template]}} {{my_template.hbs}}
```

codecrafters

Practice writing complex software.

More information: https://docs.codecrafters.io/cli/usage.

- Run tests without committing changes:

  ```
  codecrafters test
  ```

- Run tests for all previous stages and the current stage without committing changes:

  ```
  codecrafters test --previous
  ```

- Commit changes and submit, to move to the next stage:

  ```
  codecrafters submit
  ```

- Update language version:

  ```
  codecrafters update-buildpack
  ```

codespell

Spellchecker for source code.

More information: https://manned.org/codespell.

- Check for typos in all text files in the current directory, recursively:

```
codespell
```

- Correct all typos found in-place:

```
codespell {{[-w|--write-changes]}}
```

- Skip files with names that match the specified pattern (accepts a comma-separated list of patterns using wildcards):

```
codespell {{[-S|--skip]}} "{{pattern}}"
```

- Use a custom dictionary file when checking (`--dictionary` can be used multiple times):

```
codespell {{[-D|--dictionary]}} {{path/to/file.txt}}
```

- Do not check words that are listed in the specified file:

```
codespell {{[-I|--ignore-words]}} {{path/to/file.txt}}
```

- Do not check the specified words:

```
codespell {{[-L|--ignore-words-list]}}
{{ignored_word1,ignored_word2,...}}
```

- Print 3 lines of [C]ontext around, [B]efore, or [A]fter each match:

```
codespell {{--context|--before-context|--after-context}} 3
```

- Check file names for typos, in addition to file contents:

```
codespell {{[-f|--check-filenames]}}
```

codex

Natural language code assistant for the terminal, powered by OpenAI.

Reads and edits files in your current directory to fulfill requests.

More information: https://github.com/openai/codex.

- Start an interactive Codex session in the current directory:

```
codex
```

- Run a single Codex command using a prompt:

```
codex "{{your prompt}}"
```

- Run a prompt with automatic approval of all file edits and commands:

```
codex {{[-a|--approval-mode]}} full-auto "{{your prompt}}"
```

- Use a specific provider and model:

```
codex --provider {{provider_name}} {{[-m|--model]}}
{{model_name}} "{{your prompt}}"
```

- Load the entire repository as context (experimental):

```
codex --full-context "{{your prompt}}"
```

- Show the resource usage for the current session (run this command inside a session):

```
/cost
```

- Display help:

```
codex --help
```

coffee

Execute CoffeeScript scripts or compiles them into JavaScript.

More information: https://coffeescript.org#cli.

- Run a script:

```
coffee {{path/to/file.coffee}}
```

- Compile to JavaScript and save to a file with the same name:

```
coffee --compile {{path/to/file.coffee}}
```

- Compile to JavaScript and save to a given output file:

```
coffee --compile {{path/to/file.coffee}} --output {{path/to/file.js}}
```

- Start a REPL (interactive shell):

```
coffee --interactive
```

- Watch script for changes and re-run script:

```
coffee --watch {{path/to/file.coffee}}
```

cola

This command is an alias of **`git-cola`**.

- View documentation for the original command:

```
tldr git-cola
```

colima

Container runtimes for macOS and Linux with minimal setup.

More information: https://github.com/abiosoft/colima.

- Start the daemon in the background:

```
colima start
```

- Create a configuration file and use it:

```
colima start --edit
```

- Start and setup containerd (install `nerdctl` to use containerd via `nerdctl`):

```
colima start --runtime containerd
```

- Start with Kubernetes (`kubectl` is required):

```
colima start --kubernetes
```

- Customize CPU count, RAM memory, and disk space (in GiB):

```
colima start --cpu {{number}} --memory {{memory}} --disk
{{storage_space}}
```

- Use Docker via Colima (Docker is required):

```
colima start
```

- List containers with their information and status:

```
colima list
```

- Show runtime status:

```
colima status
```

:

Returns a successful exit status code of 0.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-_003a.

- Return a successful exit code:

```
:
```

- Make a command always exit with 0:

```
{{command}} || :
```

colordiff

A wrapper around **`diff`** that produces the same output but with pretty syntax highlighting.

Color schemes can be customized.

More information: https://manned.org/colordiff.

- Compare files:

```
colordiff {{file1}} {{file2}}
```

- Output in two columns:

```
colordiff -y {{file1}} {{file2}}
```

- Ignore case differences in file contents:

```
colordiff -i {{file1}} {{file2}}
```

- Report when two files are the same:

```
colordiff -s {{file1}} {{file2}}
```

- Ignore whitespace:

```
colordiff -w {{file1}} {{file2}}
```

colorls

Beautify **`ls`** command output, with color and font-awesome icons. Available as a Ruby gem.

More information: https://github.com/athityakumar/colorls#flags.

- List files one per line:

```
colorls -1
```

- List all files, including hidden files:

```
colorls {{[-a|--all]}}
```

- Long format list (permissions, ownership, size, and modification date) of all files:

```
colorls {{[-l|--long]}} {{[-a|--all]}}
```

- Only list directories:

```
colorls {{[-d|--dirs]}}
```

colorpicker

A minimalist X11 colorpicker.

Any mouse gesture except **`<LeftClick>`** will exit the program.

More information: https://github.com/ym1234/colorpicker.

- Launch colorpicker and print the hexadecimal and RGB value of each clicked pixel to `stdout`:

  `colorpicker`

- Only print the color of one clicked pixel and then exit:

  `colorpicker --one-shot`

- Print the color of each clicked pixel and quit when a key is pressed:

  `colorpicker --quit-on-keypress`

- Only print the RGB value:

  `colorpicker --rgb`

- Only print the hexadecimal value:

  `colorpicker --hex`

combine

Perform set operations on lines of two files.

The order of the output lines is determined by the order of the lines in the first file.

See also: **`diff`**.

More information: https://manned.org/combine.

- Output lines that are in both specified files:

```
combine {{path/to/file1}} and {{path/to/file2}}
```

- Output lines that are in the first but not in the second file:

```
combine {{path/to/file1}} not {{path/to/file2}}
```

- Output lines that in are in either of the specified files:

```
combine {{path/to/file1}} or {{path/to/file2}}
```

- Output lines that are in exactly one of the specified files:

```
combine {{path/to/file1}} xor {{path/to/file2}}
```

comby

Tool for structural code search and replace that supports many languages.

More information: https://github.com/comby-tools/comby.

- Match and rewrite templates, and print changes:

```
comby '{{assert_eq!(:[a], :[b])}}' '{{assert_eq!(:[b], :[a])}}' {{.rs}}
```

- Match and rewrite with rewrite properties:

```
comby '{{assert_eq!(:[a], :[b])}}' '{{assert_eq!(:[b].Capitalize, :[a])}}' {{.rs}}
```

- Match and rewrite in-place:

```
comby -in-place '{{match_pattern}}' '{{rewrite_pattern}}'
```

- Only perform matching and print matches:

```
comby -match-only '{{match_pattern}}' ""
```

comm

Select or reject lines common to two files. Both files must be sorted.

More information: https://www.gnu.org/software/coreutils/manual/html_node/comm-invocation.html.

- Produce three tab-separated columns: lines only in first file, lines only in second file, and common lines:

```
comm {{file1}} {{file2}}
```

- Print only lines common to both files:

```
comm -12 {{file1}} {{file2}}
```

- Print only lines common to both files, reading one file from `stdin`:

```
cat {{file1}} | comm -12 - {{file2}}
```

- Get lines only found in first file, saving the result to a third file:

```
comm -23 {{file1}} {{file2}} > {{file1_only}}
```

- Print lines only found in second file, when the files aren't sorted:

```
comm -13 <(sort {{file1}}) <(sort {{file2}})
```

comma

This command is an alias of `,`.

- View documentation for the original command:

```
tldr ,
```

command

Force the shell to execute the program and ignore any functions, builtins, and aliases with the same name.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-command.

- Execute the `ls` program literally, even if an `ls` alias exists:

```
command ls
```

- Find and execute a command using a default `$PATH` (`/bin:/usr/bin:/sbin:/usr/sbin:/etc:/usr/etc`) that guarantees to find all standard utilities:

```
command -p {{command_name}}
```

- Display the path to the executable or the alias definition of a specific command:

```
command -v {{command_name}}
```

compare

This command is an alias of **`magick compare`**.

- View documentation for the original command:

```
tldr magick compare
```

compgen

Bash built-in command for generating possible completion matches in Bash.

Usually used within custom completion functions.

See also: **`complete`**, **`compopt`**.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-compgen.

- List all shell built-ins, aliases, functions, and executables that you could run:

```
compgen -c
```

- List all commands that you could run that start with a specified string and save results to `$COMPREPLY`:

```
compgen -V COMPREPLY -c {{str}}
```

- Match against a wordlist:

```
compgen -W "{{apple orange banana}}" {{a}}
```

- List all aliases:

```
compgen -a
```

- List all functions that you could run:

```
compgen -A function
```

- Show shell reserved keywords:

```
compgen -k
```

- See all available commands/aliases starting with `ls`:

```
compgen -ac {{ls}}
```

- List all users on the system:

```
compgen -u
```

complete

Get and set argument autocompletion rules of shell commands in Bash.

The specified completions will be invoked when **<Tab>** is pressed in Bash.

See also: **compgen**, **compopt**.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-complete.

- Set arguments of a command to autocomplete through a function (completion response is sent in `$COMPREPLY` variable):

```
complete -F {{function}} {{command}}
```

- Set arguments of a command to autocomplete through another command (`$1` is the command, `$2` is the argument the cursor is on, and `$3` is the argument preceding the cursor):

```
complete -C {{autocomplete_command}} {{command}}
```

- Set arguments of a command to autocomplete to shell builtins:

```
complete -b {{command}}
```

- Apply autocompletion without appending a space to the completed word:

```
complete -o nospace -F {{function}} {{command}}
```

- List all loaded complete specifications:

```
complete -p
```

- List loaded complete specifications for a command:

```
complete -p {{command}}
```

compopt

Print or change the completion options for a command.

-o means enabled and **+o** means disabled.

See also: **compgen**, **complete**.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-compopt.

- Print the completion options for given command:

```
compopt {{command}}
```

- Enable or disable a completion option of a command:

```
compopt {{-o|+o}} {{option1}} {{-o|+o}} {{option2}} {{command}}
```

- Print the options for the currently executing completion:

```
compopt
```

- Enable or disable a completion option of a command:

```
compopt {{-o|+o}} {{option1}} {{-o|+o}} {{option2}}
```

composer audit

Analyze a PHP project's dependencies to detect known security vulnerabilities and list affected packages.

See also: **`composer`**.

More information: https://getcomposer.org/doc/03-cli.md#audit.

- Check for security vulnerabilities in your current project:

```
composer audit
```

- Omit dev dependencies in the audit:

```
composer audit --no-dev
```

- Filter vulnerabilities by output format:

```
composer audit --format {{table|plain|json|summary}}
```

- Output audit results to a file in JSON format:

```
composer audit --format json > audit_report.json
```

- Verify whether a specific package in your project is affected by security issues:

```
composer audit {{vendor}}/{{package}}
```

composer-require-checker

Analyze Composer dependencies for soft dependencies.

More information: https://github.com/maglnet/ComposerRequireChecker.

- Analyze a Composer JSON file:

```
composer-require-checker check {{path/to/composer.json}}
```

- Analyze a Composer JSON file with a specific configuration:

```
composer-require-checker check --config-file {{path/to/
config.json}} {{path/to/composer.json}}
```

composer

A package-based dependency manager for PHP projects.

More information: https://getcomposer.org/doc/03-cli.md.

- Interactively create a `composer.json` file:

  ```
  composer init
  ```

- Add a package as a dependency for this project, adding an entry to `composer.json`:

  ```
  composer require {{user/package}}
  ```

- Install all the dependencies in this project's `composer.json` and create `composer.lock`:

  ```
  composer install
  ```

- Uninstall a package from this project, removing it as a dependency from `composer.json` and `composer.lock`:

  ```
  composer remove {{user/package}}
  ```

- Update all the dependencies in this project's `composer.json` and note new versions in `composer.lock` file:

  ```
  composer update
  ```

- Update only `composer.lock` after updating `composer.json` manually:

  ```
  composer update --lock
  ```

- Learn more about why a dependency can't be installed:

  ```
  composer why-not {{user/package}}
  ```

- Update composer to its latest version:

  ```
  composer self-update
  ```

conan

The open source, decentralized, and cross-platform package manager to create and share all your native binaries.

Some subcommands such as **`frogarian`** have their own usage documentation.

More information: https://docs.conan.io/2/reference/commands.html.

- Install packages based on `conanfile.txt`:

  ```
  conan install {{.}}
  ```

- Install packages and create configuration files for a specific generator:

  ```
  conan install -g {{generator}}
  ```

- Install packages, building from source:

  ```
  conan install {{.}} --build
  ```

- Search for locally installed packages:

  ```
  conan search {{package}}
  ```

- Search for remote packages:

  ```
  conan search {{package}} -r {{remote}}
  ```

- List remotes:

  ```
  conan remote list
  ```

conda activate

Activate a conda environment.

See also: **`conda deactivate`** to deactivate a conda environment.

More information: https://docs.conda.io/projects/conda/en/stable/dev-guide/deep-dives/activation.html.

- Activate an existing environment named `myenv`:

  ```
  conda activate myenv
  ```

- Activate an existing environment located at custom path:

  ```
  conda activate {{path/to/myenv}}
  ```

- Stack `myenv` environment on top of a previous environment making libraries/commands/variables from both accessible:

  ```
  conda activate --stack myenv
  ```

- Start a clean environment `myenv` without stacking it making previous environment libraries/commands/variables not accessible:

  ```
  conda activate --no-stack myenv
  ```

- Display help:

  ```
  conda activate {{[-h|--help]}}
  ```

conda clean

Delete temporary or unused files: index cache, lock files, unused cache packages, tarballs, and log files.

More information: https://docs.conda.io/projects/conda/en/stable/commands/clean.html.

- Delete all temporary or unused files verbosely and say yes to all confirmations:

```
conda clean {{[-avy|--all --verbose --yes]}}
```

- Delete only index cache, tarballs, and log files:

```
conda clean {{[-itl|--index-cache --tarballs --logfiles]}}
```

- Delete only temporary [c]ache files that could not be deleted earlier due to being in use:

```
conda clean {{[-c|--tempfiles]}} {{path/to/tempfiles}}
```

- Delete only unused packages. Might delete packages installed with softlinks:

```
conda clean {{[-p|--packages]}}
```

- Force delete all writable packages. More broad than the `--all` option. Will delete packages installed with softlinks:

```
conda clean {{[-f|--force-pkgs-dirs]}}
```

- Display help:

```
conda clean {{[-h|--help]}}
```

conda compare

Compare packages between conda environments.

More information: https://docs.conda.io/projects/conda/en/stable/commands/compare.html.

- Compare packages in the current directory to packages from the file `file.yml`:

```
conda compare file.yml
```

- Compare packages in environment named `myenv` to packages from the file `file.yml`:

```
conda compare {{[-n|--name]}} myenv {{path/to/file.yml}}
```

- Compare packages in environment `myenv` at custom path (i.e. prefix) to packages from the file `file.yml`:

```
conda compare {{[-p|--prefix]}} {{path/to/myenv}} {{path/to/file.yml}}
```

- Display help:

```
conda compare {{[-h|--help]}}
```

conda config

Modify configuration values in `.condarc`.

More information: https://docs.conda.io/projects/conda/en/latest/commands/config.html.

- Show all configuration values:

```
conda config --show
```

- Show current value of a configuration option:

```
conda config --show {{config_option}}
```

- Set a configuration value:

```
conda config --set {{key}} {{value}}
```

- Remove a configuration value:

```
conda config --remove {{key}} {{value}}
```

- Append a value to an existing configuration key list:

```
conda config --append {{key}} {{value}}
```

- Prepend a value to an existing configuration key list:

```
conda config --prepend {{key}} {{value}}
```

- Describe given configuration option:

```
conda config --describe {{config_option}}
```

conda create

Create new conda environments.

More information: https://docs.conda.io/projects/conda/en/latest/commands/create.html.

- Create a new environment named `py39`, install Python 3.9, NumPy v1.11 or above in it, and the latest stable version of SciPy. Say yes to all confirmations:

```
conda create {{[-ny|--name --yes]}} {{py39}} python={{3.9}} "{{numpy>=1.11 scipy}}"
```

- Create a new environment named `myenv` and install packages listed in files:

```
conda create {{[-n|--name]}} myenv --file {{file1.yml}} --file {{file2.yml}}
```

- Create a new environment named `myenv` at custom path (i.e. prefix):

```
conda create {{[-p|--prefix]}} {{path/to/myenv}}
```

- Make exact copy of an environment named `py39`:

```
conda create --clone py39 {{[-n|--name]}} {{py39-copy}}
```

- Display help:

```
conda create {{[-h|--help]}}
```

conda deactivate

Deactivate a conda environment.

More information: https://docs.conda.io/projects/conda/en/latest/commands/deactivate.html.

- Deactivate a conda environment:

```
conda deactivate
```

conda doctor

Display a health report for your environment.

More information: https://docs.conda.io/projects/conda/en/latest/commands/doctor.html.

- View report for the currently active environment:

```
conda doctor
```

- Specify an environment by name:

```
conda doctor {{[-n|--name]}} {{environment_name}}
```

- Specify an environment by its path:

```
conda doctor {{[-p|--prefix]}} {{path/to/environment}}
```

- Enable verbose output (Note: the `-v` flag can be repeated to increase verbosity):

```
conda doctor {{[-v|--verbose]}}
```

conda env

Manage conda environments.

More information: https://docs.conda.io/projects/conda/en/latest/commands/env/index.html.

- Create an environment from an environment file (YAML, TXT, etc.):

```
conda env create {{[-f|--file]}} {{path/to/file}}
```

- Delete an environment and everything in it:

```
conda env remove {{[-n|--name]}} {{environment_name}}
```

- Update an environment based on an environment file:

```
conda env update {{[-f|--file]}} {{path/to/file}} --prune
```

- List all environments:

```
conda env list
```

- View environment details:

```
conda env export
```

- List environment variables:

```
conda env config vars list
```

- Set environment variables:

```
conda env config vars set {{my_var}}={{value}}
```

conda export

Export environment details.

More information: https://docs.conda.io/projects/conda/en/latest/commands/export.html.

- Export the current environment details to `stdout`:

```
conda export
```

- Export the current environment details to a `YAML` file:

```
conda export {{[-f|--file]}} {{path/to/environment.yaml}}
```

- Export details in a specific format:

```
conda export --format {{environment-json|environment-yaml|explicit|json|reqs|requirements|txt|yaml|yml}}
```

- Target an environment by name:

```
conda export {{[-n|--name]}} {{environment_name}}
```

- Target an environment by its path:

```
conda export {{[-p|--prefix]}} {{path/to/environment}}
```

- Include a specific channel:

```
conda export {{[-c|--channel]}} {{channel_name}}
```

conda info

Display details about the conda installation.

More information: https://docs.conda.io/projects/conda/en/latest/commands/info.html.

- Show all information:

```
conda info {{[-a|--all]}}
```

- Display base environment path:

```
conda info --base
```

- List all conda environments:

```
conda info {{[-e|--envs]}}
```

- List environment variables:

```
conda info {{[-s|--system]}}
```

- Display list of channels with tokens exposed:

```
conda info --unsafe-channels
```

conda init

Initialize conda for shell interaction.

Most shells need to be closed and restarted for changes to take effect.

More information: https://docs.conda.io/projects/conda/en/latest/commands/init.html.

- Initialize a specific shell (if none is specified, defaults to `bash` for UNIX and `powershell` for Windows):

```
conda init {{zsh|bash|powershell|fish|tcsh|xonsh}}
```

- Initialize all available shells:

```
conda init --all
```

- Initialize conda for all users on the system:

```
conda init --system
```

- Don't initialize conda for the current user:

```
conda init --no-user
```

- Add `condabin/` directory to `$PATH`:

```
conda init --condabin
```

- Undo effects of the last `conda init`:

```
conda init --reverse
```

conda install

Install packages into an existing conda environment.

More information: https://docs.conda.io/projects/conda/en/latest/commands/install.html.

- Install one or more package into the currently active conda environment:

```
conda install {{package1 package2 ...}}
```

- Install a single package into the currently active conda environment using channel conda-forge:

```
conda install {{[-c|--channel]}} conda-forge {{package}}
```

- Install a single package into the currently active conda environment using channel conda-forge and ignoring other channels:

```
conda install {{[-c|--channel]}} conda-forge --override-channels {{package}}
```

- Install a specific version of a package:

```
conda install {{package}}={{version}}
```

- Install a package into a specific environment:

```
conda install {{[-n|--name]}} {{environment}} {{package}}
```

- Update a package in the current environment:

```
conda install --upgrade {{package}}
```

- Install a package and agree to the transactions without prompting:

```
conda install {{[-y|--yes]}} {{package}}
```

conda list

List installed packages in a conda environment.

More information: https://docs.conda.io/projects/conda/en/stable/commands/list.html.

- List all packages in the current environment:

```
conda list
```

- List packages in the named environment:

```
conda list {{[-n|--name]}} {{environment}}
```

- List packages installed in a given path:

```
conda list {{[-p|--prefix]}} {{path/to/environment}}
```

- Filter installed packages using `regex`:

```
conda list {{regex}}
```

- Save packages for future use:

```
conda list {{[-e|--export]}} > {{path/to/package-list.txt}}
```

conda notices

Retrieve latest channel notifications.

More information: https://docs.conda.io/projects/conda/en/latest/commands/notices.html.

- Show notices for the default channel and all `.condarc` channels:

```
conda notices
```

- Include a specific channel:

```
conda notices {{[-c|--channel]}} {{channel_name}}
```

- Ignore default and `.condarc` channels:

```
conda notices {{[-c|--channel]}} {{channel_name}} --override-channels
```

conda package

Create low-level conda packages.

More information: https://docs.conda.io/projects/conda/en/stable/commands/package.html.

- Get conda package from file:

```
conda package {{[-w|--which]}} {{path/to/file}}
```

- Remove all untracked files:

```
conda package {{[-r|--reset]}}
```

- Display all untracked files:

```
conda package {{[-u|--untracked]}}
```

- Designate package name of the package being created:

```
conda package --pkg-name {{name}}
```

- Designate package version of the package being created:

```
conda package --pkg-version {{version}}
```

- Designate package build number of the package being created:

```
conda package --pkg-build {{build_number}}
```

conda remove

Remove packages from a conda environment.

More information: https://docs.conda.io/projects/conda/en/latest/commands/remove.html.

- Remove `scipy` from the currently active environment:

```
conda remove scipy
```

- Remove a list of packages from the specified environment:

```
conda remove {{[-n|--name]}} {{environment_name}} {{package1 package2 ...}}
```

- Remove all packages and the environment itself:

```
conda remove {{[-n|--name]}} {{environment_name}} --all
```

- Remove all packages, but keep the environment:

```
conda remove {{[-n|--name]}} {{environment_name}} --all --keep-env
```

conda rename

Rename an existing conda environment.

The base environment and the currently-active environment cannot be renamed.

More information: https://docs.conda.io/projects/conda/en/latest/commands/rename.html.

- Rename an environment via its name:

```
conda rename {{[-n|--name]}} {{current_name}} {{new_name}}
```

- Rename an environment via its full path (i.e. prefix):

```
conda rename {{[-p|--prefix]}} {{path/to/env}} {{new_name}}
```

conda repoquery

Advanced search for packages in a conda repository.

More information: https://docs.conda.io/projects/conda/en/latest/commands/repoquery/index.html.

- Show available versions of the specified package:

```
conda repoquery search {{package}}
```

- Show dependencies of the specified package:

```
conda repoquery depends {{package}}
```

- Show packages that depend on the specified package:

```
conda repoquery whoneeds {{package}}
```

conda run

Run an executable command in a conda environment.

More information: https://docs.conda.io/projects/conda/en/latest/commands/run.html.

- Run a command in the currently active environment:

```
conda run {{command}}
```

- Target an environment by name:

```
conda run {{[-n|--name]}} {{environment_name}} {{command}}
```

- Target an environment by its path (i.e. prefix):

```
conda run {{[-p|--prefix]}} {{path/to/env}} {{command}}
```

conda search

Search for packages and show their details.

More information: https://docs.conda.io/projects/conda/en/latest/commands/search.html.

- Search for a specific package:

```
conda search {{package_name}}
```

- Search for a package along with its details:

```
conda search {{package_name}} {{[-i|--info]}}
```

- Search for packages containing `string` in the package name:

```
conda search "*string*"
```

- Search for specific version of the package:

```
conda search "{{package_name}}>={{package_version}}"
```

- Search a package within a specific channel:

```
conda search {{channel}}::{{package_name}}
```

- Search if package is installed in any local environments:

```
conda search --envs {{package_name}}
```

conda update

Update packages within a conda environment, including conda itself.

More information: https://docs.conda.io/projects/conda/en/latest/commands/update.html.

- Update all packages in the current environment:

```
conda update {{[--all|--update-all]}}
```

- Update a specific package in the current environment:

```
conda update {{package_name}}
```

- Update conda itself in the base environment:

```
conda update {{[-n|--name]}} base conda
```

- Update packages while ignoring pinned packages:

```
conda update --no-pin
```

- Update packages in offline mode:

```
conda update --offline
```

conda

Package, dependency, and environment management for any programming language.

Some subcommands such as **`create`** have their own usage documentation.

More information: https://docs.conda.io/projects/conda/en/latest/commands/index.html.

- Create a new environment, installing named packages into it:

```
conda create {{[-n|--name]}} {{environment_name}} {{python=3.9 matplotlib}}
```

- List all environments:

```
conda info {{[-e|--envs]}}
```

- Activate an environment:

```
conda activate {{environment_name}}
```

- Deactivate an environment:

```
conda deactivate
```

- Delete an environment (remove all packages):

```
conda remove {{[-n|--name]}} {{environment_name}} --all
```

- Install packages into the current environment:

```
conda install {{python=3.4 numpy}}
```

- List currently installed packages in current environment:

```
conda list
```

- Delete unused packages and caches:

```
conda clean {{[-a|--all]}}
```

confettysh

Display animated confetti and fireworks over SSH.

See also: **`ssh`**.

More information: https://github.com/charmbracelet/confettysh.

- Start a local `confettysh` server:

  `confettysh`

- Run the server on a custom port:

  `confettysh {{[-p|--port]}} {{2323}}`

- Connect to the local server and show fireworks:

  `ssh {{[-p|--port]}} {{2222}} localhost -t fireworks`

consul kv

Distributed key-value store with health checking and service discovery.

More information: https://developer.hashicorp.com/consul/docs/automate/kv/store.

- Read a value from the key-value store:

  ```
  consul kv get {{key}}
  ```

- Store a new key-value pair:

  ```
  consul kv put {{key}} {{value}}
  ```

- Delete a key-value pair:

  ```
  consul kv delete {{key}}
  ```

consul

Distributed key-value store with health checking and service discovery.

Some subcommands such as **kv** have their own usage documentation.

More information: https://developer.hashicorp.com/consul/commands.

- Display help:

```
consul --help
```

- Display help for a subcommand:

```
consul {{subcommand}} --help
```

- Display version:

```
consul --version
```

continue

Skip to the next iteration of a **`for`**, **`while`**, **`until`**, or **`select`** loop.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-continue.

- Skip to the next iteration:

```
while :; do continue; {{echo "This will never be reached"}};
done
```

- Skip to the next iteration from within a nested loop:

```
for i in {{{1..3}}}; do {{echo $i}}; while :; do continue 2;
done; done
```

convert

This command is an alias of **`magick convert`**.

Note: This alias is deprecated since ImageMagick 7. It has been replaced by **`magick`**.

Use **`magick convert`** if you need to use the old tool in versions 7+.

- View documentation for the original command:

```
tldr magick convert
```

convmv

Convert filenames (NOT file content) from one encoding to another.

More information: https://www.j3e.de/linux/convmv/man/.

- Test filename encoding conversion (don't actually change the filename):

```
convmv -f {{from_encoding}} -t {{to_encoding}} {{input_file}}
```

- Convert filename encoding and rename the file to the new encoding:

```
convmv -f {{from_encoding}} -t {{to_encoding}} --notest
{{input_file}}
```

copilot

Interact with GitHub Copilot.

More information: https://docs.github.com/en/copilot/concepts/agents/about-copilot-cli.

- Start interactive mode:

```
copilot
```

- Allow all file editing:

```
copilot --allow-tool write
```

- Resume the most recent session:

```
copilot --continue
```

- Resume a previous session using session picker:

```
copilot --resume
```

- Use a specific model:

```
copilot --model "{{gpt-5}}"
```

- Allow all Git commands except `git push`:

```
copilot --allow-tool 'shell(git:*)' --deny-tool 'shell(git push)'
```

- Execute a prompt directly without interactive mode, while allowing `copilot` to run any command:

```
copilot {{[-p|--prompt]}} "{{Fix the bug in main.js}}" --allow-all-tools
```

copr-cli

Interface with Fedora-Projects copr instance for building RPMs and publishing them.

More information: https://manned.org/copr-cli.

- Show user logged in to copr:

```
copr-cli whoami
```

- Build a local spec file on copr:

```
copr-cli build {{repository}} {{path/to/spec_file}}
```

- Check status of builds:

```
copr-cli list-builds {{repository}}
```

- Trigger a copr build of a spec-file from public (Git) repository:

```
copr-cli buildscm {{repository}} --clone-url {{https://
git.example.org/repo}} --spec {{spec_file_name}}
```

copr

This command is an alias of **`copr-cli`**.

- View documentation for the original command:

  ```
  tldr copr-cli
  ```

coproc

Bash builtin for creating interactive asynchronous subshells.

More information: https://www.gnu.org/software/bash/manual/bash.html#Coprocesses.

- Run a subshell asynchronously:

```
coproc { {{command1; command2; ...}}; }
```

- Create a coprocess with a specific name:

```
coproc {{name}} { {{command1; command2; ...}}; }
```

- Write to a specific coprocess `stdin`:

```
echo "{{input}}" >&"${{{name[1]}}}"
```

- Read from a specific coprocess `stdout`:

```
read <&"${{{name[0]}}}" {{variable}}
```

- Create a coprocess which repeatedly reads `stdin` and runs some commands on the input:

```
coproc {{name}} { while read {{line}}; do {{command1;
command2; ...}}; done }
```

- Create a coprocess which repeatedly reads `stdin`, runs a pipeline on the input, and writes the output to `stdout`:

```
coproc {{name}} { while read {{line}}; do {{echo "$line"}} |
{{command1 | command2 | ...}} | cat /dev/fd/0; done }
```

- Create and use a coprocess running `bc`:

```
coproc BC { bc {{[-l|--mathlib]}}; }; echo "1/3" >&"$
{BC[1]}"; read <&"${BC[0]}" output; echo "$output"
```

copyq

Clipboard manager with advanced features.

More information: https://copyq.readthedocs.io/en/latest/command-line.html.

- Launch CopyQ to store clipboard history:

```
copyq
```

- Show current clipboard content:

```
copyq clipboard
```

- Insert raw text into the clipboard history:

```
copyq add -- {{text1}} {{text2}} {{text3}}
```

- Insert text containing escape sequences ('\n', '\t') into the clipboard history:

```
copyq add {{firstline\nsecondline}}
```

- Print the content of the first 3 items in the clipboard history:

```
copyq read 0 1 2
```

- Copy a file's contents into the clipboard:

```
copyq < {{path/to/file.txt}} copy
```

- Copy a JPEG image into the clipboard:

```
copyq < {{path/to/image.jpg}} copy image/jpeg
```

cordova

Mobile apps with HTML, CSS & JS.

More information: https://cordova.apache.org/docs/en/latest/guide/cli/.

- Create a Cordova project:

```
cordova create {{path/to/directory}} {{package}} {{project_name}}
```

- Display the current workspace status:

```
cordova info
```

- Add a Cordova platform:

```
cordova platform add {{platform}}
```

- Remove a Cordova platform:

```
cordova platform remove {{platform}}
```

- Add a Cordova plugin:

```
cordova plugin add {{pluginid}}
```

- Remove a Cordova plugin:

```
cordova plugin remove {{pluginid}}
```

core-validate-commit

Validate commit messages for Node.js core.

More information: https://github.com/nodejs/core-validate-commit.

- Validate the current commit:

```
core-validate-commit
```

- Validate a specific commit:

```
core-validate-commit {{commit_hash}}
```

- Validate a range of commits:

```
git rev-list {{commit_hash}}..HEAD | xargs core-validate-commit
```

- List all validation rules:

```
core-validate-commit {{[-l|--list]}}
```

- List all valid Node.js subsystems:

```
core-validate-commit {{[-ls|--list-subsystem]}}
```

- Validate the current commit formatting the output in tap format:

```
core-validate-commit {{[-t|--tap]}}
```

- Display help:

```
core-validate-commit {{[-h|--help]}}
```

corepack

Zero-runtime-dependency package acting as bridge between Node projects and their package managers.

More information: https://github.com/nodejs/corepack.

- Add the Corepack shims to the Node.js installation directory to make them available as global commands:

```
corepack enable
```

- Add the Corepack shims to a specific directory:

```
corepack enable --install-directory {{path/to/directory}}
```

- Remove the Corepack shims from the Node.js installation directory:

```
corepack disable
```

- Prepare a specific package manager:

```
corepack prepare {{package_manager}}@{{version}} --activate
```

- Prepare the package manager configured for the project in the current path:

```
corepack prepare
```

- Use a package manager without installing it as a global command:

```
corepack {{npm|pnpm|yarn}} {{package_manager_arguments}}
```

- Install a package manager from the specified archive:

```
corepack hydrate {{path/to/corepack.tgz}}
```

- Display help for a subcommand:

```
corepack {{subcommand}} --help
```

coreutils

Uutils coreutils is a cross-platform reimplementation of the GNU coreutils in Rust Language.

Uutils includes a multi-call binary from which the utils can be invoked. This reduces the binary size of the binary and can be useful for portability.

More information: https://uutils.github.io/coreutils/docs/multicall.html.

- Run a utility with arguments:

```
coreutils {{util}} {{util_options}}
```

- List files in [l]ong format:

```
coreutils ls -l
```

- Display help for `ls`:

```
coreutils ls --help
```

cosign

Container Signing, Verification, and Storage in an OCI registry.

More information: https://github.com/sigstore/cosign/blob/main/doc/cosign.md.

- Generate a key-pair:

```
cosign generate-key-pair
```

- Sign a container and store the signature in the registry:

```
cosign sign --key {{cosign.key}} {{image}}
```

- Sign a container image with a key pair stored in a Kubernetes secret:

```
cosign sign --key k8s://{{namespace}}/{{key}} {{image}}
```

- Sign a blob with a local key pair file:

```
cosign sign-blob --key {{cosign.key}} {{path/to/file}}
```

- Verify a container against a public key:

```
cosign verify --key {{cosign.pub}} {{image}}
```

- Verify images with a public key in a Dockerfile:

```
cosign dockerfile verify -key {{cosign.pub}} {{path/to/
Dockerfile}}
```

- Verify an image with a public key stored in a Kubernetes secret:

```
cosign verify --key k8s://{{namespace}}/{{key}} {{image}}
```

- Copy a container image and its signatures:

```
cosign copy {{example.com/src:latest}} {{example.com/
dest:latest}}
```

cotton

Markdown test specification runner.

More information: https://github.com/chonla/cotton.

- Use a specific base URL:

```
cotton -u {{base_url}} {{path/to/file.md}}
```

- Disable certificate verification (insecure mode):

```
cotton -u {{base_url}} -i {{path/to/file.md}}
```

- Stop running when a test fails:

```
cotton -u {{base_url}} -s {{path/to/file.md}}
```

couchdb

Command-line interface for Apache CouchDB database server.

More information: https://manned.org/couchdb.

- Start CouchDB:

```
couchdb
```

- Start CouchDB interactive shell:

```
couchdb -i
```

- Start CouchDB as a background process:

```
couchdb -b
```

- Kill the background process (Note: It will respawn if needed):

```
couchdb -k
```

- Shutdown the background process:

```
couchdb -d
```

cowsay

Print ASCII art (by default a cow) saying or thinking something.

More information: https://manned.org/cowsay.

- Print an ASCII cow saying "hello, world":

```
cowsay "{{hello, world}}"
```

- Print an ASCII cow saying text from `stdin`:

```
echo "{{hello, world}}" | cowsay
```

- List all available art types:

```
cowsay -l
```

- Print the specified ASCII art saying "hello, world":

```
cowsay -f {{art}} "{{hello, world}}"
```

- Print a dead thinking ASCII cow:

```
cowthink -d "{{I'm just a cow, not a great thinker...}}"
```

- Print an ASCII cow with custom eyes saying "hello, world":

```
cowsay -e {{characters}} "{{hello, world}}"
```

cp

Copy files and directories.

More information: https://www.gnu.org/software/coreutils/manual/html_node/cp-invocation.html.

- Copy a file to another location:

```
cp {{path/to/source_file}} {{path/to/target_file}}
```

- Copy a file into another directory, keeping the filename:

```
cp {{path/to/source_file}} {{path/to/
target_parent_directory}}
```

- Recursively copy a directory's contents to another location (if the destination exists, the directory is copied inside it):

```
cp {{[-r|--recursive]}} {{path/to/source_directory}} {{path/
to/target_directory}}
```

- Copy a directory recursively, in verbose mode (shows files as they are copied):

```
cp {{[-vr|--verbose --recursive]}} {{path/to/
source_directory}} {{path/to/target_directory}}
```

- Copy multiple files at once to a directory:

```
cp {{[-t|--target-directory]}} {{path/to/
destination_directory}} {{path/to/file1 path/to/file2 ...}}
```

- Copy all files with a specific extension to another location, in interactive mode (prompts user before overwriting):

```
cp {{[-i|--interactive]}} {{*.ext}} {{path/to/
target_directory}}
```

- Follow symbolic links before copying:

```
cp {{[-L|--dereference]}} {{link}} {{path/to/
target_directory}}
```

- Use the full path of source files, creating any missing intermediate directories when copying:

```
cp --parents {{source/path/to/file}} {{path/to/target_file}}
```

cpan

Query, download, and build perl modules from CPAN sites.

More information: https://manned.org/cpan.

- Install a module (`-i` is optional):

```
cpan {{-i}} {{module_name}}
```

- Force install a module (`-i` is not optional):

```
cpan -fi {{module_name}}
```

- Upgrade all installed modules:

```
cpan -u
```

- Recompile modules:

```
cpan -r
```

cpdf

Manipulate PDF files.

More information: https://www.coherentpdf.com/cpdfmanual/cpdfmanual.html.

- Select pages 1, 2, 3, and 6 from a source document and write those to a destination document:

```
cpdf {{path/to/source_document.pdf}} {{1-3,6}} -o {{path/to/destination_document.pdf}}
```

- Merge two documents into a new one:

```
cpdf -merge {{path/to/source_document_one.pdf}} {{path/to/source_document_two.pdf}} -o {{path/to/destination_document.pdf}}
```

- Show the bookmarks of a document:

```
cpdf -list-bookmarks {{path/to/document.pdf}}
```

- Split a document into ten-page chunks, writing them to `chunk001.pdf`, `chunk002.pdf`, etc:

```
cpdf -split {{path/to/document.pdf}} -o {{path/to/chunk%%%.pdf}} -chunk {{10}}
```

- Encrypt a document using 128bit encryption, providing `fred` as owner password and `joe` as user password:

```
cpdf -encrypt {{128bit}} {{fred}} {{joe}} {{path/to/source_document.pdf}} -o {{path/to/encrypted_document.pdf}}
```

- Decrypt a document using the owner password `fred`:

```
cpdf -decrypt {{path/to/encrypted_document.pdf}} owner={{fred}} -o {{path/to/decrypted_document.pdf}}
```

- Show the annotations of a document:

```
cpdf -list-annotations {{path/to/document.pdf}}
```

- Create a new document from an existing one with additional metadata:

```
cpdf -set-metadata {{path/to/metadata.xml}} {{path/to/source_document.pdf}} -o {{path/to/destination_document.pdf}}
```

cpio

Copy files in and out of archives.

Supports the following archive formats: cpio's custom binary, old ASCII, new ASCII, crc, HPUX binary, HPUX old ASCII, old tar, and POSIX.1 tar.

More information: https://www.gnu.org/software/cpio/manual/cpio.html#Invoking-cpio.

- Take a list of file names from `stdin` and add them onto an archive (copy-[o]ut) in cpio's binary forma:

```
echo "{{path/to/file1 path/to/file2 ...}}" | cpio {{[-o|--create]}} > {{archive.cpio}}
```

- Copy all files and directories in a directory and add them onto an archive (copy-[o]ut), in verbose mode:

```
find {{path/to/directory}} | cpio {{[-ov|--create --verbose]}} > {{archive.cpio}}
```

- Pick all files from an archive (copy-[i]n), generating directories where needed, in verbose mode:

```
cpio < {{archive.cpio}} {{[-idv|--extract --make-directories --verbose]}}
```

cppcheck

A static analysis tool for C/C++ code.

Instead of syntax errors, it focuses on the types of bugs that compilers normally do not detect.

More information: https://manned.org/cppcheck.

- Recursively check the current directory, showing progress on the screen and logging error messages to a file:

```
cppcheck . 2> cppcheck.log
```

- Recursively check a given directory, and don't print progress messages:

```
cppcheck {{[-q|--quiet]}} {{path/to/directory}}
```

- Check a given file, specifying which tests to perform (by default only errors are shown):

```
cppcheck --enable {{error|warning|style|performance|
portability|information|all}} {{path/to/file.cpp}}
```

- List available tests:

```
cppcheck --errorlist
```

- Check a given file, ignoring specific tests:

```
cppcheck --suppress {{test_id1}} --suppress {{test_id2}}
{{path/to/file.cpp}}
```

- Check the current directory, providing paths for include files located outside it (e.g. external libraries):

```
cppcheck -I {{include/directory_1}} -I {{include/
directory_2}} .
```

- Check a Microsoft Visual Studio project (`*.vcxproj`) or solution (`*.sln`):

```
cppcheck --project {{path/to/project.sln}}
```

cppclean

Find unused code in C++ projects.

More information: https://github.com/myint/cppclean.

- Run in a project's directory:

```
cppclean {{path/to/project}}
```

- Run on a project where the headers are in the `inc1/` and `inc2/` directories:

```
cppclean {{path/to/project}} --include-path {{inc1}} --include-path {{inc2}}
```

- Run on a specific file `main.cpp`:

```
cppclean {{main.cpp}}
```

- Run on the current directory, excluding the "build" directory:

```
cppclean {{.}} --exclude {{build}}
```

crackle

Crack and decrypt Bluetooth Low Energy (BLE) encryption.

More information: https://github.com/mikeryan/crackle.

- Check whether the recorded BLE communications contain the packets necessary for recovering temporary keys (TKs):

```
crackle -i {{path/to/input.pcap}}
```

- Use brute force to recover the TK of the recorded pairing events and use it to decrypt all subsequent communications:

```
crackle -i {{path/to/input.pcap}} -o {{path/to/
decrypted.pcap}}
```

- Use the specified long-term key (LTK) to decrypt the recorded communication:

```
crackle -i {{path/to/input.pcap}} -o {{path/to/
decrypted.pcap}} -l {{81b06facd90fe7a6e9bbd9cee59736a7}}
```

cradle deploy

Manage Cradle deployments.

More information: https://cradlephp.github.io/docs/3.B.-Reference-Command-Line-Tools.html#deploy.

- Deploy Cradle to a server:

```
cradle deploy production
```

- Deploy static assets to Amazon S3:

```
cradle deploy s3
```

- Deploy static assets including the Yarn "components" directory:

```
cradle deploy s3 --include-yarn
```

- Deploy static assets including the "upload" directory:

```
cradle deploy s3 --include-upload
```

cradle elastic

Manage the Elasticsearch instances for a Cradle instance.

More information: https://cradlephp.github.io/docs/3.B.-Reference-Command-Line-Tools.html#elastic.

- Truncate the Elasticsearch index:

  ```
  cradle elastic flush
  ```

- Truncate the Elasticsearch index for a specific package:

  ```
  cradle elastic flush {{package}}
  ```

- Submit the Elasticsearch schema:

  ```
  cradle elastic map
  ```

- Submit the Elasticsearch schema for a specific package:

  ```
  cradle elastic map {{package}}
  ```

- Populate the Elasticsearch indices for all packages:

  ```
  cradle elastic populate
  ```

- Populate the Elasticsearch indices for a specific package:

  ```
  cradle elastic populate {{package}}
  ```

cradle install

Install the Cradle PHP framework components.

More information: https://cradlephp.github.io/docs/3.B.-Reference-Command-Line-Tools.html#install.

- Install Cradle's components (User will be prompted for further details):

```
cradle install
```

- Forcefully overwrite files:

```
cradle install {{[-f|--force]}}
```

- Skip running SQL migrations:

```
cradle install --skip-sql
```

- Skip running package updates:

```
cradle install --skip-versioning
```

- Use specific database details:

```
cradle install -h {{hostname}} -u {{username}} -p
{{password}}
```

cradle package

Manage packages for a Cradle instance.

More information: https://cradlephp.github.io/docs/3.B.-Reference-Command-Line-Tools.html#package.

- Display a list of available packages:

```
cradle package list
```

- Search for a package:

```
cradle package search {{package}}
```

- Install a package from Packagist:

```
cradle package install {{package}}
```

- Install a specific version of a package:

```
cradle package install {{package}} {{version}}
```

- Update a package:

```
cradle package update {{package}}
```

- Update a package to a specific version:

```
cradle package update {{package}} {{version}}
```

- Remove a specific package:

```
cradle package remove {{package}}
```

cradle sql

Manage Cradle SQL databases.

More information: https://cradlephp.github.io/docs/3.B.-Reference-Command-Line-Tools.html#sql.

- Rebuild the database schema:

```
cradle sql build
```

- Rebuild the database schema for a specific package:

```
cradle sql build {{package}}
```

- Empty the entire database:

```
cradle sql flush
```

- Empty the database tables for a specific package:

```
cradle sql flush {{package}}
```

- Populate the tables for all packages:

```
cradle sql populate
```

- Populate the tables for a specific package:

```
cradle sql populate {{package}}
```

cradle

The Cradle PHP framework.

Some subcommands such as **`install`** and **`package`** have their own usage documentation.

More information: https://cradlephp.github.io/docs/3.B.-Reference-Command-Line-Tools.html.

- Install Cradle components (prompts for additional info):

  `cradle install`

- Force install and overwrite files:

  `cradle install {{[-f|--force]}}`

- Connect to a remote server (see `config/deploy.php`):

  `cradle connect {{server_name}}`

- Display the current Cradle configuration:

  `cradle config show`

- Install a package into the current Cradle instance:

  `cradle package install {{package_name}}`

- List installed packages:

  `cradle package list`

- Display help:

  `cradle help`

- Display version:

  `cradle --version`

crane append

Push an image based on an (optional) base image.

Appends layers containing the contents of the provided tarballs.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_append.md.

- Push image based on a base image:

```
crane append {{[-b|--base]}} {{image_name}}
```

- Push image with appended layer from tarball:

```
crane append {{[-f|--new_layer]}} {{layer_name1 layer_name2 ...}}
```

- Push image with appended layer with new tag:

```
crane append {{[-t|--new_tag]}} {{tag_name}}
```

- Push resulting image to new tarball:

```
crane append {{[-o|--output]}} {{path/to/tarball}}
```

- Use empty base image of type OCI media instead of Docker:

```
crane append --oci-empty-base
```

- Annotate resulting image as being based on the base image:

```
crane append --set-base-image-annotations
```

- Display help:

```
crane append {{[-h|--help]}}
```

crane auth

Log in or access credentials.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_auth.md.

- Execute `crane auth` subcommand:

```
crane auth {{subcommand}}
```

- Implement credential helper:

```
crane auth get {{registry_address}} {{[-h|--help]}}
```

- Log in to a registry:

```
crane auth login {{registry_address}} {{[-h|--help]}} {{[-p|--password]}} {{password}} {{-password-stdin}} {{[-u|--username]}} {{username}}
```

- Log out of a registry:

```
crane auth logout {{registry_address}} {{[-h|--help]}}
```

- Retrieve a token for a remote repository:

```
crane auth token {{registry_address}} {{[-H|--header]}} {{[-h|--help]}} {{[-m|--mount]}} {{scope1 scope2 ...}} --push
```

- Display help:

```
crane auth {{[-h|--help]}}
```

crane blob

Read a blob from a registry.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_blob.md.

- Read the blob from a registry:

```
crane blob {{blob_identifier}}
```

- Display help:

```
crane blob {{[-h|--help]}}
```

crane catalog

List the repositories in a registry.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_catalog.md.

- List the repositories in a registry:

```
crane catalog {{registry_address}}
```

- Print the full image reference:

```
crane catalog {{registry_address}} --full-ref
```

- Display help:

```
crane catalog {{[-h|--help]}}
```

crane config

Get the configuration of an image.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_config.md.

- Get the configuration of an image:

```
crane config {{image_name}}
```

- Display help:

```
crane config {{[-h|--help]}}
```

crane copy

Efficiently copy a remote image from source to target while retaining the digest value.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_copy.md.

- Copy an image from source to target:

```
crane {{[cp|copy]}} {{source}} {{target}}
```

- Copy all tags:

```
crane {{[cp|copy]}} {{source}} {{target}} {{[-a|--all-tags]}}
```

- Set the maximum number of concurrent copies, defaults to GOMAXPROCS:

```
crane {{[cp|copy]}} {{source}} {{target}} {{[-j|--jobs]}} {{int}}
```

- Avoid overwriting existing tags in target:

```
crane {{[cp|copy]}} {{source}} {{target}} {{[-n|--no-clobber]}}
```

- Display help:

```
crane {{[cp|copy]}} {{[-h|--help]}}
```

crane cp

This command is an alias of **`crane copy`**.

- View documentation for the original command:

```
tldr crane copy
```

crane delete

Delete an image reference from its registry.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_delete.md.

- Delete an image reference from its registry:

```
crane delete {{image_name}}
```

- Display help:

```
crane delete {{[-h|--help]}}
```

crane digest

Get the digest of an image.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_digest.md.

- Get the digest of an image:

```
crane digest {{image_name}}
```

- Print the full image reference by digest:

```
crane digest {{image_name}} --full-ref
```

- Specify path to tarball containing the image:

```
crane digest {{image_name}} --tarball {{path/to/tarball}}
```

- Display help:

```
crane digest {{[-h|--help]}}
```

crane export

Export filesystem of a container image as a tarball.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_export.md.

- Write tarball to `stdout`:

```
crane export {{image_name}} -
```

- Write tarball to file:

```
crane export {{image_name}} {{path/to/tarball}}
```

- Read image from `stdin`:

```
crane export - {{path/to/file}}
```

crane flatten

Flatten an image's layers into a single layer.

Pushes digest to original image repository if no tags are specified.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_flatten.md.

- Flatten an image:

  ```
  crane flatten
  ```

- Apply new tag to flattened image:

  ```
  crane flatten {{[-t|--tag]}} {{tag_name}}
  ```

- Display help:

  ```
  crane flatten {{[-h|--help]}}
  ```

crane index append

Append manifest to a remote index.

This sub-command pushes an index based on an (optional) base index, with appended manifests.

The platform for appended manifests is inferred from the configuration file or omitted if that is infeasible.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_index_append.md.

- Append manifest to a remote index:

```
crane index append
```

- Reference to manifests to append to the base index:

```
crane index append {{[-m|--manifest]}} {{manifest_name1 manifest_name2 ...}}
```

- Tag to apply to resulting image:

```
crane index append {{[-t|--tag]}} {{tag_name}}
```

- Empty base index will have Docker media types instead of OCI:

```
crane index append --docker-empty-base
```

- Append each of its children rather than the index itself (defaults true):

```
crane index append --flatten
```

- Display help:

```
crane index append {{[-h|--help]}}
```

crane index filter

Modifies a remote index by filtering based on platform.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_index_filter.md.

- Modify remote index:

```
crane index filter
```

- Specify the platform(s) to keep from base in the form `os/arch/variant:osversion,platform`:

```
crane index filter --platform {{platform1 platform2 ...}}
```

- Tag to apply to resulting image:

```
crane index filter {{[-t|--tags]}} {{tag_name}}
```

- Display help:

```
crane index filter {{[-h|--help]}}
```

crane index

Modify an image index.

Some subcommands such as **`append`** and **`filter`** have their own usage documentation.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_index.md.

- Modify an image index:

```
crane index
```

- Modify an image index with subcommand:

```
crane index {{subcommand}}
```

- Display help:

```
crane index {{[-h|--help]}}
```

crane ls

List the tags in a repository.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_ls.md.

- List the tags:

```
crane ls {{repository}}
```

- Print the full image reference:

```
crane ls {{repository}} --full-ref
```

- Omit digest tags:

```
crane ls {{[-o|--omit-digest-tags]}}
```

- Display help:

```
crane ls {{[-h|--help]}}
```

crane manifest

Get the manifest of an image.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_manifest.md.

- Get the manifest:

```
crane manifest {{image_name}}
```

- Display help:

```
crane manifest {{[-h|--help]}}
```

crane mutate

Modify image labels and annotations.

The container must be pushed to a registry, and the manifest is updated there.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_mutate.md.

- New annotations to set (default []):

```
crane mutate {{[-a|--annotation]}}/{{[-l|--label]}} {{annotation/label}}
```

- Path to tarball/command/entrypoint/environment variable/exposed-ports to append to image:

```
crane mutate {{--append}}/{{--cmd}}/{{--entrypoint}}/{{[-e|--env]}}/{{--exposed-ports}} {{var1 var2 ...}}
```

- Path to new tarball of resulting image:

```
crane mutate {{[-o|--output]}} {{path/to/tarball}}
```

- Repository in the form `os/arch/variant:osversion,platform` to push mutated image:

```
crane mutate --set-platform {{platform_name}}
```

- New tag reference to apply to mutated image:

```
crane mutate {{[-t|--tag]}} {{tag_name}}
```

- New user to set:

```
crane mutate {{[-u|--user]}} {{username}}
```

- New working dir to set:

```
crane mutate {{[-w|--workdir]}} {{path/to/work_directory}}
```

- Display help:

```
crane mutate {{[-h|--help]}}
```

crane pull

Pull remote images by reference and store their contents locally.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_pull.md.

- Pull remote image:

```
crane pull {{image_name}} {{path/to/tarball}}
```

- Preserve image reference used to pull as an annotation when used with `--format=oci`:

```
crane pull {{image_name}} {{path/to/tarball}} --annotate-ref
```

- Path to cache image layers:

```
crane pull {{image_name}} {{path/to/tarball}} {{[-c|--cache_path]}} {{path/to/cache}}
```

- Format in which to save images (default `tarball`):

```
crane pull {{image_name}} {{path/to/tarball}} {{-format}} {{format_name}}
```

- Display help:

```
crane pull {{[-h|--help]}}
```

crane push

Push local image contents to a remote registry.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_push.md.

- Push local image to remote registry:

```
crane push {{path/to/tarball}} {{image_name}}
```

- Path to file with list of published image references:

```
crane push {{path/to/tarball}} {{image_name}} --image-refs {{path/to/file}}
```

- Push a collection of images as a single index (required if path has multiple images):

```
crane push {{path/to/tarball}} {{image_name}} --index
```

- Display help:

```
crane push {{[-h|--help]}}
```

crane rebase

Rebase an image onto a new base image.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_rebase.md.

- Rebase image:

```
crane rebase
```

- New base image to insert:

```
crane rebase --new_base {{image_name}}
```

- Old base image to remove:

```
crane rebase --old_base {{image_name}}
```

- Tag to apply to rebased image:

```
crane rebase {{[-t|--tag]}} {{tag_name}}
```

- Display help:

```
crane rebase {{[-h|--help]}}
```

crane registry

This command serves a registry implementation on an automatically chosen port (**`:0`**), **`$PORT`**, or **`--address`**.

The command blocks while the server accepts pushes and pulls and contents are can be stored in memory, and disk.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_registry_serve.md.

- Serve a registry implementation:

```
crane registry serve
```

- Address to listen on:

```
crane registry serve --address {{address_name}}
```

- Path to a directory where blobs will be stored:

```
crane registry serve --disk {{path/to/store_directory}}
```

- Display help for `crane registry`:

```
crane registry {{[-h|--help]}}
```

- Display help for `crane registry serve`:

```
crane registry serve {{[-h|--help]}}
```

crane tag

Efficiently tag a remote image without downloading it, which differs from the **copy** command.

It skips the layer existence checks because we know the manifest already exists making it slightly faster.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_tag.md.

- Tag remote image:

```
crane tag {{image_name}} {{tag_name}}
```

- Display help:

```
crane tag {{[-h|--help]}}
```

crane validate

Validate that an image is well-formed.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_validate.md.

- Validate an image:

```
crane validate
```

- Skip downloading/digesting layers:

```
crane validate --fast
```

- Name of remote image to validate:

```
crane validate --remote {{image_name}}
```

- Path to tarball to validate:

```
crane validate --tarball {{path/to/tarball}}
```

- Display help:

```
crane validate {{[-h|--help]}}
```

crane version

Print the version of a binary.

The version string is completely dependent on how the binary was built, so you should not depend on the version format. It may change without notice.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane_version.md.

- Display version:

  ```
  crane version
  ```

- Display help:

  ```
  crane version {{[-h|--help]}}
  ```

crane

Container images managing tool.

Some subcommands such as **`pull`**, **`push`**, **`copy`**, etc. have their own usage documentation.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/crane/doc/crane.md/.

- Log in to a registry:

```
crane auth login {{registry}} {{[-u|--username]}} {{user}} {{[-p|--password]}} {{password}}
```

- List the repos in a registry:

```
crane catalog {{registry}} --full-ref
```

- List the tags in a repository:

```
crane ls {{repository}} {{[-o|--omit-digest-tags]}}
```

- Pull remote images by reference and store their contents locally:

```
crane pull {{image}} {{tarball}}
```

- Push local image contents to a remote registry:

```
crane push {{path/to/directory_or_tarball}} {{image}}
```

- Efficiently tag a remote image:

```
crane tag {{image}} {{tag}}
```

- Efficiently copy a remote image while retaining the digest value:

```
crane {{[cp|copy]}} {{source}} {{destination}} {{[-a|--all-tags]}}
```

- Delete an image reference from its registry:

```
crane delete {{image}}
```

createdb

Create a PostgreSQL database.

More information: https://www.postgresql.org/docs/current/app-createdb.html.

- Create a database owned by the current user:

```
createdb {{database_name}}
```

- Create a database owned by a specific user with a description:

```
createdb {{[-O|--owner]}} {{username}} {{database_name}}
'{{description}}'
```

- Create a database from a template:

```
createdb {{[-T|--template]}} {{template_name}}
{{database_name}}
```

createuser

Create a PostgreSQL user (role).

More information: https://www.postgresql.org/docs/current/app-createuser.html.

- Create a user interactively:

```
createuser --interactive {{username}}
```

- Create a user with no special rights:

```
createuser {{username}}
```

- Create a superuser:

```
createuser {{[-s|--superuser]}} {{username}}
```

- Create a user allowed to create databases, manage roles, and prompt for a password:

```
createuser {{[-d|--createdb]}} {{[-r|--createrole]}} {{[-P|--pwprompt]}} {{username}}
```

- Create a user without the ability to create databases or manage roles:

```
createuser {{[-D|--no-createdb]}} {{[-R|--no-createrole]}} {{username}}
```

crictl

Manage CRI-compatible container runtimes.

More information: https://github.com/kubernetes-sigs/cri-tools/blob/master/docs/crictl.md.

- List all Kubernetes pods (Ready and NotReady):

```
crictl pods
```

- List all containers (Running and Exited):

```
crictl ps {{[-a|--all]}}
```

- List all images:

```
crictl images
```

- Print information about specific containers:

```
crictl inspect {{container_id1 container_id2 ...}}
```

- Open a specific shell inside a running container:

```
crictl exec {{[-it|--interactive --tty]}} {{container_id}} {{sh}}
```

- Pull a specific image from a registry:

```
crictl pull {{image:tag}}
```

- Print and follow logs of a specific container:

```
crictl logs {{[-f|--follow]}} {{container_id}}
```

- Remove one or more images:

```
crictl rmi {{image_id1 image_id2 ...}}
```

croc

Send and receive files easily and securely over any network.

More information: https://github.com/schollz/croc.

- Send a file or directory:

```
croc send {{path/to/file_or_directory}}
```

- Send a file or directory with a specific passphrase:

```
croc send {{[-c|--code]}} {{passphrase}} {{path/to/
file_or_directory}}
```

- Receive a file or directory on receiving machine:

```
croc {{passphrase}}
```

- Send and connect over a custom relay:

```
croc --relay {{ip_to_relay}} send {{path/to/
file_or_directory}}
```

- Receive and connect over a custom relay:

```
croc --relay {{ip_to_relay}} {{passphrase}}
```

- Host a croc relay on the default ports:

```
croc relay
```

- Display parameters and options for a croc command:

```
croc {{send|relay}} --help
```

cron

A system scheduler for running jobs or tasks unattended.

The command to submit, edit, or delete entries to **`cron`** is called **`crontab`**.

- View documentation for managing `cron` entries:

  ```
  tldr crontab
  ```

cronic

Bash script for wrapping cron jobs to prevent excess email sending.

More information: https://manned.org/cronic.

- Call a command and display its output if it returns a non-zero exit code:

```
cronic {{command}}
```

crontab

Schedule cron jobs to run on a time interval for the current user.

More information: https://manned.org/crontab.

- Edit the crontab file for the current user:

```
crontab -e
```

- Edit the crontab file for a specific user:

```
sudo crontab -e -u {{user}}
```

- Replace the current crontab with the contents of the given file:

```
crontab {{path/to/file}}
```

- View a list of existing cron jobs for current user:

```
crontab -l
```

- Remove all cron jobs for the current user:

```
crontab -r
```

- Sample cron job which runs at 10:00 every day (* means any value):

```
0 10 * * * {{command_to_execute}}
```

- Sample cron job which runs a command every 10 minutes:

```
*/10 * * * * {{command_to_execute}}
```

- Sample cron job which runs a certain script at 02:30 every Friday:

```
30 2 * * Fri /{{path/to/script.sh}}
```

crunch

Wordlist generator.

More information: https://manned.org/crunch.

- Output a list of words of length 1 to 3 with only lowercase characters:

```
crunch {{1}} {{3}}
```

- Output a list of hexadecimal words of length 8:

```
crunch {{8}} {{8}} {{0123456789abcdef}}
```

- Output a list of all permutations of abc (lengths are not processed):

```
crunch {{1}} {{1}} -p {{abc}}
```

- Output a list of all permutations of the given strings (lengths are not processed):

```
crunch {{1}} {{1}} -p {{abc}} {{def}} {{ghi}}
```

- Output a list of words generated according to the given pattern and a maximum number of duplicate letters:

```
crunch {{5}} {{5}} {{abcde123}} -t {{@@@12}} -d 2@
```

- Write a list of words in chunk files of a given size, starting with the given string:

```
crunch {{3}} {{5}} -o {{START}} -b {{10kb}} -s {{abc}}
```

- Write a list of words stopping with the given string and inverting the wordlist:

```
crunch {{1}} {{5}} -o {{START}} -e {{abcde}} -i
```

- Write a list of words in compressed chunk files with a specified number of words:

```
crunch {{1}} {{5}} -o {{START}} -c {{1000}} -z {{gzip|bzip2|lzma|7z}}
```

crush

AI-powered terminal assistant for software development tasks.

Provides interactive chat interface with AI capabilities, code analysis, and LSP integration.

More information: https://github.com/charmbracelet/crush.

- Start interactive mode:

```
crush
```

- Run with debug logging:

```
crush {{[-d|--debug]}}
```

- Run with debug logging in a specific directory:

```
crush {{[-d|--debug]}} {{[-c|--cwd]}} {{path/to/project}}
```

- Run a single non-interactive prompt:

```
crush run "{{Explain the use of context in Go}}"
```

- Run in dangerous mode (auto-accept all permissions):

```
crush {{[-y|--yolo]}}
```

- Display version:

```
crush {{[-v|--version]}}
```

cryfs

A cryptographic filesystem for the cloud.

More information: https://manned.org/cryfs.

- Mount an encrypted filesystem. The initialization wizard will be started on the first execution:

```
cryfs {{path/to/cipher_directory}} {{path/to/mount_point}}
```

- Unmount an encrypted filesystem:

```
cryfs-unmount {{path/to/mount_point}}
```

- Automatically unmount after ten minutes of inactivity:

```
cryfs --unmount-idle {{10}} {{path/to/cipher_directory}} {{path/to/mount_point}}
```

- List supported ciphers:

```
cryfs --show-ciphers
```

crystal

Manage Crystal source code.

More information: https://crystal-lang.org/reference/using_the_compiler.

- Run a Crystal file:

```
crystal {{path/to/file.cr}}
```

- Compile a file and all dependencies to a single executable:

```
crystal build {{path/to/file.cr}}
```

- Read Crystal source code from the command-line or `stdin`, and execute it:

```
crystal eval '{{code}}'
```

- Generate API documentation from inline docstrings in Crystal files:

```
crystal docs
```

- Compile and run a Crystal specification suite:

```
crystal spec
```

- Start a local interactive server for testing the language:

```
crystal play
```

- Create a project directory for a Crystal application:

```
crystal init app {{application_name}}
```

- Display help:

```
crystal help
```

cs complete-dep

Search for libraries without doing it directly on the web.

More information: https://get-coursier.io/docs/cli-complete.

- Print which artifacts are published under a specific Maven group identifier:

```
cs complete-dep {{group_id}}
```

- List published library versions under a specific Maven group identifier and an artifact one:

```
cs complete-dep {{group_id}}:{{artifact_id}}
```

- Print which artifacts are pubblished under a given Maven groupId searching in the ivy2local:

```
cs complete-dep {{group_id}} --repository ivy2local
```

- List published artifacts under a Maven group identifier searching in a specific repository and credentials:

```
cs complete-dep {{group_id}}:{{artifact_id}} --repository
{{repository_url}} --credentials {{user}}:{{password}}
```

cs fetch

Fetch fetches the JARs of dependencies.

More information: https://get-coursier.io/docs/cli-fetch.

- Fetch a specific version of a `.jar`:

```
cs fetch {{group_id}}:{{artifact_id}}:{{artifact_version}}
```

- Fetch a package and evaluate the classpath corresponding to the selected package in an env var:

```
CP="$(cs fetch --classpath org.scalameta::scalafmt-cli:latest.release)"
```

- Fetch a source of a specific `.jar`:

```
cs fetch --sources {{group_id}}:{{artifact_id}}:{{artifact_version}}
```

- Fetch the javadoc jars:

```
cs fetch --javadoc {{group_id}}:{{artifact_id}}:{{artifact_version}}
```

- Fetch dependency with javadoc jars and source jars:

```
cs fetch --default={{true}} --sources --javadoc {{group_id}}:{{artifact_id}}:{{artifact_version}}
```

- Fetch jars coming from dependency files:

```
cs fetch {{--dependency-file path/to/file1 --dependency-file path/to/file2 ...}}
```

cs install

Install an application in the installation directory onfigured when installing **`cs`** (to enable the binary to be loaded add to your **`.bash_profile`** the **`$ eval "$(cs install --env)"`** command).

More information: https://get-coursier.io/docs/cli-install.

- Install a specific application:

```
cs install {{application_name}}
```

- Install a specific version of an application:

```
cs install {{application_name}}:{{application_version}}
```

- Search an application by a specific name:

```
cs search {{application_partial_name}}
```

- Update a specific application if available:

```
cs update {{application_name}}
```

- Update all the installed applications:

```
cs update
```

- Uninstall a specific application:

```
cs uninstall {{application_name}}
```

- List all installed applications:

```
cs list
```

- Pass specific Java options to an installed application:

```
{{application_name}} {{-Jjava_option_name1=value1 -
Jjava_option_name2=value2 ...}}
```

cs java

The **`java`** and **`java-home`** commands fetch and install JVMs. The **`java`** command runs them too.

More information: https://get-coursier.io/docs/cli-java.

- Display Java version by using coursier:

```
cs java -version
```

- Call a specific Java version with custom properties using coursier:

```
cs java --jvm {{jvm_name}}:{{jvm_version}} -Xmx32m -
X{{another_jvm_opt}} -jar {{path/to/jar_name.jar}}
```

- List all the available JVM in the coursier default index:

```
cs java --available
```

- List all the installed JVM in the system with his own location:

```
cs java --installed
```

- Set a specific JVM as one-off default for the shell instance:

```
cs java --jvm {{jvm_name}}:{{jvm_version}} --env
```

- Revert the changes for the default JVM settings:

```
eval "$(cs java --disable)"
```

- Set a specific JVM as default for the whole system:

```
cs java --jvm {{jvm_name}}:{{jvm_version}} --setup
```

cs launch

Launch an application from the name directly from Maven dependencies without the need of installing it.

More information: https://get-coursier.io/docs/cli-launch.

- Launch a specific application with arguments:

```
cs launch {{application_name}} -- {{argument1 argument2 ...}}
```

- Launch a specific application version with arguments:

```
cs launch {{application_name}}:{{application_version}} --
{{argument1 argument2 ...}}
```

- Launch a specific version of an application specifying which is the main file:

```
cs launch {{group_id}}:{{artifact_id}}:{{artifact_version}}
--main-class {{path/to/main_class_file}}
```

- Launch an application with specific Java options and JVM memory ones:

```
cs launch --java-opt {{-Doption_name1:option_value1 -
Doption_name2:option_value2 ...}} --java-opt {{-Xjvm_option1
-Xjvm_option2 ...}} {{application_name}}
```

cs resolve

Resolve lists the transitive dependencies of other dependencies.

More information: https://get-coursier.io/docs/cli-resolve.

- Resolve lists of transitive dependencies of two dependencies:

```
cs resolve {{group_id1}}:{{artifact_id1}}:
{{artifact_version1}} {{group_id2}}:{{artifact_id2}}:
{{artifact_version2}}
```

- Resolve lists of transitive dependencies of a package by the dependency tree:

```
cs resolve --tree {{group_id}}:{{artifact_id}}:
{{artifact_version}}
```

- Resolve dependency tree in a reverse order (from a dependency to its dependencies):

```
cs resolve --reverse-tree {{group_id}}:{{artifact_id}}:
{{artifact_version}}
```

- Print all the libraries that depends on a specific library:

```
cs resolve {{group_id}}:{{artifact_id}}:{{artifact_version}}
--what-depends-on {{searched_group_id}}:
{{searched_artifact_id}}
```

- Print all the libraries that depends on a specific library version:

```
cs resolve {{group_id}}:{{artifact_id}}:{{artifact_version}}
--what-depends-on {{searched_group_id}}:
{{searched_artifact_id}}{{searched_artifact_version}}
```

- Print eventual conflicts between a set of packages:

```
cs resolve --conflicts
{{group_id1:artifact_id1:artifact_version1
group_id2:artifact_id2:artifact_version2 ...}}
```

cs

Application and artifact manager for the Scala language.

Installs Scala applications and sets up a Scala development environment.

Some subcommands such as **`install`**, **`launch`**, **`java`**, **`fetch`**, **`resolve`**, **`complete-dep`**, etc. have their own usage documentation.

More information: https://get-coursier.io/docs/overview.

- List installed applications:

  ```
  cs list
  ```

- Install a specific application:

  ```
  cs install {{application_name}}
  ```

- Uninstall a specific application:

  ```
  cs uninstall {{application_name}}
  ```

- Setup machine for the Scala development:

  ```
  cs setup
  ```

- Update all the installed applications:

  ```
  cs update
  ```

- Display version:

  ```
  cs version
  ```

csc

The Microsoft C# Compiler.

More information: https://learn.microsoft.com/dotnet/csharp/language-reference/compiler-options/command-line-building-with-csc-exe.

- Compile one or more C# files to a CIL executable:

```
csc {{path/to/input_file1.cs path/to/input_file2.cs ...}}
```

- Specify the output filename:

```
csc /out:{{path/to/file}} {{path/to/input_file.cs}}
```

- Compile into a `.dll` library instead of an executable:

```
csc /target:library {{path/to/input_file.cs}}
```

- Reference another assembly:

```
csc /reference:{{path/to/library.dll}} {{path/to/
input_file.cs}}
```

- Embed a resource:

```
csc /resource:{{path/to/resource_file}} {{path/to/
input_file.cs}}
```

- Automatically generate XML documentation:

```
csc /doc:{{path/to/output.xml}} {{path/to/input_file.cs}}
```

- Specify an icon:

```
csc /win32icon:{{path/to/icon.ico}} {{path/to/input_file.cs}}
```

- Strongly-name the resulting assembly with a keyfile:

```
csc /keyfile:{{path/to/keyfile}} {{path/to/input_file.cs}}
```

csh

The shell (command interpreter) with C-like syntax.

See also: **`tcsh`**.

More information: https://www.mkssoftware.com/docs/man1/csh.1.asp.

- Start an interactive shell session:

```
csh
```

- Start an interactive shell session [f]aster without loading startup configs:

```
csh -f
```

- Execute specific [c]ommands:

```
csh -c "{{echo 'csh is executed'}}"
```

- Execute a specific script:

```
csh {{path/to/script.csh}}
```

csslint

Lint CSS code.

More information: https://github.com/CSSLint/csslint/wiki/Command-line-interface.

- Lint a single CSS file:

```
csslint {{file.css}}
```

- Lint multiple CSS files:

```
csslint {{file1.css file2.css ...}}
```

- List all possible style rules:

```
csslint --list-rules
```

- Treat certain rules as errors (which results in a non-zero exit code):

```
csslint --errors={{errors,universal-selector,imports}}
{{file.css}}
```

- Treat certain rules as warnings:

```
csslint --warnings={{box-sizing,selector-max,floats}}
{{file.css}}
```

- Ignore specific rules:

```
csslint --ignore={{ids,rules-count,shorthand}} {{file.css}}
```

csv-diff

View differences between two CSV, TSV, or JSON files.

More information: https://github.com/simonw/csv-diff.

- Display a human-readable summary of differences between files using a specific column as a unique identifier:

```
csv-diff {{path/to/file1.csv}} {{path/to/file2.csv}} --key {{column_name}}
```

- Display a human-readable summary of differences between files that includes unchanged values in rows with at least one change:

```
csv-diff {{path/to/file1.csv}} {{path/to/file2.csv}} --key {{column_name}} --show-unchanged
```

- Display a summary of differences between files in JSON format using a specific column as a unique identifier:

```
csv-diff {{path/to/file1.csv}} {{path/to/file2.csv}} --key {{column_name}} --json
```

csv2tsv

Convert CSV (comma-separated) text to TSV (tab-separated) format.

More information: https://github.com/eBay/tsv-utils/blob/master/README.md#csv2tsv.

- Convert from CSV to TSV:

```
csv2tsv {{path/to/input_csv1 path/to/input_csv2 ...}} > {{path/to/output_tsv}}
```

- Convert field delimiter separated CSV to TSV:

```
csv2tsv -c'{{field_delimiter}}' {{path/to/input_csv}}
```

- Convert semicolon separated CSV to TSV:

```
csv2tsv -c';' {{path/to/input_csv}}
```

csvclean

Find and clean common syntax errors in CSV files.

Included in csvkit.

More information: https://csvkit.readthedocs.io/en/latest/scripts/csvclean.html.

- Clean a CSV file:

```
csvclean {{bad.csv}}
```

- List locations of syntax errors in a CSV file:

```
csvclean -n {{bad.csv}}
```

csvcut

Filter and truncate CSV files. Like Unix's **`cut`** command, but for tabular data.

Included in csvkit.

More information: https://csvkit.readthedocs.io/en/latest/scripts/csvcut.html.

- Print indices and names of all columns:

```
csvcut {{[-n|--names]}} {{data.csv}}
```

- Extract the first and third columns:

```
csvcut {{[-c|--columns]}} {{1,3}} {{data.csv}}
```

- Extract all columns except the fourth one:

```
csvcut {{[-C|--not-columns]}} {{4}} {{data.csv}}
```

- Extract the columns named "id" and "first name" (in that order):

```
csvcut {{[-c|--columns]}} {{id,"first name"}} {{data.csv}}
```

csvformat

Convert a CSV file to a custom output format.

Included in csvkit.

More information: https://csvkit.readthedocs.io/en/latest/scripts/csvformat.html.

- Convert to a tab-delimited file (TSV):

```
csvformat {{[-T|--out-tabs]}} {{data.csv}}
```

- Convert delimiters to a custom character:

```
csvformat {{[-D|--out-delimiter]}}
"{{custom_character}}" {{data.csv}}
```

- Convert line endings to carriage return (^M) + line feed:

```
csvformat {{[-M|--out-lineterminator]}}
"{{\r\n}}" {{data.csv}}
```

- Minimize use of quote characters:

```
csvformat {{[-U|--out-quoting]}} 0 {{data.csv}}
```

- Maximize use of quote characters:

```
csvformat {{[-U|--out-quoting]}} 1 {{data.csv}}
```

csvgrep

Filter CSV rows with string and pattern matching.

Included in csvkit.

More information: https://csvkit.readthedocs.io/en/latest/scripts/csvgrep.html.

- Find rows that have a certain string in column 1:

```
csvgrep {{[-c|--columns]}} {{1}} {{[-m|--match]}} {{string_to_match}} {{data.csv}}
```

- Find rows in which columns 3 or 4 match a certain `regex`:

```
csvgrep {{[-c|--columns]}} {{3,4}} {{[-r|--regex]}} {{regex}} {{data.csv}}
```

- Find rows in which the "name" column does NOT include the string "John Doe":

```
csvgrep {{[-i|--invert-match]}} {{[-c|--columns]}} {{name}} {{[-m|--match]}} "{{John Doe}}" {{data.csv}}
```

csvlook

Render a CSV file in the console as a fixed-width table.

Included in csvkit.

More information: https://csvkit.readthedocs.io/en/latest/scripts/csvlook.html.

- View a CSV file:

```
csvlook {{data.csv}}
```

csvpy

Load a CSV file into a Python shell.

Included in csvkit.

More information: https://csvkit.readthedocs.io/en/latest/scripts/csvpy.html.

- Load a CSV file into a `CSVKitReader` object:

  ```
  csvpy {{data.csv}}
  ```

- Load a CSV file into a `CSVKitDictReader` object:

  ```
  csvpy --dict {{data.csv}}
  ```

csvsort

Sort CSV files.

Included in csvkit.

More information: https://csvkit.readthedocs.io/en/latest/scripts/csvsort.html.

- Sort a CSV file by column 9:

```
csvsort {{[-c|--columns]}} {{9}} {{data.csv}}
```

- Sort a CSV file by the "name" column in descending order:

```
csvsort {{[-r|--reverse]}} {{[-c|--columns]}} {{name}}
{{data.csv}}
```

- Sort a CSV file by column 2, then by column 4:

```
csvsort {{[-c|--columns]}} {{2,4}} {{data.csv}}
```

- Sort a CSV file without inferring data types:

```
csvsort {{[-I|--no-inference]}} {{[-c|--columns]}}
{{columns}} {{data.csv}}
```

csvsql

Generate SQL statements for a CSV file or execute those statements directly on a database.

Included in csvkit.

More information: https://csvkit.readthedocs.io/en/latest/scripts/csvsql.html.

- Generate a `CREATE TABLE` SQL statement for a CSV file:

```
csvsql {{path/to/data.csv}}
```

- Import a CSV file into an SQL database:

```
csvsql --insert --db "{{mysql://user:password@host/
database}}" {{data.csv}}
```

- Run an SQL query on a CSV file:

```
csvsql --query "{{select * from 'data'}}" {{data.csv}}
```

csvstat

Print descriptive statistics for all columns in a CSV file.

Included in csvkit.

More information: https://csvkit.readthedocs.io/en/latest/scripts/csvstat.html.

- Show all stats for all columns:

```
csvstat {{data.csv}}
```

- Show all stats for columns 2 and 4:

```
csvstat {{[-c|--columns]}} {{2,4}} {{data.csv}}
```

- Show sums for all columns:

```
csvstat --sum {{data.csv}}
```

- Show the max value length for column 3:

```
csvstat {{[-c|--columns]}} {{3}} --len {{data.csv}}
```

- Show the number of unique values in the "name" column:

```
csvstat {{[-c|--columns]}} {{name}} --unique {{data.csv}}
```

csvtool

Utility to filter and extract data from CSV formatted sources.

More information: https://github.com/maroofi/csvtool.

- Extract the second column from a CSV file:

```
csvtool {{[-c|--column]}} {{2}} {{path/to/file.csv}}
```

- Extract the second and fourth columns from a CSV file:

```
csvtool {{[-c|--column]}} {{2,4}} {{path/to/file.csv}}
```

- Extract lines from a CSV file where the second column exactly matches `String`:

```
csvtool {{[-c|--column]}} {{2}} {{[-s|--search]}}
'{{^String$}}' {{path/to/file.csv}}
```

- Extract lines from a CSV file where the second column starts with `Bar`:

```
csvtool {{[-c|--column]}} {{2}} {{[-s|--search]}}
'{{^Bar}}' {{path/to/file.csv}}
```

- Find lines in a CSV file where the second column ends with `Baz` and then extract the third and sixth columns:

```
csvtool {{[-c|--column]}} {{2}} {{[-s|--search]}}
'{{Baz$}}' {{path/to/file.csv}} | csvtool {{[-e|--no-
header]}} {{[-c|--column]}} {{3,6}}
```

ctags

Generate an index (or tag) file of language objects found in source files for many popular programming languages.

More information: https://docs.ctags.io/en/latest/man/ctags.1.html.

- Generate tags for a single file and output them to a file named "tags" in the current directory, overwriting the file if it exists:

```
ctags {{path/to/file}}
```

- Generate tags for all files in the current directory and output them to a specific file, overwriting the file if it exists:

```
ctags -f {{path/to/file}} *
```

- Generate tags for all files in the current directory and all subdirectories:

```
ctags --recurse
```

- Generate tags for a single file and output them with start line number and end line number in JSON format:

```
ctags --fields=+ne --output-format=json {{path/to/file}}
```

ctest

CMake test driver program.

More information: https://gitlab.kitware.com/cmake/community/-/wikis/doc/ctest/Testing-With-CTest.

- Run all tests defined in the CMake project, executing 4 [j]obs at a time in parallel:

```
ctest {{[-j|--parallel]}} {{4}} --output-on-failure
```

- List available tests:

```
ctest {{[-N|--show-only]}}
```

- Run a single test based on its name, or filter on a `regex`:

```
ctest --output-on-failure {{[-R|--tests-regex]}}
'^{{test_name}}$'
```

cups-config

Show technical information about your CUPS print server installation.

More information: https://openprinting.github.io/cups/doc/man-cups-config.html.

- Show where CUPS is currently installed:

```
cups-config --serverbin
```

- Show the location of CUPS' configuration directory:

```
cups-config --serverroot
```

- Show the location of CUPS' data directory:

```
cups-config --datadir
```

- Display help:

```
cups-config --help
```

- Display version:

```
cups-config --version
```

CUPS

Open source printing system.

CUPS isn't a command, but a set of commands.

More information: https://www.cups.org/index.html.

- View documentation for running the CUPS daemon:

```
tldr cupsd
```

- View documentation for managing printers:

```
tldr lpadmin
```

- View documentation for printing files:

```
tldr lp
```

- View documentation for checking status information about the current classes, jobs, and printers:

```
tldr lpstat
```

- View documentation for cancelling print jobs:

```
tldr lprm
```

cupsaccept

Accept jobs sent to destinations.

Note: Destination is referred as a printer or a class of printers.

See also: **`cupsreject`**, **`cupsenable`**, **`cupsdisable`**, **`lpstat`**.

More information: https://www.cups.org/doc/man-cupsaccept.html.

- Accept print jobs to the specified destinations:

```
cupsaccept {{destination1 destination2 ...}}
```

- Specify a different server:

```
cupsaccept -h {{server}} {{destination1 destination2 ...}}
```

cupsctl

Update or query a server's **`cupsd.conf`**.

More information: https://openprinting.github.io/cups/doc/man-cupsctl.html.

- Display the current configuration values:

```
cupsctl
```

- Display the configuration values of a specific server:

```
cupsctl -h {{server[:port]}}
```

- Enable encryption on the connection to the scheduler:

```
cupsctl -E
```

- Enable or disable debug logging to the `error_log` file:

```
cupsctl {{--debug-logging|--no-debug-logging}}
```

- Enable or disable remote administration:

```
cupsctl {{--remote-admin|--no-remote-admin}}
```

- Parse the current debug logging state:

```
cupsctl | grep '^_debug_logging' | awk -F= '{print $2}'
```

cupsd

Server daemon for the CUPS print server.

More information: https://openprinting.github.io/cups/doc/man-cupsd.html.

- Start `cupsd` in the background, aka. as a daemon:

  `cupsd`

- Start `cupsd` on the [f]oreground:

  `cupsd -f`

- [l]aunch `cupsd` on-demand (commonly used by `launchd` or `systemd`):

  `cupsd -l`

- Start `cupsd` using the specified `cupsd.conf` [c]onfiguration file:

  `cupsd -c {{path/to/cupsd.conf}}`

- Start `cupsd` using the specified `cups-files.conf` configuration file:

  `cupsd -s {{path/to/cups-files.conf}}`

- [t]est the `cupsd.conf` [c]onfiguration file for errors:

  `cupsd -t -c {{path/to/cupsd.conf}}`

- [t]est the `cups-files.conf` configuration file for errors:

  `cupsd -t -s {{path/to/cups-files.conf}}`

- Display [h]elp:

  `cupsd -h`

cupsdisable

Stop printers and classes.

Note: Destination is referred as a printer or a class of printers.

See also: **`cupsenable`**, **`cupsaccept`**, **`cupsreject`**, **`lpstat`**.

More information: https://openprinting.github.io/cups/doc/man-cupsenable.html.

- Stop one or more destination(s):

```
cupsdisable {{destination1 destination2 ...}}
```

- Cancel all jobs of the specified destination(s):

```
cupsdisable -c {{destination1 destination2 ...}}
```

cupsenable

Start printers and classes.

Note: Destination is referred as a printer or a class of printers.

See also: **`cupsdisable`**, **`cupsaccept`**, **`cupsreject`**, **`lpstat`**.

More information: https://www.cups.org/doc/man-cupsenable.html.

- Start one or more destination(s):

```
cupsenable {{destination1 destination2 ...}}
```

- Resume printing of pending jobs of a destination (use after `cupsdisable` with `--hold`):

```
cupsenable --release {{destination}}
```

- Cancel all jobs of the specified destination(s):

```
cupsenable -c {{destination1 destination2 ...}}
```

cupsreject

Reject jobs sent to printers.

Note: Destination is referred as a printer or a class of printers.

See also: **`cupsaccept`**, **`cupsenable`**, **`cupsdisable`**, **`lpstat`**.

More information: https://www.cups.org/doc/man-cupsaccept.html.

- Reject print jobs to the specified destinations:

```
cupsreject {{destination1 destination2 ...}}
```

- Specify a different server:

```
cupsreject -h {{server}} {{destination1 destination2 ...}}
```

- Specify a reason string ("Reason Unknown" by default):

```
cupsreject -r {{reason}} {{destination1 destination2 ...}}
```

cupstestppd

Test conformance of PPD files to the version 4.3 of the specification.

Error codes (1, 2, 3, and 4, respectively): bad CLI arguments, unable to open file, unskippable format errors, and non-conformance with PPD specification.

Note: This command is deprecated.

See also: **`lpadmin`**.

More information: https://openprinting.github.io/cups/doc/man-cupstestppd.html.

- Test the conformance of one or more files in quiet mode:

```
cupstestppd -q {{path/to/file1.ppd path/to/file2.ppd ...}}
```

- Get the PPD file from `stdin`, showing detailed conformance testing results:

```
cupstestppd < {{path/to/file.ppd}} -v -
```

- Test all PPD files under the current directory, printing the names of each file that does not conform:

```
find . -name \*.ppd \! -execdir cupstestppd -q '{}' \; -print
```

curl

Transfers data from or to a server.

Supports most protocols, including HTTP, HTTPS, FTP, SCP, etc.

See also: **`wcurl`**, **`wget`**.

More information: https://curl.se/docs/manpage.html.

- Make an HTTP GET request and dump the contents in `stdout`:

```
curl {{https://example.com}}
```

- Make an HTTP GET request, follow any `3xx` redirects, and dump the reply headers and contents to `stdout`:

```
curl {{[-L|--location]}} {{[-D|--dump-header]}} - {{https://example.com}}
```

- Download a file, saving the output under the filename indicated by the URL:

```
curl {{[-O|--remote-name]}} {{https://example.com/filename.zip}}
```

- Send form-encoded data (POST request of type `application/x-www-form-urlencoded`). Use `--data @file_name` or `--data @'-'` to read from `stdin`:

```
curl {{[-X|--request]}} POST {{[-d|--data]}} '{{name=bob}}' {{http://example.com/form}}
```

- Send a request with an extra header, using a custom HTTP method and over a proxy (such as BurpSuite), ignoring insecure self-signed certificates:

```
curl {{[-k|--insecure]}} {{[-x|--proxy]}} {{http://127.0.0.1:8080}} {{[-H|--header]}} '{{Authorization: Bearer token}}' {{[-X|--request]}} {{GET|PUT|POST|DELETE|PATCH|...}} {{https://example.com}}
```

- Send data in JSON format, specifying the appropriate Content-Type header:

```
curl {{[-d|--data]}} '{{{"name":"bob"}}}' {{[-H|--header]}}
'{{Content-Type: application/json}}' {{http://example.com/
users/1234}}
```

- Pass client certificate and private key for the request, skipping certificate validation:

  ```
  curl {{[-E|--cert]}} {{client.pem}} --key {{key.pem}} {{[-
  k|--insecure]}} {{https://example.com}}
  ```

- Resolve a hostname to a custom IP address, with verbose output (similar to editing the `/etc/hosts` file for custom DNS resolution):

  ```
  curl {{[-v|--verbose]}} --resolve {{example.com}}:{{80}}:
  {{127.0.0.1}} {{http://example.com}}
  ```

cut

Cut out fields from **`stdin`** or files.

More information: https://www.gnu.org/software/coreutils/manual/html_node/cut-invocation.html.

- Print the fifth character on each line:

```
{{command}} | cut {{[-c|--characters]}} 5
```

- Print the fifth to tenth character of each line of the specified file:

```
cut {{[-c|--characters]}} 5-10 {{path/to/file}}
```

- Split each line in a file by a delimiter into fields and print fields two and six (default delimiter is TAB):

```
cut {{[-f|--fields]}} 2,6 {{path/to/file}}
```

- Split each line by the specified delimiter and print all from the second field onward:

```
{{command}} | cut {{[-d|--delimiter]}} "{{delimiter}}" {{[-f|--fields]}} 2-
```

- Use space as a delimiter and print only the first 3 fields:

```
{{command}} | cut {{[-d|--delimiter]}} " " {{[-f|--fields]}} -3
```

- Print specific fields of lines that use NUL to terminate lines instead of newlines:

```
{{find . -print0}} | cut {{[-z|--zero-terminated]}} {{[-d|--delimiter]}} "{{/}}" {{[-f|--fields]}} {{2}}
```

CVS

Concurrent Versions System, a revision control system.

More information: https://manned.org/cvs.

- Create a new repository (requires the `$CVSROOT` environment variable to be set externally):

```
cvs -d {{path/to/repository}} init
```

- Add a project to the repository:

```
cvs import -m "{{message}}" {{project_name}} {{version}} {{vendor}}
```

- Checkout a project:

```
cvs checkout {{project_name}}
```

- Show changes made to files:

```
cvs diff {{path/to/file}}
```

- Add a file:

```
cvs add {{path/to/file}}
```

- Commit a file:

```
cvs commit -m "{{message}}" {{path/to/file}}
```

- Update the working directory from the remote repository:

```
cvs update
```

cwebp

Compress an image file to a WebP file.

More information: https://developers.google.com/speed/webp/docs/cwebp.

- Compress a WebP file with default settings (q = 75) to the [o]utput file:

```
cwebp {{path/to/image_file}} -o {{path/to/output.webp}}
```

- Compress a WebP file with the best [q]uality and largest file size:

```
cwebp {{path/to/image_file}} -o {{path/to/output.webp}} -q
{{100}}
```

- Compress a WebP file with the worst [q]uality and smallest file size:

```
cwebp {{path/to/image_file}} -o {{path/to/output.webp}} -q
{{0}}
```

- Compress a WebP file and apply resize to image:

```
cwebp {{path/to/image_file}} -o {{path/to/output.webp}} -
resize {{width}} {{height}}
```

- Compress a WebP file and drop alpha channel information:

```
cwebp {{path/to/image_file}} -o {{path/to/output.webp}} -
noalpha
```

cypher-shell

Open an interactive session and run Cypher queries against a Neo4j instance.

See also: **`neo4j-admin`**, **`mysql`**.

More information: https://neo4j.com/docs/operations-manual/current/cypher-shell/.

- Connect to a local instance on the default port (`neo4j://localhost:7687`):

```
cypher-shell
```

- Connect to a remote instance:

```
cypher-shell --address neo4j://{{host}}:{{port}}
```

- Connect and supply security credentials:

```
cypher-shell --username {{username}} --password {{password}}
```

- Connect to a specific database:

```
cypher-shell --database {{database_name}}
```

- Execute Cypher statements in a file and close:

```
cypher-shell --file {{path/to/file.cypher}}
```

- Enable logging to a file:

```
cypher-shell --log {{path/to/file.log}}
```

- Display help:

```
cypher-shell --help
```

cython

A compiler that converts **`.pyx`** files into C or C++ source files.

More information: https://docs.cython.org/en/latest/.

- Compile into C code:

```
cython {{path/to/file}}
```

- Compile into C++ code:

```
cython --cplus {{path/to/file}}
```

- Specify an output file:

```
cython {{[-o|--output-file]}} {{path/to/output_file}} {{path/to/file}}
```

- Display version:

```
cython {{[-V|--version]}}
```

czkawka_cli

Find duplicates, empty folders, similar images and much more.

More information: https://github.com/qarmin/czkawka/blob/master/czkawka_cli/README.md.

- List duplicate in specific directories and write the results into a file:

```
czkawka_cli dup {{[-d|--directories]}} {{path/to/directory1}} {{[-d|--directories]}} {{path/to/directory2}} {{[-f|--file-to-save]}} {{path/to/results.txt}}
```

- Find duplicate files in specific directories and delete them (default: `NONE`):

```
czkawka_cli dup {{[-d|--directories]}} {{path/to/directory}} {{[-D|--delete-method]}} {{AEN|AEO|ON|OO|HARD|NONE}}
```

- Find similar looking image with a specific similarity level (default: `High`):

```
czkawka_cli image {{[-d|--directories]}} {{path/to/directory}} {{[-s|--similarity-preset]}} {{Minimal|VerySmall|Small|Medium|High|VeryHigh|Original}} {{[-f|--file-to-save]}} {{path/to/results.txt}}
```

- Display help:

```
czkawka_cli {{[-h|--help]}}
```

d2

A modern diagram scripting language that turns text to diagrams.

Note: The output file supports SVG and PNG file formats.

More information: https://d2lang.com/tour/man/.

- Compile and render a D2 source file into an output file:

```
d2 {{path/to/input_file.d2}} {{path/to/output_file.ext}}
```

- Watch live changes made to a D2 source file in the default web browser:

```
d2 {{[-w|--watch]}} {{path/to/input_file.d2}} {{path/to/output_file.ext}}
```

- Format a D2 source file:

```
d2 fmt {{path/to/input_file.d2}}
```

- List available themes:

```
d2 themes
```

- Use a different theme for the output file (list available themes first to get the desired `theme_id`):

```
d2 {{[-t|--theme]}} {{theme_id}} {{path/to/input_file.d2}} {{path/to/output_file.ext}}
```

- Make rendered diagrams look like hand sketches:

```
d2 {{[-s|--sketch]}} true {{path/to/input_file.d2}} {{path/to/output_file.ext}}
```

d8

Developer shell for the V8 JavaScript engine.

More information: https://v8.dev/docs/d8.

- Start a REPL (interactive shell):

```
d8
```

- Run a JavaScript file:

```
d8 {{path/to/file.js}}
```

- Evaluate a JavaScript expression:

```
d8 -e "{{code}}"
```

dalfox

A powerful open-source XSS scanner focused on automation.

More information: https://dalfox.hahwul.com/page/usage/.

- Scan a single URL for XSS vulnerabilities:

```
dalfox url {{https://example.com}}
```

- Scan a URL using a header for authentication:

```
dalfox url {{https://example.com}} {{[-H|--header]}} '{{X-My-Header: 123}}'
```

- Scan a list of URLs from a file:

```
dalfox file {{path/to/file}}
```

- Start Dalfox as a REST API server:

```
dalfox server --host {{0.0.0.0}} --port {{8080}}
```

daps

An open source program for transforming DocBook XML into output formats such as HTML or PDF.

More information: https://opensuse.github.io/daps/doc/index.html.

- Check if a DocBook XML file is valid:

```
daps {{[-d|--docconfig]}} {{path/to/file.xml}} validate
```

- Convert a DocBook XML file into PDF:

```
daps {{[-d|--docconfig]}} {{path/to/file.xml}} pdf
```

- Convert a DocBook XML file into a single HTML file:

```
daps {{[-d|--docconfig]}} {{path/to/file.xml}} html --single
```

- Display help:

```
daps {{[-h|--help]}}
```

- Display version:

```
daps --version
```

darkhttpd

Darkhttpd web server.

More information: https://github.com/emikulic/darkhttpd#how-to-run-darkhttpd.

- Start server serving the specified document root:

```
darkhttpd {{path/to/docroot}}
```

- Start server on specified port (port 8080 by default if running as non-root user):

```
darkhttpd {{path/to/docroot}} --port {{port}}
```

- Listen only on specified IP address (by default, the server listens on all interfaces):

```
darkhttpd {{path/to/docroot}} --addr {{ip_address}}
```

dart

Manage Dart projects.

More information: https://dart.dev/tools/dart-tool.

- Initialize a new Dart project in a directory of the same name:

```
dart create {{project_name}}
```

- Run a Dart file:

```
dart run {{path/to/file.dart}}
```

- Download dependencies for the current project:

```
dart pub get
```

- Run unit tests for the current project:

```
dart test
```

- Update an outdated project's dependencies to support null-safety:

```
dart pub upgrade --null-safety
```

- Compile a Dart file to a native binary:

```
dart compile exe {{path/to/file.dart}}
```

- Apply automated fixes to the current project:

```
dart fix --apply
```

dash

Debian Almquist Shell, a modern, POSIX-compliant implementation of **sh** (not Bash-compatible).

More information: https://manned.org/dash.

- Start an interactive shell session:

```
dash
```

- Execute specific [c]ommands:

```
dash -c "{{echo 'dash is executed'}}"
```

- Execute a specific script:

```
dash {{path/to/script.sh}}
```

- Check a specific script for syntax errors:

```
dash -n {{path/to/script.sh}}
```

- Execute a specific script while printing each command before executing it:

```
dash -x {{path/to/script.sh}}
```

- Execute a specific script and stop at the first [e]rror:

```
dash -e {{path/to/script.sh}}
```

- Execute specific commands from `stdin`:

```
{{echo "echo 'dash is executed'"}} | dash
```

datashader_cli

Quick visualization of large datasets using CLI based on datashader.

More information: https://github.com/wybert/datashader-cli.

- Create a shaded scatter plot of points and save it to a PNG file and set the background color:

```
datashader_cli points {{path/to/input.parquet}} --x
{{pickup_x}} --y {{pickup_y}} {{path/to/output.png}} --
background {{black|white|#rrggbb}}
```

- Visualize the geospatial data (supports Geoparquet, shapefile, geojson, geopackage, etc.):

```
datashader_cli points {{path/to/input_data.geo.parquet}}
{{path/to/output_data.png}} --geo true
```

- Use matplotlib to render the image:

```
datashader_cli points {{path/to/input_data.geo.parquet}}
{{path/to/output_data.png}} --geo {{true}} --matplotlib true
```

date

Set or display the system date.

More information: https://www.gnu.org/software/coreutils/manual/html_node/date-invocation.html.

- Display the current date using the default locale's format:

```
date +%c
```

- Display the current date in UTC, using the ISO 8601 format:

```
date {{[-u|--utc]}} +%Y-%m-%dT%H:%M:%S%Z
```

- Display the current date as a Unix timestamp (seconds since the Unix epoch):

```
date +%s
```

- Convert a date specified as a Unix timestamp to the default format:

```
date {{[-d|--date]}} @{{1473305798}}
```

- Convert a given date to the Unix timestamp format:

```
date {{[-d|--date]}} "{{2018-09-01 00:00}}" +%s {{[-u|--utc]}}
```

- Display the current date using the RFC-3339 format (`YYYY-MM-DD hh:mm:ss TZ`):

```
date --rfc-3339 s
```

- Set the current date using the format `MMDDhhmmYYYY.ss` (`YYYY` and `.ss` are optional):

```
date {{093023592021.59}}
```

- Display the current ISO week number:

```
date +%V
```

dbeaver

A GUI SQL client supporting many databases.

More information: https://dbeaver.com/docs/dbeaver/Command-Line/.

- Open DBeaver:

```
dbeaver
```

- Open DBeaver connecting to a specific database:

```
dbeaver {{[-con|--connect]}} {{database}}
```

- Force the creation of a new instance:

```
dbeaver --newInstance
```

- Stop the running instance:

```
dbeaver --quit
```

- Close all tabs within DBeaver:

```
dbeaver --closeTabs
```

- Bring DBeaver to the top of applications:

```
dbeaver --bringToFront
```

- Display help:

```
dbeaver --help
```

dbt

A tool to model transformations in data warehouses.

More information: https://github.com/dbt-labs/dbt-core.

- Debug the dbt project and the connection to the database:

  ```
  dbt debug
  ```

- Run all models of the project:

  ```
  dbt run
  ```

- Run all tests of `example_model`:

  ```
  dbt test --select example_model
  ```

- Build (load seeds, run models, snapshots, and tests associated with) `example_model` and its downstream dependents:

  ```
  dbt build --select example_model+
  ```

- Build all models, except the ones with the tag `not_now`:

  ```
  dbt build --exclude "tag:not_now"
  ```

- Build all models with tags `one` and `two`:

  ```
  dbt build --select "tag:one,tag:two"
  ```

- Build all models with tags `one` or `two`:

  ```
  dbt build --select "tag:one tag:two"
  ```

dbx

Interact with the Databricks platform.

Note: This tool has been retired and it is recommended to use Databricks Asset Bundles instead.

More information: https://dbx.readthedocs.io/en/latest/reference/cli/#dbx.

- Create a new `dbx` project in the current working directory:

  ```
  dbx configure --profile {{DEFAULT}}
  ```

- Sync local files from the specified path to DBFS and watch for changes:

  ```
  dbx sync dbfs --source {{path/to/directory}} --dest {{path/to/remote_directory}}
  ```

- Deploy the specified workflow to artifact storage:

  ```
  dbx deploy {{workflow_name}}
  ```

- Launch the specified workflow after deploying it:

  ```
  dbx launch {{workflow_name}}
  ```

dc

An arbitrary precision calculator. Uses reverse polish notation (RPN).

See also: **`bc`**, **`qalc`**.

More information: https://www.gnu.org/software/bc/manual/dc-1.05/html_mono/dc.html.

- Start an interactive session:

```
dc
```

- Execute a script:

```
dc {{path/to/script.dc}}
```

- Calculate an expression with the specified scale:

```
dc {{[-e|--expression]}} '{{10}} k {{5 3 /}} p'
```

- Calculate 4 times 5 (4 5 *), subtract 17 (17 -), and [p]rint the output:

```
dc {{[-e|--expression]}} '4 5 * 17 - p'
```

- Specify the number of decimal places to 7 (7 k), calculate 5 divided by -3 (5 _3 /) and [p]rint:

```
dc {{[-e|--expression]}} '7 k 5 _3 / p'
```

- Calculate the golden ratio, phi: set number of decimal places to 100 (100 k), square root of 5 (5 v) plus 1 (1 +), divided by 2 (2 /), and [p]rint result:

```
dc {{[-e|--expression]}} '100 k 5 v 1 + 2 / p'
```

dcfldd

Enhanced version of dd for forensics and security.

More information: https://manned.org/dcfldd.

- Copy a disk to a raw image file and hash the image using SHA256:

```
dcfldd if={{/dev/disk_device}} of={{file.img}} hash=sha256
hashlog={{file.hash}}
```

- Copy a disk to a raw image file, hashing each 1 GB chunk:

```
dcfldd if={{/dev/disk_device}} of={{file.img}} hash={{sha512|
sha384|sha256|sha1|md5}} hashlog={{file.hash}}
hashwindow={{1G}}
```

dcg

Drupal code generator.

More information: https://github.com/Chi-teck/drupal-code-generator.

- Start a wizard to choose what kind of code (e.g. module, service, form, etc.) to generate:

  ```
  dcg
  ```

- Directly specify the kind of code to generate:

  ```
  dcg {{service|plugin|theme|module|form}}
  ```

- Generate the code in a specific directory:

  ```
  dcg --directory {{path/to/directory}}
  ```

dcgmi

Manage and monitor NVIDIA Data Center GPUs.

More information: https://developer.nvidia.com/dcgm.

- Display information on all available GPUs and processes using them:

```
dcgmi discovery {{[-l|--list]}}
```

- List created groups:

```
dcgmi group {{[-l|--list]}}
```

- Display current usage statistics for device 0:

```
dcgmi dmon {{[-e|--field-id]}}{{1001,1002,1003,1004,1005}}
```

- Display help:

```
dcgmi {{[-h|--help]}}
```

- Display help for a subcommand:

```
dcgmi {{subcommand}} {{[-h|--help]}}
```

dcode

Recursively detect and decode strings, supporting hex, decimal, binary, base64, URL, FromChar encodings, Caesar ciphers, and MD5, SHA1, and SHA2 hashes.

Warning: uses 3rd-party web services for MD5, SHA1, and SHA2 hash lookups. For sensitive data, use **`-s`** to avoid these services.

More information: https://github.com/s0md3v/Decodify.

- Recursively detect and decode a string:

```
dcode "{{NjM3YTQyNzQ1YTQ0NGUzMg==}}"
```

- Rotate a string by the specified offset:

```
dcode -rot {{11}} "{{spwwz hzcwo}}"
```

- Rotate a string by all 26 possible offsets:

```
dcode -rot {{all}} "{{bpgkta xh qtiitg iwpc sr}}"
```

- Reverse a string:

```
dcode -rev "{{hello world}}"
```

dd

Convert and copy a file.

More information: https://manned.org/dd.1p.

- Make a bootable USB drive from an isohybrid file (such as `archlinux-xxx.iso`) and show the progress:

```
dd if={{path/to/file.iso}} of={{/dev/usb_drive}} status=progress
```

- Clone a drive to another drive with 4 MiB block size and flush writes before the command terminates:

```
dd bs=4194304 conv=fsync if={{/dev/source_drive}} of={{/dev/dest_drive}}
```

- Generate a file with a specific number of random bytes by using kernel random driver:

```
dd bs={{100}} count={{1}} if=/dev/urandom of={{path/to/random_file}}
```

- Benchmark the sequential write performance of a disk:

```
dd bs={{1024}} count={{1000000}} if=/dev/zero of={{path/to/file_1GB}}
```

- Create a system backup, save it into an IMG file (can be restored later by swapping `if` and `of`), and show the progress:

```
dd if={{/dev/drive_device}} of={{path/to/file.img}} status=progress
```

ddev

Container based local development tool for PHP environments.

More information: https://docs.ddev.com/en/stable/users/usage/cli/.

- Start up a project:

  ```
  ddev start
  ```

- Configure a project's type and docroot:

  ```
  ddev config
  ```

- Follow the log trail:

  ```
  ddev logs {{[-f|--follow]}}
  ```

- Run composer within the container:

  ```
  ddev composer
  ```

- Install a specific Node.js version:

  ```
  ddev nvm install {{version}}
  ```

- Export a database:

  ```
  ddev export-db {{[-f|--file]}} {{/tmp/db.sql.gz}}
  ```

- Run a specific command within a container:

  ```
  ddev exec {{echo 1}}
  ```

ddgr

Search DuckDuckGo (HTML version) from the terminal.

More information: https://github.com/jarun/ddgr#usage.

- Start in interactive mode:

```
ddgr
```

- Search DuckDuckGo for a keyword:

```
ddgr {{keyword}}
```

- Limit the number of search results to n:

```
ddgr {{[-n|--num]}} {{n}} {{keyword}}
```

- Display the complete URL in search results:

```
ddgr {{[-x|--expand]}} {{keyword}}
```

- Search DuckDuckGo for a keyword and open the first result in the browser:

```
ddgr !w {{keyword}}
```

- Perform a website-specific search:

```
ddgr {{[-w|--site]}} {{site}} {{keyword}}
```

- Search for a specific file type:

```
ddgr {{keyword}} filetype:{{filetype}}
```

- Display help in interactive mode:

```
<?>
```

decaffeinate

Move your CoffeeScript source to modern JavaScript.

More information: https://www.npmjs.com/package/decaffeinate#common-options.

- Convert a CoffeeScript file to JavaScript:

  ```
  decaffeinate {{path/to/file.coffee}}
  ```

- Convert a CoffeeScript v2 file to JavaScript:

  ```
  decaffeinate --use-cs2 {{path/to/file.coffee}}
  ```

- Convert require and `module.exports` to import and export:

  ```
  decaffeinate --use-js-modules {{path/to/file.coffee}}
  ```

- Convert a CoffeeScript, allowing named exports:

  ```
  decaffeinate --loose-js-modules {{path/to/file.coffee}}
  ```

declare

Declare variables and give them attributes.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-declare.

- Declare a string variable with the specified value:

```
declare {{variable}}="{{value}}"
```

- Declare an integer variable with the specified value:

```
declare -i {{variable}}="{{value}}"
```

- Declare an array variable with the specified value:

```
declare -a {{variable}}=({{item_a item_b item_c}})
```

- Declare an associative array variable with the specified value:

```
declare -A {{variable}}=({{[key_a]=item_a [key_b]=item_b [key_c]=item_c}})
```

- Declare a readonly string variable with the specified value:

```
declare -r {{variable}}="{{value}}"
```

- Declare a global variable within a function with the specified value:

```
declare -g {{variable}}="{{value}}"
```

- Print a function definition:

```
declare -f {{function_name}}
```

- Print a variable definition:

```
declare -p {{variable_name}}
```

deemix

A barebone deezer downloader library built from the ashes of Deezloader Remix.

It can be used as a standalone CLI app or implemented in a UI using the API.

More information: https://gitlab.com/RemixDev/deemix-py.

- Download a track or playlist:

  ```
  deemix {{https://www.deezer.com/us/track/00000000}}
  ```

- Download track/playlist at a specific bitrate:

  ```
  deemix --bitrate {{FLAC|MP3}} {{url}}
  ```

- Download to a specific path:

  ```
  deemix --bitrate {{bitrate}} --path {{path}} {{url}}
  ```

- Create a portable deemix configuration file in the current directory:

  ```
  deemix --portable --bitrate {{bitrate}} --path {{path}}
  {{url}}
  ```

deepseek

An AI coding assistant using DeepSeek Coder models.

More information: https://github.com/holasoymalva/deepseek-cli#cli-commands.

- Start interactive mode:

```
deepseek
```

- Run a single prompt:

```
deepseek chat "{{write a Python function for binary search}}"
```

- Start interactive mode with a specific model:

```
deepseek --model {{deepseek-coder:6.7b}}
```

- Set up the local environment (Ollama):

```
deepseek setup
```

- Force the CLI to use local mode:

```
deepseek --local
```

- Display help:

```
deepseek --help
```

delta

A viewer for Git and diff output.

More information: https://dandavison.github.io/delta/full---help-output.html.

- Compare files or directories:

```
delta {{path/to/old_file_or_directory}} {{path/to/
new_file_or_directory}}
```

- Compare files or directories, showing the line numbers:

```
delta {{[-n|--line-numbers]}} {{path/to/
old_file_or_directory}} {{path/to/new_file_or_directory}}
```

- Compare files or directories, showing the differences side by side:

```
delta {{[-s|--side-by-side]}} {{path/to/
old_file_or_directory}} {{path/to/new_file_or_directory}}
```

- Compare files or directories, ignoring any Git configuration settings:

```
delta --no-gitconfig {{path/to/old_file_or_directory}}
{{path/to/new_file_or_directory}}
```

- Compare, rendering commit hashes, file names, and line numbers as hyperlinks, according to the hyperlink spec for terminal emulators:

```
delta --hyperlinks {{path/to/old_file_or_directory}} {{path/
to/new_file_or_directory}}
```

- Display the current settings:

```
delta --show-config
```

- Display supported languages and associated file extensions:

```
delta --list-languages
```

deluge-console

An interactive interface for the Deluge BitTorrent client.

More information: https://deluge-torrent.org/userguide/thinclient/.

- Start the interactive console interface:

  ```
  deluge-console
  ```

- [Interactive] Connect to a Deluge daemon instance:

  ```
  connect {{hostname}}:{{port}}
  ```

- [Interactive] Add a torrent to the daemon:

  ```
  add {{url|magnet|path/to/file}}
  ```

- [Interactive] Display information about all torrents:

  ```
  info
  ```

- [Interactive] Display information about a specific torrent:

  ```
  info {{torrent_id}}
  ```

- [Interactive] Pause a torrent:

  ```
  pause {{torrent_id}}
  ```

- [Interactive] Resume a torrent:

  ```
  resume {{torrent_id}}
  ```

- [Interactive] Remove a torrent from the daemon:

  ```
  rm {{torrent_id}}
  ```

deluge

A BitTorrent client.

More information: https://manned.org/deluge.

- Download a torrent:

```
deluge {{url|magnet|path/to/file}}
```

- Download a torrent using a specific configuration file:

```
deluge {{[-c|--config]}} {{path/to/configuration_file}}
{{url|magnet|path/to/file}}
```

- Download a torrent and launch the specified user interface:

```
deluge -u {{gtk|web|console}} {{url|magnet|path/to/file}}
```

- Download a torrent and output the log to a file:

```
deluge {{[-l|--logfile]}} {{path/to/log_file}} {{url|magnet|
path/to/file}}
```

deluged

A daemon process for the Deluge BitTorrent client.

More information: https://manned.org/deluged.

- Start the Deluge daemon:

```
deluged
```

- Start the Deluge daemon on a specific port:

```
deluged {{[-p|--port]}} {{port}}
```

- Start the Deluge daemon using a specific configuration file:

```
deluged {{[-c|--config]}} {{path/to/configuration_file}}
```

- Start the Deluge daemon and output the log to a file:

```
deluged {{[-l|--logfile]}} {{path/to/log_file}}
```

deno

A secure runtime for JavaScript, TypeScript, and WebAssembly.

Includes dependency management using **`npm`** or **`jsr`**, and tooling like bench, bundle, doc, and coverage.

More information: https://docs.deno.com/runtime/reference/cli/.

- Start a REPL (interactive shell, also known as Read-Eval-Print Loop):

  ```
  deno
  ```

- Start a new project named sample and test it:

  ```
  deno init sample && cd sample && deno test
  ```

- Run a file securely. It will ask (if needed) to allow net, read, etc:

  ```
  deno run {{path/to/file.ts}}
  ```

- Run a file with explicit permissions or allow all (only if you trust the source):

  ```
  deno run {{[--allow-env|--allow-net|--allow-write|--allow-all]}} {{jsr:@deno/deployctl}}
  ```

- List and run tasks from `deno.json` or scripts from `package.json`:

  ```
  deno task
  ```

- Install dependencies listed in `deno.json` or `package.json` (also lock files):

  ```
  deno install
  ```

- Check types, format, and lint (fix if possible):

  ```
  deno check && deno fmt && deno lint --fix
  ```

- Compile the script, imported dependencies, and runtime into a self contained executable:

  ```
  deno compile {{path/to/file.ts}}
  ```

dep

Deploy PHP applications.

Note: The Go command **dep** with the same name is deprecated and archived.

More information: https://deployer.org/docs/8.x/cli.

- Interactively initialize deployer in the local path (use a framework template with `--template=template`):

  ```
  dep init
  ```

- Deploy an application to a remote host:

  ```
  dep deploy {{hostname}}
  ```

- Rollback to the previous working release:

  ```
  dep rollback
  ```

- Connect to a remote host via SSH:

  ```
  dep ssh {{hostname}}
  ```

- List commands:

  ```
  dep list
  ```

- Run any arbitrary command on the remote hosts:

  ```
  dep run "{{command}}"
  ```

- Display help for a command:

  ```
  dep help {{command}}
  ```

detox

Renames files to make them easier to work with.

It removes spaces and other such annoyances like duplicate underline characters.

More information: https://manned.org/detox.

- Remove spaces and other undesirable characters from a file's name:

```
detox {{path/to/file}}
```

- Show how detox would rename all the files in a directory tree:

```
detox {{[-n|--dry-run]}} -r {{path/to/directory}}
```

- Remove spaces and other undesirable characters from all files in a directory tree:

```
detox -r {{path/to/directory}}
```

devcontainer

Use a Docker container as a development environment.

More information: https://containers.dev/implementors/reference/.

- Create and run a Dev Container:

  ```
  devcontainer up
  ```

- Apply a Dev Container Template to a workspace:

  ```
  devcontainer templates apply {{[-t|--template-id]}} {{template_id}} {{[-a|--template-args]}} {{template_args}} {{[-w|--workspace-folder]}} {{path/to/workspace}}
  ```

- Execute a command on a running Dev Container in the current workspace:

  ```
  devcontainer exec {{command}}
  ```

- Build a Dev Container image from `devcontainer.json`:

  ```
  devcontainer build {{path/to/workspace}}
  ```

- Open a Dev Container in VS Code (the path is optional):

  ```
  devcontainer open {{path/to/workspace}}
  ```

- Read and print the configuration of a Dev Container from `devcontainer.json`:

  ```
  devcontainer read-configuration
  ```

devenv

Fast, declarative, reproducible, and composable developer environments using Nix.

More information: https://devenv.sh/getting-started/#commands.

- Initialize the environment:

  ```
  devenv init
  ```

- Enter the Development Environment with relaxed hermeticity (state of being airtight):

  ```
  devenv shell --impure
  ```

- Get detailed information about the current environment:

  ```
  devenv info --verbose
  ```

- Start processes with `devenv`:

  ```
  devenv up --config {{path/to/file}}
  ```

- Clean the environment variables and re-enter the shell in offline mode:

  ```
  devenv --clean --offline
  ```

- Delete the previous shell generations:

  ```
  devenv gc
  ```

devpod

Launch reproducible development environments using Docker, Kubernetes, or SSH.

More information: https://devpod.sh/docs/quickstart/devpod-cli/.

- Add a provider such as Docker or Kubernetes:

  ```
  devpod provider add {{provider_name}}
  ```

- List all available providers:

  ```
  devpod provider list-available
  ```

- Start a workspace from a GitHub repository with a specific IDE:

  ```
  devpod up {{github.com/user/repo}} {{[-i|--ide]}} {{vscode}}
  ```

- Start a workspace from a local directory:

  ```
  devpod up {{path/to/project}}
  ```

- Recreate an existing workspace:

  ```
  devpod up {{workspace_name}} {{[-r|--recreate]}}
  ```

- Reset a workspace to a clean state:

  ```
  devpod up {{workspace_name}} {{[-x|--reset]}}
  ```

- Add a custom provider from a GitHub repository:

  ```
  devpod provider add {{org/provider-repo}}
  ```

devspace

Develop, deploy, and debug applications inside Kubernetes.

More information: https://www.devspace.sh/docs/cli.

- Initialize a new DevSpace project in the current directory:

```
devspace init
```

- Start development mode with port forwarding, file synchronization, and terminal access:

```
devspace dev
```

- Start development mode in a specific namespace:

```
devspace dev {{[-n|--namespace]}} {{namespace}}
```

- Deploy the project to Kubernetes:

```
devspace deploy
```

- Deploy the project with a specific profile:

```
devspace deploy {{[-p|--profile]}} {{profile-name}}
```

- Build all defined images:

```
devspace build
```

- Follow logs from a pod:

```
devspace logs {{[-f|--follow]}}
```

- Open the DevSpace UI in the browser:

```
devspace ui
```

dexdump

Display information about Android DEX files.

More information: https://manned.org/man/debian-stretch/dexdump.

- Extract classes and methods from an APK file:

```
dexdump {{path/to/file.apk}}
```

- Display header information of DEX files contained in an APK file:

```
dexdump -f {{path/to/file.apk}}
```

- Display the dis-assembled output of executable sections:

```
dexdump -d {{path/to/file.apk}}
```

- Output results to a file:

```
dexdump -o {{path/to/file}} {{path/to/file.apk}}
```

dexter

Authenticate the **`kubectl`** users with OpenId Connect.

More information: https://github.com/gini/dexter#run-dexter.

- Create and authenticate a user with Google OIDC:

```
dexter auth {{[-i|--client-id]}} {{client_id}} {{[-s|--
client-secret]}} {{client_secret}}
```

- Override the default kube configuration file location:

```
dexter auth {{[-i|--client-id]}} {{client_id}} {{[-s|--
client-secret]}} {{client_secret}} {{[-k|--kube-config]}}
{{sample/config}}
```

df

Display an overview of the filesystem disk space usage.

More information: https://manned.org/df.1posix.

- Display all filesystems and their disk usage (using 512-byte units):

```
df
```

- Display the filesystem containing the specified file or directory:

```
df {{path/to/file_or_directory}}
```

- Use [k]ibibyte (1024 byte) units when showing size figures:

```
df -k
```

- Display information in a portable way:

```
df -P
```

dfc

Get an overview of the filesystem disk space usage with colors and graphs.

More information: https://manned.org/dfc.

- Display filesystems and their disk usage in human-readable form with colors and graphs:

```
dfc
```

- Display all filesystems including pseudo, duplicate, and inaccessible filesystems:

```
dfc -a
```

- Display filesystems without color:

```
dfc -c never
```

- Display filesystems containing "ext" in the filesystem type:

```
dfc -t ext
```

dhclient

DHCP client.

More information: https://manned.org/dhclient.

- Get an IP address for the `eth0` interface:

```
sudo dhclient {{eth0}}
```

- Release an IP address for the `eth0` interface:

```
sudo dhclient -r {{eth0}}
```

dhcpig

Initiates an advanced DHCP exhaustion attack and stress test.

DHCPig needs to be run with root privileges.

More information: https://github.com/kamorin/DHCPig#usage.

- Exhaust all of the available DHCP addresses using the specified interface:

```
sudo {{path/to}}/pig.py {{eth0}}
```

- Exhaust IPv6 addresses using eth1 interface:

```
sudo {{path/to}}/pig.py {{[-6|--ipv6]}} {{eth1}}
```

- Send fuzzed/malformed data packets using the interface:

```
sudo {{path/to}}/pig.py {{[-f|--fuzz]}} {{eth1}}
```

- Enable color output:

```
sudo {{path/to}}/pig.py {{[-c|--color]}} {{eth1}}
```

- Enable minimal verbosity and color output:

```
sudo {{path/to}}/pig.py {{[-c|--color]}} {{[-v|--verbosity]}}
1 {{eth1}}
```

- Use a debug verbosity of 100 and scan network of neighboring devices using ARP packets:

```
sudo {{path/to}}/pig.py {{[-c|--color]}} {{[-v|--verbosity]}}
100 {{[-n|--neighbors-scan-arp]}} {{eth1}}
```

- Enable printing lease information, attempt to scan and release all neighbor IP addresses:

```
sudo {{path/to}}/pig.py {{[-n|--neighbors-scan-arp]}} {{[-
r|--neighbors-attack-release]}} {{[-o|--show-options]}}
{{eth1}}
```

dhcpwn

Test DHCP IP exhaustion attacks and sniff local DHCP traffic.

More information: https://github.com/mschwager/dhcpwn.

- Flood the network with IP requests:

```
dhcpwn {{[-i|--interface]}} {{network_interface}} flood {{[-c|--count]}} {{number_of_requests}}
```

- Sniff local DHCP traffic:

```
dhcpwn {{[-i|--interface]}} {{network_interface}} sniff
```

dict

Dictionary that uses the DICT protocol.

More information: https://manned.org/dict.

- List available databases:

```
dict {{[-D|--dbs]}}
```

- Get information about a database:

```
dict {{[-i|--info]}} {{database_name}}
```

- Look up a word in a specific database:

```
dict {{[-d|--database]}} {{database_name}} {{word}}
```

- Look up a word in all available databases:

```
dict {{word}}
```

- Show information about the DICT server:

```
dict {{[-I|--serverinfo]}}
```

diff-pdf

Compare two PDFs.

More information: https://github.com/vslavik/diff-pdf.

- Compare PDFs, indicating changes using return codes (`0` = no difference, `1` = PDFs differ):

```
diff-pdf {{path/to/a.pdf}} {{path/to/b.pdf}}
```

- Compare PDFs, outputting a PDF with visually highlighted differences:

```
diff-pdf --output-diff={{path/to/diff.pdf}} {{path/to/a.pdf}} {{path/to/b.pdf}}
```

- Compare PDFs, viewing differences in a simple GUI:

```
diff-pdf --view {{path/to/a.pdf}} {{path/to/b.pdf}}
```

diff-so-fancy

Colorize **`diff`** output in a more human readable way.

More information: https://github.com/so-fancy/diff-so-fancy#-usage.

- Colorize `diff`:

```
diff {{[-u|--unified]}} {{path/to/file1}} {{path/to/file2}} |
diff-so-fancy
```

- Set `diff-so-fancy` to colorize the output during Git's interactive staging:

```
git config --global interactive.diffFilter "diff-so-fancy --
patch"
```

diff

Compare files and directories.

More information: https://manned.org/diff.

- Compare files (lists changes to turn `old_file` into `new_file`):

```
diff {{old_file}} {{new_file}}
```

- Compare files, ignoring white spaces:

```
diff {{[-w|--ignore-all-space]}} {{old_file}} {{new_file}}
```

- Compare files, showing the differences side by side:

```
diff {{[-y|--side-by-side]}} {{old_file}} {{new_file}}
```

- Compare files, showing the differences in unified format (as used by `git diff`):

```
diff {{[-u|--unified]}} {{old_file}} {{new_file}}
```

- Compare directories recursively (shows names for differing files/directories as well as changes made to files):

```
diff {{[-r|--recursive]}} {{old_directory}} {{new_directory}}
```

- Compare directories, only showing the names of files that differ:

```
diff {{[-r|--recursive]}} {{[-q|--brief]}} {{old_directory}}
{{new_directory}}
```

- Create a patch file for Git from the differences of two text files, treating nonexistent files as empty:

```
diff {{[-a|--text]}} {{[-u|--unified]}} {{[-N|--new-file]}}
{{old_file}} {{new_file}} > {{diff.patch}}
```

- Compare files, showing output in color and try hard to find smaller set of changes:

```
diff {{[-d|--minimal]}} --color=always {{old_file}}
{{new_file}}
```

diffimg

Generate an image where each pixel is the difference between corresponding pixels in the 2 source images.

More information: https://graphviz.org/pdf/diffimg.1.pdf.

- Compare two images and output the difference image to the specified file:

```
diffimg {{path/to/image1}} {{path/to/image2}} {{path/to/output_image}}
```

diffoscope

Compare files, archives, and directories.

More information: https://manned.org/diffoscope.

- Compare two files:

```
diffoscope {{path/to/file1}} {{path/to/file2}}
```

- Compare two files without displaying a progress bar:

```
diffoscope --no-progress {{path/to/file1}} {{path/to/file2}}
```

- Compare two files and write an HTML-report to a file (use `-` for `stdout`):

```
diffoscope --html {{path/to/outfile|-}} {{path/to/file1}}
{{path/to/file2}}
```

- Compare two directories excluding files with a name matching a specified pattern:

```
diffoscope --exclude {{pattern}} {{path/to/directory1}}
{{path/to/directory2}}
```

- Compare two directories and control whether directory metadata is considered:

```
diffoscope --exclude-directory-metadata {{auto|yes|no|
recursive}} {{path/to/directory1}} {{path/to/directory2}}
```

diffstat

Create a histogram from the output of the **`diff`** command.

More information: https://manned.org/diffstat.

- Display changes in a histogram:

```
diff {{path/to/file1}} {{path/to/file2}} | diffstat
```

- Display inserted, deleted, and modified changes as a table:

```
diff {{path/to/file1}} {{path/to/file2}} | diffstat -t
```

difft

Compare files or directories based on the syntax of the programming language.

See also: **`delta`**, **`diff`**.

More information: https://difftastic.wilfred.me.uk/introduction.html.

- Compare two files or directories:

```
difft {{path/to/file_or_directory1}} {{path/to/
file_or_directory2}}
```

- Only report the presence of differences between the files:

```
difft --check-only {{path/to/file1}} {{path/to/file2}}
```

- Specify the display mode (default is `side-by-side`):

```
difft --display {{side-by-side|side-by-side-show-both|inline|
json}} {{path/to/file1}} {{path/to/file2}}
```

- Ignore comments when comparing:

```
difft --ignore-comments {{path/to/file1}} {{path/to/file2}}
```

- Enable/Disable syntax highlighting of source code (default is `on`):

```
difft --syntax-highlight {{on|off}} {{path/to/file1}} {{path/
to/file2}}
```

- Do not output anything at all if there are no differences between files:

```
difft --skip-unchanged {{path/to/file_or_directory1}} {{path/
to/file_or_directory2}}
```

- Print all programming languages supported by the tool, along with their extensions:

```
difft --list-languages
```

dig

DNS lookup utility.

More information: https://manned.org/dig.

- Lookup the IP(s) associated with a hostname (A records):

```
dig +short {{example.com}}
```

- Get a detailed answer for a given domain (A records):

```
dig +noall +answer {{example.com}}
```

- Query a specific DNS record type associated with a given domain name:

```
dig +short {{example.com}} {{A|MX|TXT|CNAME|NS}}
```

- Specify an alternate DNS server to query and optionally use DNS over TLS (DoT):

```
dig {{+tls}} @{{1.1.1.1|8.8.8.8|9.9.9.9|...}} {{example.com}}
```

- Perform a reverse DNS lookup on an IP address (PTR record):

```
dig -x {{8.8.8.8}}
```

- Find authoritative name servers for the zone and display SOA records:

```
dig +nssearch {{example.com}}
```

- Perform iterative queries and display the entire trace path to resolve a domain name:

```
dig +trace {{example.com}}
```

- Query a DNS server over a non-standard [p]ort using the TCP protocol:

```
dig +tcp -p {{port}} @{{dns_server_ip}} {{example.com}}
```

dijkstra

Compute shortest-path distances from a single source node in a graph.

More information: https://graphviz.org/pdf/dijkstra.1.pdf.

- Compute distances from a given source node in a graph file:

```
dijkstra {{source_node_file}}
```

- Treat the graph as [d]irected when computing distances:

```
dijkstra -d {{source_node_file}}
```

- Record the [p]revious closest node for each node on the shortest path:

```
dijkstra -p {{source_node_file}}
```

- [a]ssign large distance values to unreachable nodes:

```
dijkstra -a {{source_node_file}}
```

dillo

A lightweight web browser intended for slow computers.

More information: https://manned.org/dillo.

- Launch Dillo:

```
dillo
```

- Launch Dillo with a specific window size and screen location:

```
dillo {{[-g|--geometry]}} {{width}}x{{height}}+{{x_position}}
+{{y_position}}
```

- Launch Dillo and open a specific URL:

```
dillo {{duckduckgo.com}}
```

- Launch Dillo and open a file or directory:

```
dillo {{path/to/file_or_directory}}
```

- Launch Dillo in full-screen mode:

```
dillo {{[-f|--fullwindow]}}
```

- Display help:

```
dillo {{[-h|--help]}}
```

- Display version:

```
dillo {{[-v|--version]}}
```

dircolors

Output commands to set the **`$LS_COLOR`** environment variable and style **`ls`**, **`dir`**, etc.

More information: https://www.gnu.org/software/coreutils/manual/html_node/dircolors-invocation.html.

- Output commands to set `$LS_COLOR` using default colors:

```
dircolors
```

- Display each filetype with the color they would appear in `ls`:

```
dircolors --print-ls-colors
```

- Output commands to set `$LS_COLOR` using colors from a file:

```
dircolors {{path/to/file}}
```

- Output commands for Bourne shell:

```
dircolors {{[-b|--bourne-shell]}}
```

- Output commands for C shell:

```
dircolors {{[-c|--c-shell]}}
```

- View the default colors for file types and extensions:

```
dircolors {{[-p|--print-database]}}
```

direnv

Shell extension to load and unload environment variables depending on the current directory.

More information: https://github.com/direnv/direnv/blob/master/man/direnv.1.md.

- Grant direnv permission to load the `.envrc` present in the current directory:

```
direnv allow {{.}}
```

- Revoke the authorization to load the `.envrc` present in the current directory:

```
direnv deny {{.}}
```

- Edit the `.envrc` file in the default text editor and reload the environment on exit:

```
direnv edit {{.}}
```

- Trigger a reload of the environment:

```
direnv reload
```

- Print some debug status information:

```
direnv status
```

dirname

Remove trailing filename portion from a path.

More information: https://www.gnu.org/software/coreutils/manual/html_node/dirname-invocation.html.

- Calculate the parent directory of a given path:

```
dirname {{path/to/file_or_directory}}
```

- Calculate the parent directory of multiple paths:

```
dirname {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}}
```

- Delimit output with a NUL character instead of a newline (useful when combining with `xargs`):

```
dirname {{[-z|--zero]}} {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}}
```

dirs

Display or manipulate the directory stack.

The directory stack is a list of recently visited directories that can be manipulated with the **pushd** and **popd** commands.

See also: **pushd**, **popd**.

More information: https://www.gnu.org/software/bash/manual/bash.html#Directory-Stack-Builtins.

- Display the directory stack with a space between each entry:

```
dirs
```

- Display the directory stack with one entry per line:

```
dirs -p
```

- Display a numbered list of entries in the directory stack:

```
dirs -v
```

- Display the directory stack without the tilde-prefix (~):

```
dirs -l
```

- Display only the nth entry in the directory stack, starting at 0 (Bash only):

```
dirs +{{n}}
```

- Display only the nth entry in the directory stack from the last, starting at 0 (Bash only):

```
dirs -{{n}}
```

- Clear the directory stack:

```
dirs -c
```

dirsearch

Web path scanner.

More information: https://github.com/maurosoria/dirsearch#options.

- Scan a web server for common paths with common extensions:

```
dirsearch {{[-u|--url]}} {{url}} --extensions-list
```

- Scan a list of web servers for common paths with given file extensions:

```
dirsearch {{[-l|--url-list]}} {{path/to/url-list.txt}} {{[-e|--extensions]}} {{php,jsp,aspx,...}}
```

- Scan a web server for user-defined paths with common extensions:

```
dirsearch {{[-u|--url]}} {{url}} --extensions-list {{[-w|--wordlists]}} {{path/to/url-paths1.txt,path/to/url-paths2.txt,...}}
```

- Scan a web server using a cookie:

```
dirsearch {{[-u|--url]}} {{url}} {{[-e|--extensions]}} {{php}} --cookie {{cookie}}
```

- Scan a web server using the `HEAD` HTTP method:

```
dirsearch {{[-u|--url]}} {{url}} {{[-e|--extensions]}} {{php}} {{[-m|--http-method]}} {{HEAD}}
```

- Scan a web server, saving the results to a `.json` file:

```
dirsearch {{[-u|--url]}} {{url}} {{[-e|--extensions]}} {{php}} --json-report {{path/to/report.json}}
```

diskonaut

Terminal disk space navigator, written in Rust.

More information: https://github.com/imsnif/diskonaut.

- Start `diskonaut` in the current directory:

```
diskonaut
```

- Start `diskonaut` in a specific directory:

```
diskonaut {{path/to/directory}}
```

- Show file sizes rather than their block usage on the disk:

```
diskonaut --apparent-size {{path/to/directory}}
```

- Disable deletion confirmation:

```
diskonaut --disable-delete-confirmation
```

disown

Allow sub-processes to live beyond the shell that they are attached to.

See also: **`jobs`** for finding job numbers.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-disown.

- Disown the current job:

```
disown
```

- Disown a specific job (run `jobs` to find the job number):

```
disown %{{job_number}}
```

- Disown all jobs (Bash only):

```
disown -a
```

- Keep job (do not disown it), but mark it so that no future SIGHUP is received on shell exit (Bash only):

```
disown -h %{{job_number}}
```

distcc

Distributed C/C++/ObjC compilation client that works with **`distccd`**.

More information: https://manned.org/distcc.

- Compile a source file using a compiler like `gcc`:

```
distcc {{gcc}} -c {{path/to/source.c}} -o {{path/to/output.o}}
```

- Set remote hosts to distribute compilation:

```
export DISTCC_HOSTS="localhost {{ip1 ip2 ...}}"
```

- Compile a project with `make` using `distcc`:

```
make {{[-j|--jobs]}} {{parallel_jobs}} CC="distcc {{gcc}}"
```

- Show the list of current `distcc` hosts:

```
distcc --show-hosts
```

- Display help:

```
distcc --help
```

- Display version:

```
distcc --version
```

distccd

Server daemon for the distcc distributed compiler.

More information: https://manned.org/distccd.

- Start a daemon with the default settings:

```
distccd --daemon
```

- Start a daemon, accepting connections from IPv4 private network ranges:

```
distccd --daemon --allow-private
```

- Start a daemon, accepting connections from a specific network address or address range:

```
distccd --daemon {{[-a|--allow]}} {{ip_address|network_prefix}}
```

- Start a daemon with a lowered priority that can run a maximum of 4 tasks at a time:

```
distccd --daemon {{[-j|--jobs]}} {{4}} {{[-N|--nice]}} {{5}}
```

- Start a daemon and register it via mDNS/DNS-SD (Zeroconf):

```
distccd --daemon --zeroconf
```

dive

Explore a Docker image, layer contents, and discover ways to shrink it.

More information: https://github.com/wagoodman/dive.

- Analyze a Docker image:

```
dive {{your_image_tag}}
```

- Build an image and start analyzing it:

```
dive build -t {{some_tag}}
```

django-admin

Django's utility for administrative tasks.

More information: https://docs.djangoproject.com/en/stable/ref/django-admin/.

- Create a new Django project:

  ```
  django-admin startproject {{project_name}}
  ```

- Create a new app for the current project:

  ```
  django-admin startapp {{app_name}}
  ```

- Display help for a specific command:

  ```
  django-admin help {{command}}
  ```

- Display version:

  ```
  django-admin --version
  ```

djxl

Decompress JPEG XL images.

Accepted output extensions are PNG, APNG, JPEG, EXR, PGM, PPM, PNM, PFM, PAM, EXIF, XMP, and JUMBF.

More information: https://github.com/libjxl/libjxl/blob/main/doc/man/djxl.txt.

- Decompress a JPEG XL image to another format:

```
djxl {{path/to/image.jxl}} {{path/to/output.ext}}
```

- Display an extremely detailed help:

```
djxl {{[-h -v -v -v -v|--help --verbose --verbose --verbose --verbose]}}
```

dlv

Debugger for the Go programming language.

More information: https://github.com/go-delve/delve/blob/master/Documentation/usage/dlv.md.

- Compile and begin debugging the main package in the current directory (by default, with no arguments):

```
dlv debug
```

- Compile and begin debugging a specific package:

```
dlv debug {{package}} {{arguments}}
```

- Compile a test binary and begin debugging the compiled program:

```
dlv test
```

- Connect to a headless debug server:

```
dlv connect {{ip_address}}
```

- Attach to a running process and begin debugging:

```
dlv attach {{pid}}
```

- Compile and begin tracing a program:

```
dlv trace {{package}} --regexp '{{regex}}'
```

dmd

Official D compiler.

More information: https://dlang.org/dmd-windows.html.

- Build a D source file:

```
dmd {{path/to/source.d}}
```

- Generate code for all template instantiations:

```
dmd -allinst
```

- Control bounds checking:

```
dmd -boundscheck={{on|safeonly|off}}
```

- List information on all available checks:

```
dmd -check={{h|help|?}}
```

- Turn on colored console output:

```
dmd -color
```

dmypy

Type check Python code, running **mypy** as a daemon for better speed.

See also: **mypy** for more options to use with check and run.

More information: https://mypy.readthedocs.io/en/stable/mypy_daemon.html.

- Type check a file, and start the daemon if it is not running:

```
dmypy check -- {{path/to/file.py}}
```

- Start the daemon:

```
dmypy start
```

- Type check a file (requires the daemon to be running):

```
dmypy run -- {{path/to/file.py}}
```

- Stop the daemon:

```
dmypy stop
```

dnsmasq

Lightweight DNS, DHCP, TFTP, and PXE server.

More information: https://manned.org/dnsmasq.

- Start dnsmasq with default configuration:

```
dnsmasq
```

- Run dnsmasq in the foreground (for debugging):

```
dnsmasq --no-daemon
```

- Specify a custom configuration file:

```
dnsmasq --conf-file={{path/to/config.conf}}
```

- Enable verbose logging:

```
dnsmasq --log-queries --log-facility=-
```

- Set a DHCP range and lease time:

```
dnsmasq --dhcp-range={{192.168.0.50,192.168.0.150,12h}}
```

- Display version:

```
dnsmasq --version
```

dnswalk

DNS debugger.

"Walk" across zones and validate database consistency and best practices.

More information: https://manned.org/dnswalk.

- Debug a DNS pathway for a Fully Qualified Domain Name (FQDN):

```
dnswalk {{domain}}.
```

- Process sub-domains [r]ecursively:

```
dnswalk -r {{domain}}.
```

- Only perform a `dnswalk` if the zone has been [m]odified since the last run:

```
dnswalk -m {{domain}}.
```

- Print [d]ebugging and status information to `stderr` instead of `stdout`:

```
dnswalk -d {{domain}}.
```

- Suppress the check for [i]nvalid characters in the domain name:

```
dnswalk -i {{domain}}.
```

- Enable duplicate A record warnings:

```
dnswalk -a {{domain}}.
```

- Enable "[F]ascist checking" to compare the A record PTR name with the forward name and report mismatches:

```
dnswalk -F {{domain}}.
```

- Enable "[l]ame delegation" to test whether the listed host is returning authoritative answers:

```
dnswalk -l {{domain}}.
```

dnsx

A fast and multi-purpose DNS toolkit to run multiple DNS queries.

Note: Input to **`dnsx`** needs to be passed through **`stdin`** (pipe **`|`**) in some cases.

See also: **`dig`**, **`dog`**, **`dnstracer`**.

More information: https://docs.projectdiscovery.io/opensource/dnsx/usage.

- Query the A record of a (sub)domain and show [re]sponse received:

```
echo {{example.com}} | dnsx -a {{[-re|-resp]}}
```

- Query all the DNS records (A, AAAA, CNAME, NS, TXT, SRV, PTR, MX, SOA, AXFR, CAA):

```
dnsx <<< {{example.com}} -recon {{[-re|-resp]}}
```

- Query a specific type of DNS record:

```
echo {{example.com}} | dnsx {{[-re|-resp]}} -{{a|aaaa|cname|
ns|txt|srv|ptr|mx|soa|any|axfr|caa}}
```

- Output response only (do not show the queried domain or subdomain):

```
echo {{example.com}} | dnsx {{[-ro|-resp-only]}}
```

- Display raw response of a query, specifying resolvers to use and retry attempts for failures:

```
echo {{example.com}} | dnsx -{{debug|raw}} {{[-r|-resolver]}}
{{1.1.1.1,8.8.8.8,...}} -retry {{number}}
```

- Brute force DNS records using a placeholder:

```
dnsx {{[-d|-domain]}} {{FUZZ.example.com}} {{[-w|-wordlist]}}
{{path/to/wordlist.txt}} {{[-re|-resp]}}
```

- Brute force DNS records from a list of domains and wordlists, appending output to a file with no color codes:

```
dnsx {{[-d|-domain]}} {{path/to/domain.txt}} {{[-w|-
wordlist]}} {{path/to/wordlist.txt}} {{[-re|-resp]}} {{[-o|-
output]}} {{path/to/output.txt}} {{[-nc|-no-color]}}
```

- Extract `CNAME` records for the given list of subdomains, with rate limiting DNS queries per second:

```
subfinder -silent {{[-d|-domain]}} {{example.com}} | dnsx -
cname {{[-re|-resp]}} {{[-rl|-rate-limit]}} {{number}}
```

do

This shell keyword is used with **`for`**, **`while`**, **`select`**, and **`until`** to mark the start of a loop.

- View documentation for the `for` keyword:

  ```
  tldr for
  ```

- View documentation for the `while` keyword:

  ```
  tldr while
  ```

- View documentation for the `select` keyword:

  ```
  tldr select
  ```

- View documentation for the `until` keyword:

  ```
  tldr until
  ```

doas

Execute a command as another user.

See also: **`sudo`**, **`pkexec`**, **`run0`**.

More information: https://man.openbsd.org/doas.

- Run a command as root:

```
doas {{command}}
```

- Run a command as another user:

```
doas -u {{user}} {{command}}
```

- Launch the default shell as root:

```
doas -s
```

- Parse a configuration file and check if the execution of a command as another user is allowed:

```
doas -C {{path/to/config_file}} {{command}}
```

- Make `doas` request a password even after it was supplied earlier:

```
doas -L
```

dockdiver

A tool for interacting with Docker registries, including listing and dumping repositories.

More information: https://github.com/MachiavelliII/dockdiver#instructions.

- List all repositories in a Docker registry:

```
dockdiver -url {{https://example.com}} -list
```

- Dump a specific repository to the default output directory (docker_dump):

```
dockdiver -url {{https://example.com}} -dump
{{repository_name}}
```

- Dump all repositories with basic authentication:

```
dockdiver -url {{https://example.com}} -dump-all -username
{{username}} -password {{password}}
```

- Dump a repository with a rate limit and a custom port (the default port is `5000`):

```
dockdiver -url {{https://example.com}} -dump
{{repository_name}} -port {{port}} -rate
{{requests_per_second}} -dir {{path/to/output_directory}}
```

- Dump all repositories with bearer token for authorization:

```
dockdiver -url {{https://example.com}} -dump-all -bearer
{{bearer_token}}
```

- Add custom headers as JSON (e.g., '{"X-Custom": "Value"}'):

```
dockdiver -url {{https://example.com}} -list -headers '{{{"X-
Custom": "Value"}}}'
```

docker build

Build an image from a Dockerfile.

More information: https://docs.docker.com/reference/cli/docker/buildx/build/.

- Build a Docker image using the Dockerfile in the current directory:

```
docker build .
```

- Build a Docker image from a Dockerfile at a specified URL:

```
docker build {{github.com/creack/docker-firefox}}
```

- Build a Docker image and tag it:

```
docker build {{[-t|--tag]}} {{name:tag}} .
```

- Build a Docker image with no build context:

```
docker < {{Dockerfile}} build {{[-t|--tag]}} {{name:tag}} -
```

- Do not use the cache when building the image:

```
docker build --no-cache {{[-t|--tag]}} {{name:tag}} .
```

- Build a Docker image using a specific Dockerfile:

```
docker build {{[-f|--file]}} {{Dockerfile}} .
```

- Build with custom build-time variables:

```
docker build --build-arg {{HTTP_PROXY=http://
10.20.30.2:1234}} --build-arg {{FTP_PROXY=http://
40.50.60.5:4567}} .
```

docker commit

This command is an alias of **`docker container commit`**.

- View documentation for the original command:

```
tldr docker container commit
```

docker compose down

Stop and remove containers, networks, images, and volumes created by **`docker compose up`**.

More information: https://docs.docker.com/reference/cli/docker/compose/down/.

- Stop and remove all containers and networks:

```
docker compose down
```

- Stop and remove containers, networks, and all images used by services:

```
docker compose down --rmi all
```

- Stop and remove containers, networks, and only images without a custom tag:

```
docker compose down --rmi local
```

- Stop and remove containers, networks, and all volumes:

```
docker compose down {{[-v|--volumes]}}
```

- Stop and remove everything including orphaned containers:

```
docker compose down --remove-orphans
```

- Stop and remove containers using an alternate compose file:

```
docker compose {{[-f|--file]}} {{path/to/config}} down
```

- Stop and remove containers with a custom timeout in seconds:

```
docker compose down {{[-t|--timeout]}} {{timeout}}
```

- Remove containers for services not defined in the Compose file:

```
docker compose down --remove-orphans {{[-v|--volumes]}}
```

docker compose logs

View output from containers in a Docker Compose application.

More information: https://docs.docker.com/reference/cli/docker/compose/logs/.

- View logs for all services:

```
docker compose logs
```

- View logs for a specific service:

```
docker compose logs {{service_name}}
```

- View logs and follow new output (like `tail --follow`):

```
docker compose logs {{[-f|--follow]}}
```

- View logs with timestamps:

```
docker compose logs {{[-t|--timestamps]}}
```

- View only the last `n` lines of logs for each container:

```
docker compose logs {{[-n|--tail]}} {{n}}
```

- View logs from a specific time onwards:

```
docker compose logs --since {{timestamp}}
```

- View logs until a specific time:

```
docker compose logs --until {{timestamp}}
```

- View logs for multiple specific services:

```
docker compose logs {{service1 service2 ...}}
```

docker compose up

Start and run Docker services defined in a Compose file.

More information: https://docs.docker.com/reference/cli/docker/compose/up/.

- Start all services defined in the docker-compose file:

```
docker compose up
```

- Start services in the background (detached mode):

```
docker compose up {{[-d|--detach]}}
```

- Start services and rebuild images before starting:

```
docker compose up --build
```

- Start specific services only:

```
docker compose up {{service1 service2 ...}}
```

- Start services with custom compose file:

```
docker compose {{[-f|--file]}} {{path/to/config}} up
```

- Start services and remove orphaned containers:

```
docker compose up --remove-orphans
```

- Start services with scaled instances:

```
docker compose up --scale {{service}}={{count}}
```

- Start services and show logs with timestamps:

```
docker compose up --timestamps
```

docker compose

Run and manage multi container Docker applications.

More information: https://docs.docker.com/reference/cli/docker/compose/.

- List all running containers:

```
docker compose ps
```

- Create and start all containers in the background using a `docker-compose.yml` file from the current directory:

```
docker compose up {{[-d|--detach]}}
```

- Start all containers, rebuild if necessary:

```
docker compose up --build
```

- Start all containers by specifying a project name and using an alternate compose file:

```
docker compose {{[-p|--project-name]}} {{project_name}} {{[-f|--file]}} {{path/to/file}} up
```

- Stop all running containers:

```
docker compose stop
```

- Stop and remove all containers, networks, images, and volumes:

```
docker compose down --rmi all {{[-v|--volumes]}}
```

- Follow logs for all containers:

```
docker compose logs {{[-f|--follow]}}
```

- Follow logs for a specific container:

```
docker compose logs {{[-f|--follow]}} {{container_name}}
```

docker container commit

Create a new image from a container's changes.

More information: https://docs.docker.com/reference/cli/docker/container/commit/.

- Create an image from a specific container:

```
docker {{[commit|container commit]}} {{container}} {{image}}:{{tag}}
```

- Apply a `CMD` Dockerfile instruction to the created image:

```
docker {{[commit|container commit]}} {{[-c|--change]}} "CMD {{command}}" {{container}} {{image}}:{{tag}}
```

- Apply an `ENV` Dockerfile instruction to the created image:

```
docker {{[commit|container commit]}} {{[-c|--change]}} "ENV {{name}}={{value}}" {{container}} {{image}}:{{tag}}
```

- Create an image with a specific author in the metadata:

```
docker {{[commit|container commit]}} {{[-a|--author]}} "{{author}}" {{container}} {{image}}:{{tag}}
```

- Create an image with a specific comment in the metadata:

```
docker {{[commit|container commit]}} {{[-m|--message]}} "{{comment}}" {{container}} {{image}}:{{tag}}
```

- Create an image without pausing the container during commit:

```
docker {{[commit|container commit]}} {{[-p|--pause]}} false {{container}} {{image}}:{{tag}}
```

- Display help:

```
docker {{[commit|container commit]}} --help
```

docker container cp

Copy files or directories between host and container filesystems.

More information: https://docs.docker.com/reference/cli/docker/container/cp/.

- Copy a file or directory from the host to a container:

```
docker {{[cp|container cp]}} {{path/to/
file_or_directory_on_host}} {{container_name}}:{{path/to/
file_or_directory_in_container}}
```

- Copy a file or directory from a container to the host:

```
docker {{[cp|container cp]}} {{container_name}}:{{path/to/
file_or_directory_in_container}} {{path/to/
file_or_directory_on_host}}
```

- Copy a file or directory from the host to a container, following symlinks (copies the symlinked files directly, not the symlinks themselves):

```
docker {{[cp|container cp]}} {{[-L|--follow-link]}} {{path/
to/symlink_on_host}} {{container_name}}:{{path/to/
file_or_directory_in_container}}
```

docker container diff

Inspect changes to files or directories on a container's filesystem.

More information: https://docs.docker.com/reference/cli/docker/container/diff/.

- Inspect the changes to a container since it was created:

```
docker {{[diff|container diff]}} {{container}}
```

- Display help:

```
docker {{[diff|container diff]}} --help
```

docker container exec

Execute a command on an already running Docker container.

More information: https://docs.docker.com/reference/cli/docker/container/exec/.

- Enter an interactive shell session on an already-running container:

```
docker {{[exec|container exec]}} {{[-it|--interactive --
tty]}} {{container_name}} {{/bin/bash}}
```

- Run a command in the background (detached) on a running container:

```
docker {{[exec|container exec]}} {{[-d|--detach]}}
{{container_name}} {{command}}
```

- Select the working directory for a given command to execute into:

```
docker {{[exec|container exec]}} {{[-it|--interactive --
tty]}} {{[-w|--workdir]}} {{path/to/directory}}
{{container_name}} {{command}}
```

- Run a command in background on existing container but keep `stdin` open:

```
docker {{[exec|container exec]}} {{[-i|--interactive]}} {{[-
d|--detach]}} {{container_name}} {{command}}
```

- Set an environment variable in a running Bash session:

```
docker {{[exec|container exec]}} {{[-it|--interactive --
tty]}} {{[-e|--env]}} {{variable_name}}={{value}}
{{container_name}} {{/bin/bash}}
```

- Run a command as a specific user:

```
docker {{[exec|container exec]}} {{[-u|--user]}} {{user}}
{{container_name}} {{command}}
```

docker container logs

Print container logs.

More information: https://docs.docker.com/reference/cli/docker/container/logs/.

- Print logs from a container:

```
docker {{[logs|container logs]}} {{container_name}}
```

- Print logs and follow them:

```
docker {{[logs|container logs]}} {{[-f|--follow]}}
{{container_name}}
```

- Print last 5 lines:

```
docker {{[logs|container logs]}} {{container_name}} {{[-n|--
tail]}} 5
```

- Print logs and append them with timestamps:

```
docker {{[logs|container logs]}} {{[-t|--timestamps]}}
{{container_name}}
```

- Print logs from a certain point in time of container execution (i.e. 23m, 10s, 2013-01-02T13:23:37):

```
docker {{[logs|container logs]}} {{container_name}} --until
{{time}}
```

docker container ls

List Docker containers.

More information: https://docs.docker.com/reference/cli/docker/container/ls/.

- List currently running Docker containers:

```
docker {{[ps|container ls]}}
```

- List all Docker containers (running and stopped):

```
docker {{[ps|container ls]}} {{[-a|--all]}}
```

- Show the latest created container (includes all states):

```
docker {{[ps|container ls]}} {{[-l|--latest]}}
```

- Filter containers that contain a substring in their name:

```
docker {{[ps|container ls]}} {{[-f|--filter]}}
"name={{name}}"
```

- Filter containers that share a given image as an ancestor:

```
docker {{[ps|container ls]}} {{[-f|--filter]}}
"ancestor={{image}}:{{tag}}"
```

- Filter containers by exit status code:

```
docker {{[ps|container ls]}} {{[-a|--all]}} {{[-f|--filter]}}
"exited={{code}}"
```

- Filter containers by status (created, running, removing, paused, exited, and dead):

```
docker {{[ps|container ls]}} {{[-f|--filter]}}
"status={{status}}"
```

- Filter containers that mount a specific volume or have a volume mounted in a specific path:

```
docker {{[ps|container ls]}} {{[-f|--filter]}}
"volume={{path/to/directory}}" --format "table {{.ID}}
\t{{.Image}}\t{{.Names}}\t{{.Mounts}}"
```

docker container remove

This command is an alias of **`docker container rm`**.

- View documentation for the original command:

```
tldr docker container rm
```

docker container rename

Rename a container.

More information: https://docs.docker.com/reference/cli/docker/container/rename/.

- Rename a container:

```
docker {{[rename|container rename]}} {{container}} {{new_name}}
```

- Display help:

```
docker {{[rename|container rename]}} --help
```

docker container rm

Remove containers.

More information: https://docs.docker.com/reference/cli/docker/container/rm/.

- Remove containers:

```
docker {{[rm|container rm]}} {{container1 container2 ...}}
```

- Force remove a container:

```
docker {{[rm|container rm]}} {{[-f|--force]}} {{container1 container2 ...}}
```

- Remove a container and its volumes:

```
docker {{[rm|container rm]}} {{[-v|--volumes]}} {{container}}
```

- Display help:

```
docker {{[rm|container rm]}} {{[-h|--help]}}
```

docker container run

Run a command in a new Docker container.

More information: https://docs.docker.com/reference/cli/docker/container/run/.

- Run command in a new container from a tagged image:

```
docker {{[run|container run]}} {{image:tag}} {{command}}
```

- Run command in a new container in background and display its ID:

```
docker {{[run|container run]}} {{[-d|--detach]}} {{image}}
{{command}}
```

- Run command in a one-off container in interactive mode and pseudo-TTY:

```
docker {{[run|container run]}} --rm {{[-it|--interactive --
tty]}} {{image}} {{command}}
```

- Run command in a new container with passed environment variables:

```
docker {{[run|container run]}} {{[-e|--env]}} '{{variable}}
={{value}}' {{[-e|--env]}} {{variable}} {{image}} {{command}}
```

- Run command in a new container with bind mounted volumes:

```
docker {{[run|container run]}} {{[-v|--volume]}} /{{path/to/
host_path}}:/{{path/to/container_path}} {{image}} {{command}}
```

- Run command in a new container with published ports:

```
docker {{[run|container run]}} {{[-p|--publish]}}
{{host_port}}:{{container_port}} {{image}} {{command}}
```

- Run command in a new container overwriting the entrypoint of the image:

```
docker {{[run|container run]}} --entrypoint {{command}}
{{image}}
```

- Run command in a new container connecting it to a network:

```
docker {{[run|container run]}} --network {{network}}
{{image}}
```

docker container start

Start stopped containers.

More information: https://docs.docker.com/reference/cli/docker/container/start/.

- Start a Docker container:

```
docker {{[start|container start]}} {{container}}
```

- Start a container, attaching `stdout` and `stderr`, and forwarding signals:

```
docker {{[start|container start]}} {{[-a|--attach]}}
{{container}}
```

- Start one or more containers:

```
docker {{[start|container start]}} {{container1
container2 ...}}
```

- Display help:

```
docker {{[start|container start]}} --help
```

docker container stats

Display a live stream of resource usage statistics for containers.

More information: https://docs.docker.com/reference/cli/docker/container/stats/.

- Display a live stream for the statistics of all running containers:

```
docker {{[stats|container stats]}}
```

- Display a live stream of statistics for one or more containers:

```
docker {{[stats|container stats]}} {{container1
container2 ...}}
```

- Change the columns format to display container's CPU usage percentage:

```
docker {{[stats|container stats]}} --format "{{.Name}}:
\t{{.CPUPerc}}"
```

- Display statistics for all containers (both running and stopped):

```
docker {{[stats|container stats]}} {{[-a|--all]}}
```

- Disable streaming stats and only pull the current stats:

```
docker {{[stats|container stats]}} --no-stream
```

docker container top

Display the running processes of a container.

More information: https://docs.docker.com/reference/cli/docker/container/top/.

- Display the running processes of a container:

```
docker {{[top|container top]}} {{container}}
```

- Display help:

```
docker {{[top|container top]}} --help
```

docker container update

Update configuration of Docker containers.

Note: This command is not supported for Windows containers.

More information: https://docs.docker.com/reference/cli/docker/container/update/.

- Update restart policy to apply when a specific container exits:

```
docker {{[update|container update]}} --restart {{always|no|
on-failure|unless-stopped}} {{container_name}}
```

- Update the policy to restart up to three times a specific container when it exits with non-zero exit status:

```
docker {{[update|container update]}} --restart on-failure:3
{{container_name}}
```

- Update the number of CPUs available to a specific container:

```
docker {{[update|container update]}} --cpus {{count}}
{{container_name}}
```

- Update the memory limit in [M]egabytes for a specific container:

```
docker {{[update|container update]}} {{[-m|--memory]}}
{{limit}}M {{container_name}}
```

- Update the maximum number of process IDs allowed inside a specific container (use `-1` for unlimited):

```
docker {{[update|container update]}} --pids-limit {{count}}
{{container_name}}
```

- Update the amount of memory in [M]egabytes a specific container can swap to disk (use `-1` for unlimited):

```
docker {{[update|container update]}} --memory-swap {{limit}}M
{{container_name}}
```

docker container

Manage Docker containers.

More information: https://docs.docker.com/reference/cli/docker/container/.

- List currently running Docker containers:

```
docker {{[ps|container ls]}}
```

- Start one or more stopped containers:

```
docker {{[start|container start]}} {{container1_name}} {{container2_name}}
```

- Kill one or more running containers:

```
docker {{[kill|container kill]}} {{container_name}}
```

- Stop one or more running containers:

```
docker {{[stop|container stop]}} {{container_name}}
```

- Pause all processes within one or more containers:

```
docker {{[pause|container pause]}} {{container_name}}
```

- Display detailed information on one or more containers:

```
docker container inspect {{container_name}}
```

- Export a container's filesystem as a `.tar` archive:

```
docker {{[export|container export]}} {{container_name}}
```

- Create a new image from a container's changes:

```
docker {{[commit|container commit]}} {{container_name}}
```

docker context

Switch between contexts to manage multiple Docker environments.

More information: https://docs.docker.com/reference/cli/docker/context/.

- Create a context using a specific Docker endpoint:

```
docker context create {{context_name}} --docker
"host={{tcp://remote-host:2375}}"
```

- Create a context based on the `$DOCKER_HOST` environment variable:

```
docker context create {{context_name}}
```

- Switch to a context:

```
docker context use {{context_name}}
```

- List all contexts:

```
docker context ls
```

docker cp

This command is an alias of **`docker container cp`**.

- View documentation for the original command:

```
tldr docker container cp
```

docker diff

This command is an alias of **`docker container diff`**.

- View documentation for the original command:

  ```
  tldr docker container diff
  ```

docker exec

This command is an alias of **`docker container exec`**.

- View documentation for the original command:

```
tldr docker container exec
```

docker image load

Load Docker images from files or **`stdin`**.

More information: https://docs.docker.com/reference/cli/docker/image/load/.

- Load a Docker image from `stdin`:

```
docker < {{path/to/image_file.tar}} {{[load|image load]}}
```

- Load a Docker image from a specific file:

```
docker {{[load|image load]}} {{[-i|--input]}} {{path/to/image_file.tar}}
```

- Load a Docker image from a specific file in quiet mode:

```
docker {{[load|image load]}} {{[-q|--quiet]}} {{[-i|--input]}} {{path/to/image_file.tar}}
```

docker image ls

List Docker images.

More information: https://docs.docker.com/reference/cli/docker/image/ls/.

- List all Docker images:

```
docker {{[images|image ls]}}
```

- List all Docker images including intermediates:

```
docker {{[images|image ls]}} {{[-a|--all]}}
```

- List the output in quiet mode (only numeric IDs):

```
docker {{[images|image ls]}} {{[-q|--quiet]}}
```

- List all Docker images not used by any container:

```
docker {{[images|image ls]}} {{[-f|--filter]}} dangling=true
```

- List images that contain a substring in their name:

```
docker {{[images|image ls]}} "{{*name*}}"
```

- Sort images by size:

```
docker {{[images|image ls]}} --format "\{\{.ID\}\}\t\{\
{.Size\}\}\t\{\{.Repository\}\}:\{\{.Tag\}\}" | sort {{[-k|--
key]}} 2 {{[-h|--human-numeric-sort]}}
```

docker image pull

Download Docker images from a registry.

More information: https://docs.docker.com/reference/cli/docker/image/pull/.

- Download a specific Docker image:

```
docker {{[pull|image pull]}} {{image}}:{{tag}}
```

- Download a specific Docker image in quiet mode:

```
docker {{[pull|image pull]}} {{[-q|--quiet]}} {{image}}:
{{tag}}
```

- Download all tags of a specific Docker image:

```
docker {{[pull|image pull]}} {{[-a|--all-tags]}} {{image}}
```

- Download a Docker images for a specific platform:

```
docker {{[pull|image pull]}} --platform {{linux/amd64}}
{{image}}:{{tag}}
```

- Display help:

```
docker {{[pull|image pull]}} {{[-h|--help]}}
```

docker image rm

Remove Docker images.

More information: https://docs.docker.com/reference/cli/docker/image/rm/.

- Remove one or more images given their names:

```
docker {{[rmi|image rm]}} {{image1 image2 ...}}
```

- Force remove an image:

```
docker {{[rmi|image rm]}} {{[-f|--force]}} {{image}}
```

- Remove an image without deleting untagged parents:

```
docker {{[rmi|image rm]}} --no-prune {{image}}
```

- Display help:

```
docker {{[rmi|image rm]}}
```

docker image save

Export Docker images to archive.

More information: https://docs.docker.com/reference/cli/docker/image/save/.

- Save an image by redirecting `stdout` to a `.tar` archive:

```
docker {{[save|image save]}} {{image}}:{{tag}} > {{path/to/file.tar}}
```

- Save an image to a `.tar` archive:

```
docker {{[save|image save]}} {{[-o|--output]}} {{path/to/file.tar}} {{image}}:{{tag}}
```

- Save all tags of the image:

```
docker {{[save|image save]}} {{[-o|--output]}} {{path/to/file.tar}} {{image_name}}
```

- Cherry-pick particular tags of an image to save:

```
docker {{[save|image save]}} {{[-o|--output]}} {{path/to/file.tar}} {{image_name:tag1 image_name:tag2 ...}}
```

docker image tag

Assign tags to existing Docker images.

More information: https://docs.docker.com/reference/cli/docker/image/tag/.

- Assign a name and tag to a specific image ID:

```
docker {{[tag|image tag]}} {{id}} {{name}}:{{tag}}
```

- Assign a tag to a specific image:

```
docker {{[tag|image tag]}} {{image}}:{{current_tag}} {{image}}:{{new_tag}}
```

- Display help:

```
docker {{[tag|image tag]}}
```

docker image

Manage Docker images.

See also: **`docker build`**, **`docker image pull`**, **`docker image rm`**.

More information: https://docs.docker.com/reference/cli/docker/image/.

- List local Docker images:

  ```
  docker {{[images|image ls]}}
  ```

- Delete unused local Docker images:

  ```
  docker image prune
  ```

- Delete all unused images (not just those without a tag):

  ```
  docker image prune {{[-a|--all]}}
  ```

- Show the history of a local Docker image:

  ```
  docker {{[history|image history]}} {{image}}
  ```

docker images

This command is an alias of **`docker image ls`**.

- View documentation for the original command:

  ```
  tldr docker image ls
  ```

docker inspect

Return low-level information on Docker objects.

More information: https://docs.docker.com/reference/cli/docker/inspect/.

- Display information about a container, image, or volume using a name or ID:

```
docker inspect {{container|image|ID}}
```

- Display a container's IP address:

```
docker inspect {{[-f|--format]}} '\{\
{range.NetworkSettings.Networks\}\}\{\{.IPAddress\}\}\{\
{end\}\}' {{container}}
```

- Display the path to the container's log file:

```
docker inspect {{[-f|--format]}} '\{\{.LogPath\}
\}' {{container}}
```

- Display the image name of the container:

```
docker inspect {{[-f|--format]}} '\{\{.Config.Image\}
\}' {{container}}
```

- Display the configuration information as JSON:

```
docker inspect {{[-f|--format]}} '\{\{json .Config\}
\}' {{container}}
```

- Display all port bindings:

```
docker inspect {{[-f|--format]}} '\{\{range $p,
$conf := .NetworkSettings.Ports\}\} \{\{$p\}\} -> \{\{(index
$conf 0).HostPort\}\} \{\{end\}\}' {{container}}
```

- Display help:

```
docker inspect
```

docker load

This command is an alias of **`docker image load`**.

- View documentation for the original command:

  ```
  tldr docker image load
  ```

docker login

Log into a Docker registry.

More information: https://docs.docker.com/reference/cli/docker/login/.

- Interactively log into a registry:

```
docker login
```

- Log into a registry with a specific username (user will be prompted for a password):

```
docker login {{[-u|--username]}} {{username}}
```

- Log into a registry with username and password:

```
docker login {{[-u|--username]}} {{username}} {{[-p|--password]}} {{password}} {{server}}
```

- Log into a registry with password from `stdin`:

```
echo "{{password}}" | docker login {{[-u|--username]}} {{username}} --password-stdin
```

docker logs

This command is an alias of **`docker container logs`**.

- View documentation for the original command:

```
tldr docker container logs
```

docker-machine

Create and manage machines running Docker.

More information: https://github.com/docker-archive-public/docker.machine.

- List currently running Docker machines:

```
docker-machine ls
```

- Create a new Docker machine with specific name:

```
docker-machine create {{name}}
```

- Get the status of a machine:

```
docker-machine status {{name}}
```

- Start a machine:

```
docker-machine start {{name}}
```

- Stop a machine:

```
docker-machine stop {{name}}
```

- Inspect information about a machine:

```
docker-machine inspect {{name}}
```

docker network

Create and manage Docker networks.

More information: https://docs.docker.com/reference/cli/docker/network/.

- List all available and configured networks on Docker daemon:

```
docker network ls
```

- Create a user-defined network:

```
docker network create {{[-d|--driver]}} {{driver_name}}
{{network_name}}
```

- Display detailed information about one or more networks:

```
docker network inspect {{network_name1 network_name2 ...}}
```

- Connect a container to a network using a name or ID:

```
docker network connect {{network_name}} {{container_name|ID}}
```

- Disconnect a container from a network:

```
docker network disconnect {{network_name}} {{container_name|
ID}}
```

- Remove all unused (not referenced by any container) networks:

```
docker network prune
```

- Remove one or more unused networks:

```
docker network rm {{network_name1 network_name2 ...}}
```

docker node

Manage Docker Swarm nodes.

More information: https://docs.docker.com/reference/cli/docker/node/.

- List nodes in the swarm:

```
docker node ls
```

- List tasks running on one or more nodes, defaults to the current node:

```
docker node ps {{node1 node2 node3 ...}}
```

- Display detailed information on one or more nodes:

```
docker node inspect {{node1 node2 node3 ...}}
```

- Promote one or more nodes to manager in the swarm:

```
docker node promote {{node1 node2 node3 ...}}
```

- Demote one or more nodes from manager in the swarm:

```
docker node demote {{node1 node2 node3 ...}}
```

- Remove one or more nodes from the swarm:

```
docker node rm {{node1 node2 node3 ...}}
```

- Update metadata about a node, such as its availability, labels, or roles:

```
docker node update --{{availability|role|label-add|...}}
{{active|worker|...}} {{node1}}
```

docker ps

This command is an alias of **`docker container ls`**.

- View documentation for the original command:

```
tldr docker container ls
```

docker pull

This command is an alias of **`docker image pull`**.

- View documentation for the original command:

  ```
  tldr docker image pull
  ```

docker rename

This command is an alias of **`docker container rename`**.

- View documentation for the original command:

```
tldr docker container rename
```

docker rm

This command is an alias of **`docker container rm`**.

- View documentation for the original command:

```
tldr docker container rm
```

docker rmi

This command is an alias of **`docker image rm`**.

- View documentation for the original command:

```
tldr docker image rm
```

docker run

This command is an alias of **`docker container run`**.

- View documentation for the original command:

```
tldr docker container run
```

docker save

This command is an alias of **`docker image save`**.

- View documentation for the original command:

```
tldr docker image save
```

docker search

Search for Docker images on Docker Hub.

More information: https://docs.docker.com/reference/cli/docker/search/.

- Search for Docker images by name or keyword:

```
docker search {{keyword}}
```

- Search for images and only show official ones:

```
docker search {{[-f|--filter]}} is-official=true {{keyword}}
```

- Search for images and only show automated builds:

```
docker search {{[-f|--filter]}} is-automated=true {{keyword}}
```

- Search for images with a minimum number of stars:

```
docker search {{[-f|--filter]}} stars={{number}} {{keyword}}
```

- Limit the number of results:

```
docker search --limit {{number}} {{keyword}}
```

- Customize the output format:

```
docker search {{[-f|--format]}} "{{.Name}}:
{{.Description}}" {{keyword}}
```

docker secret

Manage Docker swarm secrets.

More information: https://docs.docker.com/reference/cli/docker/secret/.

- Create a new secret from `stdin`:

```
{{command}} | docker secret create {{secret_name}} -
```

- Create a new secret from a file:

```
docker secret create {{secret_name}} {{path/to/file}}
```

- List all secrets:

```
docker secret ls
```

- Display detailed information on one or multiple secrets in a human friendly format:

```
docker secret inspect --pretty {{secret_name1
secret_name2 ...}}
```

- Remove one or more secrets:

```
docker secret rm {{secret_name1 secret_name2 ...}}
```

docker service

Manage the services on a Docker daemon.

More information: https://docs.docker.com/reference/cli/docker/service/.

- List the services on a Docker daemon:

```
docker service ls
```

- Create a new service:

```
docker service create --name {{service_name}} {{image}}:
{{tag}}
```

- Display detailed information about one or more services:

```
docker service inspect {{service_name_or_ID1
service_name_or_ID2}}
```

- List the tasks of one or more services:

```
docker service ps {{service_name_or_ID1
service_name_or_ID2 ...}}
```

- Scale to a specific number of replicas for a space-separated list of services:

```
docker service scale {{service_name}}={{count_of_replicas}}
```

- Remove one or more services:

```
docker service rm {{service_name_or_ID1 service_name_or_ID2}}
```

docker-slim

This command is an alias of **`slim`**.

- View documentation for the original command:

  ```
  tldr slim
  ```

docker start

This command is an alias of **`docker container start`**.

- View documentation for the original command:

```
tldr docker container start
```

docker stats

This command is an alias of **`docker container stats`**.

- View documentation for the original command:

```
tldr docker container stats
```

docker swarm

A container orchestration tool.

More information: https://docs.docker.com/engine/swarm/.

- Initialize a swarm cluster:

```
docker swarm init
```

- Display the token to join a manager or a worker:

```
docker swarm join-token {{worker|manager}}
```

- Join a new node to the cluster:

```
docker swarm join --token {{token}} {{manager_node_url:2377}}
```

- Remove a worker from the swarm (run inside the worker node):

```
docker swarm leave
```

- Display the current CA certificate in PEM format:

```
docker swarm ca
```

- Rotate the current CA certificate and display the new certificate:

```
docker swarm ca --rotate
```

- Change the valid period for node certificates:

```
docker swarm update --cert-expiry {{hours}}h{{minutes}}
m{{seconds}}s
```

docker system

Manage Docker data and display system-wide information.

More information: https://docs.docker.com/reference/cli/docker/system/.

- Show Docker disk usage:

```
docker system df
```

- Show detailed information on disk usage:

```
docker system df {{[-v|--verbose]}}
```

- Remove unused data (append `--volumes` to remove unused volumes as well):

```
docker system prune
```

- Remove unused data created more than a specified amount of time in the past:

```
docker system prune --filter "until={{hours}}h{{minutes}}m"
```

- Display real-time events from the Docker daemon:

```
docker system events
```

- Display real-time events from containers streamed as valid JSON Lines:

```
docker system events {{[-f|--filter]}} 'type=container' --format '{{json .}}'
```

- Display system-wide information:

```
docker system info
```

- Display help:

```
docker system
```

docker tag

This command is an alias of **`docker image tag`**.

- View documentation for the original command:

```
tldr docker image tag
```

docker top

This command is an alias of **`docker container top`**.

- View documentation for the original command:

```
tldr docker container top
```

docker update

This command is an alias of **`docker container update`**.

- View documentation for the original command:

  ```
  tldr docker container update
  ```

docker volume

Manage Docker volumes.

More information: https://docs.docker.com/reference/cli/docker/volume/.

- Create a volume:

```
docker volume create {{volume_name}}
```

- Create a volume with a specific label:

```
docker volume create --label {{label}} {{volume_name}}
```

- Create a `tmpfs` volume a size of 100 MiB and an uid of 1000:

```
docker volume create {{[-o|--opt]}} {{type}}={{tmpfs}} {{[-
o|--opt]}} {{device}}={{tmpfs}} {{[-o|--opt]}} {{o}}
={{size=100m,uid=1000}} {{volume_name}}
```

- List all volumes:

```
docker volume ls
```

- Remove a volume:

```
docker volume rm {{volume_name}}
```

- Display information about a volume:

```
docker volume inspect {{volume_name}}
```

- Remove all unused local volumes:

```
docker volume prune
```

- Display help for a subcommand:

```
docker volume {{subcommand}} --help
```

docker

Manage Docker containers and images.

Some subcommands such as **`container`** and **`image`** have their own usage documentation.

More information: https://docs.docker.com/reference/cli/docker/.

- List all Docker containers (running and stopped):

```
docker {{[ps|container ls]}} {{[-a|--all]}}
```

- Start a container from an image, with a custom name:

```
docker {{[run|container run]}} --name {{container_name}} {{image}}
```

- Start or stop an existing container:

```
docker container {{start|stop}} {{container_name}}
```

- Pull an image from a Docker registry:

```
docker {{[pull|image pull]}} {{image}}
```

- Display the list of already downloaded images:

```
docker {{[images|image ls]}}
```

- Open an interactive tty with Bourne shell (`sh`) inside a running container:

```
docker {{[exec|container exec]}} {{[-it|--interactive --tty]}} {{container_name}} {{sh}}
```

- Remove stopped containers:

```
docker {{[rm|container rm]}} {{container1 container2 ...}}
```

- Fetch and follow the logs of a container:

```
docker {{[logs|container logs]}} {{[-f|--follow]}} {{container_name}}
```

docsify

Initialize and serve markdown documentation.

More information: https://cli.docsifyjs.org/#/?id=usage.

- Initialize a new documentation in the current directory:

```
docsify init
```

- Initialize a new documentation in the specified directory:

```
docsify init {{path/to/directory}}
```

- Serve local documentation on `localhost:3000` with live reload:

```
docsify serve {{path/to/directory}}
```

- Serve local documentation on `localhost` at the specified port:

```
docsify serve {{[-p|--port]}} {{80}} {{path/to/directory}}
```

- Generate a sidebar markdown file in the specified directory:

```
docsify generate {{path/to/directory}}
```

doctl account

Retrieve information about Digital Ocean accounts.

More information: https://docs.digitalocean.com/reference/doctl/reference/account/.

- Display account info:

```
doctl account {{[g|get]}}
```

- Show the hourly API limit, progress towards it, and when the rate limit resets:

```
doctl account {{[rl|ratelimit]}}
```

- Display help:

```
doctl account {{[-h|--help]}}
```

doctl apps

Manage DigitalOcean apps.

More information: https://docs.digitalocean.com/reference/doctl/reference/apps/.

- Create an app:

```
doctl {{[a|apps]}} {{[c|create]}}
```

- Create a deployment for a specific app:

```
doctl {{[a|apps]}} {{[cd|create-deployment]}} {{app_id}}
```

- Delete an app interactively:

```
doctl {{[a|apps]}} {{[d|delete]}} {{app_id}}
```

- Get an app:

```
doctl {{[a|apps]}} {{[g|get]}}
```

- List all apps:

```
doctl {{[a|apps]}} {{[ls|list]}}
```

- List all deployments from a specific app:

```
doctl {{[a|apps]}} {{[lsd|list-deployments]}} {{app_id}}
```

- Get logs from a specific app:

```
doctl {{[a|apps]}} {{[l|logs]}} {{app_id}}
```

- Update a specific app with a given app spec:

```
doctl {{[a|apps]}} {{[u|update]}} {{app_id}} --spec {{path/
to/spec.yml}}
```

doctl auth

Authenticate **`doctl`** with API tokens.

More information: https://docs.digitalocean.com/reference/doctl/reference/auth/.

- Open a prompt to enter an API token and label its context:

  ```
  doctl auth init --context {{token_label}}
  ```

- List authentication contexts (API tokens):

  ```
  doctl auth {{[ls|list]}}
  ```

- Switch contexts (API tokens):

  ```
  doctl auth switch --context {{token_label}}
  ```

- Remove a stored authentication context (API token):

  ```
  doctl auth remove --context {{token_label}}
  ```

- Show available commands:

  ```
  doctl auth {{[-h|--help]}}
  ```

doctl balance

Show the balance of a Digital Ocean account.

More information: https://docs.digitalocean.com/reference/doctl/reference/balance/.

- Get balance of the account associated with the current context:

```
doctl balance {{[g|get]}}
```

- Get the balance of an account associated with an access token:

```
doctl balance {{[g|get]}} {{[-t|--access-token]}} {{access_token}}
```

- Get the balance of an account associated with a specified context:

```
doctl balance {{[g|get]}} --context
```

doctl compute droplet

List, create, and delete virtual machines which are called droplets.

More information: https://docs.digitalocean.com/reference/doctl/reference/compute/droplet/.

- Create a droplet:

```
doctl compute {{[d|droplet]}} {{[c|create]}} --region
{{region}} --image {{os_image}} --size {{vps_type}}
{{droplet_name}}
```

- Delete a droplet:

```
doctl compute {{[d|droplet]}} {{[d|delete]}} {{droplet_id|
droplet_name}}
```

- List droplets:

```
doctl compute {{[d|droplet]}} {{[ls|list]}}
```

doctl databases db

Manage databases that are served by a database cluster.

More information: https://docs.digitalocean.com/reference/doctl/reference/databases/db/.

- Run a `doctl databases db` command with an access token:

```
doctl {{[d|databases]}} db {{command}} {{[-t|--access-token]}} {{access_token}}
```

- Retrieve the name of the given database hosted in the given database cluster:

```
doctl {{[d|databases]}} db {{[g|get]}} {{database_id}} {{database_name}}
```

- List existing databases hosted within a given database cluster:

```
doctl {{[d|databases]}} db {{[ls|list]}} {{database_id}}
```

- Create a database with the given name in the given database cluster:

```
doctl {{[d|databases]}} db {{[c|create]}} {{database_id}} {{database_name}}
```

- Delete the database with the given name in the given database cluster:

```
doctl {{[d|databases]}} db {{[rm|delete]}} {{database_id}} {{database_name}}
```

doctl databases firewalls

Manage firewalls for database clusters.

More information: https://docs.digitalocean.com/reference/doctl/reference/databases/firewalls/.

- Run a `doctl databases firewalls` command with an access token:

```
doctl {{[d|databases]}} {{[fw|firewalls]}} {{command}} {{[-t|--access-token]}} {{access_token}}
```

- Retrieve a list of firewall rules for a given database:

```
doctl {{[d|databases]}} {{[fw|firewalls]}} {{[ls|list]}}
```

- Add a database firewall rule to a given database:

```
doctl {{[d|databases]}} {{[fw|firewalls]}} {{[a|append]}} {{database_id}} --rule {{droplet|k8s|ip_addr|tag|app}}:{{value}}
```

- Remove a firewall rule for a given database:

```
doctl {{[d|databases]}} {{[fw|firewalls]}} {{[rm|remove]}} {{database_id}} {{rule_uuid}}
```

doctl databases maintenance-window

Schedule, and check the schedule of, maintenance windows for your databases.

More information: https://docs.digitalocean.com/reference/doctl/reference/databases/maintenance-window/.

- Run a `doctl databases maintenance-window` command with an access token:

  ```
  doctl {{[d|databases]}} {{[mw|maintenance-window]}} {{command}} {{[-t|--access-token]}} {{access_token}}
  ```

- Retrieve details about a database cluster's maintenance windows:

  ```
  doctl {{[d|databases]}} {{[mw|maintenance-window]}} {{[g|get]}} {{database_id}}
  ```

- Update the maintenance window for a database cluster:

  ```
  doctl {{[d|databases]}} {{[mw|maintenance-window]}} {{[u|update]}} {{database_id}} --day {{day_of_the_week}} --hour {{hour_in_24_hours_format}}
  ```

doctl databases options

Enable the navigation of available options under each database engine.

More information: https://docs.digitalocean.com/reference/doctl/reference/databases/options/.

- Run a `doctl databases options` command with an access token:

```
doctl {{[d|databases]}} {{[o|options]}} {{command}} {{[-t|--access-token]}} {{access_token}}
```

- Retrieve a list of the available database engines:

```
doctl {{[d|databases]}} {{[o|options]}} {{[eng|engines]}}
```

- Retrieve a list of the available regions for a given database engine:

```
doctl {{[d|databases]}} {{[o|options]}} {{[r|regions]}} --engine {{pg|mysql|redis|mongodb}}
```

- Retrieve a list of the available slugs for a given database engine:

```
doctl {{[d|databases]}} {{[o|options]}} {{[s|slugs]}} --engine {{pg|mysql|redis|mongodb}}
```

- Retrieve a list of the available versions for a given database engine:

```
doctl {{[d|databases]}} {{[o|options]}} {{[v|versions]}} --engine {{pg|mysql|redis|mongodb}}
```

doctl databases pool

Manage connection pools for your database cluster.

More information: https://docs.digitalocean.com/reference/doctl/reference/databases/pool/.

- Run a `doctl databases pool` command with an access token:

```
doctl {{[d|databases]}} {{[p|pool]}} {{command}} {{[-t|--access-token]}} {{access_token}}
```

- Retrieve information about a database connection pool:

```
doctl {{[d|databases]}} {{[p|pool]}} {{[g|get]}} {{database_id}} {{pool_name}}
```

- List connection pools for a database cluster:

```
doctl {{[d|databases]}} {{[p|pool]}} {{[ls|list]}} {{database_id}}
```

- Create a connection pool for a database:

```
doctl {{[d|databases]}} {{[p|pool]}} {{[c|create]}} {{database_id}} {{pool_name}} --db {{new_pool_name}} --size {{pool_size}}
```

- Delete a connection pool for a database:

```
doctl {{[d|databases]}} {{[p|pool]}} {{[rm|delete]}} {{database_id}} {{pool_name}}
```

doctl databases replica

Manage read-only replicas associated with a database cluster.

More information: https://docs.digitalocean.com/reference/doctl/reference/databases/replica/.

- Run a `doctl databases replica` command with an access token:

```
doctl {{[d|databases]}} {{[r|replica]}} {{command}} {{[-t|--access-token]}} {{access_token}}
```

- Retrieve information about a read-only database replica:

```
doctl {{[d|databases]}} {{[r|replica]}} {{[g|get]}} {{database_id}} {{replica_name}}
```

- Retrieve list of read-only database replicas:

```
doctl {{[d|databases]}} {{[r|replica]}} {{[ls|list]}} {{database_id}}
```

- Create a read-only database replica:

```
doctl {{[d|databases]}} {{[r|replica]}} {{[c|create]}} {{database_id}} {{replica_name}}
```

- Delete a read-only database replica:

```
doctl {{[d|databases]}} {{[r|replica]}} {{[rm|delete]}} {{database_id}} {{replica_name}}
```

doctl databases sql-mode

View and configure a MySQL database cluster's global SQL modes.

More information: https://docs.digitalocean.com/reference/doctl/reference/databases/sql-mode/.

- Run a `doctl databases sql-mode` command with an access token:

```
doctl {{[d|databases]}} {{[sm|sql-mode]}} {{command}} {{[-t|--access-token]}} {{access_token}}
```

- Get a MySQL database cluster's SQL modes:

```
doctl {{[d|databases]}} {{[sm|sql-mode]}} {{[g|get]}} {{database_id}}
```

- Overwrite a MySQL database cluster's SQL modes to the specified modes:

```
doctl {{[d|databases]}} {{[sm|sql-mode]}} {{[s|set]}} {{database_id}} {{sql_mode_1 sql_mode_2 ...}}
```

doctl databases user

View details for, and create, database users.

More information: https://docs.digitalocean.com/reference/doctl/reference/databases/user/.

- Run a `doctl databases user` command with an access token:

```
doctl {{[d|databases]}} {{[u|user]}} {{command}} {{[-t|--access-token]}} {{access_token}}
```

- Retrieve details about a database user:

```
doctl {{[d|databases]}} {{[u|user]}} {{[g|get]}} {{database_id}} {{user_name}}
```

- Retrieve a list of database users for a given database:

```
doctl {{[d|databases]}} {{[u|user]}} {{[ls|list]}} {{database_id}}
```

- Reset the auth password for a given user:

```
doctl {{[d|databases]}} {{[u|user]}} {{[rs|reset]}} {{database id}} {{user_name}}
```

- Reset the MySQL auth plugn for a given user:

```
doctl {{[d|databases]}} {{[u|user]}} {{[rs|reset]}} {{database_id}} {{user_name}} {{caching_sha2_password|mysql_native_password}}
```

- Create a user in the given database with a given username:

```
doctl {{[d|databases]}} {{[u|user]}} {{[c|create]}} {{database_id}} {{user_name}}
```

- Delete a user from the given database with the given username:

```
doctl {{[d|databases]}} {{[u|user]}} {{[rm|delete]}} {{database_id}} {{user_name}}
```

doctl databases

Manage your MySQL, Redis, PostgreSQL, and MongoDB database services.

More information: https://docs.digitalocean.com/reference/doctl/reference/databases/.

- Run a `doctl databases` command with an access token:

  ```
  doctl {{[d|databases]}} {{command}} {{[-t|--access-token]}} {{access_token}}
  ```

- Get details for a database cluster:

  ```
  doctl {{[d|databases]}} {{[g|get]}}
  ```

- List your database clusters:

  ```
  doctl {{[d|databases]}} {{[ls|list]}}
  ```

- Create a database cluster:

  ```
  doctl {{[d|databases]}} {{[c|create]}} {{database_name}}
  ```

- Delete a cluster:

  ```
  doctl {{[d|databases]}} {{[rm|delete]}} {{database_id}}
  ```

doctl kubernetes cluster

Manage Kubernetes clusters and view configuration options relating to clusters.

More information: https://docs.digitalocean.com/reference/doctl/reference/kubernetes/cluster/.

- Create a Kubernetes cluster:

```
doctl {{[k|kubernetes]}} {{[c|cluster]}} {{[c|create]}} --
count {{3}} --region {{nyc1}} --size {{s-1vcpu-2gb}} --
version {{latest}} {{cluster_name}}
```

- List all Kubernetes clusters:

```
doctl {{[k|kubernetes]}} {{[c|cluster]}} {{[ls|list]}}
```

- Fetch and save the kubeconfig:

```
doctl {{[k|kubernetes]}} {{[c|cluster]}} {{[cfg|kubeconfig]}}
{{[s|save]}} {{cluster_name}}
```

- Check for available upgrades:

```
doctl {{[k|kubernetes]}} {{[c|cluster]}} {{[gu|get-
upgrades]}} {{cluster_name}}
```

- Upgrade a cluster to a new Kubernetes version:

```
doctl {{[k|kubernetes]}} {{[c|cluster]}} upgrade
{{cluster_name}}
```

- Delete a cluster:

```
doctl {{[k|kubernetes]}} {{[c|cluster]}} {{[d|delete]}}
{{cluster_name}}
```

doctl kubernetes options

Get values available for use with **`doctl`**'s Kubernetes commands.

More information: https://docs.digitalocean.com/reference/doctl/reference/kubernetes/options/.

- List regions that support Kubernetes clusters:

```
doctl {{[k|kubernetes]}} {{[o|options]}} {{[r|regions]}}
```

- List machine sizes that can be used in a Kubernetes cluster:

```
doctl {{[k|kubernetes]}} {{[o|options]}} {{[s|sizes]}}
```

- List Kubernetes versions that can be used with DigitalOcean clusters:

```
doctl {{[k|kubernetes]}} {{[o|options]}} {{[v|versions]}}
```

doctl serverless

Manage serverless functions.

More information: https://docs.digitalocean.com/reference/doctl/reference/serverless/.

- Connect local serverless support to a functions namespace:

```
doctl {{[sls|serverless]}} connect
```

- Deploy a functions project to your functions namespace:

```
doctl {{[sls|serverless]}} deploy
```

- Obtain metadata of a functions project:

```
doctl {{[sls|serverless]}} get-metadata
```

- Provide information about serverless support:

```
doctl {{[sls|serverless]}} status
```

doctum

Generate documentation for a PHP API.

More information: https://github.com/code-lts/doctum.

- Parse a project:

```
doctum parse
```

- Render a project:

```
doctum render
```

- Parse then render a project:

```
doctum update
```

- Parse and render only a specific version of a project:

```
doctum update --only-version={{version}}
```

- Parse and render a project using a specific configuration:

```
doctum update {{path/to/config.php}}
```

dog

DNS lookup utility.

It has colorful output, supports DNS-over-TLS and DNS-over-HTTPS protocols, and can emit JSON.

More information: https://github.com/ogham/dog#examples.

- Lookup the IP(s) associated with a hostname (A records):

```
dog {{example.com}}
```

- Query the MX records type associated with a given domain name:

```
dog {{example.com}} MX
```

- Specify a specific DNS server to query (e.g. Cloudflare):

```
dog {{example.com}} MX @{{1.1.1.1}}
```

- Query over TCP rather than UDP:

```
dog {{example.com}} MX @{{1.1.1.1}} {{[-T|--tcp]}}
```

- Query the MX records type associated with a given domain name over TCP using explicit arguments:

```
dog {{[-q|--query]}} {{example.com}} {{[-t|--type]}} MX {{[-n|--nameserver]}} {{1.1.1.1}} {{[-T|--tcp]}}
```

- Lookup the IP(s) associated with a hostname (A records) using DNS over HTTPS (DoH):

```
dog {{example.com}} {{[-H|--https]}} @{{https://cloudflare-dns.com/dns-query}}
```

doggo

DNS client for Humans.

Written in Golang.

More information: https://github.com/mr-karan/doggo/blob/main/docs/src/content/docs/guide/reference.md.

- Perform a simple DNS lookup:

```
doggo {{example.com}}
```

- Query MX records using a specific nameserver:

```
doggo MX {{codeberg.org}} @{{1.1.1.2}}
```

- Use DNS over HTTPS:

```
doggo {{example.com}} @{{https://dns.quad9.net/dns-query}}
```

- Output in the JSON format:

```
doggo {{example.com}} {{[-J|--json]}} | jq
'{{.responses[0].answers[].address}}'
```

- Perform a reverse DNS lookup:

```
doggo {{[-x|--reverse]}} {{8.8.4.4}} --short
```

dokku

Docker powered mini-Heroku (PaaS).

Easily deploy multiple apps to your server in different languages using a single **`git-push`** command.

More information: https://dokku.com/docs/deployment/application-deployment/.

- List running apps:

  ```
  dokku apps
  ```

- Create an app:

  ```
  dokku apps:create {{app_name}}
  ```

- Remove an app:

  ```
  dokku apps:destroy {{app_name}}
  ```

- Install plugin:

  ```
  dokku plugin:install {{full_repo_url}}
  ```

- Link database to an app:

  ```
  dokku {{db}}:link {{db_name}} {{app_name}}
  ```

dolt add

Add the contents of a table to the list of Dolt staged tables.

More information: https://docs.dolthub.com/cli-reference/cli#dolt-add.

- Add a table to the list of staged tables (stage a table):

```
dolt add {{table}}
```

- Stage all tables:

```
dolt add {{[-A|--all]}}
```

dolt blame

Display commit information for each row of a Dolt table.

More information: https://docs.dolthub.com/cli-reference/cli#dolt-blame.

- Display the latest commit for each row of a table:

```
dolt blame {{table}}
```

- Display the latest commits for each row of a table when the specified commit was made:

```
dolt blame {{commit}} {{table}}
```

- Display help:

```
dolt blame --help
```

dolt branch

Manage Dolt branches.

More information: https://docs.dolthub.com/cli-reference/cli#dolt-branch.

- List local branches (current branch is highlighted by *):

```
dolt branch
```

- List all local and remote branches:

```
dolt branch {{[-A|--all]}}
```

- Create a new branch based on the current branch:

```
dolt branch {{branch_name}}
```

- Create a new branch with the specified commit as the latest:

```
dolt branch {{branch_name}} {{commit}}
```

- Rename a branch:

```
dolt branch {{[-m|--move]}} {{branch_name1}} {{branch_name2}}
```

- Duplicate a branch:

```
dolt branch {{[-c|--copy]}} {{branch_name1}} {{branch_name2}}
```

- Delete a branch:

```
dolt branch {{[-d|--delete]}} {{branch_name}}
```

- Display the name of the current branch:

```
dolt branch --show-current
```

dolt checkout

Checkout the work tree or tables to a branch or commit.

More information: https://docs.dolthub.com/cli-reference/cli#dolt-checkout.

- Switch to a branch:

```
dolt checkout {{branch_name}}
```

- Revert unstaged changes to a table:

```
dolt checkout {{table}}
```

- Create new branch and switch to it:

```
dolt checkout -b {{branch_name}}
```

- Create new branch based on a specified commit and switch to it:

```
dolt checkout -b {{branch_name}} {{commit}}
```

dolt clone

Clone a repository into a new directory.

More information: https://docs.dolthub.com/cli-reference/cli#dolt-clone.

- Clone an existing repository into a specific directory (defaults to the repository name):

```
dolt clone {{repository_url}} {{path/to/directory}}
```

- Clone an existing repository and add a specific remote (defaults to origin):

```
dolt clone --remote {{remote_name}} {{repository_url}}
```

- Clone an existing repository only fetching a specific branch (defaults to all branches):

```
dolt clone {{[-b|--branch]}} {{branch_name}}
{{repository_url}}
```

- Clone a repository, using an AWS region (uses the profile's default region if none is provided):

```
dolt clone --aws-region {{region_name}} {{repository_url}}
```

- Clone a repository, using an AWS credentials file:

```
dolt clone --aws-creds-file {{credentials_file}}
{{repository_url}}
```

- Clone a repository, using an AWS credentials profile (uses the default profile if none is provided):

```
dolt clone --aws-creds-profile {{profile_name}}
{{repository_url}}
```

- Clone a repository, using an AWS credentials type:

```
dolt clone --aws-creds-type {{credentials_type}}
{{repository_url}}
```

dolt commit

Commit staged changes to tables.

More information: https://docs.dolthub.com/cli-reference/cli#dolt-commit.

- Commit all staged changes, opening the editor specified by `$EDITOR` to enter the commit message:

```
dolt commit
```

- Commit all staged changes with the specified message:

```
dolt commit {{[-m|--message]}} "{{commit_message}}"
```

- Stage all unstaged changes to tables before committing:

```
dolt commit {{[-a|--all]}}
```

- Use the specified ISO 8601 commit date (defaults to current date and time):

```
dolt commit --date "{{2021-12-31T00:00:00}}"
```

- Use the specified author for the commit:

```
dolt commit --author "{{author_name}} <{{author_email}}>"
```

- Allow creating an empty commit, with no changes:

```
dolt commit --allow-empty
```

- Ignore foreign key warnings:

```
dolt commit {{[-f|--force]}}
```

dolt config

Read and write local (per repository) and global (per user) Dolt configuration variables.

More information: https://docs.dolthub.com/cli-reference/cli#dolt-config.

- List all local and global configuration options and their values:

  ```
  dolt config --list
  ```

- Display the value of a local or global configuration variable:

  ```
  dolt config --get {{name}}
  ```

- Modify the value of a local configuration variable, creating it if it doesn't exist:

  ```
  dolt config --add {{name}} {{value}}
  ```

- Modify the value of a global configuration variable, creating it if it doesn't exist:

  ```
  dolt config --global --add {{name}} {{value}}
  ```

- Delete a local configuration variable:

  ```
  dolt config --unset {{name}}
  ```

- Delete a global configuration variable:

  ```
  dolt config --global --unset {{name}}
  ```

dolt fetch

Download objects and refs from another repository.

More information: https://docs.dolthub.com/cli-reference/cli#dolt-fetch.

- Fetch the latest changes from the default remote upstream repository (origin):

```
dolt fetch
```

- Fetch latest changes from a specific remote upstream repository:

```
dolt fetch {{remote_name}}
```

- Update branches with the current state of the remote, overwriting any conflicting history:

```
dolt fetch -f
```

dolt gc

Search the repository for data that are no longer referenced and no longer needed.

More information: https://docs.dolthub.com/cli-reference/cli#dolt-gc.

- Clean up unreferenced data from the repository:

```
dolt gc
```

- Initiate a faster but less thorough garbage collection process:

```
dolt gc {{[-s|--shallow]}}
```

dolt init

Create an empty Dolt data repository.

More information: https://docs.dolthub.com/cli-reference/cli#dolt-init.

- Initialize a new Dolt data repository in the current directory:

```
dolt init
```

- Initialize a new Dolt data repository creating a commit with the specified metadata:

```
dolt init --name "{{name}}" --email "{{email}}" --date
"{{2021-12-31T00:00:00}}" {{[-b|--initial-branch]}}
"{{branch_name}}"
```

dolt merge

Join two or more development histories together.

More information: https://docs.dolthub.com/cli-reference/cli#dolt-merge.

- Incorporate changes from the named commits into the current branch:

```
dolt merge {{branch_name}}
```

- Incorporate changes from the named commits into the current branch without updating the commit history:

```
dolt merge --squash {{branch_name}}
```

- Merge a branch and create a merge commit even when the merge resolves as a fast-forward:

```
dolt merge --no-ff {{branch_name}}
```

- Merge a branch and create a merge commit with a specific commit message:

```
dolt merge --no-ff {{[-m|--message]}}
"{{message}}" {{branch_name}}
```

- Abort the current conflict resolution process:

```
dolt merge --abort
```

dolt sql

Run an SQL query. Multiple SQL statements must be separated by semicolons.

More information: https://docs.dolthub.com/cli-reference/cli#dolt-sql.

- Run a single query:

```
dolt sql {{[-q|--query]}} "{{INSERT INTO t values (1, 3);}}"
```

- List all saved queries:

```
dolt sql {{[-l|--list-saved]}}
```

dolt status

Display the status of the database session.

More information: https://docs.dolthub.com/cli-reference/cli#dolt-status.

- Display the status:

```
dolt status
```

dolt version

Display the current dolt CLI version.

More information: https://docs.dolthub.com/cli-reference/cli#dolt-version.

- Display version:

```
dolt version
```

dolt

An SQL database that you can fork, clone, branch, merge, push, and pull just like a Git repository.

Some subcommands such as **`commit`** have their own usage documentation.

More information: https://docs.dolthub.com/cli-reference/cli.

- Initialize a new Dolt data repository:

```
dolt init
```

- Show the current working tree status:

```
dolt status
```

- Add a remote Dolt repository:

```
dolt remote add {{repository_name}} {{url}}
```

- Stage changes to tables:

```
dolt add {{table_name}}
```

- Record staged changes to the repository:

```
dolt commit {{[-m|--message]}} "{{commit_message}}"
```

- Push local changes to a remote:

```
dolt push
```

- Pull changes from a remote:

```
dolt pull
```

done

This shell keyword is used with **`for`**, **`while`**, **`select`**, and **`until`** to mark the end of a loop.

- View documentation for the `for` keyword:

  ```
  tldr for
  ```

- View documentation for the `while` keyword:

  ```
  tldr while
  ```

- View documentation for the `select` keyword:

  ```
  tldr select
  ```

- View documentation for the `until` keyword:

  ```
  tldr until
  ```

DOOM

Classic open-source boomer shooter featuring modding and multiplayer.

`zandronum-server` can be replaced with almost any sourceport.

More information: https://doomwiki.org/wiki/Source_port_parameters.

- Host co-op multiplayer:

```
{{zandronum-server}} -iwad {{wad}} +map {{map}} -host {{players}}
```

- Host deathmatch multiplayer:

```
{{zandronum-server}} -iwad {{wad}} +map {{map}} -host {{players}} -deathmatch
```

doppler projects

Manage Doppler Projects.

More information: https://docs.doppler.com/docs/cli.

- Get all projects:

```
doppler projects
```

- Get info for a project:

```
doppler projects get {{name|project_id}}
```

- Create a project:

```
doppler projects create {{name}}
```

- Update a project's name and description:

```
doppler projects update {{name|project_id}} --name
"{{new_name}}" --description "{{new_description}}"
```

- Delete a project:

```
doppler projects delete {{name|project_id}}
```

doppler run

Run a command with Doppler secrets injected into the environment.

More information: https://docs.doppler.com/docs/cli#run-a-command-with-secrets-populated-in-environment.

- Run a command:

```
doppler run --command {{command}}
```

- Run multiple commands:

```
doppler run --command {{command1 && command2}}
```

- Run a script:

```
doppler run {{path/to/command.sh}}
```

- Run command with specified project and config:

```
doppler run -p {{project_name}} -c {{config_name}} --
{{command}}
```

- Automatically restart process when secrets change:

```
doppler run --watch {{command}}
```

doppler secrets

Manage your Doppler project's secrets.

More information: https://docs.doppler.com/docs/accessing-secrets.

- Get all secrets:

```
doppler secrets
```

- Get value(s) of one or more secrets:

```
doppler secrets get {{secrets}}
```

- Upload a secrets file:

```
doppler secrets upload {{path/to/file.env}}
```

- Delete value(s) of one or more secrets:

```
doppler secrets delete {{secrets}}
```

- Download secrets as `.env`:

```
doppler secrets download --format=env --no-file > {{path/
to/.env}}
```

doppler

Manage environment variables across different environments.

Some subcommands such as **`run`** and **`secrets`** have their own usage documentation.

More information: https://docs.doppler.com/docs/cli.

- Setup Doppler project and configuration in current directory:

  ```
  doppler setup
  ```

- Run a command with secrets injected into the environment:

  ```
  doppler run --command {{command}}
  ```

- View your project list:

  ```
  doppler projects
  ```

- View your secrets for current project:

  ```
  doppler secrets
  ```

- Open Doppler dashboard in browser:

  ```
  doppler open
  ```

dosbox

MS-DOS emulator to run legacy DOS applications and games.

More information: https://www.dosbox.com/wiki/Usage.

- Start DOSBox with default settings:

```
dosbox
```

- Run a DOS executable located at a specific path:

```
dosbox {{path/to/executable.exe}}
```

- Mount a folder as C: and run an executable:

```
dosbox {{path/to/executable.exe}} -c "MOUNT C {{path/to/folder}}"
```

- Start DOSBox in fullscreen mode:

```
dosbox -fullscreen
```

- Exit DOSBox automatically after running a program:

```
dosbox {{path/to/executable.exe}} -exit
```

dot

Render an image of a **`linear directed`** network graph from a **`graphviz`** file.

Layouts: **`dot`**, **`neato`**, **`twopi`**, **`circo`**, **`fdp`**, **`sfdp`**, **`osage`** & **`patchwork`**.

More information: https://graphviz.org/doc/info/command.html.

- Render a PNG image with a filename based on the input filename and output format (uppercase -O):

```
dot -T {{png}} -O {{path/to/input.gv}}
```

- Render a SVG image with the specified output filename (lowercase -o):

```
dot -T {{svg}} -o {{path/to/image.svg}} {{path/to/input.gv}}
```

- Render the output in PS, PDF, SVG, Fig, PNG, GIF, JPEG, JSON, or DOT format:

```
dot -T {{format}} -O {{path/to/input.gv}}
```

- Render a GIF image using `stdin` and `stdout`:

```
echo "{{digraph {this -> that} }}" | dot -T {{gif}} > {{path/to/image.gif}}
```

- Display help:

```
dot -?
```

dotenvx

A better **`dotenv`**, from the creator of **`dotenv`**.

More information: https://dotenvx.com/docs/.

- Run a command with environment variables from a `.env` file:

```
dotenvx run -- {{command}}
```

- Run a command with environment variables from a specific `.env` file:

```
dotenvx run -f {{path/to/file.env}} -- {{command}}
```

- Set an environment variable with encryption:

```
dotenvx set {{key}} {{value}}
```

- Set an environment variable without encryption:

```
dotenvx set {{key}} {{value}} --plain
```

- Return environment variables defined in a `.env` file:

```
dotenvx get
```

- Return the value of an environment variable defined in a `.env` file:

```
dotenvx get {{key}}
```

- Return all environment variables from `.env` files and OS:

```
dotenvx get --all
```

dotnet add package

Add or update a .NET package reference in a project file.

More information: https://learn.microsoft.com/dotnet/core/tools/dotnet-add-package.

- Add a package to the project in the current directory:

```
dotnet add package {{package}}
```

- Add a package to a specific project:

```
dotnet add {{path/to/file.csproj}} package {{package}}
```

- Add a specific version of a package to the project:

```
dotnet add package {{package}} {{[-v|--version]}} {{1.0.0}}
```

- Add a package using a specific NuGet source:

```
dotnet add package {{package}} {{[-s|--source]}} {{https://api.nuget.org/v3/index.json}}
```

- Add a package only when targeting a specific framework:

```
dotnet add package {{package}} {{[-f|--framework]}} {{net7.0}}
```

- Add and specify the directory where to restore packages (`~/.nuget/packages` by default):

```
dotnet add package {{package}} --package-directory {{path/to/directory}}
```

dotnet add reference

Add .NET project-to-project references.

More information: https://learn.microsoft.com/dotnet/core/tools/dotnet-add-reference.

- Add a reference to the project in the current directory:

```
dotnet add reference {{path/to/reference.csproj}}
```

- Add multiple references to the project in the current directory:

```
dotnet add reference {{path/to/reference1.csproj path/to/reference2.csproj ...}}
```

- Add a reference to the specific project:

```
dotnet add {{path/to/project.csproj}} reference {{path/to/reference.csproj}}
```

- Add multiple references to the specific project:

```
dotnet add {{path/to/project.csproj}} reference {{path/to/reference1.csproj path/to/reference2.csproj ...}}
```

dotnet build

Builds a .NET application and its dependencies.

More information: https://learn.microsoft.com/dotnet/core/tools/dotnet-build.

- Compile the project or solution in the current directory:

```
dotnet build
```

- Compile a .NET project or solution in debug mode:

```
dotnet build {{path/to/project_or_solution}}
```

- Compile in release mode:

```
dotnet build {{[-c|--configuration]}} {{Release}}
```

- Compile without restoring dependencies:

```
dotnet build --no-restore
```

- Compile with a specific verbosity level:

```
dotnet build {{[-v|--verbosity]}} {{quiet|minimal|normal|
detailed|diagnostic}}
```

- Compile for a specific runtime:

```
dotnet build {{[-r|--runtime]}} {{runtime_identifier}}
```

- Specify the output directory:

```
dotnet build {{[-o|--output]}} {{path/to/directory}}
```

dotnet ef

Perform design-time development tasks for Entity Framework Core.

More information: https://learn.microsoft.com/ef/core/cli/dotnet.

- Update the database to a specified migration:

```
dotnet ef database update {{migration}}
```

- Drop the database:

```
dotnet ef database drop
```

- List available `DbContext` types:

```
dotnet ef dbcontext list
```

- Generate code for a `DbContext` and entity types for a database:

```
dotnet ef dbcontext scaffold {{connection_string}}
{{provider}}
```

- Add a new migration:

```
dotnet ef migrations add {{name}}
```

- Remove the last migration, rolling back the code changes that were done for the latest migration:

```
dotnet ef migrations remove
```

- List available migrations:

```
dotnet ef migrations list
```

- Generate an SQL script from migrations range:

```
dotnet ef migrations script {{from_migration}}
{{to_migration}}
```

dotnet publish

Publish a .NET application and its dependencies to a directory for deployment to a hosting system.

More information: https://learn.microsoft.com/dotnet/core/tools/dotnet-publish.

- Compile a .NET project in release mode:

```
dotnet publish {{[-c|--configuration]}} Release {{path/to/project_file}}
```

- Publish the .NET Core runtime with your application for the specified runtime:

```
dotnet publish {{[-sc|--self-contained]}} true {{[-r|--runtime]}} {{runtime_identifier}} {{path/to/project_file}}
```

- Package the application into a platform-specific single-file executable:

```
dotnet publish {{[-r|--runtime]}} {{runtime_identifier}} -p:PublishSingleFile=true {{path/to/project_file}}
```

- Trim unused libraries to reduce the deployment size of an application:

```
dotnet publish {{[-sc|--self-contained]}} true {{[-r|--runtime]}} {{runtime_identifier}} -p:PublishTrimmed=true {{path/to/project_file}}
```

- Compile a .NET project without restoring dependencies:

```
dotnet publish --no-restore {{path/to/project_file}}
```

- Specify the output directory:

```
dotnet publish {{[-o|--output]}} {{path/to/directory}} {{path/to/project_file}}
```

dotnet restore

Restores the dependencies and tools of a .NET project.

More information: https://learn.microsoft.com/dotnet/core/tools/dotnet-restore.

- Restore dependencies for a .NET project or solution in the current directory:

```
dotnet restore
```

- Restore dependencies for a .NET project or solution in a specific location:

```
dotnet restore {{path/to/project_or_solution}}
```

- Restore dependencies without caching the HTTP requests:

```
dotnet restore --no-cache
```

- Force all dependencies to be resolved even if the last restore was successful:

```
dotnet restore --force
```

- Restore dependencies using package source failures as warnings:

```
dotnet restore --ignore-failed-sources
```

- Restore dependencies with a specific verbosity level:

```
dotnet restore {{[-v|--verbosity]}} {{quiet|minimal|normal|
detailed|diagnostic}}
```

dotnet run

Run a .NET application without explicit compile or launch commands.

More information: https://learn.microsoft.com/dotnet/core/tools/dotnet-run.

- Run the project in the current directory:

```
dotnet run
```

- Run a specific project:

```
dotnet run --project {{path/to/file.csproj}}
```

- Run the project with specific arguments:

```
dotnet run -- {{arg1=foo arg2=bar ...}}
```

- Run the project using a target framework moniker:

```
dotnet run {{[-f|--framework]}} {{net7.0}}
```

- Specify architecture and OS, available since .NET 6 (Don't use `--runtime` with these options):

```
dotnet run {{[-a|--arch]}} {{x86|x64|arm|arm64}} --os {{win|win7|osx|linux|ios|android}}
```

dotnet test

Execute tests for a .NET application.

Note: View https://learn.microsoft.com/dotnet/core/testing/selective-unit-tests for supported filter expressions.

More information: https://learn.microsoft.com/dotnet/core/tools/dotnet-test.

- Execute tests for a .NET project/solution in the current directory:

```
dotnet test
```

- Execute tests for a .NET project/solution in a specific location:

```
dotnet test {{path/to/project_or_solution}}
```

- Execute tests matching the given filter expression:

```
dotnet test --filter {{Name~TestMethod1}}
```

dotnet tool

Manage .NET tools and search published tools in NuGet.

More information: https://learn.microsoft.com/dotnet/core/tools/global-tools.

- Install a global tool (don't use `--global` for local tools):

```
dotnet tool install {{[-g|--global]}} {{dotnetsay}}
```

- Install tools defined in the local tool manifest:

```
dotnet tool restore
```

- Update a specific global tool (don't use `--global` for local tools):

```
dotnet tool update {{[-g|--global]}} {{tool_name}}
```

- Uninstall a global tool (don't use `--global` for local tools):

```
dotnet tool uninstall {{[-g|--global]}} {{tool_name}}
```

- List installed global tools (don't use `--global` for local tools):

```
dotnet tool list {{[-g|--global]}}
```

- Search tools in NuGet:

```
dotnet tool search {{search_term}}
```

- Display help:

```
dotnet tool {{[-h|--help]}}
```

dotnet

Cross platform .NET tools for .NET Core.

Some subcommands such as **`build`** have their own usage documentation.

More information: https://learn.microsoft.com/dotnet/core/tools.

- Initialize a new .NET project:

```
dotnet new {{template_short_name}}
```

- Restore NuGet packages:

```
dotnet restore
```

- Build and execute the .NET project in the current directory:

```
dotnet run
```

- Run a packaged dotnet application (only needs the runtime, the rest of the commands require the .NET Core SDK installed):

```
dotnet {{path/to/application.dll}}
```

dotty

A customizable interactive graph editor for the X Window System.

Note: This tool has been deprecated, but this entry is retained to aid anyone still using it.

More information: https://graphviz.org/pdf/dotty.1.pdf.

- Open a graph file (`.gv` or `.dot`) in the Dotty editor:

```
dotty {{path/to/graph.gv}}
```

- Start Dotty with the [V]ersion information displayed:

```
dotty -V
```

- Set the [l]ayout [m]ode to synchronous or asynchronous:

```
dotty -lm {{sync|async}} {{path/to/graph.gv}}
```

- Set the m[e]ssage verbosity [l]evel (`0` for minimal, `1` for detailed):

```
dotty -el {{0|1}} {{path/to/graph.gv}}
```

doxygen

A documentation system for various programming languages.

More information: https://manned.org/doxygen.

- Generate documentation, using `Doxyfile` as configuration file if it exists:

```
doxygen
```

- Generate a default template configuration file `Doxyfile`:

```
doxygen -g
```

- Generate a template configuration file:

```
doxygen -g {{path/to/config_file}}
```

- Generate documentation using an existing configuration file:

```
doxygen {{path/to/config_file}}
```

drill

Perform various DNS queries.

More information: https://manned.org/drill.

- Lookup the IP(s) associated with a hostname (A records):

```
drill {{example.com}}
```

- Lookup the mail server(s) associated with a given domain name (MX record):

```
drill mx {{example.com}}
```

- Get all types of records for a given domain name:

```
drill any {{example.com}}
```

- Specify an alternate DNS server to query:

```
drill {{example.com}} @{{8.8.8.8}}
```

- Perform a reverse DNS lookup on an IP address (PTR record):

```
drill -x {{8.8.8.8}}
```

- Perform DNSSEC trace from root servers down to a domain name:

```
drill -TD {{example.com}}
```

- Show DNSKEY record(s) for a domain name:

```
drill -s dnskey {{example.com}}
```

dropdb

Remove a PostgreSQL database.

A simple wrapper around the SQL command **`DROP DATABASE`**.

More information: https://www.postgresql.org/docs/current/app-dropdb.html.

- Destroy a database:

```
dropdb {{database_name}}
```

- Request a verification prompt before any destructive actions:

```
dropdb {{[-i|--interactive]}} {{database_name}}
```

- Connect with a specific username and destroy a database:

```
dropdb {{[-U|--username]}} {{username}} {{database_name}}
```

- Force a password prompt before connecting to the database:

```
dropdb {{[-W|--password]}} {{database_name}}
```

- Suppress a password prompt before connecting to the database:

```
dropdb {{[-w|--no-password]}} {{database_name}}
```

- Specify the server host name:

```
dropdb {{[-h|--host]}} {{host}} {{database_name}}
```

- Specify the server port:

```
dropdb {{[-p|--port]}} {{port}} {{database_name}}
```

- Attempt to terminate existing connections before destroying the database:

```
dropdb {{[-f|--force]}} {{database_name}}
```

dropuser

Remove an existing PostgreSQL user (role).

More information: https://www.postgresql.org/docs/current/app-dropuser.html.

- Prompt for confirmation and the username before user removal:

```
dropuser {{[-i|--interactive]}}
```

- Remove user instantly:

```
dropuser {{username}}
```

- No error if the user to be removed doesn't exist:

```
dropuser --if-exists {{username}}
```

- Remove a user on the server with address 127.0.0.1 on port 4321:

```
dropuser {{[-h|--host]}} 127.0.0.1 {{[-p|--port]}} 4321
{{username}}
```

- Remove a user on the server with address 127.0.0.1 on port 4321 as user "admin":

```
dropuser {{[-U|--username]}} admin {{[-h|--host]}} 127.0.0.1
{{[-p|--port]}} 4321 {{username}}
```

drupal-check

Check Drupal PHP code for deprecations.

More information: https://github.com/mglaman/drupal-check#usage.

- Check the code in a specific directory for deprecations:

```
drupal-check {{path/to/directory}}
```

- Check the code excluding a comma-separated list of directories:

```
drupal-check {{[-e|--exclude-dir]}} {{path/to/
excluded_directory}},{{path/to/excluded_files/*.php}} {{path/
to/directory}}
```

- Don't show a progress bar:

```
drupal-check --no-progress {{path/to/directory}}
```

- Perform static analysis to detect bad coding practices:

```
drupal-check {{[-a|--analysis]}} {{path/to/directory}}
```

drupal

Generate boilerplate code, interact with and debug Drupal projects.

Some subcommands such as **`check`** have their own usage documentation.

`drupal` has been deprecated. Use **`drush`** instead.

More information: https://drupalize.me/topic/drupal-console.

- Install a module:

  ```
  drupal module:install {{module_name}}
  ```

- Uninstall a module:

  ```
  drupal module:uninstall {{module_name}}
  ```

- Clear all caches:

  ```
  drupal cache:rebuild
  ```

- View current Drupal installation status:

  ```
  drupal site:status
  ```

drush

Shell and scripting interface for Drupal.

More information: https://www.drush.org/latest/usage/.

- Enable module "foo":

```
drush en {{foo}}
```

- Uninstall module "foo":

```
drush pmu {{foo}}
```

- Clear all caches:

```
drush cr
```

- Clear CSS and JavaScript caches:

```
drush cc css-js
```

dtc

The Device Tree Compiler, a tool for recompiling device trees between formats.

More information: https://manned.org/dtc.

- Compile a device tree source `.dts` file into a binary device tree blob `.dtb` file:

```
dtc -I dts -O dtb -o {{path/to/output_file.dtb}} {{path/to/input_file.dts}}
```

- Compile a device tree source `.dts` file into a binary device tree blob overlay `.dtbo` file:

```
dtc -@ -I dts -O dtb -o {{path/to/output_file.dtbo}} {{path/to/input_file.dts}}
```

- Decompile a device tree blob `.dtb` file into a readable device tree source `.dts` file:

```
dtc -I dtb -O dts -o {{path/to/output_file.dts}} {{path/to/input_file.dtb}}
```

- Decompile the current device tree from the system into a readable device tree source `.dts` file:

```
dtc -I fs -O dts /proc/device-tree
```

dtrx

"Do The Right eXtraction" - extract any archive into new directory by guessing the tool from extension.

More information: https://github.com/dtrx-py/dtrx.

- Extract archive, guessing the extraction tool from extension:

```
dtrx {{path/to/file}}
```

- Extract archive, overwrite any existing target output:

```
dtrx --overwrite {{path/to/file}}
```

- Extract archive, put everything into current directory:

```
dtrx --flat {{path/to/file}}
```

du

Disk usage: estimate and summarize file and directory space usage.

More information: https://www.gnu.org/software/coreutils/manual/html_node/du-invocation.html.

- List the sizes of a directory and any subdirectories, in the given unit (B/KiB/MiB):

```
du -{{b|k|m}} {{path/to/directory}}
```

- List the sizes of a directory and any subdirectories, in human-readable form (i.e. auto-selecting the appropriate unit for each size):

```
du {{[-h|--human-readable]}} {{path/to/directory}}
```

- Show the size of a single directory, in human-readable units:

```
du {{[-sh|--summarize --human-readable]}} {{path/to/directory}}
```

- List the human-readable sizes of a directory and of all the files and directories within it:

```
du {{[-ah|--all --human-readable]}} {{path/to/directory}}
```

- List the human-readable sizes of a directory and any subdirectories, up to `n` levels deep:

```
du {{[-h|--human-readable]}} {{[-d|--max-depth]}} {{n}} {{path/to/directory}}
```

- List the human-readable size of all `.jpg` files in current directory, and show a cumulative total at the end:

```
du {{[-ch|--total --human-readable]}} *.jpg
```

- List all files and directories (including hidden ones) above a certain threshold size (useful for investigating what is actually taking up the space):

```
du {{[-ah|--all --human-readable]}} {{[-t|--threshold]}} {{1G|1024M|1048576K}} .[^.]* *
```

dua

Dua (Disk Usage Analyzer): get the disk space usage of a directory.

More information: https://github.com/Byron/dua-cli.

- Analyze specific directory:

```
dua {{path/to/directory}}
```

- Display apparent size instead of disk usage:

```
dua --apparent-size
```

- Count hard-linked files each time they are seen:

```
dua --count-hard-links
```

- Aggregate the consumed space of one or more directories or files:

```
dua aggregate
```

- Launch the terminal user interface:

```
dua interactive
```

- Format printing byte counts:

```
dua --format {{metric|binary|bytes|GB|GiB|MB|MiB}}
```

- Use a specific number of threads (defaults to the process number of threads):

```
dua --threads {{count}}
```

dub

Package manager for D packages.

More information: https://dub.pm/commandline/.

- Interactively create a new D project:

```
dub init {{project_name}}
```

- Non-interactively create a new D project:

```
dub init {{project_name}} {{[-n|--non-interactive]}}
```

- Build and run a D project:

```
dub
```

- Install dependencies specified in a D project's `dub.json` or `dub.sdl` file:

```
dub fetch
```

- Update the dependencies in a D project:

```
dub upgrade
```

- Display help:

```
dub {{[-h|--help]}}
```

duc

A collection of tools for indexing, inspecting, and visualizing disk usage.

Duc maintains a database of accumulated sizes of directories of the file system, allowing queries in this database, or creating fancy graphs to show where data is.

More information: https://htmlpreview.github.io/?https://github.com/zevv/duc/blob/master/doc/duc.1.html.

- Index the `/usr` directory, writing to the default database location `~/.duc.db`:

```
duc index {{/usr}}
```

- List all files and directories under `/usr/local`, showing relative file sizes in a graph:

```
duc ls {{[-Fg|--classify --graph]}} {{/usr/local}}
```

- List all files and directories under `/usr/local` using treeview recursively:

```
duc ls {{[-Fg|--classify --graph]}} {{[-R|--recursive]}} {{/usr/local}}
```

- Start the graphical interface to explore the file system using sunburst graphs:

```
duc gui {{/usr}}
```

- Run the ncurses console interface to explore the file system:

```
duc ui {{/usr}}
```

- Dump database info:

```
duc info
```

duckdb

Client for DuckDB, an in-process analytical SQL engine.

More information: https://duckdb.org/docs/stable/clients/cli/arguments.

- Start an interactive shell with a transient in-memory database:

```
duckdb
```

- Start an interactive shell on a database file. If the file does not exist, a new database is created:

```
duckdb {{path/to/dbfile}}
```

- Query a CSV, JSON, or Parquet file using SQL:

```
duckdb -c "{{SELECT * FROM 'data_source.[csv|csv.gz|json|json.gz|parquet]'}}"
```

- Directly query a CSV, JSON, or Parquet file using the `file` view:

```
duckdb {{data_source.[csv|csv.gz|json|json.gz|parquet]}} -c "{{ SELECT * FROM file }}"
```

- Run an SQL script:

```
duckdb -f {{path/to/script.sql}}
```

- Run query on database file and keep the interactive shell open:

```
duckdb {{path/to/dbfile}} -cmd "{{SELECT DISTINCT * FROM tbl}}"
```

- Read CSV from `stdin` and write CSV to `stdout`:

```
cat {{path/to/source.csv}} | duckdb -c "{{COPY (FROM read_csv('/dev/stdin')) TO '/dev/stdout' WITH (FORMAT CSV, HEADER)}}"
```

- Start the DuckDB UI, a web interface with notebooks:

```
duckdb -ui
```

duf

Disk Usage/Free Utility.

More information: https://github.com/muesli/duf#usage.

- List accessible devices:

```
duf
```

- List everything (such as pseudo, duplicate, or inaccessible file systems):

```
duf --all
```

- Only show specified devices or mount points:

```
duf {{path/to/directory1 path/to/directory2 ...}}
```

- Sort the output by a specified criteria:

```
duf --sort {{size|used|avail|usage}}
```

- Show or hide specific filesystems:

```
duf --{{only-fs|hide-fs}} {{tmpfs|vfat|ext4|xfs}}
```

- Sort the output by key:

```
duf --sort {{mountpoint|size|used|avail|usage|inodes|
inodes_used|inodes_avail|inodes_usage|type|filesystem}}
```

- Change the theme (if `duf` fails to use the right theme):

```
duf --theme {{dark|light}}
```

dumpcap

A network traffic dump tool.

More information: https://www.wireshark.org/docs/man-pages/dumpcap.html.

- Display available interfaces:

```
dumpcap {{[-D|--list-interfaces]}}
```

- Capture packets on a specific interface:

```
dumpcap {{[-i|--interface]}} {{1}}
```

- Capture packets to a specific location:

```
dumpcap {{[-i|--interface]}} {{1}} -w {{path/to/
output_file.pcapng}}
```

- Write to a ring buffer with a specific max file limit of a specific size:

```
dumpcap {{[-i|--interface]}} {{1}} -w {{path/to/
output_file.pcapng}} {{[-b|--ring-buffer]}} filesize:
{{500000}} {{[-b|--ring-buffer]}} files:{{10}}
```

dune

A build system for OCaml programs.

More information: https://dune.readthedocs.io/en/stable/reference/cli.html.

- Build all targets:

  ```
  dune build
  ```

- Clean up the workspace:

  ```
  dune clean
  ```

- Run all tests:

  ```
  dune runtest
  ```

- Start the utop REPL with compiled modules automatically loaded into it, to remove the need to load them by hand:

  ```
  dune utop
  ```

dunst

A lightweight and customizable notification daemon for X11 and Wayland.

If not started manually, D-Bus will automatically start **`dunst`** when a notification is sent.

More information: https://dunst-project.org/documentation/dunst/.

- Start `dunst`:

```
dunst
```

- Display a notification on startup:

```
dunst -startup_notification
```

- Print incoming notifications to `stdout`:

```
dunst -print
```

- Use the specified configuration file (default: `$XDG_CONFIG_HOME/dunst/dunstrc`):

```
dunst {{[-conf|-config]}} {{path/to/file}}
```

dunstctl

Control the **dunst** notification daemon.

More information: https://dunst-project.org/documentation/dunstctl/.

- Pause/Unpause/Toggle desktop notifications:

```
dunstctl set-paused {{true|false|toggle}}
```

- Close all notifications:

```
dunstctl close-all
```

- Delete all notifications from history:

```
dunstctl history-clear
```

- Display the latest notification from history:

```
dunstctl history-pop
```

- Reload the configuration file:

```
dunstctl reload
```

- Display help:

```
dunstctl {{[-h|--help]}}
```

dunstify

A notification tool that is an extension of **`notify-send`**, but has more features based around **`dunst`**.

Accepts all options of **`notify-send`**.

More information: https://dunst-project.org/documentation/dunstify/.

- Show a notification with a given title and message:

```
dunstify "{{Title}}" "{{Message}}"
```

- Show a notification with the specified urgency:

```
dunstify "{{Title}}" "{{Message}}" {{[-u|--urgency]}} {{low|normal|critical}}
```

- Specify a message ID (overwrites any previous messages with the same ID):

```
dunstify "{{Title}}" "{{Message}}" {{[-r|--replace]}} {{123}}
```

- Display help:

```
dunstify {{[-?|--help]}}
```

duplicacy

A lock-free deduplication cloud backup tool.

More information: https://github.com/gilbertchen/duplicacy/wiki.

- Use current directory as the repository, initialize a SFTP storage and encrypt the storage with a password:

```
duplicacy init {{[-e|-encrypt]}} {{snapshot_id}} {{sftp://user@192.168.2.100/path/to/storage}}/
```

- Save a snapshot of the repository to the default storage:

```
duplicacy backup
```

- List snapshots of current repository:

```
duplicacy list
```

- Restore the repository to a previously saved snapshot:

```
duplicacy restore -r {{revision}}
```

- Check the integrity of snapshots:

```
duplicacy check
```

- Add another storage to be used for the existing repository:

```
duplicacy add {{storage_name}} {{snapshot_id}} {{storage_url}}
```

- Prune a specific revision of snapshot:

```
duplicacy prune -r {{revision}}
```

- Prune revisions, keeping one revision every `n` days for all revisions older than `m` days:

```
duplicacy prune -keep {{n:m}}
```

duplicity

Create incremental, compressed, encrypted and versioned backups.

Can also upload the backups to a variety of backend services.

It is worth mentioning that depending on the version, some options may not be available (e.g. **`--gio`** in 2.0.0).

More information: https://duplicity.gitlab.io/stable/duplicity.1.html#name.

- Backup a directory via FTPS to a remote machine, encrypting it with a password:

```
FTP_PASSWORD={{ftp_login_password}}
PASSPHRASE={{encryption_password}} duplicity {{path/to/
source_directory}} {{ftps://user@hostname/path/to/
target_directory}}/
```

- Backup a directory to Amazon S3, doing a full backup every month:

```
duplicity --full-if-older-than {{1M}} s3://{{bucket_name[/
prefix]}}
```

- Delete versions older than 1 year from a backup stored on a WebDAV share:

```
FTP_PASSWORD={{webdav_login_password}} duplicity remove-
older-than {{1Y}} --force {{webdav[s]://user@hostname[:port]/
some_directory}}
```

- List the available backups:

```
duplicity collection-status "file://{{absolute/path/to/
backup_directory}}"
```

- List the files in a backup stored on a remote machine, via SSH:

```
duplicity list-current-files {{[-t|--time]}} {{YYYY-MM-DD}}
scp://{{user@hostname}}/{{path/to/backup_directory}}
```

- Restore a subdirectory from a GnuPG-encrypted local backup to a given location:

```
PASSPHRASE={{gpg_key_password}} duplicity restore --encrypt-
key {{gpg_key_id}} --path-to-restore {{path/to/
restore_directory}} file://{{absolute/path/to/
backup_directory}} {{path/to/directory_to_restore_to}}
```

dust

Give an instant overview of which directories are using disk space.

See also: **du**, **ncdu**.

More information: https://github.com/bootandy/dust#usage.

- Display information for the current directory:

```
dust
```

- Display information about one or more directories:

```
dust {{path/to/directory1 path/to/directory2 ...}}
```

- Display 30 directories (defaults to 21):

```
dust {{[-n|--number-of-lines]}} 30
```

- Display information for the current directory, up to 3 levels deep:

```
dust {{[-d|--depth]}} 3
```

- Display the largest directories at the top in descending order:

```
dust {{[-r|--reverse]}}
```

- Ignore a file or directory:

```
dust {{[-X|--ignore-directory]}} {{path/to/
file_or_directory}}
```

- Do not display percent bars and percentages:

```
dust {{[-b|--no-percent-bars]}}
```

dvc add

Add changed files to the index.

More information: https://doc.dvc.org/command-reference/add.

- Add a single target file to the index:

```
dvc add {{path/to/file}}
```

- Add a target directory to the index:

```
dvc add {{path/to/directory}}
```

- Recursively add all the files in a given target directory:

```
dvc add --recursive {{path/to/directory}}
```

- Add a target file with a custom `.dvc` filename:

```
dvc add --file {{custom_name.dvc}} {{path/to/file}}
```

dvc checkout

Checkout data files and directories from cache.

More information: https://doc.dvc.org/command-reference/checkout.

- Checkout the latest version of all target files and directories:

```
dvc checkout
```

- Checkout the latest version of a specified target:

```
dvc checkout {{target}}
```

- Checkout a specific version of a target from a different Git commit/tag/branch:

```
git checkout {{commit_hash|tag|branch}} {{target}} && dvc checkout {{target}}
```

dvc commit

Record changes to DVC-tracked files in the project.

More information: https://doc.dvc.org/command-reference/commit.

- Commit changes to all DVC-tracked files and directories:

```
dvc commit
```

- Commit changes to a specified DVC-tracked target:

```
dvc commit {{target}}
```

- Recursively commit all DVC-tracked files in a directory:

```
dvc commit {{[-R|--recursive]}} {{path/to/directory}}
```

dvc config

Low level command to manage custom configuration options for dvc repositories.

These configurations can be on project, local, global, or system level.

More information: https://doc.dvc.org/command-reference/config.

- Get the name of the default remote:

  ```
  dvc config core.remote
  ```

- Set the project's default remote:

  ```
  dvc config core.remote {{remote_name}}
  ```

- Unset the project's default remote:

  ```
  dvc config {{[-u|--unset]}} core.remote
  ```

- Get the configuration value for a specified key for the current project:

  ```
  dvc config {{key}}
  ```

- Set the configuration value for a key on a project level:

  ```
  dvc config {{key}} {{value}}
  ```

- Unset a project level configuration value for a given key:

  ```
  dvc config {{[-u|--unset]}} {{key}}
  ```

- Set a local, global, or system level configuration value:

  ```
  dvc config --{{local|global|system}} {{key}} {{value}}
  ```

dvc dag

Visualize the pipeline(s) defined in **`dvc.yaml`**.

More information: https://doc.dvc.org/command-reference/dag.

- Visualize the entire pipeline:

  ```
  dvc dag
  ```

- Visualize the pipeline stages up to a specified target stage:

  ```
  dvc dag {{target}}
  ```

- Export the pipeline in the dot format:

  ```
  dvc dag --dot > {{path/to/pipeline.dot}}
  ```

dvc destroy

Remove all DVC files and directories from a DVC project.

More information: https://doc.dvc.org/command-reference/destroy.

- Destroy the current project:

```
dvc destroy
```

- Force destroy the current project:

```
dvc destroy {{[-f|--force]}}
```

dvc diff

Show changes in DVC tracked file and directories.

More information: https://doc.dvc.org/command-reference/diff.

- Compare DVC tracked files from different Git commits, tags, and branches w.r.t the current workspace:

```
dvc diff {{commit_hash/tag/branch}}
```

- Compare the changes in DVC tracked files from 1 Git commit to another:

```
dvc diff {{revision1}} {{revision2}}
```

- Compare DVC tracked files, along with their latest hash:

```
dvc diff --show-hash {{commit}}
```

- Compare DVC tracked files, displaying the output as JSON:

```
dvc diff --show-json --show-hash {{commit}}
```

- Compare DVC tracked files, displaying the output as Markdown:

```
dvc diff --show-md --show-hash {{commit}}
```

dvc fetch

Download DVC tracked files and directories from a remote repository.

More information: https://doc.dvc.org/command-reference/fetch.

- Fetch the latest changes from the default remote upstream repository (if set):

```
dvc fetch
```

- Fetch changes from a specific remote upstream repository:

```
dvc fetch {{[-r|--remote]}} {{remote_name}}
```

- Fetch the latest changes for a specific target/s:

```
dvc fetch {{target/s}}
```

- Fetch changes for all branch and tags:

```
dvc fetch {{[-a|--all-branches]}} {{[-T|--all-tags]}}
```

- Fetch changes for all commits:

```
dvc fetch {{[-A|--all-commits]}}
```

dvc freeze

Freeze stages in the DVC pipeline.

This prevents DVC from tracking changes in stage dependencies and re-execution until unfreeze.

See also: **`dvc unfreeze`**.

More information: https://doc.dvc.org/command-reference/freeze.

- Freeze one or more specified stages:

```
dvc freeze {{stage_name1 stage_name2 ...}}
```

dvc gc

Remove unused files and directories from the cache or remote storage.

More information: https://doc.dvc.org/command-reference/gc.

- Garbage collect from the cache, keeping only versions referenced by the current workspace:

```
dvc gc {{[-w|--workspace]}}
```

- Garbage collect from the cache, keeping only versions referenced by branch, tags, and commits:

```
dvc gc {{[-a|--all-branches]}} {{[-T|--all-tags]}} {{[-a|--all-commits]}}
```

- Garbage collect from the cache, including the default cloud remote storage (if set):

```
dvc gc {{[-a|--all-commits]}} {{[-c|--cloud]}}
```

- Garbage collect from the cache, including a specific cloud remote storage:

```
dvc gc {{[-a|--all-commits]}} {{[-c|--cloud]}} {{[-r|--remote]}} {{remote_name}}
```

dvc init

Initialize a new local DVC repository.

More information: https://doc.dvc.org/command-reference/init.

- Initialize a new local repository:

```
dvc init
```

- Initialize DVC without Git:

```
dvc init --no-scm
```

- Initialize DVC in a subdirectory:

```
cd {{path/to/subdirectory}} && dvc init --sudir
```

dvc unfreeze

Unfreeze stages in the DVC pipeline.

This allows DVC to start tracking changes in stage dependencies again after they were frozen.

See also: **`dvc freeze`**.

More information: https://doc.dvc.org/command-reference/unfreeze.

- Unfreeze one or more specified stages:

```
dvc unfreeze {{stage_name1 stage_name2 ...}}
```

dvc

Data Version Control system for machine learning projects.

Some subcommands such as **`commit`** have their own usage documentation.

More information: https://doc.dvc.org/command-reference.

- Initialize a new DVC project:

```
dvc init
```

- Configure a remote storage location:

```
dvc remote add {{storage_name}} {{url}}
```

- Add one or more data files or directories to tracking:

```
dvc add {{path/to/file_or_directory}}
```

- Show project status:

```
dvc status
```

- Upload tracked files to remote storage:

```
dvc push
```

- Download tracked files from remote storage:

```
dvc pull
```

- Display help:

```
dvc {{[-h|--help]}}
```

- Display version:

```
dvc --version
```

dwebp

dwebp decompresses WebP files into PNG, PAM, PPM, or PGM images.

Animated WebP files are not supported.

More information: https://developers.google.com/speed/webp/docs/dwebp/.

- Convert a WebP file into a PNG file:

```
dwebp {{path/to/input.webp}} -o {{path/to/output.png}}
```

- Convert a WebP file into a specific filetype:

```
dwebp {{path/to/input.webp}} -bmp|-tiff|-pam|-ppm|-pgm|-yuv -
o {{path/to/output}}
```

- Convert a WebP file, using multi-threading if possible:

```
dwebp {{path/to/input.webp}} -o {{path/to/output.png}} -mt
```

- Convert a WebP file, but also crop and scale at the same time:

```
dwebp {{input.webp}} -o {{output.png}} -crop {{x_pos}}
{{y_pos}} {{width}} {{height}} -scale {{width}} {{height}}
```

- Convert a WebP file and flip the output:

```
dwebp {{path/to/input.webp}} -o {{path/to/output.png}} -flip
```

- Convert a WebP file and don't use in-loop filtering to speed up the decoding process:

```
dwebp {{path/to/input.webp}} -o {{path/to/output.png}} -
nofilter
```

dzdo

Execute privileged commands as root or another user via Active Directory roles.

Similar to **sudo** but integrated with Delinea; supports Ansible become plugin.

More information: https://docs.delinea.com/online-help/server-suite/commandref/centrify-command-reference-2025.pdf#page=102.

- Run a command with elevated privileges:

```
dzdo {{command}}
```

- Run a command as another user:

```
dzdo -u {{user}} {{command}}
```

- Edit a file with elevated privileges using the default editor:

```
dzdo -e {{path/to/file}}
```

- Launch an interactive login shell with elevated privileges:

```
dzdo -i
```

- Launch the default shell with elevated privileges:

```
dzdo -s
```

- List allowed commands for the current user:

```
dzdo -l
```

- Validate and update authentication timestamp:

```
dzdo -v
```

- Display version:

```
dzdo -V
```

ebook-convert

Can be used to convert e-books between common formats, e.g. PDF, EPUB, and MOBI.

Part of the Calibre e-book library tool.

More information: https://manual.calibre-ebook.com/generated/en/ebook-convert.html.

- Convert an e-book into another format:

```
ebook-convert {{path/to/input_file}} {{output_file}}
```

- Convert Markdown or HTML to e-book with TOC, title, and author:

```
ebook-convert {{path/to/input_file}} {{output_file}} --
level1-toc="//h:h1" --level2-toc="//h:h2" --level3-toc="//
h:h3" --title={{title}} --authors={{author}}
```

echo

Print given arguments.

See also: **`printf`**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/echo-invocation.html.

- Print a text message. Note: Quotes are optional:

```
echo "{{Hello World}}"
```

- Print a message with environment variables:

```
echo "{{My path is $PATH}}"
```

- Print a message without the trailing newline:

```
echo -n "{{Hello World}}"
```

- Append a message to the file:

```
echo "{{Hello World}}" >> {{file.txt}}
```

- Enable interpretation of backslash escapes (special characters):

```
echo -e "{{Column 1\tColumn 2}}"
```

- Print the exit status of the last executed command (Note: In Windows Command Prompt and PowerShell the equivalent commands are `echo %errorlevel%` and `$lastexitcode` respectively):

```
echo $?
```

- Pass text to another program through `stdin`:

```
echo "{{Hello World}}" | {{program}}
```

ecpg

Embedded SQL preprocessor for C programs.

More information: https://www.postgresql.org/docs/current/app-ecpg.html.

- Preprocess a specific file:

```
ecpg {{input.pgc}}
```

- Preprocess from `stdin` and output to `stdout`:

```
ecpg -o - -
```

- Preprocess from `stdin` and write to a file:

```
cat input.pgc | ecpg -o output.c -
```

- Preprocess and specify an output file:

```
ecpg -o {{output.c}} {{input.pgc}}
```

- Preprocess a header file (`.pgh` extension):

```
ecpg {{input.pgh}}
```

- Preprocess in a specific compatibility mode:

```
ecpg -C {{INFORMIX|INFORMIX_SE|ORACLE}} {{input.pgc}}
```

- Preprocess with autocommit enabled:

```
ecpg -t {{input.pgc}}
```

ect

Efficient Compression Tool.

File optimizer written in C++. It supports PNG, JPEG, gzip, and Zip files.

More information: https://github.com/fhanau/Efficient-Compression-Tool.

- Compress a file:

```
ect {{path/to/file.png}}
```

- Compress a file with specified compression level and multithreading (1=Fastest (Worst), 9=Slowest (Best), default is 3):

```
ect -{{9}} --mt-deflate {{path/to/file.zip}}
```

- Compress all files in a directory recursively:

```
ect -recurse {{path/to/directory}}
```

- Compress a file, keeping the original modification time:

```
ect -keep {{path/to/file.png}}
```

- Compress a file, stripping metadata:

```
ect -strip {{path/to/file.png}}
```

ed

The original Unix text editor.

See also: **awk**, **sed**.

More information: https://www.gnu.org/software/ed/manual/ed_manual.html.

- Start an interactive editor session with an empty document:

```
ed
```

- Start an interactive editor session with an empty document and a specific prompt:

```
ed {{[-p|--prompt]}} '{{> }}'
```

- Start an interactive editor session with user-friendly errors:

```
ed {{[-v|--verbose]}}
```

- Start an interactive editor session with an empty document and without diagnostics, byte counts and '!' prompt:

```
ed {{[-q|--quiet]}} {{[-s|--script]}}
```

- Start an interactive editor session without exit status change when command fails:

```
ed {{[-l|--loose-exit-status]}}
```

- Edit a specific file (this shows the byte count of the loaded file):

```
ed {{path/to/file}}
```

- [Interactive] Replace a string with a specific replacement for all lines:

```
,s/{{regex}}/{{replacement}}/g
```

- [Interactive] Exit `ed`:

```
q
```

edgepaint

Colorize edges of a graph layout to clarify crossing edges.

Graphviz filters: **`acyclic`**, **`bcomps`**, **`comps`**, **`edgepaint`**, **`gvcolor`**, **`gvpack`**, **`mingle`**, **`nop`**, **`sccmap`**, **`tred`**, & **`unflatten`**.

More information: https://graphviz.org/pdf/edgepaint.1.pdf.

- Colorize edges of one or more graph layouts (that already have layout information) to clarify crossing edges:

```
edgepaint {{path/to/layout1.gv path/to/layout2.gv ...}} > {{path/to/output.gv}}
```

- Colorize edges using a color scheme. (See https://graphviz.org/doc/info/colors.html#brewer):

```
edgepaint -color-scheme={{accent7}} {{path/to/layout.gv}} > {{path/to/output.gv}}
```

- Lay out a graph and colorize its edges, then convert to a PNG image:

```
dot {{path/to/input.gv}} | edgepaint | dot -T {{png}} > {{path/to/output.png}}
```

- Display help:

```
edgepaint -?
```

eget

Easily install prebuilt binaries from GitHub.

More information: https://github.com/zyedidia/eget#usage.

- Download a prebuilt binary for the current system from a repository on GitHub:

```
eget {{zyedidia/micro}}
```

- Download from a URL:

```
eget {{https://go.dev/dl/go1.17.5.linux-amd64.tar.gz}}
```

- Specify the location to place the downloaded files:

```
eget {{zyedidia/micro}} --to {{path/to/directory}}
```

- Specify a Git tag instead of using the latest version:

```
eget {{zyedidia/micro}} {{[-t|--tag]}} {{v2.0.10}}
```

- Install the latest pre-release instead of the latest stable version:

```
eget {{zyedidia/micro}} --pre-release
```

- Only download the asset, skipping extraction:

```
eget {{zyedidia/micro}} {{[-d|--download-only]}}
```

- Only download if there is a newer release then the currently downloaded version:

```
eget {{zyedidia/micro}} --upgrade-only
```

egrep

This command is an alias of **`grep --extended-regexp`**.

- View documentation for the original command:

  `tldr grep`

eim

Install and manage ESP-IDF.

More information: https://docs.espressif.com/projects/idf-im-ui/en/latest/cli_commands.html.

- Install the default (latest) ESP-IDF version in the default location (`C:\esp` on Windows and `~/.espressif` on POSIX systems):

```
eim install
```

- Install a specific ESP-IDF version:

```
eim install {{[-i|--idf-versions]}} {{v5.3.2}}
```

- Run the interactive, guided installation wizard:

```
eim wizard
```

- Install a specific version to a custom path, forcing interactive mode (to prompt for choices):

```
eim install {{[-i|--idf-versions]}} {{v5.3.2}} {{[-p|--path]}} {{/opt/esp-idf}} {{[-n|--non-interactive]}} false
```

- List all currently installed ESP-IDF versions:

```
eim list
```

- Remove a specific installed ESP-IDF version:

```
eim remove {{v5.3.2}}
```

- Install in headless mode using all options defined in a TOML configuration file:

```
eim install {{[-c|--config]}} {{path/to/config.toml}}
```

- Install offline using a pre-downloaded archive file:

```
eim install --use-local-archive {{path/to/archive.zst}}
```

eksctl

The official CLI for Amazon EKS.

More information: https://docs.aws.amazon.com/eks/latest/eksctl/what-is-eksctl.html.

- Create a basic cluster:

```
eksctl create cluster
```

- List the details about a cluster or all of the clusters:

```
eksctl get cluster --name={{name}} --region={{region}}
```

- Create a cluster passing all configuration information in a file:

```
eksctl create cluster --config-file={{path/to/file}}
```

- Create a cluster using a configuration file and skip creating nodegroups until later:

```
eksctl create cluster --config-file={{path/to/file}} --without-nodegroup
```

- Delete a cluster:

```
eksctl delete cluster --name={{name}} --region={{region}}
```

- Create cluster and write cluster credentials to a file other than the default:

```
eksctl create cluster --name={{name}} --nodes={{4}} --kubeconfig={{path/to/config.yaml}}
```

- Create a cluster and prevent storing cluster credentials locally:

```
eksctl create cluster --name={{name}} --nodes={{4}} --write-kubeconfig=false
```

- Create a cluster and let `eksctl` manage cluster credentials under the `~/.kube/eksctl/clusters` directory:

```
eksctl create cluster --name={{name}} --nodes={{4}} --auto-kubeconfig
```

elasticsearch-certutil

Generate and manage SSL certificates for Elasticsearch security.

More information: https://www.elastic.co/docs/reference/elasticsearch/command-line-tools/certutil.

- Generate a new Certificate Authority (CA) with default options:

```
elasticsearch-certutil ca
```

- Generate a new certificate using the built-in CA:

```
elasticsearch-certutil cert
```

- Generate certificates non-interactively and output PEM files:

```
elasticsearch-certutil cert {{[-s|--silent]}} --pem
```

- Generate HTTP certificates with the built-in CA:

```
elasticsearch-certutil http
```

- Generate transport certificates non-interactively:

```
elasticsearch-certutil transport {{[-s|--silent]}}
```

- Generate a certificate signing request (CSR):

```
elasticsearch-certutil csr
```

- Generate encrypted keystore passwords:

```
elasticsearch-certutil password
```

- Generate a keystore password with a specified value:

```
elasticsearch-certutil password --pass {{password}}
```

elasticsearch-create-enrollment-token

Create enrollment tokens for Elasticsearch nodes and Kibana instances.

More information: https://www.elastic.co/docs/reference/elasticsearch/command-line-tools/create-enrollment-token.

- Create an enrollment token for adding a new Elasticsearch node:

```
elasticsearch-create-enrollment-token {{[-s|--scope]}} node
```

- Create an enrollment token for adding a new Kibana instance:

```
elasticsearch-create-enrollment-token {{[-s|--scope]}} kibana
```

- Create an enrollment token and display verbose output:

```
elasticsearch-create-enrollment-token {{[-s|--scope]}} node
--verbose
```

- Create an enrollment token for a Kibana instance with a custom Elasticsearch URL:

```
elasticsearch-create-enrollment-token {{[-s|--scope]}} kibana
--url "{{IP}}"
```

- Display help:

```
elasticsearch-create-enrollment-token {{[-h|--help]}}
```

elasticsearch-croneval

Validate and evaluate a **`cron`** expression. This command helps verify that **`cron`** expressions are valid for use with Elasticsearch and produce the expected results.

More information: https://www.elastic.co/docs/reference/elasticsearch/command-line-tools/elasticsearch-croneval.

- Evaluate a `cron` expression and display the next 10 trigger times (default behavior):

  ```
  elasticsearch-croneval "{{cron_expression}}"
  ```

- Evaluate a `cron` expression and display a specific number of future trigger times:

  ```
  elasticsearch-croneval "{{cron_expression}}" {{[-c|--count]}} {{integer}}
  ```

- Display detailed information (including stack trace) for an invalid `cron` expression:

  ```
  elasticsearch-croneval "{{invalid_cron_expression}}" {{[-d|--detail]}}
  ```

- Display minimal output (silent mode):

  ```
  elasticsearch-croneval "{{cron_expression}}" {{[-s|--silent]}}
  ```

- Display verbose output:

  ```
  elasticsearch-croneval "{{cron_expression}}" {{[-v|--verbose]}}
  ```

elasticsearch-keystore

Manage secure settings (e.g., passwords, tokens, and credentials) used by Elasticsearch.

More information: https://www.elastic.co/docs/reference/elasticsearch/command-line-tools/elasticsearch-keystore.

- Create a new keystore (not password-protected):

  ```
  elasticsearch-keystore create
  ```

- Create a new password-protected keystore:

  ```
  elasticsearch-keystore create -p
  ```

- Add a setting interactively:

  ```
  elasticsearch-keystore add {{setting_name}}
  ```

- Add a setting from `stdin`:

  ```
  echo "{{setting_value}}" | elasticsearch-keystore add --stdin {{setting_name}}
  ```

- Remove a setting from the keystore:

  ```
  elasticsearch-keystore remove {{setting_name}}
  ```

- Change the keystore password:

  ```
  elasticsearch-keystore passwd
  ```

- List all settings stored in the keystore:

  ```
  elasticsearch-keystore list
  ```

- Upgrade the keystore format (after an Elasticsearch upgrade):

  ```
  elasticsearch-keystore upgrade
  ```

elasticsearch-node

Manage low-level Elasticsearch node operations such as shutdown, repurpose, or viewing info.

More information: https://www.elastic.co/docs/reference/elasticsearch/command-line-tools/node-tool.

- Display information about the current node:

  ```
  elasticsearch-node info
  ```

- Prepare the node for a full cluster restart (e.g., after upgrading):

  ```
  elasticsearch-node unsafe-bootstrap
  ```

- Repurpose a node for a different role (e.g., from master to data node):

  ```
  elasticsearch-node repurpose
  ```

- List the roles assigned to the node:

  ```
  elasticsearch-node roles
  ```

- Show the installed JVM version, Elasticsearch home path, and other diagnostic information:

  ```
  elasticsearch-node diagnostics
  ```

- Display help:

  ```
  elasticsearch-node {{[-h|--help]}}
  ```

elasticsearch-reset-password

Reset the passwords of users in the native realm and built-in users.

More information: https://www.elastic.co/docs/reference/elasticsearch/command-line-tools/reset-password.

- Reset the password of the user to an auto-generated value and print it in the console:

```
elasticsearch-reset-password {{[-u|--username]}} {{user}}
```

- Prompt interactively to reset the password for a native user:

```
elasticsearch-reset-password {{[-u|--username]}} {{user}}
{{[-i|--interactive]}}
```

- Interactively reset the password for a user at a specified Elasticsearch node URL:

```
elasticsearch-reset-password --url {{host}}:{{port}} {{[-u|--
username]}} {{user}} {{[-i|--interactive]}}
```

elasticsearch-saml-metadata

Generate SAML Service Provider metadata for configuring a SAML Identity Provider.

More information: https://www.elastic.co/docs/reference/elasticsearch/command-line-tools/saml-metadata.

- Generate SAML metadata for a specific realm and print it to `stdout`:

```
elasticsearch-saml-metadata --realm {{realm_name}}
```

- Generate SAML metadata and write it to a specific file:

```
elasticsearch-saml-metadata --realm {{realm_name}} --out
{{path/to/file.xml}}
```

- Display help:

```
elasticsearch-saml-metadata {{[-h|--help]}}
```

elasticsearch-syskeygen

Create a system key file in the Elasticsearch configuration directory.

More information: https://www.elastic.co/docs/reference/elasticsearch/command-line-tools/syskeygen.

- Generate the `system_key` file in the default `$ES_HOME/config` directory:

  ```
  elasticsearch-syskeygen
  ```

elasticsearch-users

Manage native realm users in Elasticsearch, including creating, updating, and deleting users.

More information: https://www.elastic.co/docs/reference/elasticsearch/command-line-tools/users-command.

- Add a new user interactively (prompts for password):

```
elasticsearch-users useradd {{username}}
```

- Add a new user and specify roles:

```
elasticsearch-users useradd {{username}} -r {{role1,role2}}
```

- Change the password for an existing user:

```
elasticsearch-users passwd {{username}}
```

- Delete a user:

```
elasticsearch-users userdel {{username}}
```

- List all users in the native realm:

```
elasticsearch-users list
```

electron-packager

Build Electron app executables for Windows, Linux, and macOS.

Requires a valid package.json in the application directory.

More information: https://github.com/electron/packager.

- Package an application for the current architecture and platform:

```
electron-packager "{{path/to/app}}" "{{app_name}}"
```

- Package an application for all architectures and platforms:

```
electron-packager "{{path/to/app}}" "{{app_name}}" --all
```

- Package an application for 64-bit Linux:

```
electron-packager "{{path/to/app}}" "{{app_name}}" --
platform="{{linux}}" --arch="{{x64}}"
```

- Package an application for ARM macOS:

```
electron-packager "{{path/to/app}}" "{{app_name}}" --
platform="{{darwin}}" --arch="{{arm64}}"
```

electrum

Ergonomic Bitcoin wallet and private key management.

More information: https://manned.org/electrum.

- Create a new wallet:

```
electrum {{[-w|--wallet]}} {{path/to/new_wallet.dat}} create
```

- Restore an existing wallet from seed offline:

```
electrum {{[-w|--wallet]}} {{path/to/recovery_wallet.dat}}
restore {{[-o|--offline]}}
```

- Create a signed transaction offline:

```
electrum mktx {{recipient}} {{amount}} {{[-f|--fee]}}
0.0000001 {{[-F|--from-addr]}} {{from}} {{[-o|--offline]}}
```

- Display all wallet receiving addresses:

```
electrum listaddresses -a
```

- Sign a message:

```
electrum signmessage {{address}} {{message}}
```

- Verify a message:

```
electrum verifymessage {{address}} {{signature}} {{message}}
```

- Connect only to a specific electrum-server instance:

```
electrum {{[-p|--proxy]}} socks5:{{127.0.0.1}}:9050 {{[-s|--
server]}} {{56ckl5obj37gypcu.onion}}:50001:t {{[-1|--
oneserver]}}
```

elif

This shell keyword is used in combination with **`if`** and **`else`** to define a code branch.

- View documentation for `if` command:

  ```
  tldr if
  ```

elinks

A text based browser similar to **`lynx`**.

More information: https://github.com/rkd77/elinks.

- Start ELinks:

```
elinks
```

- Quit elinks:

```
<Ctrl c>
```

- Dump output of webpage to console, colorizing the text with ANSI control codes:

```
elinks -dump -dump-color-mode {{1}} {{url}}
```

elixir

Elixir programming language interpreter.

More information: https://manned.org/elixir.

- Run an Elixir file:

```
elixir {{path/to/file}}
```

- Evaluate Elixir code by passing it as an argument:

```
elixir {{[-e|--eval]}} "{{code}}"
```

elm

Compile and run Elm source files.

More information: https://guide.elm-lang.org/install/elm.html.

- Initialize an Elm project, generates an elm.json file:

```
elm init
```

- Start interactive Elm shell:

```
elm repl
```

- Compile an Elm file, output the result to an `index.html` file:

```
elm make {{source}}
```

- Compile an Elm file, output the result to a JavaScript file:

```
elm make {{source}} --output={{destination}}.js
```

- Start local web server that compiles Elm files on page load:

```
elm reactor
```

- Install Elm package from https://package.elm-lang.org:

```
elm install {{author}}/{{package}}
```

else

This shell keyword is used in combination with **`if`** and **`elif`** to define a code branch if no other branch was valid.

- View documentation for the `if` keyword:

  ```
  tldr if
  ```

elvish

Expressive programming language and a versatile interactive shell.

See also: **nu**.

More information: https://elv.sh/ref/command.html.

- Start an interactive shell session:

```
elvish
```

- Execute specific [c]ommands:

```
elvish -c "{{echo 'elvish is executed'}}"
```

- Execute a specific script:

```
elvish {{path/to/script.elv}}
```

emacs

The extensible, customizable, self-documenting, real-time display editor.

See also: **`emacsclient`**.

More information: https://www.gnu.org/software/emacs.

- Start Emacs and open a file:

```
emacs {{path/to/file}}
```

- Open a file at a specified line number:

```
emacs +{{line_number}} {{path/to/file}}
```

- Run an Emacs Lisp file as a script:

```
emacs --script {{path/to/file.el}}
```

- Start Emacs in console mode (without an X window):

```
emacs {{[-nw|--no-window-system]}}
```

- Start an Emacs server in the background (accessible via `emacsclient`):

```
emacs --daemon
```

- Stop a running Emacs server and all its instances, asking for confirmation on unsaved files:

```
emacsclient --eval '(save-buffers-kill-emacs)'
```

- Save a file in Emacs:

```
<Ctrl x><Ctrl s>
```

- Quit Emacs:

```
<Ctrl x><Ctrl c>
```

emacsclient

Open files in an existing Emacs server.

See also: **`emacs`**.

More information: https://www.gnu.org/software/emacs/manual/html_node/emacs/emacsclient-Options.html.

- Open a file in an existing Emacs server (using GUI if available):

```
emacsclient {{path/to/file}}
```

- Open a file in console mode (without an X window):

```
emacsclient {{[-nw|--no-window-system]}} {{path/to/file}}
```

- Open a file in a new Emacs window:

```
emacsclient {{[-c|--create-frame]}} {{path/to/file}}
```

- Evaluate a command, printing the output to `stdout`, and then quit:

```
emacsclient {{[-e|--eval]}} '({{command}})'
```

- Specify an alternative editor in case no Emacs server is running:

```
emacsclient {{[-a|--alternate-editor]}} {{editor}} {{path/to/file}}
```

- Stop a running Emacs server and all its instances, asking for confirmation on unsaved files:

```
emacsclient {{[-e|--eval]}} '(save-buffers-kill-emacs)'
```

ember

Ember CLI: create and manage Ember.js applications.

More information: https://cli.emberjs.com/release/advanced-use/cli-commands-reference/.

- Create a new Ember application:

```
ember new {{my_new_app}}
```

- Create a new Ember addon:

```
ember addon {{my_new_addon}}
```

- Build the project:

```
ember build
```

- Build the project in production mode:

```
ember build -prod
```

- Run the development server:

```
ember serve
```

- Run the test suite:

```
ember test
```

- Run a blueprint to generate something like a route or component:

```
ember generate {{type}} {{name}}
```

- Install an ember-cli addon:

```
ember install {{name_of_addon}}
```

emulator

Manage Android emulators.

More information: https://developer.android.com/studio/run/emulator-commandline.

- Start an Android emulator device:

```
emulator -avd {{name}}
```

- Display the webcams on your development computer that are available for emulation:

```
emulator -avd {{name}} -webcam-list
```

- Start an emulator overriding the facing back camera setting (use `-camera-front` for front camera):

```
emulator -avd {{name}} -camera-back {{none|emulated|webcamN}}
```

- Start an emulator, with a maximum network speed:

```
emulator -avd {{name}} -netspeed {{gsm|hscsd|gprs|edge|hsdpa|lte|evdo|full}}
```

- Start an emulator with network latency:

```
emulator -avd {{name}} -netdelay {{gsm|hscsd|gprs|edge|hsdpa|lte|evdo|none}}
```

- Start an emulator, making all TCP connections through a specified HTTP/HTTPS proxy (port number is required):

```
emulator -avd {{name}} -http-proxy {{http://example.com:80}}
```

- Start an emulator with a given SD card partition image file:

```
emulator -avd {{name}} -sdcard {{path/to/sdcard.img}}
```

- Display help:

```
emulator -help
```

enable

Enable and disable shell builtins.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-enable.

- Print the list of builtins:

```
enable
```

- Disable a builtin (works in Bash only):

```
enable -n {{command}}
```

- Re-enable a builtin:

```
enable {{command}}
```

enca

Detect and convert the encoding of text files.

More information: https://manned.org/enca.

- Detect file(s) encoding according to the system's locale:

```
enca {{path/to/file1 path/to/file2 ...}}
```

- Detect file(s) encoding specifying a language in the POSIX/C locale format (e.g. zh_CN, en_US):

```
enca {{[-L|--language]}} {{language}} {{path/to/file1 path/to/file2 ...}}
```

- Convert file(s) to a specific encoding:

```
enca {{[-L|--language]}} {{language}} {{[-x|--convert-to]}} {{to_encoding}} {{path/to/file1 path/to/file2 ...}}
```

- Create a copy of an existing file using a different encoding:

```
enca < {{original_file}} {{[-L|--language]}} {{language}} {{[-x|--convert-to]}} {{to_encoding}} > {{new_file}}
```

encfs

Mount or create encrypted virtual filesystems.

See also: **`fusermount`** which can unmount filesystems mounted by this command.

More information: https://manned.org/encfs.

- Initialize or mount an encrypted filesystem:

```
encfs /{{path/to/cipher_directory}} /{{path/to/mount_point}}
```

- Initialize an encrypted filesystem with standard settings:

```
encfs --standard /{{path/to/cipher_directory}} /{{path/to/
mount_point}}
```

- Run encfs in the foreground instead of spawning a daemon:

```
encfs -f /{{path/to/cipher_directory}} /{{path/to/
mount_point}}
```

- Mount an encrypted snapshot of a plain directory:

```
encfs --reverse {{path/to/plain_directory}} {{path/to/
cipher_directory}}
```

enscript

Convert text files to PostScript, HTML, RTF, ANSI, and overstrikes.

More information: https://manned.org/enscript.

- Generate a PostScript file from a text file:

```
enscript {{path/to/input_file}} {{[-o|--output]}} {{path/to/output_file}}
```

- Generate a file in a different language than PostScript:

```
enscript {{path/to/input_file}} {{[-w|--language]}} {{html|rtf|...}} {{[-o|--output]}} {{path/to/output_file}}
```

- Generate a PostScript file with a landscape layout, splitting the page into columns (maximum 9):

```
enscript {{path/to/input_file}} --columns {{num}} {{[-r|--landscape]}} {{[-o|--output]}} {{path/to/output_file}}
```

- Display available syntax highlighting languages and file formats:

```
enscript --help-highlight
```

- Generate a PostScript file with syntax highlighting and color for a specified language:

```
enscript {{path/to/input_file}} --color 1 {{[-E|--highlight]}} {{language}} {{[-o|--output]}} {{path/to/output_file}}
```

entr

Run arbitrary commands when files change.

More information: https://eradman.com/entrproject/.

- Rebuild with `make` if any file in any subdirectory changes:

```
{{ag --files-with-matches}} | entr {{make}}
```

- Rebuild and test with `make` if any `.c` source files in the current directory change:

```
{{ls *.c}} | entr '{{make && make test}}'
```

- Send a `SIGTERM` to any previously spawned ruby subprocesses before executing `ruby main.rb`:

```
{{ls *.rb}} | entr -r {{ruby main.rb}}
```

- Run a command with the changed file (`/_`) as an argument:

```
{{ls *.sql}} | entr {{psql -f}} /_
```

- [c]lear the screen and run a query after the SQL script is updated:

```
{{echo my.sql}} | entr -cp {{psql -f}} /_
```

- Rebuild the project if source files change, limiting output to the first few lines:

```
{{find src/}} | entr -s '{{make | sed 10q}}'
```

- Launch and auto-[r]eload a Node.js server:

```
{{ls *.js}} | entr -r {{node app.js}}
```

env

Show the environment or run a program in a modified environment.

More information: https://www.gnu.org/software/coreutils/manual/html_node/env-invocation.html.

- Show the environment:

```
env
```

- Run a program. Often used in scripts after the shebang (#!) for looking up the path to the program:

```
env {{program}}
```

- Clear the environment and run a program:

```
env {{[-i|--ignore-environment]}} {{program}}
```

- Remove variable from the environment and run a program:

```
env {{[-u|--unset]}} {{variable}} {{program}}
```

- Set a variable and run a program:

```
env {{variable}}={{value}} {{program}}
```

- Set one or more variables and run a program:

```
env {{variable1=value variable2=value variable3=value ...}} {{program}}
```

- Run a program under a different name:

```
env {{[-a|--argv0]}} {{custom_name}} {{program}}
```

envoy

A PHP-based task manager for Laravel remote servers.

More information: https://laravel.com/docs/envoy.

- Initialize a configuration file:

```
envoy init {{host_name}}
```

- Run a task:

```
envoy run {{task_name}}
```

- Run a task from a specific project:

```
envoy run --path {{path/to/directory}} {{task_name}}
```

- Run a task and continue on failure:

```
envoy run --continue {{task_name}}
```

- Dump a task as a Bash script for inspection:

```
envoy run --pretend {{task_name}}
```

- Connect to the specified server via SSH:

```
envoy ssh {{server_name}}
```

envsubst

Substitutes environment variables with their value in shell format strings.

Variables to be replaced should be in either **`${var}`** or **`$var`** format.

More information: https://www.gnu.org/software/gettext/manual/gettext.html#envsubst-Invocation.

- Replace environment variables in `stdin` and output to `stdout`:

```
echo '{{$HOME}}' | envsubst
```

- Replace environment variables in an input file and output to `stdout`:

```
envsubst < {{path/to/input_file}}
```

- Replace environment variables in an input file and output to a file:

```
envsubst < {{path/to/input_file}} > {{path/to/output_file}}
```

- Replace environment variables in an input file from a space-separated list:

```
envsubst < {{path/to/input_file}} '{{$USER $SHELL $HOME}}'
```

eol

Show end-of-life dates (EoLs) for a number of products.

More information: https://github.com/hugovk/norwegianblue#example-command-line-use.

- List all available products:

```
eol
```

- Get EoLs of one or more products:

```
eol {{product1 product2 ...}}
```

- Open the product webpage:

```
eol {{product}} {{[-w|--web]}}
```

- Get EoLs of a one or more products in a specific format:

```
eol {{product1 product2 ...}} --{{html|json|md|markdown|
pretty|rst|csv|tsv|yaml}}
```

- Get EoLs of one or more products as a single markdown file:

```
eol {{product1 product2 ...}} --{{markdown}} >
{{eol_report.md}}
```

- Display help:

```
eol {{[-h|--help]}}
```

eqn

Equation preprocessor for the groff (GNU Troff) document formatting system.

See also: **`troff`**, **`groff`**.

More information: https://manned.org/eqn.

- Process input with equations, saving the output for future typesetting with groff to PostScript:

```
eqn {{path/to/input.eqn}} > {{path/to/output.roff}}
```

- Typeset an input file with equations to PDF using the [me] macro package:

```
eqn -T {{pdf}} {{path/to/input.eqn}} | groff -{{me}} -T
{{pdf}} > {{path/to/output.pdf}}
```

erl

Run and manage programs in the Erlang programming language.

More information: https://erlang.org/documentation/doc-16.0/erts-16.0/doc/html/erl_cmd.html.

- Compile and run sequential Erlang program as a common script and then exit:

```
erlc {{path/to/file1 path/to/file2 ...}} && erl -noshell
'{{mymodule:myfunction(arguments)}}, init:stop().'
```

- Connect to a running Erlang node:

```
erl -remsh {{nodename}}@{{hostname}} -sname
{{custom_shortname}} -hidden -setcookie
{{cookie_of_remote_node}}
```

- Tell the Erlang shell to load modules from a directory:

```
erl -pa {{path/to/directory_with_beam_files}}
```

ern

Electrode Native platform client.

More information: https://native.electrode.io/reference/index-6.

- Create a new `ern` application (`MiniApp`):

```
ern create-miniapp {{application_name}}
```

- Run one or more `MiniApps` in the iOS/Android Runner application:

```
ern run-{{ios|android}}
```

- Create an Electrode Native container:

```
ern create-container --miniapps /{{path/to/
miniapp_directory}} --platform {{ios|android}}
```

- Publish an Electrode Native container to a local Maven repository:

```
ern publish-container --publisher {{maven}} --platform
{{android}} --extra
'{{{"groupId":"com.walmart.ern","artifactId":"quickstart"}}}'
```

- Transform an iOS container into a pre-compiled binary framework:

```
ern transform-container --platform {{ios}} --transformer
{{xcframework}}
```

- List all installed versions of Electrode Native:

```
ern platform versions
```

- Set a logging level:

```
ern platform config set logLevel {{trace|debug}}
```

errno

Look up errno names and descriptions.

More information: https://joeyh.name/code/moreutils/.

- Lookup errno description by name or code:

```
errno {{name|code}}
```

- List all errno names, codes, and descriptions:

```
errno {{[-l|--list]}}
```

- Search for code whose description contains all of the given text:

```
errno {{[-s|--search]}} {{text}}
```

- Search for code whose description contains all of the given text (all locales):

```
errno {{[-S|--search-all-locales]}} {{text}}
```

esac

This shell keyword is used to end a **`case`** statement.

- View documentation for the `case` keyword:

  ```
  tldr case
  ```

esbuild

JavaScript bundler and minifier built for speed.

More information: https://esbuild.github.io/api/#general-options.

- Bundle a JavaScript application and print to `stdout`:

```
esbuild --bundle {{path/to/file.js}}
```

- Bundle a JSX application from `stdin`:

```
esbuild < {{path/to/file.jsx}} --bundle --outfile={{path/to/out.js}}
```

- Bundle and minify a JSX application with source maps in `production` mode:

```
esbuild --bundle --define:{{process.env.NODE_ENV=\"production\"}} --minify --sourcemap {{path/to/file.js}}
```

- Bundle a JSX application for a comma-separated list of browsers:

```
esbuild --bundle --minify --sourcemap --target={{chrome58,firefox57,safari11,edge16}} {{path/to/file.jsx}}
```

- Bundle a JavaScript application for a specific node version:

```
esbuild --bundle --platform={{node}} --target={{node12}} {{path/to/file.js}}
```

- Bundle a JavaScript application enabling JSX syntax in `.js` files:

```
esbuild --bundle app.js --loader:{{.js=jsx}} {{path/to/file.js}}
```

- Bundle and serve a JavaScript application on an HTTP server:

```
esbuild --bundle --serve={{port}} --outfile={{index.js}} {{path/to/file.js}}
```

- Bundle a list of files to an output directory:

```
esbuild --bundle --outdir={{path/to/output_directory}} {{path/to/file1 path/to/file2 ...}}
```

escp2topbm

Convert a PBM image to a ESC/P2 printer file.

See also: **pbmtoescp2**.

More information: https://netpbm.sourceforge.net/doc/escp2topbm.html.

- Convert a ESC/P2 printer file to a PBM image:

```
escp2topbm {{path/to/image.escp2}} > {{path/to/output.pbm}}
```

eslint

A pluggable linting utility for JavaScript and JSX.

More information: https://eslint.org/docs/latest/use/command-line-interface.

- Create the ESLint configuration file:

```
eslint --init
```

- Lint one or more files:

```
eslint {{path/to/file1.js path/to/file2.js ...}}
```

- Fix lint issues:

```
eslint --fix
```

- Lint using the specified configuration file:

```
eslint {{[-c|--config]}} {{path/to/config_file}} {{path/to/
file1.js path/to/file2.js ...}}
```

espanso

Cross-platform Text Expander written in Rust.

More information: https://espanso.org/docs/command%20lIne/cli_list/.

- Check status:

```
espanso status
```

- Edit the configuration:

```
espanso edit config
```

- Install a package from the hub store (https://hub.espanso.org/):

```
espanso install {{package}}
```

- Restart (required after installing a package, useful in case of failure):

```
espanso restart
```

espeak-ng

A multi-lingual software speech synthesizer.

See also: **`speak-ng`**, **`espeak`**.

More information: https://github.com/espeak-ng/espeak-ng/blob/master/src/espeak-ng.1.ronn.

- Speak a phrase aloud:

```
espeak-ng "{{text}}"
```

- Speak text from `stdin`:

```
echo "{{text}}" | espeak-ng
```

- Speak the contents of a [f]ile:

```
espeak-ng -f {{path/to/file}}
```

- Speak using a specific [v]oice:

```
espeak-ng -v {{voice}} "{{text}}"
```

- Speak at a specific [s]peed (default is 175) and [p]itch (default is 50):

```
espeak-ng -s {{speed}} -p {{pitch}} "{{text}}"
```

- Output the audio to a [w]AV file instead of speaking it directly:

```
espeak-ng -w {{path/to/output.wav}} "{{text}}"
```

- List all available voices:

```
espeak-ng --voices
```

espeak

A multi-lingual software speech synthesizer.

Note: **espeak** is considered discontinued, as development has shifted to **espeak-ng**.

More information: https://manned.org/espeak.

- Speak a phrase aloud:

```
espeak "{{text}}"
```

- Speak text from `stdin`:

```
echo "{{text}}" | espeak
```

- Speak the contents of a [f]ile:

```
espeak -f {{path/to/file}}
```

- Speak using a specific [v]oice:

```
espeak -v {{voice}} "{{text}}"
```

- Speak at a specific [s]peed (default is 160) and [p]itch (default is 50):

```
espeak -s {{speed}} -p {{pitch}} "{{text}}"
```

- Output the audio to a [w]AV file instead of speaking it directly:

```
espeak -w {{path/to/output.wav}} "{{text}}"
```

- List all available voices:

```
espeak --voices
```

esptool.py

Bootloader utility for Espressif chips (e.g. ESP8266).

More information: https://docs.espressif.com/projects/esptool/en/latest/esp32/.

- Flash a firmware file to an ESP chip with a given port and baud rate:

```
sudo esptool.py --port {{port}} --baud {{baud_rate}}
write_flash 0x0 {{path/to/firmware.bin}}
```

- Clear the flash of an ESP chip:

```
sudo esptool.py --port {{port}} --baud {{baud_rate}}
erase_flash
```

etcd

A distributed, reliable key-value store for the most critical data of a distributed system.

More information: https://etcd.io/docs/latest/op-guide/configuration/#command-line-flags.

- Start a single-node etcd cluster:

  ```
  etcd
  ```

- Start a single-node etcd cluster, listening for client requests on a custom URL:

  ```
  etcd --advertise-client-urls {{http://127.0.0.1:1234}} --listen-client-urls {{http://127.0.0.1:1234}}
  ```

- Start a single-node etcd cluster with a custom name:

  ```
  etcd --name {{my_etcd_cluster}}
  ```

- Start a single-node etcd cluster with extensive metrics available at http://localhost:2379/debug/pprof/:

  ```
  etcd --enable-pprof --metrics extensive
  ```

etcdctl

Interact with **`etcd`**, a highly-available key-value pair store.

More information: https://etcd.io/docs/latest/dev-guide/interacting_v3/.

- Display the value associated with a specified key:

```
etcdctl get {{my/key}}
```

- Store a key-value pair:

```
etcdctl put {{my/key}} {{my_value}}
```

- Delete a key-value pair:

```
etcdctl del {{my/key}}
```

- Store a key-value pair, reading the value from a file:

```
etcdctl < {{path/to/file.txt}} put {{my/file}}
```

- Save a snapshot of the etcd keystore:

```
etcdctl snapshot save {{path/to/snapshot.db}}
```

- Restore a snapshot of an etcd keystore (restart the etcd server afterwards):

```
etcdctl snapshot restore {{path/to/snapshot.db}}
```

- Add a user:

```
etcdctl user add {{my_user}}
```

- Watch a key for changes:

```
etcdctl watch {{my/key}}
```

eva

Simple calculator REPL, similar to **bc**, with syntax highlighting and persistent history.

More information: https://github.com/oppiliappan/eva#usage.

- Run the calculator in interactive mode:

```
eva
```

- Calculate the result of an expression:

```
eva "{{(1 + 2) * 2 ^ 2}}"
```

- Calculate an expression forcing the number of decimal places to 5:

```
eva --fix {{5}} "{{5 / 3}}"
```

- Calculate an expression with sine and cosine:

```
eva "{{sin(1) + cos(1)}}"
```

eval

Execute arguments as a single command in the current shell and return its result.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-eval.

- Call `echo` with the "foo" argument:

```
eval "{{echo foo}}"
```

- Set a variable in the current shell:

```
eval "{{foo=bar}}"
```

evil-winrm

Windows Remote Management (WinRM) shell for pentesting.

Once connected, we get a PowerShell prompt on the target host.

More information: https://github.com/Hackplayers/evil-winrm.

- Connect to a host and start an interactive session:

```
evil-winrm {{[-i|--ip]}} {{ip_address}} {{[-u|--user]}} {{user}} {{[-p|--password]}} {{password}}
```

- Connect to a host using pass-the-hash authentication instead of a password:

```
evil-winrm {{[-i|--ip]}} {{ip_address}} {{[-u|--user]}} {{user}} {{[-H|--hash]}} {{nt_hash}}
```

- Connect to a host, specifying directories for PowerShell scripts and executables:

```
evil-winrm {{[-i|--ip]}} {{ip_address}} {{[-u|--user]}} {{user}} {{[-p|--password]}} {{password}} {{[-s|--scripts]}} {{path/to/scripts}} {{[-e|--executables]}} {{path/to/executables}}
```

- Connect to a host, using SSL:

```
evil-winrm {{[-i|--ip]}} {{ip_address}} {{[-u|--user]}} {{user}} {{[-p|--password]}} {{password}} {{[-S|--ssl]}} {{[-c|--pub-key]}} {{path/to/pubkey}} {{[-k|--priv-key]}} {{path/to/privkey}}
```

- [Interactive] Upload a file to the host:

```
upload {{path/to/local_file}} {{path/to/remote_file}}
```

- [Interactive] List all loaded PowerShell functions:

```
menu
```

- [Interactive] Load a PowerShell script from the `--scripts` directory:

```
{{script.ps1}}
```

- [Interactive] Invoke a binary on the host from the `--executables` directory:

```
Invoke-Binary {{binary.exe}}
```

ex

Text editor.

See also: **`vim`**.

More information: https://www.vim.org/.

- Open a file:

  `ex {{path/to/file}}`

- Save and Quit:

  `wq<Enter>`

- Undo the last operation:

  `undo<Enter>`

- Search for a pattern in the file:

  `/{{search_pattern}}<Enter>`

- Perform a `regex` substitution in the whole file:

  `%s/{{regex}}/{{replacement}}/g<Enter>`

- Insert text:

  `i<Enter>{{text}}<Ctrl c>`

- Switch to Vim:

  `visual<Enter>`

exa

A modern replacement for **`ls`** (List directory contents).

More information: https://github.com/ogham/exa#command-line-options.

- List files one per line:

```
exa {{[-1|--oneline]}}
```

- List all files, including hidden files:

```
exa {{[-a|--all]}}
```

- Long format list (permissions, ownership, size, and modification date) of all files:

```
exa {{[-l|--long]}} {{[-a|--all]}}
```

- List files with the largest at the top:

```
exa {{[-r|--reverse]}} {{[-s|--sort]}} {{size}}
```

- Display a tree of files, three levels deep:

```
exa {{[-l|--long]}} {{[-T|--tree]}} {{[-L|--level]}} {{3}}
```

- List files sorted by modification date (oldest first):

```
exa {{[-l|--long]}} {{[-s|--sort]}} {{modified}}
```

- List files with their headers, icons, and Git statuses:

```
exa {{[-l|--long]}} {{[-h|--header]}} --icons --git
```

- Don't list files mentioned in `.gitignore`:

```
exa --git-ignore
```

exec

Execute a command without creating a child process.

More information: https://manned.org/exec.1posix.

- Execute a specific command using the current environment variables:

```
exec {{command -with -flags}}
```

exenv

Easily install Elixir versions and manage application environments.

More information: https://github.com/mururu/exenv.

- Display a list of installed versions:

  ```
  exenv versions
  ```

- Use a specific version of Elixir across the whole system:

  ```
  exenv global {{version}}
  ```

- Use a specific version of Elixir for the current application/project directory:

  ```
  exenv local {{version}}
  ```

- Show the currently selected Elixir version:

  ```
  exenv {{version}}
  ```

- Install a version of Elixir (requires `elixir-build` plugin https://github.com/mururu/elixir-build):

  ```
  exenv install {{version}}
  ```

exercism

Download coding exercises in any language and submit your solutions.

More information: https://exercism.org/docs/using/solving-exercises/working-locally.

- Configure exercism following instructions for the API token:

  ```
  exercism configure
  ```

- Download `hello-world` for any programming language into exercism workspace:

  ```
  exercism download --track {{programming_language}} --exercise hello-world
  ```

- Open an exercise directory on the website:

  ```
  exercism open {{path/to/directory}}
  ```

- Test your solution. It will also tell you if you are missing tools for the programming language:

  ```
  exercism test {{path/to/directory}}
  ```

- Submit your solution. You can share from the website or ask a community mentor for help:

  ```
  exercism submit {{path/to/directory}}
  ```

exfatlabel

Get or set an exFAT filesystem label.

More information: https://manned.org/exfatlabel.

- Display the current filesystem label:

```
exfatlabel {{/dev/sda}}
```

- Set the filesystem label:

```
exfatlabel {{/dev/sda}} {{new_label}}
```

exiftool

Read and write meta information in files.

More information: https://exiftool.org/exiftool_pod.html.

- Print the EXIF metadata for a given file:

```
exiftool {{path/to/file}}
```

- Remove all EXIF metadata from the given files:

```
exiftool -All= {{path/to/file1 path/to/file2 ...}}
```

- Remove GPS EXIF metadata from given image files:

```
exiftool "-gps*=" {{path/to/image1 path/to/image2 ...}}
```

- Remove all EXIF metadata from the given image files, then re-add metadata for color and orientation:

```
exiftool -All= -tagsfromfile @ -colorspacetags -orientation {{path/to/image1 path/to/image2 ...}}
```

- Move the date at which all photos in a directory were taken 1 hour forward:

```
exiftool "-AllDates+=0:0:0 1:0:0" {{path/to/directory}}
```

- Move the date at which all JPEG photos in the current directory were taken 1 day and 2 hours backward:

```
exiftool "-AllDates-=0:0:1 2:0:0" {{[-ext|-extension]}} jpg
```

- Only change the `DateTimeOriginal` field subtracting 1.5 hours, without keeping backups:

```
exiftool -DateTimeOriginal-=1.5 -overwrite_original
```

- Recursively rename all JPEG photos in a directory based on the `DateTimeOriginal` field:

```
exiftool '-filename<DateTimeOriginal' {{[-d|-dateFormat]}} %Y-%m-%d_%H-%M-%S%%lc.%%e {{path/to/directory}} {{[-r|-recurse]}} {{[-ext|-extension]}} jpg
```

exit

Exit the shell.

More information: https://manned.org/exit.1posix.

- Exit with the exit status of the most recently executed command:

```
exit
```

- Exit with a specific exit status:

```
exit {{exit_code}}
```

exiv2

Image metadata manipulation tool.

More information: https://exiv2.org/manpage.html.

- Print a summary of the image Exif metadata:

```
exiv2 {{path/to/file}}
```

- Print all metadata (Exif, IPTC, XMP) with interpreted values:

```
exiv2 {{[-P|-Print]}} kt {{path/to/file}}
```

- Print all metadata with raw values:

```
exiv2 {{[-P|-Print]}} kv {{path/to/file}}
```

- Delete all metadata from an image:

```
exiv2 {{[-d|--delete]}} a {{path/to/file}}
```

- Delete all metadata, preserving the file timestamp:

```
exiv2 {{[-d|--delete]}} a {{[-k|--keep]}} {{path/to/file}}
```

- Rename the file, prepending the date and time from metadata (not from the file timestamp):

```
exiv2 {{[-r|--rename]}}
'{{%Y%m%d_%H%M%S_:basename:}}' {{path/to/file}}
```

exo compute block-storage

Manage the Exoscale Block Storage service.

More information: https://community.exoscale.com/product/storage/block-storage/.

- Create a 20GB Block Storage Volume:

```
exo compute block-storage create {{volume_name}} --size 20
{{[-z|--zone]}} {{zone}}
```

- List Block Storage Volumes:

```
exo compute block-storage list
```

- Attach a Block Storage Volume to a Compute instance:

```
exo compute block-storage attach {{volume_name|id}}
{{instance_name|id}} {{[-z|--zone]}} {{zone}}
```

- Forcefully detach a Block Storage Volume (does not require confirmation):

```
exo compute block-storage detach {{volume_name|id}} {{[-z|--
zone]}} {{zone}} {{[-f|--force]}}
```

- Create a snapshot of a Block Storage Volume:

```
exo compute block-storage snapshot create {{volume_name|id}}
--name {{snapshot_name}} {{[-z|--zone]}} {{zone}}
```

- Create a Block Storage Volume from a snapshot:

```
exo compute block-storage create {{volume_name}} --snapshot
{{snapshot_name|id}} {{[-z|--zone]}} {{zone}}
```

- Update an existing Block Storage Volume with a new name and a new volume size of 30GB:

```
exo compute block-storage update {{volume_name|id}} --size 30
--name {{new_name}}
```

exo compute instance

Manage Exoscale Compute instances.

More information: https://community.exoscale.com/product/compute/instances/.

- Create a Debian based Compute instance with a disk size of 10GB:

```
exo compute instance create --disk-size 10 {{instance_name}}
{{[-z|--zone]}} {{zone}} --template '{{Linux Debian 12
(Bookworm) 64-bit}}'
```

- Log into a Compute instance via SSH:

```
exo compute instance ssh {{instance_name|id}}
```

- List all of the Compute instances:

```
exo compute instance list
```

- Add an instance to a Security Group:

```
exo compute instance security-group add {{instance_name|id}}
{{security_group_name|id}}
```

- Scale the size of a Compute instance:

```
exo compute instance scale {{instance_name|id}}
{{instance_type}}
```

- Create a snapshot of a Compute instance:

```
exo compute instance snapshot create {{instance_name|id}}
```

- Revert a Compute instance to a snapshot (the data written after the snapshot has been created will be lost):

```
exo compute instance snapshot revert {{snapshot_id}}
{{instance_name|id}}
```

- Resize the disk size of a Compute instance to 20GB:

```
exo compute instance resize-disk {{instance_name|id}} 20
```

exo compute sks

Manage the Exoscale Scalable Kubernetes Service (SKS).

More information: https://community.exoscale.com/product/compute/containers/.

- List the supported SKS cluster versions:

```
exo compute sks versions
```

- Create a new SKS cluster:

```
exo compute sks create {{cluster_name}} {{[-z|--zone]}}
{{zone}}
```

- List all SKS clusters:

```
exo compute sks list
```

- Generate a Kubernetes kubeconfig file for an SKS cluster that expires in 1800 seconds:

```
exo compute sks kubeconfig {{cluster_name|id}} {{user}} --ttl
1800 {{[-z|--zone]}} {{zone}}
```

- Create and add a Nodepool containing 3 nodes to an SKS cluster:

```
exo compute sks nodepool add {{cluster_name|id}}
{{nodepool_name}} --size 3 {{[-z|--zone]}} {{zone}}
```

- Remove a Nodepool from an SKS cluster:

```
exo compute sks nodepool delete {{cluster_name|id}}
{{nodepool_name|id}}
```

- Evict a Node from a Nodepool in an SKS cluster:

```
exo compute sks nodepool evict {{cluster_name|id}}
{{nodepool_name|id}} {{node_name|id}}
```

- Enable the Exoscale CSI driver for an existing SKS cluster:

```
exo compute sks update {{cluster_name|id}} --enable-csi-addon
{{[-z|--zone]}} {{zone}}
```

exo compute

Manage Exoscale Compute resources.

Some subcommands such as **`instance`** have their own documentation.

More information: https://community.exoscale.com/product/.

- Quickly create an Exoscale Compute resource (e.g., instance, Security Group, SKS cluster,...):

```
exo compute {{resource_type}} create {{resource_name}}
```

- List Exoscale Compute instance types:

```
exo compute instance-type list
```

- Register a new SSH key that can be used to access Compute instances:

```
exo compute ssh-key register {{key_name}} {{public_key_file}}
```

- Create a Compute instance with an ssh-key deployed on it:

```
exo compute instance create {{instance_name}}
{{ssh_key_name}}
```

- Register a new Compute instance template based on a Snapshot of a Compute instance (useful when you want to quickly create a replica of a Compute instance):

```
exo compute instance template register {{template_name}} --
from-snapshot {{snapshot_id}}
```

- Add a new rule to an existing Security Group:

```
exo compute security-group rule add {{security_group_name|
id}} --description '{{Allow SSH access}}' --flow {{ingress}}
--port {{22}} --network {{0.0.0.0/0}}
```

- Manage the services of an existing Network Load Balancer:

```
exo compute load-balancer service add {{load_balancer_name|
id}} {{service_name}} --port {{service_port}}
```

exo dbaas

Manage Exoscale DBaaS.

More information: https://community.exoscale.com/product/dbaas/.

- List available Database Service types:

```
exo dbaas type list
```

- List available plans for a Database Service type:

```
exo dbaas type show {{database_service_type}} --plans
```

- Create a new Database Service (an IP filter must be specified in order to access the service):

```
exo dbaas create {{database_service_type}}
{{database_service_type_plan}} {{database_service_name}} --
{{database_service_type}}-ip-filter {{1.2.3.4/32}}
```

- Show the connection URI for a Database Service:

```
exo dbaas show {{database_service_name}} --uri
```

- Set a specified maintenance time and day of the week for a Database Service:

```
exo dbaas update {{database_service_name}} --maintenance-dow
{{day_of_the_week}} --maintenance-time {{HH:MM:SS}}
```

- Get help for a specific Database Service type:

```
exo dbaas {{subcommand}} --help-{{database_service_type}}
```

exo iam

Manage the Exoscale IAM service.

More information: https://community.exoscale.com/product/iam/.

- List all of the IAM roles:

  ```
  exo iam role list
  ```

- Create a new API key:

  ```
  exo iam api-key create {{api_key_name}} {{iam_role_name}}
  ```

- Create a new IAM role:

  ```
  cat {{path/to/policy.json}} | exo iam role create
  {{iam_role_name}} --editable --policy -
  ```

- Show the policy of an existing IAM role:

  ```
  exo iam role show {{iam_role_name}} --policy {{[-O|--output-
  format]}} {{json}} | jq .
  ```

- Update the default Organization policy (the default Organization policy will be applied to all of the API keys within the Organization):

  ```
  cat {{path/to/policy.json}} | exo iam org-policy update -
  ```

exo storage

Manage the Exoscale Simple Object Storage (SOS) service.

More information: https://community.exoscale.com/product/storage/object-storage/.

- Create a new SOS bucket:

```
exo storage mb {{bucket_name}}
```

- Upload a file to a bucket:

```
exo storage put {{path/to/file}} {{bucket_name}}/{{prefix/}}
```

- List the objects within a bucket:

```
exo storage ls {{bucket_name}}
```

- Simulate the download of an object from a bucket:

```
exo storage get {{bucket_name}}/{{object_key}} {{local_path}}
--dry-run
```

- Manage the metadata of an object:

```
exo storage metadata add {{bucket_name}}/{{object_key}}
{{key=value}}
```

exo

Manage the Exoscale services.

Some subcommands such as **`compute`** have their own usage documentation.

More information: https://community.exoscale.com/tools/command-line-interface/.

- Configure the exo command-line:

```
exo config
```

- Generate the exo autocompletion script for a specified shell:

```
exo completion {{zsh}}
```

- List all of the available zones and output them as json:

```
exo zone {{[-O|--output-format]}} {{json}}
```

- Quietly create a Compute instance in a specific zone (disables the non-essential command output):

```
exo compute instance create {{instance_name}} --zone {{zone}} {{[-Q|--quiet]}}
```

- List just the name of all of the buckets in the Organization:

```
exo storage list {{[-O|--output-template]}} '\{\{ .Name \}\}
```

- Display help for a specific sub-command:

```
exo {{iam}} {{[-h|--help]}}
```

expand

Convert tabs to spaces.

More information: https://www.gnu.org/software/coreutils/manual/html_node/expand-invocation.html.

- Convert tabs in each file to spaces, writing to `stdout`:

```
expand {{path/to/file}}
```

- Convert tabs to spaces, reading from `stdin`:

```
expand
```

- Do not convert tabs after non blanks:

```
expand {{[-i|--initial]}} {{path/to/file}}
```

- Have tabs a certain number of characters apart, not 8:

```
expand {{[-t|--tabs]}} {{number}} {{path/to/file}}
```

- Use a comma separated list of explicit tab positions:

```
expand {{[-t|--tabs]}} {{1,4,6}}
```

expo

Build, develop, and deploy React Native apps.

More information: https://docs.expo.dev/eas/.

- Build an Android APK or AAB:

  `expo build:android`

- Build an iOS IPA:

  `expo build:ios`

- Run the app in Expo Go:

  `expo start`

- Install a dependency:

  `expo install {{package_name}}`

- Prebuild native Android/iOS projects:

  `expo prebuild`

- Run the app on Android:

  `expo run:android`

- Run the app on iOS:

  `expo run:ios`

export

Export shell variables to child processes.

More information: https://manned.org/export.1posix.

- Set an environment variable:

```
export {{VARIABLE}}={{value}}
```

- Append a pathname to the environment variable `$PATH`:

```
export PATH=$PATH:{{path/to/append}}
```

expose

An open source tunnel application for sharing websites.

More information: http://expose.dev/docs/introduction.

- Register your authentication token:

  ```
  expose token {{token}}
  ```

- Share the current working directory:

  ```
  expose
  ```

- Share the current working directory with a specific subdomain:

  ```
  expose --subdomain={{subdomain}}
  ```

- Share a local URL:

  ```
  expose share {{url}}
  ```

- Run the Expose server:

  ```
  expose serve
  ```

- Run the Expose server with a specific hostname:

  ```
  expose serve {{hostname}}
  ```

expr

Evaluate expressions and manipulate strings.

More information: https://www.gnu.org/software/coreutils/manual/html_node/expr-invocation.html.

- Get the length of a specific string:

```
expr length "{{string}}"
```

- Get the substring of a string with a specific length:

```
expr substr "{{string}}" {{from}} {{length}}
```

- Match a specific substring against an anchored pattern:

```
expr match "{{string}}" '{{pattern}}'
```

- Get the first char position from a specific set in a string:

```
expr index "{{string}}" "{{chars}}"
```

- Calculate a specific mathematic expression:

```
expr {{expression1}} {{+|-|*|/|%}} {{expression2}}
```

- Get the first expression if its value is non-zero and not null otherwise get the second one:

```
expr {{expression1}} \| {{expression2}}
```

- Get the first expression if both expressions are non-zero and not null otherwise get zero:

```
expr {{expression1}} \& {{expression2}}
```

exrex

Generate all/random matching strings for a **regex**.

It can also simplify **regex**es.

More information: https://github.com/asciimoo/exrex#usage.

- Generate all possible strings that match a `regex`:

```
exrex '{{regex}}'
```

- Generate a random string that matches a `regex`:

```
exrex {{[-r|--random]}} '{{regex}}'
```

- Generate at most 100 strings that match a `regex`:

```
exrex {{[-m|--max-number]}} {{100}} '{{regex}}'
```

- Generate all possible strings that match a `regex`, joined by a custom delimiter string:

```
exrex {{[-d|--delimiter]}} "{{, }}" '{{regex}}'
```

- Print count of all possible strings that match a `regex`:

```
exrex {{[-c|--count]}} '{{regex}}'
```

- Simplify a `regex`:

```
exrex {{[-s|--simplify]}} '{{ab|ac}}'
```

- Print eyes:

```
exrex '{{[oO0](_)[oO0]}}'
```

- Print a boat:

```
exrex '{{( {20}(\| *\\|-{22}|\|)|\.={50}| ( ){0,5}\\\.| {12}
~{39})}}'
```

eyuvtoppm

Convert a Berkeley YUV file to PPM.

More information: https://netpbm.sourceforge.net/doc/eyuvtoppm.html.

- Read a Berkeley YUV file from the specified input file, convert it to a PPM image, and store it in the specified output file:

```
eyuvtoppm --width {{width}} --height {{height}} {{path/to/input_file.eyuv}} > {{path/to/output_file.ppm}}
```

eza

Modern, maintained replacement for **`ls`**, built on **`exa`**.

More information: https://github.com/eza-community/eza.

- List files one per line:

```
eza {{[-1|--oneline]}}
```

- List all files, including hidden files:

```
eza {{[-a|--all]}}
```

- Long format list (permissions, ownership, size, and modification date) of all files:

```
eza {{[-al|--all --long]}}
```

- List files with the largest at the top:

```
eza {{[-r|--reverse]}} {{[-s|--sort]}} {{size}}
```

- Display a tree of files, three levels deep:

```
eza {{[-lT|--long --tree]}} {{[-L|--level]}} {{3}}
```

- List files sorted by modification date (oldest first):

```
eza {{[-l|--long]}} {{[-s|--sort]}} {{modified}}
```

- List files with their headers, icons, and Git statuses:

```
eza {{[-lh|--long --header]}} --icons --git
```

- Don't list files mentioned in `.gitignore`:

```
eza --git-ignore
```

f3fix

Edit the partition table of a fake flash drive.

See also: **`f3probe`**, **`f3write`**, **`f3read`**.

More information: https://oss.digirati.com.br/f3/.

- Fill a fake flash drive with a single partition that matches its real capacity:

```
sudo f3fix {{/dev/device_name}}
```

- Mark the partition as bootable:

```
sudo f3fix --boot {{/dev/device_name}}
```

- Specify the filesystem:

```
sudo f3fix --fs-type={{filesystem_type}} {{/dev/device_name}}
```

f3probe

Probe a block device (e.g. a flash drive or a microSD card) for counterfeit flash memory.

See also: **`f3read`**, **`f3write`**, **`f3fix`**.

More information: https://github.com/AltraMayor/f3.

- Probe a block device:

```
sudo f3probe {{path/to/block_device}}
```

- Use the minimum about of RAM possible:

```
sudo f3probe --min-memory {{path/to/block_device}}
```

- Time disk operations:

```
sudo f3probe --time-ops {{path/to/block_device}}
```

f3read

Validate .h2w files to test the real capacity of the drive.

See also: **`f3write`**, **`f3probe`**, **`f3fix`**.

More information: https://oss.digirati.com.br/f3/.

- Validate a device by checking the files in a given directory:

```
f3read {{path/to/mount_point}}
```

f3write

Fill a drive out with .h2w files to test its real capacity.

See also: **`f3read`**, **`f3probe`**, **`f3fix`**.

More information: https://oss.digirati.com.br/f3/.

- Write test files to a given directory, filling the drive:

```
f3write {{path/to/mount_point}}
```

- Limit the write speed:

```
f3write --max-write-rate={{kb_per_second}} {{path/to/
mount_point}}
```

fabric

An open-source framework for augmenting humans using AI.

Provides a modular framework for solving specific problems using a crowdsourced set of AI prompts.

More information: https://github.com/danielmiessler/fabric#usage.

- Run the setup to configure fabric:

```
fabric {{[-S|--setup]}}
```

- List all available patterns:

```
fabric {{[-l|--listpatterns]}}
```

- Run a pattern with input from a file:

```
fabric < {{path/to/input_file}} {{[-p|--pattern]}}
{{pattern_name}}
```

- Run a pattern on a YouTube video URL:

```
fabric {{[-y|--youtube]}} "{{https://www.youtube.com/watch?
v=video_id}}" {{[-p|--pattern]}} {{pattern_name}}
```

- Chain patterns together by piping output from one to another:

```
fabric {{[-p|--pattern]}} {{pattern1}} | fabric {{[-p|--
pattern]}} {{pattern2}}
```

- Run a custom user-defined pattern:

```
fabric {{[-p|--pattern]}} {{custom_pattern_name}}
```

- Run a pattern and save the output to a file:

```
fabric {{[-p|--pattern]}} {{pattern_name}} {{[-o|--output]}}
{{path/to/output_file}}
```

- Run a pattern with the specified variables:

```
fabric {{[-p|--pattern]}} {{pattern_name}} {{[-v|--
variable]}} "{{variable_name}}:{{value}}"
```

factor

Print the prime factorization of a number.

More information: https://www.gnu.org/software/coreutils/manual/html_node/factor-invocation.html.

- Display the prime-factorization of a number:

```
factor {{number}}
```

- Take the input from `stdin` if no argument is specified:

```
echo {{number}} | factor
```

fakedata

Generate fake data using a large variety of generators.

More information: https://github.com/lucapette/fakedata.

- List all valid generators:

  ```
  fakedata --generators
  ```

- Generate data using one or more generators:

  ```
  fakedata {{generator1}} {{generator2}}
  ```

- Generate data with a specific output format:

  ```
  fakedata {{[-f|--format]}} {{csv|tab|sql}} {{generator}}
  ```

- Generate a given number of data items (defaults to 10):

  ```
  fakedata {{[-l|--limit]}} {{n}} {{generator}}
  ```

- Generate data using a custom output template (the first letter of generator names must be capitalized):

  ```
  echo "{{\{\{Generator\}\}}}" | fakedata
  ```

faker

A Python library and a tool to generate fake data.

More information: https://faker.readthedocs.io/en/master/.

- Show all fake data providers along with examples:

```
faker
```

- Generate fake data of a specific type:

```
faker {{name|address|passport_full|credit_card_full|
phone_number|email|company|date_time|user_name|password|
job|...}}
```

- Generate a number of fake addresses from a specific country (use `localectl list-locales | cut --delimiter . --fields 1` to get list of locales):

```
faker {{[-r|--repeat]}} {{number}} {{[-l|--lang]}} {{de_DE|
de_CH|...}} address
```

- Generate a number of cities in a specific country and output them to a file (use `localectl list-locales | cut --delimiter . --fields 1` to get list of locales):

```
faker {{[-r|--repeat]}} {{number}} {{[-l|--lang]}} {{en_AU|
en_US|...}} city -o {{path/to/file.txt}}
```

- Generate a number of random HTTP user-agents showing verbose output:

```
faker {{[-r|--repeat]}} {{number}} {{[-v|--verbose]}}
user_agent
```

- Generate a number of domain names and separate each using a specific separator:

```
faker {{[-r|--repeat]}} {{number}} {{[-s|--sep]}} '{{,}}'
domain_name
```

false

Returns a non-zero exit code.

See also: **`true`**.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-false.

- Return a non-zero exit code:

```
false
```

- Make a command always exit with 1:

```
{{command}} && false
```

fast

Test your download and upload speed using fast.com.

More information: https://github.com/sindresorhus/fast-cli.

- Measure the current download speed:

```
fast
```

- Measure the current upload speed in addition to download speed:

```
fast {{[-u|--upload]}}
```

- Display results on a single line to reduce spacing:

```
fast --single-line
```

- Display complete results - download/upload speeds, latency, and ISP info:

```
fast --verbose
```

fastapi

Run FastAPI apps which uses Uvicorn under the hood.

More information: https://manned.org/fastapi.

- Run a FastAPI app with automatic reload (for development):

```
fastapi run {{path/to/file.py}} --reload
```

- Serve your app in both development mode:

```
fastapi dev {{path/to/file.py}}
```

- Specify the host and port to run on:

```
fastapi run {{path/to/file.py}} --host {{host_address}} --port {{port}}
```

- Set the app variable name (if not `app`) or specify a custom app directory:

```
fastapi run {{path/to/file.py}} --app-dir {{path/to/app}} --app {{custom_app_name}}
```

- Display help:

```
fastapi --help
```

- Display help for a subcommand:

```
fastapi {{subcommand}} --help
```

fastboot

Communicate with connected Android devices when in bootloader mode (the one place ADB doesn't work).

More information: https://cs.android.com/android/platform/superproject/+/main:system/core/fastboot.

- Unlock the bootloader:

```
fastboot oem unlock
```

- Relock the bootloader:

```
fastboot oem lock
```

- Reboot the device from fastboot mode into fastboot mode again:

```
fastboot reboot bootloader
```

- Flash a given image:

```
fastboot flash {{path/to/file.img}}
```

- Flash a custom recovery image:

```
fastboot flash recovery {{path/to/file.img}}
```

- List connected devices:

```
fastboot devices
```

- Display all information of a device:

```
fastboot getvar all
```

fastd

VPN daemon.

Works on Layer 2 or Layer 3, supports different encryption methods, used by Freifunk.

See also: **`ivpn`**, **`mozillavpn`**, **`mullvad`**, **`warp-cli`**.

More information: https://fastd.readthedocs.io/en/stable/.

- Start `fastd` with a specific configuration file:

```
fastd {{[-c|--config]}} {{path/to/fastd.conf}}
```

- Start a Layer 3 VPN with an MTU of 1400, loading the rest of the configuration parameters from a file:

```
fastd {{[-m|--mode]}} {{tap}} {{[-M|--mtu]}} {{1400}} {{[-c|--config]}} {{path/to/fastd.conf}}
```

- Validate a configuration file:

```
fastd --verify-config {{[-c|--config]}} {{path/to/fastd.conf}}
```

- Generate a new keypair:

```
fastd --generate-key
```

- Show the public key to a private key in a configuration file:

```
fastd --show-key {{[-c|--config]}} {{path/to/fastd.conf}}
```

- Display version:

```
fastd {{[-v|--version]}}
```

fastfetch

Display information about your operating system, software, and hardware.

More information: https://manned.org/fastfetch.

- Display system information:

```
fastfetch
```

- Display full system information with all the modules enabled:

```
fastfetch {{[-c|--config]}} all
```

- Load a custom configuration file:

```
fastfetch {{[-c|--config]}} {{path/to/config_file}}
```

- Fetch a specific structure:

```
fastfetch {{[-s|--structure]}} {{os:kernel:de:cpu:gpu}}
```

- Use a specific logo:

```
fastfetch {{[-l|--logo]}} {{logo}}
```

- Display system information without a logo:

```
fastfetch {{[-l|--logo]}} none
```

- Use a specific color for the keys and title:

```
fastfetch --color {{blue}}
```

fastlane

Build and release mobile applications.

More information: https://docs.fastlane.tools/actions/.

- Build and sign the iOS application in the current directory:

  `fastlane run build_app`

- Run `pod install` for the project in the current directory:

  `fastlane run cocoapods`

- Delete the derived data from Xcode:

  `fastlane run clear_derived_data`

- Remove the cache for pods:

  `fastlane run clean_cocoapods_cache`

fastmod

A fast partial replacement for the codemod tool, replace and replace all in the whole codebase.

Regexes are matched by Rust regex crate.

More information: https://github.com/facebookincubator/fastmod.

- Replace a `regex` in all files of the current directory, ignoring files on `.ignore` and `.gitignore`:

```
fastmod {{regex}} {{replacement}}
```

- Replace a `regex` in case-insensitive mode in specific files or directories:

```
fastmod --ignore-case {{regex}} {{replacement}} -- {{path/to/file_or_directory1 path/to/file_or_directory2 ...}}
```

- Replace a `regex` in a specific directory in files filtered with a case-insensitive glob pattern:

```
fastmod {{regex}} {{replacement}} --dir {{path/to/directory}} --iglob '{{**/*.{js,json}}}'
```

- Replace for an exact string in `.js` or JSON files:

```
fastmod --fixed-strings {{exact_string}} {{replacement}} --extensions {{json,js}}
```

- Replace for an exact string without prompt for a confirmation (disables `regex`):

```
fastmod --accept-all --fixed-strings {{exact_string}} {{replacement}}
```

- Replace for an exact string without prompt for a confirmation, printing changed files:

```
fastmod --accept-all --print-changed-files --fixed-strings {{exact_string}} {{replacement}}
```

fc-cache

Scan font directories to build font cache files.

More information: https://manned.org/fc-cache.

- Generate font cache files:

```
fc-cache
```

- Generate font cache files verbosely:

```
fc-cache {{[-v|--verbose]}}
```

- Force a rebuild of all font cache files, without checking if cache is up-to-date:

```
fc-cache {{[-f|--force]}}
```

- Erase font cache files, then generate new font cache files:

```
fc-cache {{[-r|--really-force]}}
```

- Scan a specific directory:

```
fc-cache {{path/to/directory}}
```

- Scan system-wide directories, skipping the user's home directory:

```
fc-cache {{[-s|--system-only]}}
```

- Display version:

```
fc-cache {{[-V|--version]}}
```

fc-list

List available fonts installed on the system.

More information: https://manned.org/fc-list.

- Return a list of installed fonts:

```
fc-list
```

- Return a list of installed fonts with given name:

```
fc-list | grep '{{DejaVu Serif}}'
```

- Return the number of installed fonts:

```
fc-list | wc {{[-l|--lines]}}
```

- Return a list of installed fonts that support the language based on its locale code:

```
fc-list :lang={{jp}}
```

- Return a list of installed fonts that contain the glyph specified by its Unicode code-point:

```
fc-list :charset={{f303}}
```

fc-match

Match available fonts.

More information: https://manned.org/fc-match.

- Return a sorted list of best matching fonts:

```
fc-match {{[-s|--sort]}} '{{DejaVu Serif}}'
```

fc-pattern

Show information about a font matching a pattern.

More information: https://manned.org/fc-pattern.

- Display default information about a font:

```
fc-pattern {{[-d|--default]}} '{{DejaVu Serif}}'
```

- Display configuration information about a font:

```
fc-pattern {{[-c|--config]}} '{{DejaVu Serif}}'
```

fc

Open the recent commands for editing and then run them.

See also: **`history`**.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-fc.

- Open the last command in the default system editor and run it after editing:

```
fc
```

- Specify an editor to open with:

```
fc -e '{{emacs}}'
```

- List recent commands from history:

```
fc -l
```

- List recent commands in reverse order:

```
fc -l -r
```

- Edit and run a command from history:

```
fc {{number}}
```

- Edit commands in a given interval and run them:

```
fc '{{416}}' '{{420}}'
```

- Display help:

```
fc --help
```

fclones

Efficient duplicate file finder and remover.

More information: https://github.com/pkolaczk/fclones#usage.

- Search for duplicate files in the current directory:

```
fclones group .
```

- Search multiple directories for duplicate files and cache the results:

```
fclones group --cache {{path/to/directory1 path/to/
directory2 ...}}
```

- Search only the specified directory for duplicate files, skipping subdirectories and save the results into a file:

```
fclones group {{path/to/directory}} --depth 1 > {{path/to/
file.txt}}
```

- Move the duplicate files in a TXT file to a different directory:

```
fclones < {{path/to/file.txt}} move {{path/to/
target_directory}}
```

- Perform a dry run for soft links in a TXT file without actually linking:

```
fclones < {{path/to/file.txt}} link --soft --dry-run 2 > /
dev/null
```

- Delete the newest duplicates from the current directory without storing them in a file:

```
fclones group . | fclones remove --priority newest
```

- Preprocess JPEG files in the current directory by using an external command to strip their EXIF data before matching for duplicates:

```
fclones group . --name '*.jpg' -i --transform 'exiv2 -d a
$IN' --in-place
```

fd

Find entries in the filesystem.

See also: **`find`**.

More information: https://github.com/sharkdp/fd#how-to-use.

- Recursively find files matching a specific pattern in the current directory:

```
fd "{{string|regex}}"
```

- Find files that begin with a specific string:

```
fd "{{^string}}"
```

- Find files with a specific extension:

```
fd {{[-e|--extension]}} {{txt}}
```

- Find files in a specific directory:

```
fd "{{string|regex}}" {{path/to/directory}}
```

- Include ignored and hidden files in the search:

```
fd {{[-H|--hidden]}} {{[-I|--no-ignore]}} "{{string|regex}}"
```

- Exclude files that match a specific `regex`:

```
fd {{string}} {{[-E|--exclude]}} {{regex}}
```

- Execute a command on each search result returned:

```
fd "{{string|regex}}" {{[-x|--exec]}} {{command}}
```

- Find files only in the current directory:

```
fd {{[-d|--max-depth]}} 1 "{{string|regex}}"
```

fdfind

This command is an alias of **fd**.

- View documentation for the original command:

```
tldr fd
```

fdp

Render an image of a **force-directed** network graph from a **graphviz** file.

Layouts: **dot**, **neato**, **twopi**, **circo**, **fdp**, **sfdp**, **osage** & **patchwork**.

More information: https://graphviz.org/doc/info/command.html.

- Render a PNG image with a filename based on the input filename and output format (uppercase -O):

```
fdp -T png -O {{path/to/input.gv}}
```

- Render a SVG image with the specified output filename (lowercase -o):

```
fdp -T svg -o {{path/to/image.svg}} {{path/to/input.gv}}
```

- Render the output in a specific format:

```
fdp -T {{ps|pdf|svg|fig|png|gif|jpg|json|dot}} -O {{path/to/input.gv}}
```

- Render a `gif` image using `stdin` and `stdout`:

```
echo "{{digraph {this -> that} }}" | fdp -T gif > {{path/to/image.gif}}
```

- Display help:

```
fdp -?
```

fdroid

F-Droid build tool.

F-Droid is an installable catalog of FOSS (Free and Open Source Software) applications for the Android platform.

More information: https://f-droid.org/en/docs/Building_Applications/.

- Build a specific app:

  ```
  fdroid build {{app_id}}
  ```

- Build a specific app in a build server VM:

  ```
  fdroid build {{app_id}} --server
  ```

- Publish the app to the local repository:

  ```
  fdroid publish {{app_id}}
  ```

- Install the app on every connected device:

  ```
  fdroid install {{app_id}}
  ```

- Check if the metadata is formatted correctly:

  ```
  fdroid lint --format {{app_id}}
  ```

- Fix the formatting automatically (if possible):

  ```
  fdroid rewritemeta {{app_id}}
  ```

fdroidcl

Manage F-Droid apps of devices connected via ADB.

More information: https://github.com/Hoverth/fdroidcl#commands.

- Fetch the F-Droid index:

```
fdroidcl update
```

- Display information about an app:

```
fdroidcl show {{app_id}}
```

- Download the APK file of an app:

```
fdroidcl download {{app_id}}
```

- Search for an app in the index:

```
fdroidcl search {{search_pattern}}
```

- Install an app on a connected device:

```
fdroidcl install {{app_id}}
```

- Add a repository:

```
fdroidcl repo add {{repo_name}} {{url}}
```

- Remove, enable, or disable a repository:

```
fdroidcl repo {{remove|enable|disable}} {{repo_name}}
```

fdupes

Finds duplicate files in a set of directories.

More information: https://github.com/adrianlopezroche/fdupes#introduction.

- Search a single directory:

```
fdupes {{path/to/directory}}
```

- Search multiple directories:

```
fdupes {{directory1}} {{directory2}}
```

- Search a directory recursively:

```
fdupes {{[-r|--recurse]}} {{path/to/directory}}
```

- Search multiple directories, one recursively:

```
fdupes {{path/to/irectory1}} {{[-R|--recurse:]}} {{path/to/
directory2}}
```

- Search recursively, considering hardlinks as duplicates:

```
fdupes {{[-rH|--recurse --hardlinks]}} {{path/to/directory}}
```

- Search recursively for duplicates and display interactive prompt to pick which ones to keep, deleting the others:

```
fdupes {{[-rd|--recurse --delete]}} {{path/to/directory}}
```

- Search recursively and delete duplicates without prompting:

```
fdupes {{[-rdN|--recurse --delete --noprompt]}} {{path/to/
directory}}
```

feh

Lightweight image viewing utility.

More information: https://man.finalrewind.org/1/feh/.

- View images locally or using a URL:

```
feh {{path/to/images}}
```

- View images recursively:

```
feh {{[-r|--recursive]}} {{path/to/images}}
```

- View images and display the file name at the top-left of the images:

```
feh {{[-d|--draw-filename]}} {{path/to/images}}
```

- View images without window borders:

```
feh {{[-x|--borderless]}} {{path/to/images}}
```

- Set the behavior when reaching the beginning or end of the image list:

```
feh --on-last-slide {{hold|quit|resume}} {{path/to/images}}
```

- Use a specific slideshow cycle delay:

```
feh {{[-D|--slideshow-delay]}} {{seconds}} {{path/to/images}}
```

- Use a specific wallpaper mode (centered, filled, maximized, scaled, or tiled):

```
feh --bg-{{center|fill|max|scale|tile}} {{path/to/image}}
```

- Create a montage of all images within a directory, outputting as a new image:

```
feh {{[-m|--montage]}} {{[-E|--thumb-height]}} {{150}} {{[-
y|--thumb-width]}} {{150}} --index-info "{{%nn%wx%h}}" {{[-
o|--output]}} {{path/to/montage_image.png}}
```

feroxbuster

Simple, fast, recursive content discovery tool written in Rust.

Used to brute-force hidden paths on web servers and more.

More information: https://epi052.github.io/feroxbuster-docs/configuration/command-line.

- Discover specific directories and files that match in the wordlist with extensions and 100 threads and a random user-agent:

```
feroxbuster --url "{{https://example.com}}" --wordlist {{path/to/file}} --threads {{100}} --extensions "{{php,txt}}" --random-agent
```

- Enumerate directories without recursion through a specific proxy:

```
feroxbuster --url "{{https://example.com}}" --wordlist {{path/to/file}} --no-recursion --proxy "{{http://127.0.0.1:8080}}"
```

- Find links in webpages:

```
feroxbuster --url "{{https://example.com}}" --extract-links
```

- Filter by a specific status code and a number of chars:

```
feroxbuster --url "{{https://example.com}}" --filter-status {{301}} --filter-size {{4092}}
```

ffe

Extract fields from a flat database file and write to another format.

A configuration file is required to interpret the input and format the output.

More information: https://ff-extractor.sourceforge.net/ffe.html.

- Display all input data using the specified data configuration:

```
ffe {{[-c|--configuration]}} {{path/to/config.ffe}} {{path/to/input}}
```

- Convert an input file to an output file in a new format:

```
ffe --output={{path/to/output}} {{[-c|--configuration]}} {{path/to/config.ffe}} {{path/to/input}}
```

- Select input structure and print format from definitions in `~/.fferc` configuration file:

```
ffe {{[-s|--structure]}} {{structure}} {{[-p|--print]}} {{format}} {{path/to/input}}
```

- Write only the selected fields:

```
ffe {{[-f|--field-list]}} "{{FirstName,LastName,Age}}" {{[-c|--configuration]}} {{path/to/config.ffe}} {{path/to/input}}
```

- Write only the records that match an expression:

```
ffe {{[-e|--expression]}} "{{LastName=Smith}}" {{[-c|--configuration]}} {{path/to/config.ffe}} {{path/to/input}}
```

- Display help:

```
ffe {{[-?|--help]}}
```

ffmpeg

Video conversion tool.

See also: **`gst-launch-1.0`**.

More information: https://ffmpeg.org/ffmpeg.html#Options.

- Extract the sound from a video and save it as MP3:

```
ffmpeg -i {{path/to/video.mp4}} -vn {{path/to/sound.mp3}}
```

- Transcode a FLAC file to Red Book CD format (44100kHz, 16bit):

```
ffmpeg -i {{path/to/input_audio.flac}} -ar 44100 -sample_fmt
s16 {{path/to/output_audio.wav}}
```

- Save a video as GIF, scaling the height to 1000px and setting framerate to 15:

```
ffmpeg -i {{path/to/video.mp4}} {{[-vf|-filter:v]}}
'scale=-1:{{1000}}' -r {{15}} {{path/to/output.gif}}
```

- Combine numbered images (`frame_1.jpg`, `frame_2.jpg`, etc) into a video or GIF:

```
ffmpeg -i {{path/to/frame_%d.jpg}} -f image2 {{video.mpg|
video.gif}}
```

- Trim a video from a given start time mm:ss to an end time mm2:ss2 (omit the -to flag to trim till the end):

```
ffmpeg -i {{path/to/input_video.mp4}} -ss {{mm:ss}} -to
{{mm2:ss2}} {{[-c|-codec]}} copy {{path/to/output_video.mp4}}
```

- Convert AVI video to MP4. AAC Audio @ 128kbit, h264 Video @ CRF 23:

```
ffmpeg -i {{path/to/input_video}}.avi {{[-c|-codec]}}:a aac -
b:a 128k {{[-c|-codec]}}:v libx264 -crf 23 {{path/to/
output_video}}.mp4
```

- Remux MKV video to MP4 without re-encoding audio or video streams:

```
ffmpeg -i {{path/to/input_video}}.mkv {{[-c|-codec]}} copy
{{path/to/output_video}}.mp4
```

- Convert MP4 video to VP9 codec. For the best quality, use a CRF value (recommended range 15-35) and -b:v MUST be 0:

```
ffmpeg -i {{path/to/input_video}}.mp4 {{[-c|-codec]}}:v
libvpx-vp9 -crf {{30}} -b:v 0 {{[-c|-codec]}}:a libopus -vbr
on -threads {{number_of_threads}} {{path/to/
output_video}}.webm
```

ffplay

A simple and portable media player using the FFmpeg libraries and the SDL library.

More information: https://ffmpeg.org/ffplay-all.html.

- Play a media file:

```
ffplay {{path/to/file}}
```

- Play audio from a media file without a GUI:

```
ffplay -nodisp {{path/to/file}}
```

- Play media passed by `ffmpeg` through `stdin`:

```
ffmpeg -i {{path/to/file}} -c {{copy}} -f {{media_format}} -
| ffplay -
```

- Play a video and show motion vectors in real time:

```
ffplay -flags2 +export_mvs -vf codecview=mv=pf+bf+bb {{path/
to/file}}
```

- Show only video keyframes:

```
ffplay -vf select="{{eq(pict_type\,PICT_TYPE_I)}}" {{path/to/
file}}
```

ffprobe

Multimedia stream analyzer.

More information: https://ffmpeg.org/ffprobe.html.

- Display all available stream info for a media file:

```
ffprobe {{[-v|-loglevel]}} error -show_streams {{input.mp4}}
```

- Display media duration:

```
ffprobe {{[-v|-loglevel]}} error -show_entries
format=duration {{[-of|-output_format]}}
default=noprint_wrappers=1:nokey=1 {{input.mp4}}
```

- Display the frame rate of a video:

```
ffprobe {{[-v|-loglevel]}} error -select_streams v:0 -
show_entries stream=avg_frame_rate {{[-of|-output_format]}}
default=noprint_wrappers=1:nokey=1 {{input.mp4}}
```

- Display the width or height of a video:

```
ffprobe {{[-v|-loglevel]}} error -select_streams v:0 -
show_entries stream={{width|height}} {{[-of|-output_format]}}
default=noprint_wrappers=1:nokey=1 {{input.mp4}}
```

- Display the average bit rate of a video:

```
ffprobe {{[-v|-loglevel]}} error -select_streams v:0 -
show_entries stream=bit_rate {{[-of|-output_format]}}
default=noprint_wrappers=1:nokey=1 {{input.mp4}}
```

ffsend

Easily and securely share files.

More information: https://gitlab.com/timvisee/ffsend.

- Upload a file:

```
ffsend upload {{path/to/file}}
```

- Download a file:

```
ffsend download {{url}}
```

- Upload a file with password:

```
ffsend upload {{path/to/file}} {{[-p|--password]}}
{{password}}
```

- Download a file protected by password:

```
ffsend download {{url}} {{[-p|--password]}} {{password}}
```

- Upload a file and allow 4 downloads:

```
ffsend upload {{path/to/file}} {{[-d|--downloads]}} {{4}}
```

ffuf

A fast web fuzzer written in Go.

The **FUZZ** keyword is used as a placeholder. **`ffuf`** will try to hit the URL by replacing the word **FUZZ** with every word in the wordlist.

More information: https://github.com/ffuf/ffuf#usage.

- Enumerate directories using [c]olored output and a [w]ordlist specifying a target [u]RL:

```
ffuf -c -w {{path/to/wordlist.txt}} -u {{http://example.com/FUZZ}}
```

- Enumerate webservers of subdomains by changing the position of the keyword:

```
ffuf -w {{path/to/subdomains.txt}} -u {{http://FUZZ.example.com}}
```

- Fuzz with specified [t]hreads (default: 40) and pro[x]ying the traffic and save [o]utput to a file:

```
ffuf -o -w {{path/to/wordlist.txt}} -u {{http://example.com/FUZZ}} -t {{500}} -x {{http://127.0.0.1:8080}}
```

- Fuzz a specific [H]eader ("Name: Value") and [m]atch HTTP status [c]odes:

```
ffuf -w {{path/to/wordlist.txt}} -u {{http://example.com}} -H "{{Host: FUZZ}}" -mc {{200}}
```

- Fuzz with specified HTTP method and [d]ata, while [f]iltering out comma separated status [c]odes:

```
ffuf -w {{path/to/postdata.txt}} -X {{POST}} -d "{{username=admin\&password=FUZZ}}" -u {{http://example.com/login.php}} -fc {{401,403}}
```

- Fuzz multiple positions with multiple wordlists using different modes:

```
ffuf -w {{path/to/keys:KEY}} -w {{path/to/values:VALUE}} -mode {{pitchfork|clusterbomb}} -u {{http://example.com/id?KEY=VALUE}}
```

- Proxy requests through a HTTP MITM pro[x]y (such as Burp Suite or `mitmproxy`):

```
ffuf -w {{path/to/wordlist}} -x {{http://127.0.0.1:8080}} -u
{{http://example.com/FUZZ}}
```

fg

Run jobs in foreground.

See also: **`jobs`**, **`bg`**, **`disown`**, **`%`**.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-fg.

- Bring most recently suspended or running background job to foreground:

```
fg
```

- Bring a specific job to foreground (run `jobs` to find the job number):

```
fg %{{job_number}}
```

fgrep

This command is an alias of **`grep --fixed-strings`**.

- View documentation for the original command:

```
tldr grep
```

fi

This shell keyword is used to end an **`if`** statement.

- View documentation for the `if` keyword:

  ```
  tldr if
  ```

fiascotopnm

Convert a compressed FIASCO file to a PNM image.

More information: https://netpbm.sourceforge.net/doc/fiascotopnm.html.

- Convert a compressed FIASCO file to a PNM file or in the case of video streams multiple PNM files:

```
fiascotopnm {{path/to/file.fiasco}} {{[-o|--output]}} {{output_file_basename}}
```

- Use fast decompression, resulting in a slightly decreased quality of the output file(s):

```
fiascotopnm {{[-z|--fast]}} {{path/to/file.fiasco}} {{[-o|--output]}} {{output_file_basename}}
```

- Load the options to be used from the specified configuration file:

```
fiascotopnm {{[-f|--config]}} {{path/to/fiascorc}} {{path/to/file.fiasco}} {{[-o|--output]}} {{output_file_basename}}
```

- Magnify the decompressed image(s) by a factor of 2^n:

```
fiascotopnm {{[-m|--magnify]}} {{n}} {{path/to/file.fiasco}} {{[-o|--output]}} {{output_file_basename}}
```

- Smooth the decompressed image by the specified amount:

```
fiascotopnm {{[-s|--smoothing]}} {{n}} {{path/to/file.fiasco}} {{[-o|--output]}} {{output_file_basename}}
```

figlet

Generate ASCII banners from user input.

See also: **`showfigfonts`**.

More information: https://www.figlet.org/figlet-man.html.

- Generate by directly inputting text:

```
figlet {{input_text}}
```

- Use a custom [f]ont file:

```
figlet -f {{path/to/font_file.flf}} {{input_text}}
```

- Use a [f]ont from the default font directory (the extension can be omitted):

```
figlet -f {{font_filename}} {{input_text}}
```

- Pipe command output through FIGlet:

```
{{command}} | figlet
```

- Show available FIGlet fonts:

```
showfigfonts {{optional_string_to_display}}
```

- Use the full width of the [t]erminal and [c]enter the input text:

```
figlet -t -c {{input_text}}
```

- Display all characters at full [W]idth to avoid overlapping:

```
figlet -W {{input_text}}
```

figlist

List the figlet fonts and control files.

See also: **`figlet`**, **`showfigfonts`**, **`chkfont`**.

More information: https://manned.org/figlist.

- List all available fonts using the default font directory:

```
figlist
```

- List fonts from a custom directory:

```
figlist -d {{path/to/directory}}
```

- Search for a font by keyword:

```
figlist -d {{path/to/directory}} | grep {{keyword}}
```

- Count the total number of available fonts in a specified directory:

```
figlist -d {{path/to/directory}} | wc {{[-l|--lines]}}
```

file-rename

This command is an alias of **rename**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} common rename
```

file

Determine file type.

See also: **`stat`**.

More information: https://manned.org/file.

- Give a description of the type of the specified file:

```
file {{path/to/file}}
```

- Look inside a zipped file and determine the file type(s) inside:

```
file {{[-z|--uncompress]}} {{path/to/file.zip}}
```

- Allow `file` to work with special or device files:

```
file {{[-s|--special-files]}} {{path/to/file}}
```

- Don't stop at first file type match; keep going until the end of the file:

```
file {{[-k|--keep-going]}} {{path/to/file}}
```

- Determine the MIME encoding type of a file:

```
file {{[-i|--mime]}} {{path/to/file}}
```

filebrowser

Simple HTTP web server to manage files and directories.

More information: https://filebrowser.org/cli/filebrowser.html.

- Start a new server instance serving the current directory:

```
filebrowser
```

- Start a new server instance serving a specific root directory:

```
filebrowser {{[-r|--root]}} {{path/to/directory}}
```

- Start an instance with different host address (defaults to `127.0.0.1`) and port (defaults to `8080`):

```
filebrowser {{[-a|--address]}} {{host}} {{[-p|--port]}} {{port}} {{[-r|--root]}} {{path/to/directory}}
```

- Start an instance with a specified configuration file, storing the application database in a specific location (defaults to `filebrowser.db` on the current directory):

```
filebrowser {{[-c|--config]}} {{path/to/file}} {{[-d|--database]}} {{path/to/database.db}} {{[-r|--root]}} {{path/to/directory}}
```

- Set up a different default first-time account username and password (both default to `admin`) when setting up a new instance:

```
filebrowser --username {{username}} --password {{password}} {{[-r|--root]}} {{path/to/directory}}
```

- Set up the maximum amount of image processors used when generating thumbnails (defaults to `4`):

```
filebrowser --img-processors {{4}} {{[-r|--root]}} {{path/to/directory}}
```

- Disable image thumbnails as well as the Command Runner feature, limiting access for hosted script files from being executed inside the app:

```
filebrowser --disable-exec --disable-thumbnails {{[-r|--root]}} {{path/to/directory}}
```

- Disable resizing of image previews as well as detecting file types by reading their headers:

```
filebrowser --disable-preview-resize --disable-type-
detection-by-header {{[-r|--root]}} {{path/to/directory}}
```

FileCheck

Flexible pattern matching file verifier.

It is typically used from LLVM regression tests and forms a part of a **`lit`** test.

More information: https://llvm.org/docs/CommandGuide/FileCheck.html.

- Match `input_file` content with pattern file `check_file`:

```
FileCheck --input-file={{path/to/input_file}} {{path/to/check_file}}
```

- Match input from the `stdin` with pattern file `check_file`:

```
echo "{{some_text}}" | FileCheck {{path/to/check_file}}
```

- Match with the specified custom check `prefix` (Note: The default prefix is `CHECK`):

```
echo "{{some_text}}" | FileCheck --check-prefix={{prefix}} {{path/to/check_file}}
```

- Print good directive pattern matches:

```
echo "{{some_text}}" | FileCheck -v {{path/to/check_file}}
```

- Input `llvm_code.ll` into llvm-as, then pipe the output into FileCheck to match:

```
llvm-as {{path/to/llvm_code.ll}} | FileCheck {{path/to/check_file}}
```

filen

Interface with Filen, an end-to-end encrypted cloud storage service.

More information: https://github.com/FilenCloudDienste/filen-cli.

- Enter interactive mode:

```
filen
```

- Upload a local file to a specific remote folder:

```
filen upload {{path/to/local_file}} {{remote_folder_id}}
```

- Download a file or folder using its remote ID:

```
filen download {{remote_id}} {{path/to/local_destination}}
```

- List files and folders inside a remote folder:

```
filen ls {{remote_folder}}
```

- Delete a remote file or folder (move it to trash):

```
filen rm {{remote_id}}
```

- Restore a trashed item:

```
filen trash restore {{remote_id}}
```

- Synchronize a local folder with a remote folder (two-way sync):

```
filen sync {{path/to/local_folder}}:/{{remote_folder}} --continuous
```

- Download changes from the cloud to a local folder (one-way sync):

```
filen sync {{path/to/local_folder}}:ctl:/{{remote_folder}}
```

fin

Docksal utility.

More information: https://docs.docksal.io/fin/fin/.

- Start the project in the current directory:

```
fin project start
```

- Stop the project in the current directory:

```
fin project stop
```

- Open a shell into a specific container:

```
fin bash {{container_name}}
```

- Display logs of a specific container:

```
fin logs {{container_name}}
```

- Display logs of a specific container and follow the log:

```
fin logs {{[-f|--follow]}} {{container_name}}
```

find

Find files or directories under a directory tree, recursively.

See also: **fd**.

More information: https://manned.org/find.

- Find files by extension:

```
find {{root_path}} -name '{{*.ext}}'
```

- Find files matching multiple path/name patterns:

```
find {{root_path}} -path '{{*/path/*/*.ext}}' -or -name
'{{*pattern*}}'
```

- Find directories matching a given name, in case-insensitive mode:

```
find {{root_path}} -type d -iname '{{*lib*}}'
```

- Find files matching a given pattern, excluding specific paths:

```
find {{root_path}} -name '{{*.py}}' -not -path '{{*/site-
packages/*}}'
```

- Find files matching a given size range, limiting the recursive depth to "1":

```
find {{root_path}} -maxdepth 1 -size {{+500k}} -size {{-10M}}
```

- Run a command for each file (use `{}` within the command to access the filename):

```
find {{root_path}} -name '{{*.ext}}' -exec {{wc -l}} {} \;
```

- Find all files modified today and pass the results to a single command as arguments:

```
find {{root_path}} -daystart -mtime {{-1}} -exec {{tar -cvf
archive.tar}} {} \+
```

- Search for either empty files or directories and delete them verbosely:

```
find {{root_path}} -type {{f|d}} -empty -delete -print
```

finger

User information lookup program.

More information: https://manned.org/finger.

- Display information about currently logged in users:

  `finger`

- Display information about a specific user:

  `finger {{username}}`

- Display the user's login name, real name, terminal name, and other information:

  `finger -s`

- Produce multiline output format displaying same information as `-s` as well as user's home directory, home phone number, login shell, mail status, etc.:

  `finger -l`

- Prevent matching against user's names and only use login names:

  `finger -m`

fio

Flexible I/O tester: do an I/O action spawning multiple threads or processes.

More information: https://fio.readthedocs.io/en/latest/fio_doc.html.

- Test random reads:

```
fio --filename={{path/to/file}} --direct=1 --rw=randread --
bs=4k --ioengine=libaio --iodepth=256 --runtime=120 --
numjobs=4 --time_based --group_reporting --name={{job_name}}
--eta-newline=1 --readonly
```

- Test sequential reads:

```
fio --filename={{path/to/file}} --direct=1 --rw=read --bs=4k
--ioengine=libaio --iodepth=256 --runtime=120 --numjobs=4 --
time_based --group_reporting --name={{job_name}} --eta-
newline=1 --readonly
```

- Test random read/write:

```
fio --filename={{path/to/file}} --direct=1 --rw=randrw --
bs=4k --ioengine=libaio --iodepth=256 --runtime=120 --
numjobs=4 --time_based --group_reporting --name={{job_name}}
--eta-newline=1
```

- Test with parameters from a job file:

```
fio {{path/to/job_file}}
```

- Convert a specific job file to command-line options:

```
fio --showcmd {{path/to/job_file}}
```

firebase

Test, manage, and deploy Firebase projects.

More information: https://github.com/firebase/firebase-tools.

- Log in to https://console.firebase.google.com:

  ```
  firebase login
  ```

- List existing Firebase projects:

  ```
  firebase projects:list
  ```

- Start an interactive wizard to create a Firebase project in the current directory:

  ```
  firebase init
  ```

- Deploy code and assets to the current Firebase project:

  ```
  firebase deploy
  ```

- Start a local server to statically host the current Firebase project's assets:

  ```
  firebase serve
  ```

- Start an interactive wizard to open one of many links of the current Firebase project in the default web browser:

  ```
  firebase open
  ```

firefox

A free and open source web browser.

More information: https://wiki.mozilla.org/Firefox/CommandLineOptions.

- Launch Firefox and open a web page:

```
firefox {{https://www.duckduckgo.com}}
```

- Open a new window:

```
firefox --new-window {{https://www.duckduckgo.com}}
```

- Open a private (incognito) window:

```
firefox --private-window
```

- Search for "wikipedia" using the default search engine:

```
firefox --search "{{wikipedia}}"
```

- Launch Firefox in safe mode, with all extensions disabled:

```
firefox --safe-mode
```

- Take a screenshot of a web page in headless mode:

```
firefox --headless --screenshot {{path/to/output_file.png}} {{https://example.com/}}
```

- Use a specific profile to allow multiple separate instances of Firefox to run at once:

```
firefox --profile {{path/to/directory}} {{https://example.com/}}
```

- Set Firefox as the default browser:

```
firefox --setDefaultBrowser
```

fish

The Friendly Interactive SHell, a command-line interpreter designed to be user friendly.

More information: https://fishshell.com/docs/current/cmds/fish.html.

- Start an interactive shell session:

```
fish
```

- Start an interactive shell session without loading startup configs:

```
fish {{[-N|--no-config]}}
```

- Execute specific commands:

```
fish {{[-c|--command]}} "{{echo 'fish is executed'}}"
```

- Execute a specific script:

```
fish {{path/to/script.fish}}
```

- Check a specific script for syntax errors:

```
fish {{[-N|--no-execute]}} {{path/to/script.fish}}
```

- Execute specific commands from `stdin`:

```
{{echo "echo 'fish is executed'"}} | fish
```

- Start an interactive shell session in private mode, where the shell does not access old history or save new history:

```
fish {{[-P|--private]}}
```

- Define and export an environmental variable that persists across shell restarts (builtin):

```
set {{[-U|--universal]}} {{[-x|--export]}} {{variable_name}} {{variable_value}}
```

fisher

Fisher, a fish-shell plugin manager.

Install plugins by name or from a managed **`fishfile`** for bundled installs.

More information: https://github.com/jorgebucaran/fisher.

- Install one or more plugins:

  `fisher {{plugin1}} {{plugin2}}`

- Install a plugin from a GitHub gist:

  `fisher {{gist_url}}`

- Edit `fishfile` manually with your favorite editor and install multiple plugins:

  `{{editor}} ~/.config/fish/fishfile; fisher`

- List installed plugins:

  `fisher ls`

- Update plugins:

  `fisher update`

- Remove one or more plugins:

  `fisher remove {{plugin1}} {{plugin2}}`

fitstopnm

Convert a Flexible Image Transport System (FITS) file to a PNM image.

See also: **pamtofits**.

More information: https://netpbm.sourceforge.net/doc/fitstopnm.html.

- Convert a FITS file to a PNM image:

```
fitstopnm {{path/to/file.fits}} > {{path/to/output.pnm}}
```

- Convert the image on the specified position of the third axis in the FITS file:

```
fitstopnm {{[-i|-image]}} {{z_position}} {{path/to/
file.fits}} > {{path/to/output.pnm}}
```

fkill

Fabulously kill processes. Cross-platform.

More information: https://manned.org/fkill.

- Run without arguments to use the interactive interface:

```
fkill
```

- Kill the process by PID, name, or port:

```
fkill {{pid|name|:port}}
```

flac

Encode, decode, and test FLAC files.

More information: https://xiph.org/flac/.

- Encode a WAV file to FLAC (this will create a FLAC file in the same location as the WAV file):

```
flac {{path/to/file.wav}}
```

- Encode a WAV file to FLAC, specifying the output file:

```
flac {{[-o|--output-name]}} {{path/to/output.flac}} {{path/to/file.wav}}
```

- Decode a FLAC file to WAV, specifying the output file:

```
flac {{[-d|--decode]}} {{[-o|--output-name]}} {{path/to/output.wav}} {{path/to/file.flac}}
```

- Test a FLAC file for the correct encoding:

```
flac {{[-t|--test]}} {{path/to/file.flac}}
```

flake8

Check the style and quality of Python code.

More information: https://flake8.pycqa.org/en/latest/user/options.html.

- Lint a file or directory recursively:

```
flake8 {{path/to/file_or_directory}}
```

- Lint a file or directory recursively and show the line on which each error occurred:

```
flake8 --show-source {{path/to/file_or_directory}}
```

- Lint a file or directory recursively and ignore a list of rules. (All available rules can be found at https://www.flake8rules.com/):

```
flake8 --ignore {{rule1,rule2,...}} {{path/to/
file_or_directory}}
```

- Lint a file or directory recursively but exclude files matching the given globs or substrings:

```
flake8 --exclude {{substring1,glob2}} {{path/to/
file_or_directory}}
```

flarectl

Official CLI for Cloudflare.

More information: https://github.com/cloudflare/cloudflare-go/blob/v0/cmd/flarectl/README.md.

- Block a specific IP:

```
flarectl firewall rules create --zone="{{example.com}}" --value="{{8.8.8.8}}" --mode="{{block}}" --notes="{{Block bad actor}}"
```

- Add a DNS record:

```
flarectl dns create --zone="{{example.com}}" --name="{{app}}" --type="{{CNAME}}" --content="{{myapp.herokuapp.com}}" --proxy
```

- List all Cloudflare IPv4/IPv6 ranges:

```
flarectl ips --ip-type {{ipv4|ipv6|all}}
```

- Create many new Cloudflare zones automatically with names from `domains.txt`:

```
for domain in $(cat {{domains.txt}}); do flarectl zone info --zone=$domain; done
```

- List all firewall rules:

```
flarectl firewall rules list
```

flask-unsign

A tool to brute-force, decode, and craft **`Flask`** session cookies.

More information: https://github.com/Paradoxis/Flask-Unsign.

- Decode a Flask session cookie:

```
flask-unsign {{[-d|--decode]}} {{[-c|--cookie]}} {{cookie}}
```

- Decode a session cookie fetched from a URL which returns a `Set-Cookie` header:

```
flask-unsign {{[-d|--decode]}} --server {{URL}}
```

- Brute-force a secret key using the default flask-unsign-wordlist (requires `flask-unsign-wordlist`):

```
flask-unsign {{[-u|--unsign]}} {{[-c|--cookie]}} {{cookie}}
```

- Brute-force a secret key with a custom wordlist (use `--no-literal-eval` for unquoted entries):

```
flask-unsign {{[-u|--unsign]}} {{[-c|--cookie]}} {{cookie}}
{{[-w|--wordlist]}} {{path/to/wordlist.txt}}
```

- Sign a new session cookie with a secret key:

```
flask-unsign {{[-s|--sign]}} {{[-c|--cookie]}}
"{{{'logged_in': False}}}" {{[-S|--secret]}} {{secret}}
```

- Sign a session cookie using legacy timestamp (useful for old versions):

```
flask-unsign {{[-s|--sign]}} {{[-c|--cookie]}}
"{{{'logged_in': False}}}" {{[-S|--secret]}} {{secret}} {{[-
l|--legacy]}}
```

- Brute-force a session cookie with custom threads and no literal evaluation:

```
flask-unsign {{[-u|--unsign]}} {{[-c|--cookie]}} {{cookie}}
{{[-w|--wordlist]}} {{path/to/wordlist.txt}} {{[-t|--
threads]}} {{threads}} {{[-nE|--no-literal-eval]}}
```

flask

A general utility script for Flask applications. Loads the application defined in the **`$FLASK_APP`** environment variable.

More information: https://flask.palletsprojects.com/en/stable/cli/.

- Run a development server:

  ```
  flask run
  ```

- Show the routes for the app:

  ```
  flask routes
  ```

- Run a Python interactive shell in the app's context:

  ```
  flask shell
  ```

flexget

A multipurpose automation tool for content like torrents, nzbs, podcasts, comics, series, movies, etc.

More information: https://flexget.com/en/CLI.

- Run all Flexget tasks now:

```
flexget execute --now
```

- Start the Flexget daemon and daemonize its process:

```
flexget daemon start --daemonize
```

- List all series recorded in Flexget:

```
flexget series list
```

- Run a task from a configuration file:

```
flexget -c {{path/to/config.yml}} execute --task
{{task_name}}
```

flips

Create and apply patches for IPS and BPS files.

More information: https://github.com/Alcaro/Flips.

- Start Flips to create and apply patches interactively:

```
flips
```

- Apply a patch and create a new ROM file:

```
flips --apply {{patch.bps}} {{rom.smc}} {{hack.smc}}
```

- Create a patch from two ROMs:

```
flips --create {{rom.smc}} {{hack.smc}} {{patch.bps}}
```

flite

Speech synthesis engine.

More information: http://www.festvox.org/flite/doc/.

- List all available voices:

```
flite -lv
```

- Convert a text string to speech:

```
flite -t "{{string}}"
```

- Convert the contents of a file to speech:

```
flite -f {{path/to/file.txt}}
```

- Use the specified voice:

```
flite -voice {{file://path/to/filename.flitevox|url}}
```

- Store output into a wav file:

```
flite -voice {{file://path/to/filename.flitevox|url}} -f
{{path/to/file.txt}} -o {{output.wav}}
```

- Display version:

```
flite --version
```

flow

A static type checker for JavaScript.

More information: https://flow.org/en/docs/cli/.

- Run a flow check:

```
flow
```

- Check which files are being checked by flow:

```
flow ls
```

- Run a type coverage check on all files in a directory:

```
flow batch-coverage --show-all --strip-root {{path/to/
directory}}
```

- Display line-by-line type coverage stats:

```
flow coverage --color {{path/to/file.jsx}}
```

flox

Easy to use Nix package and environment manager.

More information: https://flox.dev/docs/reference/command-reference/flox/.

- Create a new environment in the current directory:

  ```
  flox init
  ```

- Enter an environment, or create one if it doesn't exist:

  ```
  flox activate
  ```

- Search for packages in the FloxHub catalog:

  ```
  flox search {{package}}
  ```

- Install a package into the current environment:

  ```
  flox {{[i|install]}} {{package}}
  ```

- Uninstall a package from the current environment:

  ```
  flox uninstall {{package}}
  ```

- View a list of all packages installed in the current environment:

  ```
  flox {{[l|list]}}
  ```

- Push a local environment to FloxHub to share with others:

  ```
  flox push
  ```

- Pull a shared environment from FloxHub:

  ```
  flox pull {{environment_name}}
  ```

fls

List files and directories in an image file or device.

More information: https://wiki.sleuthkit.org/index.php?title=Fls.

- Build a recursive fls list over a device, output paths will start with C:

```
fls -r -m {{C:}} {{/dev/loop1p1}}
```

- Analyze a single partition, providing the sector offset at which the filesystem starts in the image:

```
fls -r -m {{C:}} -o {{sector}} {{path/to/image_file}}
```

- Analyze a single partition, providing the timezone of the original system:

```
fls -r -m {{C:}} -z {{timezone}} {{/dev/loop1p1}}
```

flutter pub

Flutter's package manager.

Note: Packages are available on https://pub.dev.

See also: **`flutter`**.

More information: https://docs.flutter.dev/packages-and-plugins/using-packages.

- Download/Update all packages specified in `pubspec.yaml`:

  ```
  flutter pub get
  ```

- Add a package dependency to an app:

  ```
  flutter pub add {{package1 package2 ...}}
  ```

- Remove a package dependency from an app:

  ```
  flutter pub remove {{package1 package2 ...}}
  ```

- Upgrade to the highest version of a package that is allowed by `pubspec.yaml`:

  ```
  flutter pub upgrade {{package}}
  ```

flutter

Google's free, open source, and cross-platform mobile app SDK.

Some subcommands such as **pub** have their own usage documentation.

More information: https://github.com/flutter/flutter/wiki/The-flutter-tool.

- Initialize a new Flutter project in a directory of the same name:

```
flutter create {{project_name}}
```

- Check if all external tools are correctly installed:

```
flutter doctor
```

- List or change Flutter channel:

```
flutter channel {{stable|beta|dev|master}}
```

- Run Flutter on all started emulators and connected devices:

```
flutter run -d all
```

- Run tests in a terminal from the root of the project:

```
flutter test {{test/example_test.dart}}
```

- Build a release APK targeting most modern smartphones:

```
flutter build apk --target-platform {{android-arm}},
{{android-arm64}}
```

- Delete the `build` and `.dart_tool` directories:

```
flutter clean
```

- Display help about a specific command:

```
flutter help {{command}}
```

flutterfire

Configure a Firebase project for your Flutter app.

Note: Requires Firebase CLI and FlutterFire CLI to be installed.

More information: https://firebase.google.com/docs/flutter/setup.

- Initialize and configure Firebase for your current Flutter app:

  ```
  flutterfire configure
  ```

- Specify platforms (iOS, Android, web) to support:

  ```
  flutterfire configure --platforms {{ios,android,...}}
  ```

- Use a specific Firebase project:

  ```
  flutterfire configure --project {{project_id}}
  ```

fluxctl

Tool for Flux v1.

More information: https://fluxcd.io/flux/migration/.

- List workloads currently running in the cluster on specific namespace:

  ```
  fluxctl --k8s-fwd-ns={{namespace}} list-workloads
  ```

- Show deployed and available images:

  ```
  fluxctl list-images
  ```

- Synchronize the cluster with the Git repository:

  ```
  fluxctl sync
  ```

- Turn on automatic deployment for a workload:

  ```
  fluxctl automate
  ```

fly

Tool for concourse-ci.

More information: https://concourse-ci.org/fly.html.

- Authenticate with and save concourse target:

```
fly {{[-t|--target]}} {{target_name}} login {{[-n|--team-name]}} {{team_name}} {{[-c|--concourse-url]}} {{https://ci.example.com}}
```

- List targets:

```
fly targets
```

- List pipelines:

```
fly {{[-t|--target]}} {{target_name}} pipelines
```

- Upload or update a pipeline:

```
fly {{[-t|--target]}} {{target_name}} set-pipeline {{[-c|--config]}} {{pipeline.yml}} {{[-p|--pipeline]}} {{pipeline_name}}
```

- Unpause pipeline:

```
fly {{[-t|--target]}} {{target_name}} unpause-pipeline {{[-p|--pipeline]}} {{pipeline_name}}
```

- Show pipeline configuration:

```
fly {{[-t|--target]}} {{target_name}} get-pipeline {{[-p|--pipeline]}} {{pipeline_name}}
```

- Update local copy of fly:

```
fly {{[-t|--target]}} {{target_name}} sync
```

- Destroy pipeline:

```
fly {{[-t|--target]}} {{target_name}} destroy-pipeline {{[-p|--pipeline]}} {{pipeline_name}}
```

flyctl

Tool for flyctl.io.

More information: https://github.com/superfly/flyctl.

- Sign into a Fly account:

```
flyctl auth login
```

- Launch an application from a specific Dockerfile (the default path is the current working directory):

```
flyctl launch --dockerfile {{path/to/dockerfile}}
```

- Open the current deployed application in the default web browser:

```
flyctl open
```

- Deploy the Fly applications from a specific Dockerfile:

```
flyctl deploy --dockerfile {{path/to/dockerfile}}
```

- Open the Fly Web UI for the current application in a web browser:

```
flyctl dashboard
```

- List all applications in the logged-in Fly account:

```
flyctl apps list
```

- View the status of a specific running application:

```
flyctl status --app {{app_name}}
```

- Display version:

```
flyctl version
```

fmt

Reformat a text file by joining its paragraphs and limiting the line width to a number of characters (75 by default).

More information: https://www.gnu.org/software/coreutils/manual/html_node/fmt-invocation.html.

- Reformat a file:

```
fmt {{path/to/file}}
```

- Reformat a file producing output lines of (at most) n characters:

```
fmt {{[-w|--width]}} {{n}} {{path/to/file}}
```

- Reformat a file without joining lines shorter than the given width together:

```
fmt {{[-s|--split-only]}} {{path/to/file}}
```

- Reformat a file with uniform spacing (1 space between words and 2 spaces between paragraphs):

```
fmt {{[-u|--uniform-spacing]}} {{path/to/file}}
```

fnm

Fast Node.js version manager.

More information: https://github.com/Schniz/fnm/blob/master/docs/commands.md.

- Install a specific version of Node.js:

```
fnm {{[i|install]}} {{node_version}}
```

- Install Node.js LTS:

```
fnm {{[i|install]}} --lts
```

- List all available Node.js versions and highlight the default one:

```
fnm {{[ls|list]}}
```

- Use a specific version of Node.js in the current shell:

```
fnm use {{node_version}}
```

- Set the default Node.js version:

```
fnm default {{node_version}}
```

- Uninstall a given Node.js version:

```
fnm {{[uni|uninstall]}} {{node_version}}
```

fold

Wrap each line in an input file to fit a specified width and print it to **`stdout`**.

More information: https://manned.org/fold.1p.

- Wrap each line to default width (80 characters):

```
fold {{path/to/file}}
```

- Wrap each line to width "30":

```
fold -w30 {{path/to/file}}
```

- Wrap each line to width "5" and break the line at spaces (puts each space separated word in a new line, words with length > 5 are wrapped):

```
fold -w5 -s {{path/to/file}}
```

for

Perform a command several times.

More information: https://www.gnu.org/software/bash/manual/bash.html#Looping-Constructs.

- Iterate through command line parameters:

```
for {{variable}}; do {{echo $variable}}; done
```

- Execute the given commands for each of the specified items:

```
for {{variable}} in {{item1 item2 ...}}; do {{echo "Loop is executed"}}; done
```

- Iterate over a given range of numbers:

```
for {{variable}} in {{{from..to..step}}}; do {{echo "Loop is executed"}}; done
```

- Iterate over a given list of files:

```
for {{variable}} in {{path/to/file1 path/to/file2 ...}}; do {{echo "Loop is executed"}}; done
```

- Iterate over a given list of directories:

```
for {{variable}} in {{path/to/directory1/ path/to/directory2/ ...}}; do {{echo "Loop is executed"}}; done
```

- Perform a given command in every directory:

```
for {{variable}} in */; do (cd "${{variable}}" || continue; {{echo "Loop is executed"}}) done
```

forever

Server-side JavaScript application that makes sure Node.js applications run indefinitely (restarts after exit).

More information: https://github.com/foreversd/forever#usage.

- Start running a file forever (as a daemon):

```
forever {{script}}
```

- List running "forever" processes (along with IDs and other details of "forever" processes):

```
forever list
```

- Stop a running "forever" process:

```
forever stop {{ID|pid|script}}
```

fortune

Print a random quotation (fortune-cookie style).

More information: https://manned.org/fortune.

- Print a quotation:

  `fortune`

- Print an offensive quotation:

  `fortune -o`

- Print a long quotation:

  `fortune -l`

- Print a short quotation:

  `fortune -s`

- List the available quotation database files:

  `fortune -f`

- Print a quotation from one of the database files listed by `fortune -f`:

  `fortune {{path/to/file}}`

fossa

CLI for the Fossa service - Generate realtime license audits, vulnerability scans and reports about dependencies licenses.

More information: https://github.com/fossas/fossa-cli/blob/master/docs/README.md.

- Initialize a `.fossa.yml` configuration file:

  ```
  fossa init
  ```

- Run a default project build:

  ```
  fossa build
  ```

- Analyze built dependencies:

  ```
  fossa analyze
  ```

- Generate reports:

  ```
  fossa report
  ```

- Test current revision against the FOSSA scan status and exit with errors if issues are found:

  ```
  fossa test
  ```

fossil add

Put files or directories under Fossil version control.

More information: https://fossil-scm.org/home/help/add.

- Put a file or directory under version control, so it will be in the current checkout:

```
fossil add {{path/to/file_or_directory}}
```

- Remove all added files from the current checkout:

```
fossil add --reset
```

fossil ci

This command is an alias of **`fossil commit`**.

- View documentation for the original command:

```
tldr fossil commit
```

fossil commit

Commit files to a Fossil repository.

More information: https://fossil-scm.org/home/help/commit.

- Create a new version containing all the changes in the current checkout; user will be prompted for a comment:

```
fossil {{[ci|commit]}}
```

- Create a new version containing all the changes in the current checkout, using the specified [m]essage:

```
fossil {{[ci|commit]}} {{[-m|--comment]}} "{{comment}}"
```

- Create a new version containing all the changes in the current checkout with a comment read from a specific file:

```
fossil {{[ci|commit]}} {{[-M|--message-file]}} {{path/to/commit_message_file}}
```

- Create a new version containing changes from the specified files; user will be prompted for a comment:

```
fossil {{[ci|commit]}} {{path/to/file1 path/to/file2 ...}}
```

fossil delete

Remove files or directories from Fossil version control.

See also: **`fossil forget`**.

More information: https://fossil-scm.org/home/help/delete.

- Remove a file or directory from Fossil version control:

```
fossil {{[rm|delete]}} {{path/to/file_or_directory}}
```

- Remove a file or directory from Fossil version control, and also delete it from the disk:

```
fossil {{[rm|delete]}} --hard {{path/to/file_or_directory}}
```

- Re-add all previously removed and uncommitted files to Fossil version control:

```
fossil {{[rm|delete]}} --reset
```

fossil forget

This command is an alias of **`fossil rm`**, with the exception that it never removes files from the disk.

More information: https://fossil-scm.org/home/help/forget.

- View documentation for the original command:

```
tldr fossil rm
```

fossil init

Initialize a new repository for a project.

More information: https://fossil-scm.org/home/help/init.

- Create a new repository in a named file:

```
fossil init {{path/to/file}}
```

fossil new

This command is an alias of **`fossil init`**.

- View documentation for the original command:

```
tldr fossil init
```

fossil rm

This command is an alias of **`fossil delete`**.

- View documentation for the original command:

```
tldr fossil delete
```

fossil

Distributed version control system with a built-in wiki, bug tracker, and web interface.

Some subcommands such as **`commit`** have their own usage documentation.

More information: https://fossil-scm.org/home/help.

- Initialize a new empty Fossil repository:

```
fossil init {{repository_name.fossil}}
```

- Create a local copy of a remote repository:

```
fossil clone {{remote_url}}
```

- Show an overview of the current repository state:

```
fossil status
```

- Stage a new file:

```
fossil add {{path/to/file}}
```

- Stage a file for removal:

```
fossil {{[rm|delete]}} {{path/to/file}}
```

- Check in all staged changes:

```
fossil {{[ci|commit]}} {{[-m|--comment]}} "{{comment}}"
```

- Push changes from the local repository to a remote repository:

```
fossil push {{remote_url}}
```

- Pull changes from a remote repository into the local repository:

```
fossil pull {{remote_url}}
```

fping

A more powerful ping which can ping multiple hosts.

More information: https://fping.org/fping.8.html.

- List the status of all hosts within a range:

```
fping {{192.168.1.{1..254}}}
```

- List alive hosts within a subnet generated from a netmask:

```
fping {{[-a|--alive]}} {{[-g|--generate]}} {{192.168.1.0/24}}
```

- List alive hosts within a subnet generated from an IP range and prune per-probe results:

```
fping {{[-q|--quiet]}} {{[-a|--alive]}} {{[-g|--generate]}}
{{192.168.1.1}} {{192.168.1.254}}
```

- List unreachable hosts within a subnet generated from a netmask:

```
fping {{[-u|--unreach]}} {{[-g|--generate]}}
{{192.168.1.0/24}}
```

fpsync

Execute several synchronization processes locally or on several remote workers through SSH.

More information: https://manned.org/fpsync.

- Recursively synchronize a directory to another location:

```
fpsync -v /{{path/to/source}}/ /{{path/to/destination}}/
```

- Recursively synchronize a directory with the final pass (It enables rsync's `--delete` option with each synchronization job):

```
fpsync -v -E /{{path/to/source}}/ /{{path/to/destination}}/
```

- Recursively synchronize a directory to a destination using 8 concurrent synchronization jobs:

```
fpsync -v -n 8 -E /{{path/to/source}}/ /{{path/to/destination}}/
```

- Recursively synchronize a directory to a destination using 8 concurrent synchronization jobs spread over two remote workers (machine1 and machine2):

```
fpsync -v -n 8 -E -w login@machine1 -w login@machine2 -d /{{path/to/shared_directory}} /{{path/to/source}}/ /{{path/to/destination}}/
```

- Recursively synchronize a directory to a destination using 4 local workers, each one transferring at most 1000 files and 100 MB per synchronization job:

```
fpsync -v -n 4 -f 1000 -s $((100 * 1024 * 1024)) /{{path/to/source}}/ /{{path/to/destination}}/
```

- Recursively synchronize any directories but exclude specific `.snapshot*` files (Note: Options and values must be separated by a pipe character):

```
fpsync -v -O "-x|.snapshot*" /{{path/to/source}}/ /{{path/to/destination}}/
```

freeramdisk

Free memory used by **`loadlin`** ramdisk on legacy systems.

Largely deprecated by **`umount`**, **`losetup`**, and **`tmpfs`**.

More information: https://manned.org/freeramdisk.

- Free `loadlin` ramdisk memory:

```
sudo freeramdisk
```

freeze

Generate images of code and terminal output.

Supported formats are PNG, SVG, and WebP.

See also: **silicon**.

More information: https://github.com/charmbracelet/freeze#flags.

- Generate an image of code based on a file:

```
freeze {{path/to/file}}
```

- Specify the output path:

```
freeze {{path/to/file}} {{[-o|--output]}} {{path/to/output_image.png}}
```

- Generate an image of terminal output:

```
freeze {{[-x|--execute]}} {{command}}
```

- Interactively customize the output image:

```
freeze {{path/to/file}} {{[-i|--interactive]}}
```

- Select a theme for syntax highlighting:

```
freeze {{path/to/file}} {{[-t|--theme]}} {{dracula}}
```

- Use a base configuration template:

```
freeze {{path/to/file}} {{[-c|--config]}} {{base|full|user}}
```

- Capture a specific range of line numbers:

```
freeze {{path/to/file}} --lines {{start}},{{end}}
```

- Show line numbers:

```
freeze {{path/to/file}} --show-line-numbers
```

freshclam

Update virus definitions for ClamAV antivirus program.

More information: https://docs.clamav.net/manual/Usage/SignatureManagement.html#freshclam.

- Update virus definitions:

```
freshclam
```

from

Print mail header lines from the current user's mailbox.

More information: https://mailutils.org/manual/html_chapter/Programs.html#frm-and-from.

- List mail:

```
from
```

- Display the number of messages stored:

```
from --count
```

- List mail in the specified mailbox directory:

```
MAIL={{path/to/mailbox}} from
```

- Print the mail from the specified address:

```
from --sender={{me@example.com}}
```

frp

Fast Reverse Proxy: quickly set up network tunnels to expose certain services to the Internet or other external networks.

More information: https://github.com/fatedier/frp.

- View documentation for `frpc`, the `frp` client component:

```
tldr frpc
```

- View documentation for `frps`, the `frp` server component:

```
tldr frps
```

frpc

Connect to a **`frps`** server to start proxying connections on the current host.

Part of **`frp`**.

More information: https://github.com/fatedier/frp.

- Start the service, using the default configuration file (assumed to be `frps.ini` in the current directory):

```
frpc
```

- Start the service, using the newer TOML configuration file:

```
frpc {{[-c|--config]}} {{path/to/frps.toml}}
```

- Start the service, using a specific configuration file:

```
frpc {{[-c|--config]}} {{path/to/file}}
```

- Check if the configuration file is valid:

```
frpc verify {{[-c|--config]}} {{path/to/file}}
```

- Print autocompletion setup script for Bash, fish, PowerShell, or Zsh:

```
frpc completion {{bash|fish|powershell|zsh}}
```

- Display version:

```
frpc {{[-v|--version]}}
```

frps

Quickly set up a reverse proxy service.

Part of **`frp`**.

More information: https://github.com/fatedier/frp.

- Start the service, using the default configuration file (assumed to be `frps.ini` in the current directory):

```
frps
```

- Start the service, using the newer TOML configuration file:

```
frps {{[-c|--config]}} {{path/to/frps.toml}}
```

- Start the service, using a specified configuration file:

```
frps {{[-c|--config]}} {{path/to/file}}
```

- Check if the configuration file is valid:

```
frps verify {{[-c|--config]}} {{path/to/file}}
```

- Print autocompletion setup script for Bash, fish, PowerShell, or Zsh:

```
frps completion {{bash|fish|powershell|zsh}}
```

- Display version:

```
frps {{[-v|--version]}}
```

fselect

Find files with SQL-like queries.

More information: https://github.com/jhspetersson/fselect/blob/master/docs/usage.md.

- Select full path and size from temporary or configuration files in a given directory:

```
fselect size, path from {{path/to/directory}} where name = '{{*.cfg}}' or name = '{{*.tmp}}'
```

- Find square images:

```
fselect path from {{path/to/directory}} where width = height
```

- Find old-school rap 320kbps MP3 files:

```
fselect path from {{path/to/directory}} where genre = {{Rap}} and bitrate = {{320}} and mp3_year lt {{2000}}
```

- Select only the first 5 results and output as JSON:

```
fselect size, path from {{path/to/directory}} limit {{5}} into json
```

- Use SQL aggregate functions to calculate minimum, maximum, and average size of files in a directory:

```
fselect "{{MIN(size), MAX(size), AVG(size), SUM(size), COUNT(*)}} from {{path/to/directory}}"
```

fstopgm

Convert a Usenix FaceSaver file into a PGM image.

See also: **`pgmtofs`**.

More information: https://netpbm.sourceforge.net/doc/fstopgm.html.

- Convert the specified Usenix FaceSaver file into a PGM image:

```
fstopgm {{path/to/input.fs}} > {{path/to/output.pgm}}
```

fswatch

A cross-platform file change monitor.

More information: https://emcrisostomo.github.io/fswatch/.

- Run a Bash command on file creation, update, or deletion:

```
fswatch {{path/to/file}} | xargs {{[-n|--max-args]}} 1
{{bash_command}}
```

- Watch one or more files and/or directories:

```
fswatch {{path/to/file}} {{path/to/directory}} {{path/to/
another_directory/**/*.js}} | xargs {{[-n|--max-args]}} 1
{{bash_command}}
```

- Print the absolute paths of the changed files:

```
fswatch {{path/to/directory}} | xargs {{[-n|--max-args]}} 1 -
I _ echo _
```

- Filter by event type:

```
fswatch --event {{Updated|Removed|Created|...}} {{path/to/
directory}} | xargs {{[-n|--max-args]}} 1 {{bash_command}}
```

fswebcam

Small and simple webcam for *nix.

More information: https://www.sanslogic.co.uk/fswebcam/.

- Take a picture:

```
fswebcam {{filename}}
```

- Take a picture with custom resolution:

```
fswebcam {{[-r|--resolution]}} {{width}}x{{height}}
{{filename}}
```

- Take a picture from selected device(Default is `/dev/video0`):

```
fswebcam {{[-d|--device]}} {{device}} {{filename}}
```

- Take a picture with timestamp(timestamp string is formatted by strftime):

```
fswebcam --timestamp {{timestamp}} {{filename}}
```

ftp

Tools to interact with a server via File Transfer Protocol.

More information: https://manned.org/ftp.

- Connect to an FTP server and run in interactive mode:

```
ftp {{ftp.example.com}}
```

- Connect to an FTP server specifying its IP address and port:

```
ftp {{ip_address}} {{port}}
```

- [Interactive] Switch to binary transfer mode (graphics, compressed files, etc):

```
binary
```

- [Interactive] Transfer multiple files without prompting for confirmation on every file:

```
prompt off
```

- [Interactive] Download multiple files (glob expression):

```
mget {{*.png}}
```

- [Interactive] Upload multiple files (glob expression):

```
mput {{*.zip}}
```

- [Interactive] Delete multiple files on the remote server:

```
mdelete {{*.txt}}
```

- [Interactive] Rename a file on the remote server:

```
rename {{original_filename}} {{new_filename}}
```

fuck

Corrects your previous console command.

More information: https://github.com/nvbn/thefuck.

- Set the `fuck` alias to `thefuck` tool:

```
eval "$(thefuck --alias)"
```

- Try to match a rule for the previous command:

```
fuck
```

- Confirm the first choice immediately (correct argument depends on level of annoyance):

```
fuck --{{yes|yeah|hard}}
```

func

Azure Functions Core Tools: develop and test Azure Functions locally.

Local functions can connect to live Azure services, and can deploy a function app to an Azure subscription.

More information: https://learn.microsoft.com/azure/azure-functions/functions-run-local.

- Create a new functions project:

  ```
  func init {{project}}
  ```

- Create a new function:

  ```
  func new
  ```

- Run functions locally:

  ```
  func start
  ```

- Publish your code to a function app in Azure:

  ```
  func azure functionapp publish {{function}}
  ```

- Download all settings from an existing function app:

  ```
  func azure functionapp fetch-app-settings {{function}}
  ```

- Get the connection string for a specific storage account:

  ```
  func azure storage fetch-connection-string
  {{storage_account}}
  ```

function

Define a function.

More information: https://www.gnu.org/software/bash/manual/bash.html#Shell-Functions.

- Define a function with the specified name:

```
function {{func_name}} { {{echo "Function contents here"}}; }
```

- Run a function named `func_name`:

```
func_name
```

- Define a function without the `function` keyword:

```
{{func_name}}() { {{echo "Function contents here"}}; }
```

- Display help:

```
help function
```

funzip

Print the content of the first (non-directory) member in an archive without extraction.

More information: https://manned.org/funzip.

- Print the content of the first member in a Zip archive:

```
funzip {{path/to/archive.zip}}
```

- Print the content in a gzip archive:

```
funzip {{path/to/archive.gz}}
```

- Decrypt a Zip or gzip archive and print the content:

```
funzip -password {{password}} {{path/to/archive}}
```

fusermount

Mount and unmount FUSE filesystems.

More information: https://manned.org/fusermount.

- Unmount a FUSE filesystem:

```
fusermount -u {{path/to/mount_point}}
```

- Unmount a FUSE filesystem as soon as it becomes unused:

```
fusermount -z {{path/to/mount_point}}
```

- Display version:

```
fusermount --version
```

fvm

Flutter version manager.

More information: https://fvm.app/documentation/guides/basic-commands.

- Install a version of the Flutter SDK. Use without `version` for project settings:

```
fvm install {{version}}
```

- Set a specific version of Flutter SDK in a project:

```
fvm use {{version}} {{options}}
```

- Set a global version of the Flutter SDK:

```
fvm global {{version}}
```

- Delete the FVM cache:

```
fvm destroy
```

- Remove a specific version of the Flutter SDK:

```
fvm remove {{version}}
```

- List all installed versions of the Flutter SDK:

```
fvm list
```

- List all releases of the Flutter SDK:

```
fvm releases
```

fx

View and process JSON.

More information: https://fx.wtf/getting-started.

- View a JSON file interactively:

```
fx {{path/to/file.json}}
```

- Pretty-print and colorize JSON from `stdin`:

```
cat {{path/to/file.json}} | fx
```

- Open JSON data from a URL:

```
curl {{url}} | fx
```

- Filter JSON using JavaScript-like expressions:

```
fx {{path/to/file.json}} {{.name}}
```

- Parse a TOML input file into JSON:

```
fx --toml {{path/to/file.toml}}
```

- Parse a YAML input file into JSON:

```
fx --yaml {{path/to/file.yaml}}
```

fzf

Fuzzy finder.

Similar to **sk**.

More information: https://github.com/junegunn/fzf#usage.

- Start `fzf` on all files in the specified directory:

```
find {{path/to/directory}} -type f | fzf
```

- Start `fzf` for running processes:

```
ps aux | fzf
```

- Select multiple files with `<Shift Tab>` and write to a file:

```
find {{path/to/directory}} -type f | fzf {{[-m|--multi]}} > {{path/to/file}}
```

- Start `fzf` with a specified query:

```
fzf {{[-q|--query]}} "{{query}}"
```

- Start `fzf` on entries that start with `core` and end with either `go`, `rb`, or `py`:

```
fzf {{[-q|--query]}} "^core go$ | rb$ | py$"
```

- Start `fzf` on entries that do not match `pyc` and contain `travis`:

```
fzf {{[-q|--query]}} '!pyc travis'
```

g++

Compile C++ source files.

Part of GCC (GNU Compiler Collection).

More information: https://gcc.gnu.org/onlinedocs/gcc/C_002b_002b-Dialect-Options.html.

- Compile a source code file into an executable binary:

```
g++ {{path/to/source1.cpp path/to/source2.cpp ...}} {{[-o|--output]}} {{path/to/output_executable}}
```

- Activate output of all errors and warnings:

```
g++ {{path/to/source.cpp}} -Wall {{[-o|--output]}} {{path/to/output_executable}}
```

- Show common warnings, debug symbols in output, and optimize without affecting debugging:

```
g++ {{path/to/source.cpp}} -Wall {{[-g|--debug]}} -Og {{[-o|--output]}} {{path/to/output_executable}}
```

- Choose a language standard to compile for (C++98/C++11/C++14/C++17):

```
g++ {{path/to/source.cpp}} -std={{c++98|c++11|c++14|c++17}} {{[-o|--output]}} {{path/to/output_executable}}
```

- Include libraries located at a different path than the source file:

```
g++ {{path/to/source.cpp}} {{[-o|--output]}} {{path/to/output_executable}} -I{{path/to/header}} -L{{path/to/library}} -l{{library_name}}
```

- Compile and link multiple source code files into an executable binary:

```
g++ {{[-c|--compile]}} {{path/to/source1.cpp path/to/source2.cpp ...}} && g++ {{[-o|--output]}} {{path/to/output_executable}} {{path/to/source1.o path/to/source2.o ...}}
```

- Optimize the compiled program for performance:

```
g++ {{path/to/source.cpp}} -O{{1|2|3|fast}} {{[-o|--output]}}
{{path/to/output_executable}}
```

- Display version:

```
g++ --version
```

gacutil

Global Assembly Cache (GAC) management utility.

More information: https://manned.org/gacutil.

- Install the specified assembly into GAC:

```
gacutil -i {{path/to/assembly.dll}}
```

- Uninstall the specified assembly from GAC:

```
gacutil -u {{assembly_display_name}}
```

- Print the content of GAC:

```
gacutil -l
```

gallery-dl

Download image galleries and collections from several image hosting sites.

More information: https://github.com/mikf/gallery-dl.

- Download images from the specified URL:

```
gallery-dl "{{url}}"
```

- Save images to a specific directory:

```
gallery-dl --destination {{path/to/directory}} "{{url}}"
```

- Retrieve pre-existing cookies from your web browser (useful for sites that require login):

```
gallery-dl --cookies-from-browser {{browser}} "{{url}}"
```

- Get the direct URL of an image from a site supporting authentication with username and password:

```
gallery-dl --get-urls --username {{username}} --password {{password}} "{{url}}"
```

- Filter manga chapters by chapter number and language:

```
gallery-dl --chapter-filter "{{10 <= chapter < 20}}" --option "lang={{language_code}}" "{{url}}"
```

gammastep

Adjust the screen's color temperature according to the time of day.

More information: https://manned.org/gammastep.

- Turn on Gammastep with a specific [t]emperature during the day (e.g. 5700k) and at night (e.g. 3600k):

```
gammastep -t {{5700}}:{{3600}}
```

- Turn on Gammastep with a manually specified custom [l]ocation:

```
gammastep -l {{latitude}}:{{longitude}}
```

- Turn on Gammastep with a specific screen [b]rightness during the day (e.g. 70%) and at night (e.g. 40%), with minimum brightness 10% and maximum brightness 100%:

```
gammastep -b {{0.7}}:{{0.4}}
```

- Turn on Gammastep with custom [g]amma levels (between 0 and 1):

```
gammastep -g {{red}}:{{green}}:{{blue}}
```

- Turn on Gammastep with a c[O]nstant unchanging color temperature:

```
gammastep -O {{temperature}}
```

- Reset temperature adjustments applied by Gammastep:

```
gammastep -x
```

ganache-cli

Command-line version of Ganache, your personal blockchain for Ethereum development.

More information: https://archive.trufflesuite.com/ganache/.

- Run Ganache:

```
ganache-cli
```

- Run Ganache with a specific number of accounts:

```
ganache-cli --accounts={{number_of_accounts}}
```

- Run Ganache and lock available accounts by default:

```
ganache-cli --secure
```

- Run Ganache server and unlock specific accounts:

```
ganache-cli --secure --unlock "{{account_private_key1}}" --
unlock "{{account_private_key2}}"
```

- Run Ganache with a specific account and balance:

```
ganache-cli --account="{{account_private_key}},
{{account_balance}}"
```

- Run Ganache with accounts with a default balance:

```
ganache-cli --defaultBalanceEther={{default_balance}}
```

- Run Ganache and log all requests to `stdout`:

```
ganache-cli --verbose
```

gatsby

Static site generator for React.

More information: https://www.gatsbyjs.com/docs/reference/gatsby-cli/.

- Create a new site:

  `gatsby new {{site_name}}`

- Create a new site with a Gatsby `starter`:

  `gatsby new {{site_name}} {{url_of_starter_github_repo}}`

- Start a live-reloading local development server:

  `gatsby develop`

- Perform a production build and generate static HTML:

  `gatsby build`

- Start a local server which serves the production build:

  `gatsby serve`

gau

Get All URLs: fetch known URLs from AlienVault's Open Threat Exchange, the Wayback Machine, and Common Crawl for any domains.

More information: https://github.com/lc/gau#usage.

- Fetch all URLs of a domain from AlienVault's Open Threat Exchange, the Wayback Machine, Common Crawl, and URLScan:

```
gau {{example.com}}
```

- Fetch URLs of multiple domains:

```
gau {{domain1 domain2 ...}}
```

- Fetch all URLs of several domains from an input file, running multiple threads:

```
gau < {{path/to/domains.txt}} --threads {{4}}
```

- Write [o]utput results to a file:

```
gau {{example.com}} --o {{path/to/found_urls.txt}}
```

- Search for URLs from only one specific provider:

```
gau --providers {{wayback|commoncrawl|otx|urlscan}}
{{example.com}}
```

- Search for URLs from multiple providers:

```
gau --providers {{wayback,otx,...}} {{example.com}}
```

- Search for URLs within specific date range:

```
gau --from {{YYYYMM}} --to {{YYYYMM}} {{example.com}}
```

gawk

GNU version of awk, a versatile programming language for working on files.

See also: **awk**.

More information: https://www.gnu.org/software/gawk/manual/gawk.html.

- Print the fifth column (a.k.a. field) in a space-separated file:

```
gawk '{print $5}' {{path/to/file}}
```

- Print the second column of the lines containing "foo" in a space-separated file:

```
gawk '/{{foo}}/ {print $2}' {{path/to/file}}
```

- Print the last column of each line in a file, using a comma (instead of space) as a field separator:

```
gawk {{[-F|--field-separator]}} ',' '{print $NF}' {{path/to/file}}
```

- Sum the values in the first column of a file and print the total:

```
gawk '{s+=$1} END {print s}' {{path/to/file}}
```

- Print every third line starting from the first line:

```
gawk 'NR%3==1' {{path/to/file}}
```

- Print different values based on conditions:

```
gawk '{if ($1 == "foo") print "Exact match foo"; else if ($1 ~ "bar") print "Partial match bar"; else print "Baz"}' {{path/to/file}}
```

- Print all the lines which the 10th column value is between a min and a max:

```
gawk '($10 >= {{min_value}} && $10 <= {{max_value}})'
```

- Print table of users with UID >=1000 with header and formatted output, using colon as separator (`%-20s` mean: 20 left-align string characters, `%6s` means: 6 right-align string characters):

```
gawk 'BEGIN {FS=":";printf "%-20s %6s %25s\n", "Name", "UID", "Shell"} $4 >= 1000 {printf "%-20s %6d %25s\n", $1, $4, $7}' /etc/passwd
```

gc

Count nodes, edges, connected components, or clusters in Graphviz **`.dot`** files.

More information: https://graphviz.org/pdf/gc.1.pdf.

- Count nodes and edges in a file:

```
gc {{path/to/file.dot}}
```

- Count only [n]odes:

```
gc -n {{path/to/file.dot}}
```

- Count only [e]dges:

```
gc -e {{path/to/file.dot}}
```

- Count [c]onnected components:

```
gc -c {{path/to/file.dot}}
```

- Display help:

```
gc -?
```

gcal

Display calendar.

More information: https://www.gnu.org/software/gcal/manual/gcal.html#Invoking-Gcal.

- Display calendar for the current month:

```
gcal
```

- Display calendar for the month of February of the year 2010:

```
gcal 2 2010
```

- Provide calendar sheet with week numbers:

```
gcal --with-week-number
```

- Change starting day of week to 1st day of the week (Monday):

```
gcal --starting-day=1
```

- Display the previous, current, and next month surrounding today:

```
gcal .
```

gcalcli

Interact with Google Calendar.

Requests Google API authorization upon first launch.

More information: https://github.com/insanum/gcalcli.

- List your events for all your calendars over the next 7 days:

```
gcalcli agenda
```

- Show events starting from or between specific dates (also takes relative dates e.g. "tomorrow"):

```
gcalcli agenda {{mm/dd}} [{{mm/dd}}]
```

- List events from a specific calendar:

```
gcalcli --calendar {{calendar_name}} agenda
```

- Display an ASCII calendar of events by week:

```
gcalcli calw
```

- Display an ASCII calendar of events for a month:

```
gcalcli calm
```

- Quick-add an event to your calendar:

```
gcalcli --calendar {{calendar_name}} quick "{{mm/dd}}
{{HH:MM}} {{event_name}}"
```

- Add an event to calendar. Triggers interactive prompt:

```
gcalcli --calendar "{{calendar_name}}" add
```

gcc

Preprocess and compile C and C++ source files, then assemble and link them together.

Part of GCC (GNU Compiler Collection).

More information: https://gcc.gnu.org/onlinedocs/gcc/.

- Compile multiple source files into an executable:

```
gcc {{path/to/source1.c path/to/source2.c ...}} {{[-o|--output]}} {{path/to/output_executable}}
```

- Activate output of all errors and warnings:

```
gcc {{path/to/source.c}} -Wall {{[-o|--output]}} {{output_executable}}
```

- Show common warnings, debug symbols in output, and optimize without affecting debugging:

```
gcc {{path/to/source.c}} -Wall {{[-g|--debug]}} -Og {{[-o|--output]}} {{path/to/output_executable}}
```

- Include libraries from a different path:

```
gcc {{path/to/source.c}} {{[-o|--output]}} {{path/to/output_executable}} -I{{path/to/header}} -L{{path/to/library}} -l{{library_name}}
```

- Compile source code into Assembler instructions:

```
gcc {{[-S|--assemble]}} {{path/to/source.c}}
```

- Compile source code into an object file without linking:

```
gcc {{[-c|--compile]}} {{path/to/source.c}}
```

- Optimize the compiled program for performance:

```
gcc {{path/to/source.c}} -O{{1|2|3|fast}} {{[-o|--output]}} {{path/to/output_executable}}
```

- Display version:

```
gcc --version
```

gcloud app

Build scalable applications on a managed serverless platform.

See also: **`gcloud`**.

More information: https://docs.cloud.google.com/sdk/gcloud/reference/app.

- Deploy an app's code and configuration to the App Engine server:

```
gcloud app deploy {{deployables}}
```

- List all versions of all services deployed to the App Engine server:

```
gcloud app versions list
```

- Open the current app in a web browser:

```
gcloud app browse
```

- Create an App Engine app within the current project:

```
gcloud app create
```

- Display the latest App Engine app logs:

```
gcloud app logs read
```

gcloud auth

Grant and revoke authorization to **`gcloud`** and manage credentials.

See also: **`gcloud`**.

More information: https://docs.cloud.google.com/sdk/gcloud/reference/auth.

- Authorize Google Cloud access for the `gcloud` CLI with Google Cloud user credentials and set the current account as active:

```
gcloud auth login
```

- Authorize Google Cloud access similar to `gcloud auth login` but with service account credentials:

```
gcloud auth activate-service-account
```

- Manage Application Default Credentials (ADC) for Cloud Client Libraries:

```
gcloud auth application-default
```

- Display a list of Google Cloud accounts currently authenticated on your system:

```
gcloud auth list
```

- Display the current account's access token:

```
gcloud auth print-access-token
```

- Remove access credentials for an account:

```
gcloud auth revoke
```

gcloud components

Manage Google Cloud CLI components.

See also: **`gcloud`**.

More information: https://docs.cloud.google.com/sdk/gcloud/reference/components.

- View available components for installation:

```
gcloud components list
```

- Install one or more components (installs any dependencies as well):

```
gcloud components install {{component_id1 component_id2 ...}}
```

- Update all components to the latest version:

```
gcloud components update
```

- Update all components to a specific version:

```
gcloud components update --version={{1.2.3}}
```

- Update components without confirmation (useful for automation scripts):

```
gcloud components update --quiet
```

gcloud compute

Create, run, and manage VMs on Google Cloud infrastructure.

See also: **`gcloud`**.

More information: https://docs.cloud.google.com/sdk/gcloud/reference/compute.

- List Compute Engine zones:

```
gcloud compute zones list
```

- Create a VM instance:

```
gcloud compute instances create {{instance_name}}
```

- Display a VM instance's details:

```
gcloud compute instances describe {{instance_name}}
```

- List all VM instances in a project:

```
gcloud compute instances list
```

- Create a snapshot of a persistent disk:

```
gcloud compute disks snapshot {{disk_name}} --snapshot-names
{{snapshot_name}}
```

- Display a snapshot's details:

```
gcloud compute snapshots describe {{snapshot_name}}
```

- Delete a snapshot:

```
gcloud compute snapshots delete {{snapshot_name}}
```

- Connect to a VM instance using SSH:

```
gcloud compute ssh {{instance_name}}
```

gcloud config set

Set a property in the Google Cloud CLI configuration.

Properties control various aspects of Google Cloud CLI behavior.

More information: https://docs.cloud.google.com/sdk/gcloud/reference/config/set.

- Set the project property in the core section:

```
gcloud config set project {{project_id}}
```

- Set the compute zone for future operations:

```
gcloud config set compute/zone {{zone_name}}
```

- Disable prompting to make gcloud suitable for scripting:

```
gcloud config set disable_prompts true
```

- View the list of properties currently in use:

```
gcloud config list
```

- Unset a previously set property:

```
gcloud config unset {{property_name}}
```

- Create a new configuration profile:

```
gcloud config configurations create {{configuration_name}}
```

- Switch between different configuration profiles:

```
gcloud config configurations activate {{configuration_name}}
```

gcloud config

Manage different configurations of **`gcloud`**.

See also: **`gcloud`**.

More information: https://docs.cloud.google.com/sdk/gcloud/reference/config.

- Define a property (like compute/zone) for the current configuration:

```
gcloud config set {{property}} {{value}}
```

- Fetch the value of a `gcloud` property:

```
gcloud config get {{property}}
```

- Display all the properties for the current configuration:

```
gcloud config list
```

- Create a new configuration with a given name:

```
gcloud config configurations create {{configuration_name}}
```

- Display a list of all available configurations:

```
gcloud config configurations list
```

- Switch to an existing configuration with a given name:

```
gcloud config configurations activate {{configuration_name}}
```

gcloud container

Manage containerized applications on Kubernetes and clusters.

See also: **`gcloud`**.

More information: https://docs.cloud.google.com/sdk/gcloud/reference/container.

- Register `gcloud` as a Docker credential helper:

```
gcloud auth configure-docker
```

- Create a cluster to run GKE containers:

```
gcloud container clusters create {{cluster_name}}
```

- List clusters for running GKE containers:

```
gcloud container clusters list
```

- Update kubeconfig to get `kubectl` to use a GKE cluster:

```
gcloud container clusters get-credentials {{cluster_name}}
```

- List tag and digest metadata for a container image:

```
gcloud container images list-tags {{image}}
```

- Describe an existing cluster for running containers:

```
gcloud container clusters describe {{cluster_name}}
```

gcloud feedback

Provide feedback to the Google Cloud team.

See also: **`gcloud`**.

More information: https://docs.cloud.google.com/sdk/gcloud/reference/feedback.

- Provide feedback to the `gcloud` team:

```
gcloud feedback
```

- Provide feedback to the `gcloud` team and attach a log file:

```
gcloud feedback --log-file {{log_file}}
```

gcloud help

Display help and reference information for **`gcloud`**.

See also: **`gcloud topic`** for supplementary help topics not directly associated with individual commands.

More information: https://docs.cloud.google.com/sdk/gcloud/reference/help.

- Search the `gcloud` CLI reference documents for specific terms:

  ```
  gcloud help
  ```

gcloud iam

Configure Identity and Access Management (IAM) preferences and service accounts.

See also: **`gcloud`**.

More information: https://docs.cloud.google.com/sdk/gcloud/reference/iam.

- List IAM grantable roles for a resource:

```
gcloud iam list-grantable-roles {{resource}}
```

- Create a custom role for a organization or project:

```
gcloud iam roles create {{role_name}} --{{organization|
project}} {{organization|project_id}} --file {{path/to/
role.yaml}}
```

- Create a service account for a project:

```
gcloud iam service-accounts create {{name}}
```

- Add an IAM policy binding to a service account:

```
gcloud iam service-accounts add-iam-policy-binding
{{service_account_email}} --member {{member}} --role {{role}}
```

- Replace existing IAM policy binding:

```
gcloud iam service-accounts set-iam-policy
{{service_account_email}} {{policy_file}}
```

- List a service account's keys:

```
gcloud iam service-accounts keys list --iam-account
{{service_account_email}}
```

gcloud info

Display information about the current **`gcloud`** environment.

More information: https://docs.cloud.google.com/sdk/gcloud/reference/info.

- Display `gcloud` environment information:

```
gcloud info
```

- Check network connectivity and hidden properties:

```
gcloud info --run-diagnostics
```

- Print the contents of the most recent log file:

```
gcloud info --show-log
```

gcloud init

Launch an interactive workflow to setup **`gcloud`** or reinitialize configurations.

More information: https://docs.cloud.google.com/sdk/gcloud/reference/init.

- Launch a "Getting Started" workflow:

```
gcloud init
```

- Launch a workflow without diagnostics:

```
gcloud init --skip-diagnostics
```

- Use the console for authentication:

```
gcloud init --console-only
```

gcloud kms decrypt

Decrypt a ciphertext file using a Cloud KMS key.

See also: **`gcloud`**.

More information: https://docs.cloud.google.com/sdk/gcloud/reference/kms/decrypt.

- Decrypt a file using a specified key, key ring, and location:

```
gcloud kms decrypt --key={{key_name}} --keyring={{keyring_name}} --location={{global}} --ciphertext-file={{path/to/ciphertext}} --plaintext-file={{path/to/plaintext}}
```

- Decrypt a file with additional authenticated data (AAD) and write the decrypted plaintext to `stdout`:

```
gcloud kms decrypt --key={{key_name}} --keyring={{keyring_name}} --location={{global}} --additional-authenticated-data-file={{path/to/file.aad}} --ciphertext-file={{path/to/ciphertext}} --plaintext-file=-
```

gcloud logging logs list

List logs in a Google Cloud project.

Useful for identifying available logs for monitoring and analysis.

See also: **`gcloud`**.

More information: https://docs.cloud.google.com/sdk/gcloud/reference/logging/logs/list.

- List all logs in the current project:

```
gcloud logging logs list
```

- List all logs for a specific log bucket and location:

```
gcloud logging logs list --bucket={{bucket_id}} --location={{location}}
```

- List all logs for a specific view in a log bucket:

```
gcloud logging logs list --bucket={{bucket_id}} --location={{location}} --view={{view_id}}
```

- List logs with a filter expression:

```
gcloud logging logs list --filter="{{expression}}"
```

- List a specified number of logs:

```
gcloud logging logs list --limit={{number}}
```

- List logs sorted by a specific field in ascending or descending order (~ for descending):

```
gcloud logging logs list --sort-by="{{field_name}}"
```

- List logs sorted by multiple fields:

```
gcloud logging logs list --sort-by="{{field1}},~{{field2}}"
```

- List logs with verbose output, showing additional details:

```
gcloud logging logs list --verbosity=debug
```

gcloud projects

Manage project access policies in Google Cloud.

See also: **`gcloud`**.

More information: https://docs.cloud.google.com/sdk/gcloud/reference/projects.

- Create a new project:

```
gcloud projects create {{project_id|project_number}}
```

- List all active projects:

```
gcloud projects list
```

- Display metadata for a project:

```
gcloud projects describe {{project_id}}
```

- Delete a project:

```
gcloud projects delete {{project_id|project_number}}
```

- Add an IAM policy binding to a specified project:

```
gcloud projects add-iam-policy-binding {{project_id}} --
member {{principal}} --role {{role}}
```

gcloud sql backups describe

Retrieve information about a backup.

See also: **gcloud**.

More information: https://docs.cloud.google.com/sdk/gcloud/reference/sql/backups/describe.

- Retrieve information about a backup:

```
gcloud sql backups describe {{backup_id}} --
instance={{instance_id}}
```

gcloud sql export sql

Export data from a Cloud SQL instance to an SQL file in Google Cloud Storage.

Useful for creating backups or migrating data.

See also: **`gcloud`**.

More information: https://docs.cloud.google.com/sdk/gcloud/reference/sql/export/sql.

- Export data from a specific Cloud SQL instance to a Google Cloud Storage bucket as an SQL dump file:

```
gcloud sql export sql {{instance}} gs://{{bucket_name}}/{{file_name}}
```

- Export data asynchronously, returning immediately without waiting for the operation to complete:

```
gcloud sql export sql {{instance}} gs://{{bucket_name}}/{{file_name}} --async
```

- Export data from specific databases within the Cloud SQL instance:

```
gcloud sql export sql {{instance}} gs://{{bucket_name}}/{{file_name}} --database={{database1,database2,...}}
```

- Export specific tables from a specified database within the Cloud SQL instance:

```
gcloud sql export sql {{instance}} gs://{{bucket_name}}/{{file_name}} --database={{database}} --table={{table1,table2,...}}
```

- Export data while offloading the operation to a temporary instance to reduce strain on the source instance:

```
gcloud sql export sql {{instance}} gs://{{bucket_name}}/{{file_name}} --offload
```

- Export data and compress the output with `gzip`:

```
gcloud sql export sql {{instance}} gs://{{bucket_name}}/{{file_name}}.gz
```

gcloud topic

Display supplementary help for topics not directly associated with individual commands.

See also: **`gcloud help`** for general help.

More information: https://docs.cloud.google.com/sdk/gcloud/reference/topic.

- View supplementary help material for non-command topics like accessibility, filtering, and formatting:

  ```
  gcloud topic {{topic_name}}
  ```

- List all available topics:

  ```
  gcloud topic --help
  ```

gcloud-version

Print version information for Google Cloud CLI components.

More information: https://docs.cloud.google.com/sdk/gcloud/reference/version.

- Display version information for all installed components, along with available updates to them:

```
gcloud version
```

- Display help:

```
gcloud version --help
```

gcloud

The official CLI tool for Google Cloud Platform.

Some subcommands such as **`app`** and **`init`** have their own usage documentation.

More information: https://docs.cloud.google.com/sdk/gcloud.

- List all properties in one's active configuration:

```
gcloud config list
```

- Login to a Google account:

```
gcloud auth login
```

- Set the active project:

```
gcloud config set project {{project_name}}
```

- SSH into a virtual machine instance:

```
gcloud compute ssh {{user}}@{{instance}}
```

- Display all Google Compute Engine instances in a project (by default instances from all zones are listed):

```
gcloud compute instances list
```

- Update a kubeconfig file with the appropriate credentials to point `kubectl` to a specific cluster in Google Kubernetes Engine (GKE):

```
gcloud container clusters get-credentials {{cluster_name}}
```

- Update all `gcloud` components:

```
gcloud components update
```

- Display help for a given command:

```
gcloud help {{command}}
```

gcpdiag

Google Cloud Platform troubleshooting and diagnostics tool.

Run in a Docker container or in GCP Cloudshell.

More information: https://github.com/GoogleCloudPlatform/gcpdiag#usage.

- Run `gcpdiag` on your project, returning all rules:

```
gcpdiag lint --project {{gcp_project_id}}
```

- Hide rules that are ok:

```
gcpdiag lint --project {{gcp_project_id}} --hide-ok
```

- Authenticate using a service account private key file:

```
gcpdiag lint --project {{gcp_project_id}} --auth-key {{path/to/private_key}}
```

- Search logs and metrics from a number of days back (default: 3 days):

```
gcpdiag lint --project {{gcp_project_id}} --within-days {{number}}
```

- Display help:

```
gcpdiag lint --help
```

gcrane copy

Efficiently copy a remote image from source to target while retaining the digest value.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/gcrane/README.md.

- Copy an image from source to target:

```
gcrane {{[cp|copy]}} {{source}} {{target}}
```

- Set the maximum number of concurrent copies, defaults to 20:

```
gcrane copy {{source}} {{target}} {{[-j|--jobs]}}
{{nr_of_copies}}
```

- Whether to recurse through repositories:

```
gcrane copy {{source}} {{target}} {{[-r|--recursive]}}
```

- Display help:

```
gcrane copy {{[-h|--help]}}
```

gcrane gc

List images that are not tagged.

Will calculate images that can be garbage-collected.

This can be composed with **`gcrane delete`** to actually garbage collect them.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/gcrane/README.md.

- List untagged images:

  ```
  gcrane gc {{repository}}
  ```

- Whether to recurse through repositories:

  ```
  gcrane gc {{repository}} {{[-r|--recursive]}}
  ```

- Display help:

  ```
  gcrane gc {{[-h|--help]}}
  ```

gcrane help

Help provides help for any command in the application.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/gcrane/README.md.

- Display help for a subcommand:

```
gcrane help {{command}}
```

- Display help:

```
gcrane help {{[-h|--help]}}
```

gcrane ls

List the tags in a repository.

More complex form than **`crane ls`**, which allows for listing tags, manifest, and sub-repositories.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/gcrane/README.md.

- List the tags:

  ```
  gcrane ls {{repository}}
  ```

- Format response from the registry as JSON:

  ```
  gcrane ls {{repository}} --json
  ```

- Whether to recurse through repositories:

  ```
  gcrane ls {{repository}} {{[-r|--recursive]}}
  ```

- Display help:

  ```
  gcrane ls {{[-h|--help]}}
  ```

gcrane

Container images managing tool.

This tool implements a superset of the **`crane`** commands, with additional commands that are specific to Google Container Registry (**`gcr.io`**).

Some subcommands such as **`append`**, **`auth`**, **`copy`**, etc. have their own usage documentation which can be found under **`crane`**.

Some subcommands such as **`completion`**, **`gc`**, **`help`** are specific to gcrane and have their own usage documentation.

More information: https://github.com/google/go-containerregistry/blob/main/cmd/gcrane/README.md.

- Login to a registry:

```
gcrane auth login {{registry}} {{[-u|--username]}} {{user}}
{{[-p|--password]}} {{password}}
```

- List tags, manifests, and sub-repostiories:

```
gcrane ls {{registry}}/{{project_id}}
```

- Copy images from one registry to another:

```
gcrane cp {{[-r|--recursive]}} {{source_registry}}/
{{project_id}}/{{repository}} {{target_registry}}/
{{project_id}}/{{repository}}
```

- Print images that can be garbage collected:

```
gcrane gc {{registry}}/{{project_id}}/{{repository}}
```

- Delete images that can be garbage collected:

```
gcrane gc {{registry}}/{{project_id}}/{{repository}} | xargs
{{[-n|--max-args]}} 1 gcrane delete
```

- List a specific registry with specific ID:

```
gcrane ls {{gcr.io}}/{{my-project-id}}
```

- Migrate all images from US registry to EU registry:

```
gcrane cp {{[-r|--recursive]}} {{gcr.io}}/{{my-project-id}}/
{{repository}} {{eu.gcr.io}}/{{my-project-id}}/{{repository}}
```

gdal2tiles.py

Generate TMS or XYZ tiles for a raster dataset.

More information: https://gdal.org/en/stable/programs/gdal2tiles.html.

- Generate TMS tiles for the zoom levels 2 to 5 of a raster dataset:

```
gdal2tiles.py --zoom 2-5 {{path/to/input.tif}} {{path/to/output_directory}}
```

- Generate XYZ tiles for the zoom levels 2 to 5 of a raster dataset:

```
gdal2tiles.py --zoom 2-5 --xyz {{path/to/input.tif}} {{path/to/output_directory}}
```

gdal_contour

Create contour lines and polygons from a digital elevation model.

More information: https://gdal.org/en/stable/programs/gdal_contour.html.

- Create a vector dataset with contour lines spread over an 100-meter [i]nterval while [a]ttributing the elevation property as "ele":

```
gdal_contour -a {{ele}} -i {{100.0}} {{path/to/input.tif}} {{path/to/output.gpkg}}
```

- Create a vector dataset with [p]olygons spread over an 100-meter [i]nterval:

```
gdal_contour -i {{100.0}} -p {{path/to/input.tif}} {{path/to/output.gpkg}}
```

gdal_translate

Convert raster data between different formats.

More information: https://gdal.org/en/stable/programs/gdal_translate.html.

- Convert a raster dataset to JPEG format:

```
gdal_translate -of {{JPEG}} {{path/to/input.tif}} {{path/to/output.jpeg}}
```

- Assign a projection to a raster dataset:

```
gdal_translate -a_srs {{EPSG:4326}} {{path/to/input.tif}} {{path/to/output.tif}}
```

- Reduce the size of a raster dataset to a specific fraction:

```
gdal_translate -outsize {{40%}} {{40%}} {{path/to/input.tif}} {{path/to/output.tif}}
```

- Convert a GeoTiff to a Cloud Optimized GeoTiff:

```
gdal_translate {{path/to/input.tif}} {{path/to/output.tif}} -of COG -co COMPRESS=LZW
```

gdaladdo

Build overview images of raster datasets.

More information: https://gdal.org/en/stable/programs/gdaladdo.html.

- Build overview images of a raster dataset using the "average" [r]esampling method:

```
gdaladdo -r average {{path/to/input.tif}}
```

gdalbuildvrt

Build Virtual Datasets from a list of existing datasets.

More information: https://gdal.org/en/stable/programs/gdalbuildvrt.html.

- Make a virtual mosaic from all TIFF files contained in a directory:

```
gdalbuildvrt {{path/to/output.vrt}} {{path/to/
input_directory/*.tif}}
```

- Make a virtual mosaic from files whose name is specified in a text file:

```
gdalbuildvrt -input_file_list {{path/to/list.txt}} {{path/to/
output.vrt}}
```

- Make an RGB virtual mosaic from 3 single-band input files:

```
gdalbuildvrt -separate {{path/to/rgb.vrt}} {{path/to/
red.tif}} {{path/to/green.tif}} {{path/to/blue.tif}}
```

- Make a virtual mosaic with blue background color (RGB: 0 0 255):

```
gdalbuildvrt -hidenodata -vrtnodata "{{0 0 255}}" {{path/to/
output.vrt}} {{path/to/input_directory/*.tif}}
```

gdaldem

Analyze and visualize digital elevation models (DEM).

More information: https://gdal.org/en/stable/programs/gdaldem.html.

- Compute the hillshade of a DEM:

```
gdaldem hillshade {{path/to/input.tif}} {{path/to/
output.tif}}
```

- Compute the slope of a DEM:

```
gdaldem slope {{path/to/input.tif}} {{path/to/output.tif}}
```

- Compute the aspect of a DEM:

```
gdaldem aspect {{path/to/input.tif}} {{path/to/output.tif}}
```

gdalinfo

List various information about a GDAL supported raster dataset.

More information: https://gdal.org/en/stable/programs/gdalinfo.html.

- List all supported raster formats:

```
gdalinfo --formats
```

- List information about a specific raster dataset:

```
gdalinfo {{path/to/input.tif}}
```

- List information about a specific raster dataset in JSON format:

```
gdalinfo -json {{path/to/input.tif}}
```

- Show histogram values of a specific raster dataset:

```
gdalinfo -hist {{path/to/input.tif}}
```

- List information about a Web Map Service (WMS):

```
gdalinfo WMS:{{https://services.meggsimum.de/geoserver/ows}}
```

- List information about a specific dataset of a Web Map Service (WMS):

```
gdalinfo WMS:{{https://services.meggsimum.de/geoserver/ows}}
-sd {{4}}
```

gdalwarp

Image reprojection and warping utility.

More information: https://gdal.org/en/stable/programs/gdalwarp.html.

- Reproject a raster dataset:

```
gdalwarp -t_srs {{EPSG:4326}} {{path/to/input.tif}} {{path/to/output.tif}}
```

- Crop a raster dataset by using specific coordinates:

```
gdalwarp -te {{min_x}} {{min_y}} {{max_x}} {{max_y}} -te_srs {{EPSG:4326}} {{path/to/input.tif}} {{path/to/output.tif}}
```

- Crop a raster dataset using a vector layer:

```
gdalwarp -cutline {{path/to/area_to_cut.geojson}} -crop_to_cutline {{path/to/input.tif}} {{path/to/output.tif}}
```

gdb

The GNU Debugger.

More information: https://sourceware.org/gdb/current/onlinedocs/gdb#Invocation.

- Debug an executable:

```
gdb {{path/to/executable}}
```

- Attach a process to `gdb`:

```
gdb {{[-p|--pid]}} {{procID}}
```

- Debug with a core file:

```
gdb {{[-c|--core]}} {{path/to/core}} {{path/to/executable}}
```

- Execute given GDB commands upon start:

```
gdb {{[-ex|--eval-command]}} "{{commands}}" {{path/to/
executable}}
```

- Start `gdb` and pass arguments to the executable:

```
gdb --args {{path/to/executable}} {{argument1 argument2 ...}}
```

- Skip `debuginfod` and pagination prompts and then print the backtrace:

```
gdb {{[-c|--core]}} {{path/to/core}} {{path/to/executable}} -
iex 'set debuginfod enabled on' -iex 'set pagination off' -ex
bt
```

gdc

D compiler using GCC as a backend.

More information: https://wiki.dlang.org/Using_GDC.

- Create an executable:

```
gdc {{path/to/source.d}} -o {{path/to/output_executable}}
```

- Print information about module dependencies:

```
gdc -fdeps
```

- Generate Ddoc documentation:

```
gdc -fdoc
```

- Generate D interface files:

```
gdc -fintfc
```

- Do not link the standard GCC libraries in the compilation:

```
gdc -nostdlib
```

gdm-binary

This command is an alias of **gdm**.

- View documentation for the original command:

```
tldr gdm
```

gdm-restart

Restart the GNOME Display Manager (GDM) daemon.

See also: **gdm**, **gdm-binary**, **gdmsetup**, **gdm-stop**, **gdm-safe-restart**.

More information: https://manned.org/gdm.

- Restart the GNOME Display Manager application:

```
gdm-restart
```

gdm-safe-restart

Restart the GNOME Display Manager (GDM) only when all users have logged out.

See also: **gdm**, **gdm-binary**, **gdmsetup**, **gdm-stop**, **gdm-restart**.

More information: https://manned.org/gdm.

- Restart the GNOME Display Manager application when all users have logged out:

  ```
  gdm-safe-restart
  ```

gdm-stop

Immediately stop running the GNOME Display Manager (GDM).

See also: **`gdm`**, **`gdm-binary`**, **`gdmsetup`**, **`gdm-restart`**, **`gdm-safe-restart`**.

More information: https://manned.org/gdm.

- Stop the GNOME Display Manager application:

```
gdm-stop
```

gdm

The GNOME Display Manager (GDM) is a replacement for the X Display Manager (XDM).

See also: **`gdm-binary`**, **`gdmsetup`**, **`gdm-stop`**, **`gdm-restart`**, **`gdm-safe-restart`**.

More information: https://manned.org/gdm.

- Run the GNOME Display Manager application:

  `gdm`

- Prevent `gdm` from being run as a daemon background process:

  `gdm --nodaemon`

- Disable `gdm` management of local console X servers for headless or remote environments:

  `gdm --no-console`

- Prevent sanitizing environment variables that start with `$LD_`:

  `gdm --preserve-ld-vars`

- Display help:

  `gdm --help`

- Display version:

  `gdm --version`

gdmsetup

Launch a GUI for configuring the GNOME Display Manager (GDM).

Results in edited files in either **`/etc/X11/gdm/gdm.conf`** or **`/etc/gdm/gdm.conf`** depending on distribution and environment.

See also: **`gdm`**, **`gdm-binary`**, **`gdm-stop`**, **`gdm-restart`**, **`gdm-safe-restart`**.

More information: https://manned.org/gdm.

- Run the GNOME Display Manager GUI configuration application:

  ```
  gdmsetup
  ```

gdown

Download files from Google Drive and other URLs.

More information: https://github.com/wkentaro/gdown#usage.

- Download a file from a URL:

```
gdown {{url}}
```

- Download using a file ID:

```
gdown {{file_id}}
```

- Download with fuzzy file ID extraction (also works with https://docs.google.com links):

```
gdown --fuzzy {{url}}
```

- Download a folder using its ID or the full URL:

```
gdown {{folder_id|url}} {{[-O|--output]}} {{path/to/output_directory}} --folder
```

- Download a `.tar` archive, write it to `stdout`, and extract it:

```
gdown {{tar_url}} {{[-O|--output]}} - {{[-q|--quiet]}} | tar xvf -
```

gdrive

Interact with Google Drive.

Folder/file ID can be obtained from the Google Drive folder or ID URL.

More information: https://github.com/prasmussen/gdrive.

- Upload a local path to the parent folder with the specified ID:

```
gdrive upload {{[-p|--parent]}} {{id}} {{path/to/file_or_folder}}
```

- Download file or directory by ID to current directory:

```
gdrive download {{id}}
```

- Download to a given local path by its ID:

```
gdrive download --path {{path/to/folder}} {{id}}
```

- Create a new revision of an ID using a given file or folder:

```
gdrive update {{id}} {{path/to/file_or_folder}}
```

gdu

Disk usage analyzer with console interface.

More information: https://github.com/dundee/gdu#usage.

- Interactively show the disk usage of the current directory:

```
gdu
```

- Interactively show the disk usage of a given directory:

```
gdu {{path/to/directory}}
```

- Interactively show the disk usage of all mounted disks:

```
gdu --show-disks
```

- Interactively show the disk usage of the current directory but ignore some sub-directories:

```
gdu --ignore-dirs {{path/to/directory1,path/to/
directory2,...}}
```

- Ignore paths by `regex`:

```
gdu --ignore-dirs-pattern '{{.*[abc]+}}'
```

- Ignore hidden directories:

```
gdu --no-hidden
```

- Only print the result, do not enter interactive mode:

```
gdu --non-interactive {{path/to/directory}}
```

- Do not show the progress in non-interactive mode (useful in scripts):

```
gdu --no-progress {{path/to/directory}}
```

gem

A package manager for the Ruby programming language.

More information: https://guides.rubygems.org/command-reference/.

- Search for remote gem(s) and show all available versions:

```
gem search {{regex}} {{[-a|--all]}}
```

- Install the latest version of a gem:

```
gem install {{gem_name}}
```

- Install a specific version of a gem:

```
gem install {{gem_name}} {{[-v|--version]}} {{1.0.0}}
```

- Install the latest matching (SemVer) version of a gem:

```
gem install {{gem_name}} {{[-v|--version]}} '~> {{1.0}}'
```

- Update a gem:

```
gem update {{gem_name}}
```

- List all local gems:

```
gem list
```

- Uninstall a gem:

```
gem uninstall {{gem_name}}
```

- Uninstall a specific version of a gem:

```
gem uninstall {{gem_name}} {{[-v|--version]}} {{1.0.0}}
```

gemini

Launch an interactive prompt with Gemini AI.

More information: https://github.com/google-gemini/gemini-cli.

- Start a REPL session to chat interactively:

```
gemini
```

- Send the output of another command to Gemini and exit immediately:

```
{{echo "Summarize the history of Rome"}} | gemini {{[-p|--prompt]}}
```

- Override the default model (default: gemini-2.5-pro):

```
gemini {{[-m|--model]}} {{gemini-2.5-flash}}
```

- Run inside a sandbox container:

```
gemini {{[-s|--sandbox]}}
```

- Execute a prompt then stay in interactive mode:

```
gemini {{[-i|--prompt-interactive]}} "{{Give me an example of recursion in Python}}"
```

- Include all files in context:

```
gemini {{[-a|--all-files]}}
```

- Show memory usage in status bar:

```
gemini --show-memory-usage
```

gemtopbm

This command has been superseded by **`gemtopnm`**.

More information: https://netpbm.sourceforge.net/doc/gemtopbm.html.

- View documentation for the current command:

```
tldr gemtopnm
```

gemtopnm

Convert a GEM image file into a PNM image.

More information: https://netpbm.sourceforge.net/doc/gemtopnm.html.

- Convert a GEM image file to a PNM image:

```
gemtopnm {{path/to/file.img}} > {{path/to/output.pnm}}
```

- Describe the contents of the specified GEM image:

```
gemtopnm {{[-d|-debug]}} {{path/to/file.img}}
```

- Display version:

```
gemtopnm -version
```

gendesk

Specify the command to generate a **`.desktop`** file and a download icon with minimal information.

More information: https://manned.org/gendesk.

- Create a `.desktop` file named `app`:

```
gendesk -n --name "{{app}}" --exec "/{{path/to/app}}" --icon
"/{{path/to/icon.png}}" --comment "{{This is application}}"
```

- Create a `.desktop` file named `app`, do not display any output, and overwrite it if it exists:

```
gendesk -q -f -n --name "{{app}}" --exec "/{{path/to/app}}"
--icon "/{{path/to/icon.png}}" --comment "{{This is
application}}"
```

- Display help:

```
gendesk {{[-h|--help]}}
```

Get-NodeInstallLocation

Get the current Node.js installation directory for **`ps-nvm`**.

Part of **`ps-nvm`** and can only be run under PowerShell.

More information: https://github.com/aaronpowell/ps-nvm.

- Get the current Node.js installation directory:

```
Get-NodeInstallLocation
```

Get-NodeVersions

List installed and available Node.js versions for **`ps-nvm`**.

Part of **`ps-nvm`** and can only be run under PowerShell.

More information: https://github.com/aaronpowell/ps-nvm.

- List all installed Node.js versions:

  ```
  Get-NodeVersions
  ```

- List all available Node.js versions:

  ```
  Get-NodeVersions -Remote
  ```

- List all available Node.js 20.x versions:

  ```
  Get-NodeVersions -Remote -Filter ">=20.0.0 <21.0.0"
  ```

get_iplayer

Indexing tool and personal video recorder for BBC iPlayer and BBC Sounds.

More information: https://github.com/get-iplayer/get_iplayer/wiki/manpage.

- Search programs by name:

```
get_iplayer "{{program_name}}"
```

- Record program by results of search:

```
get_iplayer "{{program_name}}" {{[-g|--get]}}
```

- Record program by URL from the BBC iPlayer website:

```
get_iplayer "https://www.bbc.co.uk/iplayer/episode/
{{program_PID}}/{{name-of-show-episode-number-episode-
title}}"
```

- Download subtitles for a program by results of search:

```
get_iplayer "{{program_name}}" --subtitles-only
```

- Search for a program, record it and download subtitles:

```
get_iplayer "{{program_name}}" {{[-g|--get]}} --subtitles
```

- Display help:

```
get_iplayer {{[-h|--help]}}
```

GetADUsers.py

Retrieve a list of users from Active Directory, including attributes like last logon timestamp and email.

Part of the Impacket suite.

More information: https://github.com/fortra/impacket.

- Enumerate all Active Directory users and their attributes:

```
GetADUsers.py -all -dc-ip {{domain_controller_ip}} {{domain}}/{{username}}:{{password}}
```

- Retrieve information only for a specific user:

```
GetADUsers.py -user {{user}} -dc-ip {{domain_controller_ip}} {{domain}}/{{username}}:{{password}}
```

- Extract user details using pass-the-hash authentication:

```
GetADUsers.py -all -dc-ip {{domain_controller_ip}} -hashes {{LM_Hash}}:{{NT_Hash}} {{domain}}/{{username}}
```

- Save output to a file:

```
GetADUsers.py -all -dc-ip {{domain_controller_ip}} {{domain}}/{{username}}:{{password}} > {{path/to/output.txt}}
```

getArch.py

Determine the OS architecture (x86 or x64) of a remote Windows system.

Part of the Impacket suite.

More information: https://github.com/fortra/impacket.

- Check the architecture of a single target system:

```
getArch.py -target {{target}}
```

- Check the architecture of multiple targets from a file (one per line):

```
getArch.py -targets {{path/to/targets_file}}
```

- Set a custom socket timeout (default is 2 seconds):

```
getArch.py -target {{target}} -timeout {{seconds}}
```

- Enable debug mode for detailed output:

```
getArch.py -target {{target}} -debug
```

geth

The go-ethereum command-line interface.

More information: https://geth.ethereum.org/docs/fundamentals/command-line-options.

- Connect to the main Ethereum network and automatically download the full node:

```
geth
```

- Connect to the Ropsten test network:

```
geth --testnet
```

- Create a new account:

```
geth account new
```

- Enable mining:

```
geth --mine
```

GetNPUsers.py

Enumerate Active Directory accounts with Kerberos pre-authentication disabled, which may be susceptible to AS-REP roasting attacks.

Part of the Impacket suite.

More information: https://github.com/fortra/impacket.

- Enumerate users with Kerberos pre-authentication disabled (default anonymous enumeration):

```
GetNPUsers.py {{domain}}/ -usersfile {{path/to/userslist}} -dc-ip {{domain_controller_ip}} -no-pass
```

- Perform AS-REP roasting and dump crackable hashes for offline cracking:

```
GetNPUsers.py {{domain}}/ -usersfile {{path/to/userslist}} -dc-ip {{domain_controller_ip}} -no-pass -request
```

- Authenticate with valid credentials (if anonymous binding is disabled):

```
GetNPUsers.py {{domain}}/{{username}}:{{password}} -usersfile {{path/to/userslist}} -dc-ip {{domain_controller_ip}}
```

- Use pass-the-hash authentication instead of a password:

```
GetNPUsers.py {{domain}}/{{username}} -hashes {{LM_Hash}}:{{NT_Hash}} -usersfile {{path/to/userslist}} -dc-ip {{domain_controller_ip}}
```

- Save the output to a file for further analysis:

```
GetNPUsers.py {{domain}}/ -usersfile {{path/to/userslist}} -dc-ip {{domain_controller_ip}} -request > {{path/to/output.txt}}
```

getopts

Parse shell options from arguments.

Note: This command does not support longform options and thus using **`getopt`** is recommended instead.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-getopts.

- Check if an option is the first set option in the current context:

```
getopts {{x}} {{opt}}; echo ${{opt}}
```

- Check if an option is set in a string (specified option must be the first element of the string):

```
getopts {{x}} {{opt}} "{{string text}}"; echo ${{opt}}
```

- Set an option to require an argument and print them:

```
getopts {{x}}: {{opt}}; echo ${{opt}} $OPTARG
```

- Check for multiple options:

```
while getopts {{xyz}} {{opt}}; do case ${{opt}} in x) {{echo
x is set}};; y) {{echo y is set}};; z) {{echo z is set}};;
esac; done
```

- Set `getopts` to silent mode and handle option errors:

```
while getopts :{{x:}} {{opt}}; do case ${{opt}} in x) ;; :)
{{echo "Argument required"}};; ?) {{echo "Invalid argument"}}
esac;; done
```

- Reset `getopts`:

```
OPTIND=1
```

gettext

Translates a string using stored translations in a compiled **`.mo`** file.

Translations are stored in **`/usr/share/locale/locale_name/LC_MESSAGES/`** with **`domain`** being the filename without its extension.

See also: **`msgfmt`**, **`msgunfmt`**.

More information: https://www.gnu.org/software/gettext/manual/gettext.html#gettext-Invocation.

- Get the translation of a string as specified in the domain file (falls back to given `msgid` if no translation exists):

```
LANGUAGE={{locale}} gettext {{[-d|--domain]}} {{domain}} "{{msgid}}"
```

- Display help:

```
gettext {{[-h|--help]}}
```

- Display version:

```
gettext {{[-V|--version]}}
```

GetUserSPNs.py

Retrieve Service Principal Names (SPNs) associated with Active Directory user accounts.

Part of the Impacket suite.

More information: https://github.com/fortra/impacket.

- Enumerate user accounts with an SPN and request their Kerberos TGS tickets:

```
GetUserSPNs.py {{domain}}/{{username}}:{{password}} -dc-ip
{{domain_controller_ip}}
```

- Use pass-the-hash authentication:

```
GetUserSPNs.py {{domain}}/{{username}} -hashes {{LM_Hash}}:
{{NT_Hash}} -dc-ip {{domain_controller_ip}}
```

- Save the output to a file:

```
GetUserSPNs.py {{domain}}/{{username}}:{{password}} -dc-ip
{{domain_controller_ip}} -outputfile {{path/to/output_file}}
```

- Request only TGS tickets:

```
GetUserSPNs.py {{domain}}/{{username}}:{{password}} -dc-ip
{{domain_controller_ip}} -request
```

- Request only TGS tickets using pass-the-hash authentication:

```
GetUserSPNs.py {{domain}}/{{username}} -dc-ip
{{domain_controller_ip}} -hashes {{LM_Hash}}:{{NT_Hash}} -
request
```

gfortran

Preprocess and compile Fortran source files, then assemble and link them together.

More information: https://gcc.gnu.org/onlinedocs/gfortran/Invoking-GNU-Fortran.html.

- Compile multiple source files into an executable:

```
gfortran {{path/to/source1.f90 path/to/source2.f90 ...}} -o {{path/to/output_executable}}
```

- Show common warnings, debug symbols in output, and optimize without affecting debugging:

```
gfortran {{path/to/source.f90}} -Wall -g -Og -o {{path/to/output_executable}}
```

- Include libraries from a different path:

```
gfortran {{path/to/source.f90}} -o {{path/to/output_executable}} -I{{path/to/mod_and_include}} -L{{path/to/library}} -l{{library_name}}
```

- Compile source code into Assembler instructions:

```
gfortran -S {{path/to/source.f90}}
```

- Compile source code into an object file without linking:

```
gfortran -c {{path/to/source.f90}}
```

gh a11y

This command is an alias of **`gh accessibility`**.

- View documentation for the original command:

```
tldr gh accessibility
```

gh accessibility

Learn about GitHub CLI's accessibility experiences.

More information: https://cli.github.com/manual/.

- Open the GitHub Accessibility site in your browser:

```
gh {{[a11y|accessibility]}} {{[-w|--web]}}
```

gh agent-task

Manage GitHub agent tasks.

More information: https://cli.github.com/manual/gh_agent-task.

- List the most recent agent tasks:

```
gh {{[agent|agent-task]}} list
```

- Create a new agent task for the current repository:

```
gh {{[agent|agent-task]}} create "{{Improve the performance of the data processing pipeline}}"
```

- Create a new agent task from a file:

```
gh {{[agent|agent-task]}} create {{[-F|--from-file]}} {{path/to/file}}
```

- View details about a specific agent task:

```
gh {{[agent|agent-task]}} view {{session_id|pr_number|url|branch}}
```

- Show the log of a specific agent task:

```
gh {{[agent|agent-task]}} view --log {{session_id|pr_number|url|branch}}
```

gh agent

This command is an alias of **`gh agent-task`**.

- View documentation for the original command:

```
tldr gh agent-task
```

gh alias

Manage GitHub CLI command aliases.

More information: https://cli.github.com/manual/gh_alias.

- List all the aliases `gh` is configured to use:

```
gh alias {{[ls|list]}}
```

- Create a `gh` subcommand alias:

```
gh alias set {{pv}} '{{pr view}}'
```

- Set a shell command as a `gh` subcommand:

```
gh alias set {{[-s|--shell]}} {{alias_name}} {{command}}
```

- Delete a command shortcut:

```
gh alias delete {{alias_name}}
```

- Display the subcommand help:

```
gh alias
```

gh api

Make authenticated HTTP requests to the GitHub API and print the response.

More information: https://cli.github.com/manual/gh_api.

- Display the releases for the current repository in JSON format:

```
gh api repos/:owner/:repo/releases
```

- Create a reaction for a specific issue:

```
gh api {{[-H|--header]}} {{Accept:application/
vnd.github.squirrel-girl-preview+json}} {{[-f|--raw-field]}}
'{{content=+1}}' {{repos/:owner/:repo/issues/123/reactions}}
```

- Display the result of a GraphQL query in JSON format:

```
gh api graphql {{[-f|--field]}} {{name=':repo'}} {{[-f|--raw-
field]}} '{{query}}'
```

- Send a request using a custom HTTP method:

```
gh api {{[-X|--method]}} {{POST}} {{endpoint}}
```

- Include the HTTP response headers in the output:

```
gh api {{[-i|--include]}} {{endpoint}}
```

- Do not print the response body:

```
gh api --silent {{endpoint}}
```

- Send a request to a specific GitHub Enterprise Server:

```
gh api --hostname {{github.example.com}} {{endpoint}}
```

- Display the subcommand help:

```
gh api --help
```

gh at

This command is an alias of **`gh attestation`**.

- View documentation for the original command:

```
tldr gh attestation
```

gh attestation

Download and verify artifact attestations to ensure their integrity and provenance.

More information: https://cli.github.com/manual/gh_attestation.

- Download attestations for a local file associated with a specific repository:

```
gh {{[at|attestation]}} download {{path/to/artifact.bin}} {{[-R|--repo]}} {{owner}}/{{repository}}
```

- Download attestations for an OCI container image associated with an organization:

```
gh {{[at|attestation]}} download oci://{{image_uri}} {{[-o|--owner]}} {{organization_name}}
```

- Verify a local artifact online against attestations from a specific repository:

```
gh {{[at|attestation]}} verify {{path/to/artifact.bin}} {{[-R|--repo]}} {{owner}}/{{repository}}
```

- Verify an artifact, requiring it was signed by a specific reusable workflow for enhanced security:

```
gh {{[at|attestation]}} verify {{path/to/artifact.bin}} {{[-o|--owner]}} {{organization_name}} --signer-workflow {{owner}}/{{repository}}/{{path/to/workflow.yml}}
```

- Verify an artifact and output the detailed verification results as JSON for use in policy engines:

```
gh {{[at|attestation]}} verify {{path/to/artifact.bin}} {{[-o|--owner]}} {{organization_name}} --format json
```

- Perform a fully offline verification using a downloaded bundle and a custom trusted root file:

```
gh {{[at|attestation]}} verify {{path/to/artifact.bin}} {{[-b|--bundle]}} {{path/to/bundle.jsonl}} --custom-trusted-root {{path/to/trusted_root.jsonl}}
```

- Save the trusted root of signing certificates to a file for offline verification:

```
gh {{[at|attestation]}} trusted-root > {{path/to/trusted_root.jsonl}}
```

gh auth

Authenticate with a GitHub host.

More information: https://cli.github.com/manual/gh_auth.

- Log in with interactive prompt:

```
gh auth login
```

- Log in with a token from `stdin` (created in https://github.com/settings/tokens):

```
echo {{your_token}} | gh auth login --with-token
```

- Check if you are logged in:

```
gh auth status
```

- Log out:

```
gh auth logout
```

- Log in with a specific GitHub Enterprise Server:

```
gh auth login {{[-h|--hostname]}} {{github.example.com}}
```

- Refresh the session to ensure authentication credentials have the correct minimum scopes (removes additional scopes requested previously):

```
gh auth refresh
```

- Expand the permission scopes:

```
gh auth refresh {{[-s|--scopes]}}
{{repo,admin:repo_hook,admin:org,admin:public_key,admin:org_hook,...}}
```

gh browse

Open a GitHub repository in the browser or print the URL.

More information: https://cli.github.com/manual/gh_browse.

- Open the homepage of the current repository in the default web browser:

```
gh browse
```

- Open the homepage of a specific repository in the default web browser:

```
gh browse {{owner}}/{{repository}}
```

- Open the settings page of the current repository in the default web browser:

```
gh browse {{[-s|--settings]}}
```

- Open the wiki of the current repository in the default web browser:

```
gh browse {{[-w|--wiki]}}
```

- Open a specific issue or pull request in the web browser:

```
gh browse {{issue_number|pull_request_number}}
```

- Open a specific branch in the web browser:

```
gh browse {{[-b|--branch]}} {{branch_name}}
```

- Open a specific file or directory of the current repository in the web browser:

```
gh browse {{path/to/file_or_directory}}
```

- Print the destination URL without open the web browser:

```
gh browse {{[-n|--no-browser]}}
```

gh cache

Manage GitHub Actions caches.

More information: https://cli.github.com/manual/gh_cache.

- List caches for the current repository:

```
gh cache {{[ls|list]}}
```

- List caches for a specific repository:

```
gh cache {{[ls|list]}} {{[-R|--repo]}} {{owner}}/
{{repository}}
```

- List caches with a specific cache key prefix:

```
gh cache {{[ls|list]}} {{[-k|--key]}} {{key_prefix}}
```

- List caches for a specific branch:

```
gh cache {{[ls|list]}} {{[-r|--ref]}} refs/heads/
{{branch_name}}
```

- List caches sorted by least recently accessed:

```
gh cache {{[ls|list]}} {{[-S|--sort]}} last_accessed_at {{[-
O|--order]}} asc
```

- Delete a cache by id:

```
gh cache delete {{cache_id}}
```

- Delete a cache by key:

```
gh cache delete {{cache_key}}
```

- Delete all caches:

```
gh cache delete {{[-a|--all]}}
```

gh codespace

Connect and manage your codespaces in GitHub.

More information: https://cli.github.com/manual/gh_codespace.

- Create a codespace in GitHub interactively:

```
gh {{[cs|codespace]}} create
```

- List all available codespaces:

```
gh {{[cs|codespace]}} {{[ls|list]}}
```

- Connect to a codespace via SSH interactively:

```
gh {{[cs|codespace]}} ssh
```

- Transfer a specific file to a codespace interactively:

```
gh {{[cs|codespace]}} cp {{path/to/source_file}} remote:
{{path/to/remote_file}}
```

- List the ports of a codespace interactively:

```
gh {{[cs|codespace]}} ports
```

- Display the logs from a codespace interactively:

```
gh {{[cs|codespace]}} logs
```

- Delete a codespace interactively:

```
gh {{[cs|codespace]}} delete
```

- Display help for a subcommand:

```
gh {{[cs|codespace]}} {{code|cp|create|delete|edit|...}} {{[-
h|--help]}}
```

gh completion

Generate shell completion scripts for GitHub CLI commands.

More information: https://cli.github.com/manual/gh_completion.

- Print a completion script:

```
gh completion {{[-s|--shell]}} {{bash|zsh|fish|powershell}}
```

- Append the `gh` completion script to `~/.bashrc`:

```
gh completion {{[-s|--shell]}} bash >> ~/.bashrc
```

- Append the `gh` completion script to `~/.zshrc`:

```
gh completion {{[-s|--shell]}} zsh >> ~/.zshrc
```

- Display the subcommand help:

```
gh completion
```

gh config

Change configuration for GitHub CLI.

More information: https://cli.github.com/manual/gh_config.

- Display what Git protocol is being used:

```
gh config get git_protocol
```

- Set protocol to SSH:

```
gh config set git_protocol ssh
```

- Use `delta` in side-by-side mode as the default pager for all `gh` commands:

```
gh config set pager 'delta --side-by-side'
```

- Set text editor to Vim:

```
gh config set editor {{vim}}
```

- Reset to default text editor:

```
gh config set editor ""
```

- Disable interactive prompts:

```
gh config set prompt {{disabled}}
```

- Set a specific configuration value:

```
gh config set {{key}} {{value}}
```

gh copilot

Interact with GitHub Copilot.

Note: Deprecated in favor of **`copilot`**.

More information: https://github.com/github/gh-copilot#usage.

- Suggest a command, given a description:

```
gh copilot suggest "{{Install git}}"
```

- Suggest a Git command:

```
gh copilot suggest {{[-t|--target]}} git "{{Undo the most recent local commits}}"
```

- Explain a command:

```
gh copilot explain "{{traceroute example.com}}"
```

- Generate shell-specific aliases for Bash:

```
echo 'eval "$(gh copilot alias -- bash)"' >> ~/.bashrc
```

- Generate shell-specific aliases for Zsh:

```
echo 'eval "$(gh copilot alias -- zsh)"' >> ~/.zshrc
```

- Configure options:

```
gh copilot config
```

gh cs

This command is an alias of **`gh codespace`**.

- View documentation for the original command:

```
tldr gh codespace
```

gh environment

Display help about environment variables for the GitHub CLI command.

More information: https://cli.github.com/manual/gh_help_environment.

- Display help about environment variables that can be used with `gh`:

```
gh environment
```

gh extension

Manage extensions for the GitHub CLI.

More information: https://cli.github.com/manual/gh_extension.

- Initialize a new GitHub CLI extension project in a directory of the same name:

```
gh {{[ext|extension]}} create {{extension_name}}
```

- Install an extension from a GitHub repository:

```
gh {{[ext|extension]}} install {{owner}}/{{repository}}
```

- List installed extensions:

```
gh {{[ext|extension]}} {{[ls|list]}}
```

- Upgrade a specific extension:

```
gh {{[ext|extension]}} upgrade {{extension_name}}
```

- Upgrade all extensions:

```
gh {{[ext|extension]}} upgrade --all
```

- List installed extensions:

```
gh {{[ext|extension]}} {{[ls|list]}}
```

- Remove an extension:

```
gh {{[ext|extension]}} remove {{extension_name}}
```

- Display help about a subcommand:

```
gh {{[ext|extension]}} {{subcommand}} {{[-h|--help]}}
```

gh formatting

Formatting options for JSON data exported from gh GitHub CLI command.

More information: https://cli.github.com/manual/gh_help_formatting.

- Display help about formatting JSON output from `gh` using `jq`:

```
gh formatting
```

gh gist

Work with GitHub Gists.

More information: https://cli.github.com/manual/gh_gist.

- Create a new Gist from one or more files:

```
gh gist {{[new|create]}} {{path/to/file1 path/to/file2 ...}}
```

- Create a new Gist with a specific [desc]ription:

```
gh gist {{[new|create]}} {{path/to/file1 path/to/file2 ...}}
{{[-d|--desc]}} "{{description}}"
```

- Edit a Gist:

```
gh gist edit {{id|url}}
```

- List up to 42 Gists owned by the currently logged in user:

```
gh gist {{[ls|list]}} {{[-L|--limit]}} 42
```

- View a Gist in the default browser without rendering Markdown:

```
gh gist view {{id|url}} {{[-w|--web]}} {{[-r|--raw]}}
```

gh gpg-key

Manage GPG keys registered with the authorized GitHub account.

See also: **gpg**.

More information: https://cli.github.com/manual/gh_gpg-key.

- List GPG keys in the authorized GitHub account:

```
gh gpg-key {{[ls|list]}}
```

- Add a GPG key to the authorized GitHub account by specifying the key file:

```
gh gpg-key add {{path/to/key_file}}
```

- Add a GPG key to the authorized GitHub account by specifying the key ID:

```
gpg {{[-a|--armor]}} --export {{key_id}} | gh gpg-key add -
```

- Delete a GPG key from the authorized GitHub account:

```
gh gpg-key delete {{key_id}}
```

gh help

Display help about the GitHub CLI command.

More information: https://cli.github.com/manual/gh_help.

- Display general help:

```
gh help
```

- Display help for the `gh help` subcommand:

```
gh help {{[-h|--help]}}
```

- Display help about environment variables that can be used with `gh`:

```
gh help environment
```

- Display a markdown reference of all `gh` commands:

```
gh help reference
```

- Display help about formatting JSON output from `gh` using `jq`:

```
gh help formatting
```

- Display help about using `gh` with MinTTY:

```
gh help mintty
```

- Display help for a subcommand:

```
gh help {{subcommand}}
```

- Display help for a subcommand action:

```
gh help {{pr}} {{create}}
```

gh issue create

Create GitHub issues on a repository.

More information: https://cli.github.com/manual/gh_issue_create.

- Create a new issue against the current repository interactively:

```
gh issue {{[new|create]}}
```

- Create a new issue with the bug label interactively:

```
gh issue {{[new|create]}} {{[-l|--label]}} "bug"
```

- Create a new issue interactively and assign it to the specified users:

```
gh issue {{[new|create]}} {{[-a|--assignee]}}
{{user1,user2,...}}
```

- Create a new issue with a title and body, and assign it to the current user:

```
gh issue {{[new|create]}} {{[-t|--title]}} "{{title}}" {{[-
b|--body]}} "{{body}}" {{[-a|--assignee]}} "@me"
```

- Create a new issue interactively, reading the body text from a file:

```
gh issue {{[new|create]}} {{[-F|--body-file]}} {{path/to/
file}}
```

- Create a new issue in the default web browser:

```
gh issue {{[new|create]}} {{[-w|--web]}}
```

- Display help:

```
gh issue {{[new|create]}} {{[-h|--help]}}
```

gh issue

Manage GitHub issues.

More information: https://cli.github.com/manual/gh_issue.

- Display a specific issue:

```
gh issue view {{issue_number}}
```

- Display a specific issue in the default web browser:

```
gh issue view {{issue_number}} {{[-w|--web]}}
```

- Create a new issue in the default web browser:

```
gh issue {{[new|create]}} {{[-w|--web]}}
```

- List the last 10 issues with the bug label:

```
gh issue {{[ls|list]}} {{[-L|--limit]}} 10 {{[-l|--label]}}
"bug"
```

- List closed issues made by a specific user:

```
gh issue {{[ls|list]}} {{[-s|--state]}} closed {{[-A|--
author]}} {{username}}
```

- Display the status of issues relevant to the user, in a specific repository:

```
gh issue status {{[-R|--repo]}} {{owner}}/{{repository}}
```

- Reopen a specific issue:

```
gh issue reopen {{issue_number}}
```

gh label

Work with GitHub labels.

More information: https://cli.github.com/manual/gh_label.

- List labels for the repository in the current directory:

```
gh label {{[ls|list]}}
```

- View labels for the repository in the current directory in the default web browser:

```
gh label {{[ls|list]}} {{[-w|--web]}}
```

- Create a label with a specific name, description, and color in hexadecimal format for the repository in the current directory:

```
gh label create {{name}} {{[-d|--description]}} "{{description}}" {{[-c|--color]}} {{color_hex}}
```

- Delete a label for the repository in the current directory, prompting for confirmation:

```
gh label delete {{name}}
```

- Update the name and description for a specific label for the repository in the current directory:

```
gh label edit {{name}} {{[-n|--name]}} {{new_name}} {{[-d|--description]}} "{{description}}"
```

- Clone labels from a specific repository into the repository in the current directory:

```
gh label clone {{owner}}/{{repository}}
```

- Display help for a subcommand:

```
gh label {{subcommand}} {{[-h|--help]}}
```

gh mintty

Display help about MinTTY integration for the GitHub CLI command.

More information: https://cli.github.com/manual/gh_help_mintty.

- Display help about using `gh` with MinTTY:

```
gh mintty
```

gh org

Work with GitHub organizations.

More information: https://cli.github.com/manual/gh_org.

- List organizations for the authenticated user:

```
gh org {{[ls|list]}}
```

- List a certain amount of organizations (defaults to 30):

```
gh org {{[ls|list]}} {{[-L|--limit]}} {{100}}
```

- Display help:

```
gh org --help
```

gh pr checks

View CI checks for a GitHub pull request.

More information: https://cli.github.com/manual/gh_pr_checks.

- Show checks for the pull request of the current branch:

```
gh pr checks
```

- Show checks for a specific pull request:

```
gh pr checks {{pr_number}}
```

- Watch checks and update in real time until completion:

```
gh pr checks {{pr_number}} --watch
```

- Show only required checks:

```
gh pr checks {{pr_number}} --required
```

gh pr comment

Add a comment to a GitHub pull request.

More information: https://cli.github.com/manual/gh_pr_comment.

- Comment on the pull request of the current branch:

```
gh pr comment {{[-b|--body]}} "{{LGTM}}"
```

- Comment on a specific pull request:

```
gh pr comment {{123}} {{[-b|--body]}} "{{Thanks!}}"
```

- Comment from a file:

```
gh pr comment {{123}} {{[-F|--body-file]}} {{path/to/
file.txt}}
```

- Open the editor to write a multi-line comment:

```
gh pr comment {{123}}
```

gh pr create

Manage GitHub pull requests.

More information: https://cli.github.com/manual/gh_pr_create.

- Interactively create a pull request:

```
gh pr {{[new|create]}}
```

- Create a pull request, determining the title and description from the commit messages of the current branch:

```
gh pr {{[new|create]}} {{[-f|--fill]}}
```

- Create a draft pull request:

```
gh pr {{[new|create]}} {{[-d|--draft]}}
```

- Create a pull request specifying the base branch, title, and description:

```
gh pr {{[new|create]}} {{[-B|--base]}} {{base_branch}} {{[-t|--title]}} "{{title}}" {{[-b|--body]}} "{{body}}"
```

- Start opening a pull request in the default web browser:

```
gh pr {{[new|create]}} {{[-w|--web]}}
```

gh pr merge

Merge a GitHub pull request.

More information: https://cli.github.com/manual/gh_pr_merge.

- Merge the pull request associated with the current branch interactively:

```
gh pr merge
```

- Merge the current branch into the specified pull request:

```
gh pr merge {{pr_number}} {{[-m|--merge]}}
```

- Squash and merge a pull request, then delete the branch:

```
gh pr merge {{pr_number}} {{[-sd|--squash --delete-branch]}}
```

- Rebase and merge:

```
gh pr merge {{pr_number}} {{[-r|--rebase]}}
```

- Enable auto-merge (squash):

```
gh pr merge {{pr_number}} --auto {{[-s|--squash]}}
```

- Merge with admin privileges (if allowed):

```
gh pr merge {{pr_number}} --admin
```

gh pr view

View details of a GitHub pull request.

More information: https://cli.github.com/manual/gh_pr_view.

- View the pull request associated with the current branch:

```
gh pr view
```

- View a specific pull request:

```
gh pr view {{123}}
```

- Open the pull request in the default web browser:

```
gh pr view {{[-w|--web]}}
```

- Show comments in the terminal:

```
gh pr view {{123}} {{[-c|--comments]}}
```

gh pr

Manage GitHub pull requests.

Some subcommands such as **`create`** have their own usage documentation.

More information: https://cli.github.com/manual/gh_pr.

- Create a pull request:

```
gh pr {{[new|create]}}
```

- Check out a specific pull request locally:

```
gh {{[co|pr checkout]}} {{pr_number|url|branch}}
```

- View the changes made in the pull request for the current branch:

```
gh pr diff
```

- Approve the pull request for the current branch:

```
gh pr review {{[-a|--approve]}}
```

- Merge the pull request associated with the current branch interactively:

```
gh pr merge
```

- Edit a pull request interactively:

```
gh pr edit
```

- Edit the base branch of a pull request:

```
gh pr edit {{[-B|--base]}} {{branch_name}}
```

- Check the status of the current repository's pull requests:

```
gh pr status
```

gh preview

Preview GitHub CLI programs for testing and development purposes.

These commands are unstable and may change at any time.

More information: https://cli.github.com/manual/gh_preview.

- Run a specific preview command:

```
gh preview {{command}}
```

gh project

Work with GitHub Projects.

More information: https://cli.github.com/manual/gh_project.

- List projects owned by the currently authenticated user:

```
gh project {{[ls|list]}}
```

- List projects owned by a specific user or organization:

```
gh project {{[ls|list]}} --owner {{owner}}
```

- View a project by number:

```
gh project view {{number}} --owner {{owner}}
```

- Create a new project:

```
gh project create --owner {{owner}} --title {{project_title}}
```

- Add an item (issue or pull request) to a project:

```
gh project item-add {{number}} --owner {{owner}} --url
{{issue_or_pr_url}}
```

- List items in a project:

```
gh project item-list {{number}} --owner {{owner}}
```

- Close a project:

```
gh project close {{number}} --owner {{owner}}
```

gh reference

Display a reference about the GitHub CLI command.

More information: https://cli.github.com/manual/gh_help_reference.

- Display a markdown reference of all `gh` commands:

```
gh reference
```

gh release

Manage GitHub releases.

More information: https://cli.github.com/manual/gh_release.

- List releases in a GitHub repository, limited to 30 items:

```
gh release {{[ls|list]}}
```

- Display information about a specific release:

```
gh release view {{tag}}
```

- Create a new release:

```
gh release {{[new|create]}} {{tag}}
```

- Delete a specific release:

```
gh release delete {{tag}}
```

- Download assets from a specific release:

```
gh release download {{tag}}
```

- Upload assets to a specific release:

```
gh release upload {{tag}} {{path/to/file1 path/to/file2 ...}}
```

gh repo create

Create a new GitHub repository.

Note: **`--public`**, **`--private`**, or **`--internal`** is required when not running interactively.

More information: https://cli.github.com/manual/gh_repo_create.

- Create a new repository interactively:

```
gh repo {{[new|create]}}
```

- Create a private repository from the current directory:

```
gh repo {{[new|create]}} {{[-s|--source]}} . --private
```

- Create a public repository from the current directory:

```
gh repo {{[new|create]}} {{[-s|--source]}} . --public
```

- Create a public repository with a specified name and description:

```
gh repo {{[new|create]}} {{repo_name}} {{[-d|--description]}}
"{{repo_description}}" --public
```

- Clone the new repository locally after creation:

```
gh repo {{[new|create]}} {{repo_name}} {{[-c|--clone]}} {{--
public|--private|--internal}}
```

gh repo

Work with GitHub repositories.

More information: https://cli.github.com/manual/gh_repo.

- Create a new repository interactively:

```
gh repo {{[new|create]}}
```

- Clone a repository:

```
gh repo clone {{owner}}/{{repository}}
```

- Fork and clone a repository:

```
gh repo fork {{owner}}/{{repository}} --clone
```

- View a repository in the default web browser:

```
gh repo view {{repository}} {{[-w|--web]}}
```

- List repositories owned by a specific user or organization (if the owner is not set, the default owner will be the currently logged in user):

```
gh repo {{[ls|list]}} {{owner}}
```

- List only non-forks repositories and limit the number of repositories to list (default: 30):

```
gh repo {{[ls|list]}} {{owner}} --source {{[-L|--limit]}}
{{limit}}
```

- List repositories with a specific primary coding language:

```
gh repo {{[ls|list]}} {{owner}} {{[-l|--language]}}
{{language_name}}
```

gh rs

This command is an alias of **`gh ruleset`**.

- View documentation for the original command:

```
tldr gh ruleset
```

gh ruleset

Manage GitHub repository rulesets.

More information: https://cli.github.com/manual/gh_ruleset.

- List all rulesets for the current repository:

```
gh {{[rs|ruleset]}} {{[ls|list]}}
```

- List all rulesets for a specific organization:

```
gh {{[rs|ruleset]}} {{[ls|list]}} {{[-o|--org]}}
{{organization_name}}
```

- Check the rules that apply to the current branch:

```
gh {{[rs|ruleset]}} check
```

- Check the rules that apply to a specific branch in another repository:

```
gh {{[rs|ruleset]}} check {{branch_name}} {{[-R|--repo]}}
{{owner}}/{{repository}}
```

- Interactively select and view a ruleset for the current repository:

```
gh {{[rs|ruleset]}} view
```

- View a specific ruleset by its ID:

```
gh {{[rs|ruleset]}} view {{ruleset_id}}
```

- View an organization-level ruleset by its ID:

```
gh {{[rs|ruleset]}} view {{ruleset_id}} {{[-o|--org]}}
{{organization_name}}
```

- Open the list of rulesets for a specific repository in the browser:

```
gh {{[rs|ruleset]}} {{[ls|list]}} {{[-R|--repo]}} {{owner}}/
{{repository}} {{[-w|--web]}}
```

gh run

View, run, and watch recent GitHub Actions workflow runs.

More information: https://cli.github.com/manual/gh_run.

- Interactively select a run to see information about the jobs:

```
gh run view
```

- Display information about a specific run:

```
gh run view {{workflow_run_number}}
```

- Display information about the steps of a job:

```
gh run view {{[-j|--job]}} {{job_number}}
```

- Display the log of a job:

```
gh run view {{[-j|--job]}} {{job_number}} --log
```

- Check a specific workflow and exit with a non-zero status if the run failed:

```
gh run view {{workflow_run_number}} --exit-status && {{echo "run pending or passed"}}
```

- Interactively select an active run and wait until it's done:

```
gh run watch
```

- Display the jobs for a run and wait until it's done:

```
gh run watch {{workflow_run_number}}
```

- Re-run a specific workflow:

```
gh run rerun {{workflow_run_number}}
```

gh screensaver

Extension for GitHub CLI that runs animated terminal screensavers.

See also: **`gh extension`**.

More information: https://github.com/vilmibm/gh-screensaver.

- Run a random screensaver:

```
gh screensaver
```

- Run a specific screensaver:

```
gh screensaver {{[-s|--saver]}} {{fireworks|life|marquee|
pipes|pollock|starfield}}
```

- Run the "marquee" screensaver with a specific text and font:

```
gh screensaver {{[-s|--saver]}} marquee -- --
message="{{message}}" --font={{font_name}}
```

- Run the "starfield" screensaver with a specific density and speed:

```
gh screensaver {{[-s|--saver]}} starfield -- --density
{{500}} --speed {{10}}
```

- List available screensavers:

```
gh screensaver {{[-l|--list]}}
```

gh search

Search across all of GitHub.

More information: https://cli.github.com/manual/gh_search.

- Search for code containing specific keywords:

```
gh search code {{keyword1 keyword2 ...}}
```

- Search for issues with a specific phrase:

```
gh search issues "{{search_phrase}}"
```

- Search commits by a specific author:

```
gh search commits --author {{username}}
```

- Search pull requests assigned to yourself that are still open:

```
gh search prs --assignee @me --state open
```

- Search repositories in an organization by topic:

```
gh search repos --owner {{org_name}} --topic {{topic_name}}
```

- Search issues without a certain label (Unix-like systems):

```
gh search issues -- "{{search_query}} -label:{{label_name}}"
```

- Search issues without a certain label (PowerShell):

```
gh --% search issues -- "{{search_query}} -label:
{{label_name}}"
```

- Open the search query in the web browser:

```
gh search {{subcommand}} {{[-w|--web]}} {{query}}
```

gh secret set

Create or update GitHub secrets.

More information: https://cli.github.com/manual/gh_secret_set.

- Set a secret for the current repository (user will be prompted for the value):

```
gh secret set {{name}}
```

- Set a secret from a file for the current repository:

```
gh < {{path/to/file}} secret set {{name}}
```

- Set a secret for a specific repository:

```
gh secret set {{name}} {{[-b|--body]}} {{value}} {{[-R|--repo]}} {{owner}}/{{repository}}
```

- Set an organization secret for specific repositories:

```
gh secret set {{name}} {{[-o|--org]}} {{organization}} {{[-r|--repos]}} "{{repository1,repository2,...}}"
```

- Set an organization secret with a specific visibility:

```
gh secret set {{name}} {{[-o|--org]}} {{organization}} {{[-v|--visibility]}} {{all|private|selected}}
```

gh secret

Manage GitHub secrets.

More information: https://cli.github.com/manual/gh_secret.

- List secret keys for the current repository:

```
gh secret {{[ls|list]}}
```

- List secret keys for a specific organization:

```
gh secret {{[ls|list]}} {{[-o|--org]}} {{organization}}
```

- List secret keys for a specific repository:

```
gh secret {{[ls|list]}} {{[-R|--repo]}} {{owner}}/
{{repository}}
```

- Set a secret for the current repository (user will be prompted for the value):

```
gh secret set {{name}}
```

- Set a secret from a file for the current repository:

```
gh < {{path/to/file}} secret set {{name}}
```

- Set an organization secret for specific repositories:

```
gh secret set {{name}} {{[-o|--org]}} {{organization}} {{[-
r|--repos]}} {{repository1,repository2}}
```

- Remove a secret for the current repository:

```
gh secret remove {{name}}
```

- Remove a secret for a specific organization:

```
gh secret remove {{name}} {{[-o|--org]}} {{organization}}
```

gh skyline

Generate a 3D model of your GitHub contribution history.

By default, it will create a **`{username}-{year}-github-skyline.stl`** file in the current directory.

More information: https://github.com/github/gh-skyline.

- Generate a skyline STL file for the current year and authenticated user:

```
gh skyline
```

- Generate a skyline for a specific user and year:

```
gh skyline {{[-u|--user]}} {{username}} {{[-y|--year]}} {{year}}
```

- Generate a skyline for a range of years:

```
gh skyline {{[-u|--user]}} {{username}} {{[-y|--year]}} {{first_year}}-{{last_year}}
```

- Generate a full skyline (from the user's join year to the current year):

```
gh skyline {{[-u|--user]}} {{username}} {{[-f|--full]}}
```

- Enable debug logging:

```
gh skyline {{[-d|--debug]}}
```

- Generate a skyline and specify the output file path:

```
gh skyline {{[-o|--output]}} {{path/to/output_file.stl}}
```

- Open the GitHub profile for a specific user:

```
gh skyline {{[-u|--user]}} {{username}} {{[-w|--web]}}
```

- Display help:

```
gh skyline {{[-h|--help]}}
```

gh ssh-key

Manage GitHub SSH keys.

More information: https://cli.github.com/manual/gh_ssh-key.

- List SSH keys for the currently authenticated user:

```
gh ssh-key {{[ls|list]}}
```

- Add an SSH key to the currently authenticated user's account:

```
gh ssh-key add {{path/to/key.pub}}
```

- Add an SSH key to the currently authenticated user's account with a specific title:

```
gh ssh-key add {{[-t|--title]}} {{title}} {{path/to/key.pub}}
```

- Display help:

```
gh ssh-key
```

gh status

Check the status of subscribed repositories on GitHub.

More information: https://cli.github.com/manual/gh_status.

- Print information about all repositories you're subscribed to (issues, pull requests, reviews, mentions, activity, etc.):

```
gh status
```

- Exclude certain repositories:

```
gh status {{[-e|--exclude]}} {{repositories}}
```

- Print status of repositories belonging to an organization:

```
gh status {{[-o|--org]}} {{organization}}
```

gh variable

Manage GitHub Actions and Dependabot variables.

More information: https://cli.github.com/manual/gh_variable.

- List variables for the current repository:

```
gh variable {{[ls|list]}}
```

- List variables for a specific organization:

```
gh variable {{[ls|list]}} {{[-o|--org]}} {{organization}}
```

- Get a variable for the current repository:

```
gh variable get {{name}}
```

- Set a variable for the current repository (user will be prompted for the value):

```
gh variable set {{name}}
```

- Set a variable for a deployment environment in the current repository:

```
gh variable set {{name}} {{[-e|--env]}} {{environment_name}}
```

- Set an organization variable visible to all repositories:

```
gh variable set {{name}} {{[-o|--org]}} {{organization}} {{[-
v|--visibility]}} all
```

- Set multiple variables from a dotenv file:

```
gh variable set {{[-f|--env-file]}} {{path/to/file.env}}
```

- Delete a variable for the current repository:

```
gh variable delete {{name}}
```

gh workflow

List, view, and run GitHub Actions workflows.

More information: https://cli.github.com/manual/gh_workflow.

- Interactively select a workflow to view the latest jobs for:

```
gh workflow view
```

- View a specific workflow in the default browser:

```
gh workflow view {{id|workflow_name|filename.yml}} {{[-w|--web]}}
```

- Display the YAML definition of a specific workflow:

```
gh workflow view {{id|workflow_name|filename.yml}} {{[-y|--yaml]}}
```

- Display the YAML definition for a specific Git branch or tag:

```
gh workflow view {{id|workflow_name|filename.yml}} {{[-r|--ref]}} {{branch|tag_name}} {{[-y|--yaml]}}
```

- List workflow files (use `--all` to include disabled workflows):

```
gh workflow {{[ls|list]}}
```

- Run a manual workflow with parameters:

```
gh workflow run {{id|workflow_name|filename.yml}} {{--raw-field param1=value1 --raw-field param2=value2 ...}}
```

- Run a manual workflow using a specific branch or tag with JSON parameters from `stdin`:

```
echo '{{{"param1": "value1", "param2": "value2", ...}}}' | gh workflow run {{id|workflow_name|filename.yml}} {{[-r|--ref]}} {{branch|tag_name}}
```

- Enable or disable a specific workflow:

```
gh workflow {{enable|disable}} {{id|workflow_name|filename.yml}}
```

gh

Work seamlessly with GitHub.

Some subcommands such as **`config`** have their own usage documentation.

More information: https://cli.github.com/manual/gh.

- Clone a GitHub repository locally:

```
gh repo clone {{owner}}/{{repository}}
```

- Create a new issue:

```
gh issue {{[new|create]}}
```

- View and filter the open issues of the current repository:

```
gh issue {{[ls|list]}}
```

- View an issue in the default web browser:

```
gh issue view {{[-w|--web]}} {{issue_number|url}}
```

- Create a pull request:

```
gh pr {{[new|create]}}
```

- View a pull request in the default web browser:

```
gh pr view {{[-w|--web]}} {{pr_number|url|branch}}
```

- Check out a specific pull request locally:

```
gh {{[co|pr checkout]}} {{pr_number|url|branch}}
```

- Check the status of a repository's pull requests:

```
gh pr status
```

ghc

The Glasgow Haskell Compiler.

Compiles and links Haskell source files.

More information: https://downloads.haskell.org/ghc/latest/docs/users_guide/usage.html.

- Find and compile all modules in the current directory:

```
ghc Main
```

- Compile a single file:

```
ghc {{path/to/file.hs}}
```

- Compile using extra optimization:

```
ghc -O {{path/to/file.hs}}
```

- Stop compilation after generating object files (.o):

```
ghc -c {{path/to/file.hs}}
```

- Start a REPL (interactive shell):

```
ghci
```

- Evaluate a single expression:

```
ghc -e {{expression}}
```

ghci

The Glasgow Haskell Compiler's interactive environment.

More information: https://downloads.haskell.org/ghc/latest/docs/users_guide/ghci.html.

- Start a REPL (interactive shell):

```
ghci
```

- Start a REPL and load the specified Haskell source file:

```
ghci {{source_file.hs}}
```

- Start a REPL and enable a language option:

```
ghci -X{{language_option}}
```

- Start a REPL and enable some level of compiler warnings (e.g. `all` or `compact`):

```
ghci -W{{warning_level}}
```

- Start a REPL with a colon-separated list of directories for finding source files:

```
ghci -i{{path/to/directory1:path/to/directory2:...}}
```

ghcid

Simple and efficient CLI IDE for Haskell that reloads code on file changes.

Continuously displays compile errors, warnings, and test results.

More information: https://github.com/ndmitchell/ghcid.

- Start `ghcid` and monitor a Haskell file for changes:

```
ghcid {{path/to/Main.hs}}
```

- Start `ghcid` with a specific command, such as loading a Stack or Cabal project:

```
ghcid --command "{{stack ghci Main.hs}}"
```

- Run an action (default `main`) on each file save:

```
ghcid --run={{action}} {{path/to/Main.hs}}
```

- Set maximum height and width (default to console height and width):

```
ghcid --height={{height}} --width={{width}} {{path/to/
Main.hs}}
```

- Write full GHC compiler output to a file:

```
ghcid --outputfile={{path/to/output_file.txt}} {{path/to/
Main.hs}}
```

- Execute REPL commands (eg. `-- $> 1+1`) on each file save:

```
ghcid --allow-eval {{path/to/Main.hs}}
```

ghcup

Haskell toolchain installer.

Install, manage, and update Haskell toolchains.

More information: https://gitlab.haskell.org/haskell/ghcup-hs.

- Start the interactive TUI:

```
ghcup tui
```

- List available GHC/Cabal versions:

```
ghcup list
```

- Install the recommended GHC version:

```
ghcup install ghc
```

- Install a specific GHC version:

```
ghcup install ghc {{version}}
```

- Activate a specific GHC version:

```
ghcup set ghc {{version}}
```

- Install cabal-install:

```
ghcup install cabal
```

- Update `ghcup` itself:

```
ghcup upgrade
```

ghdl

Open-source simulator for the VHDL language.

More information: https://ghdl.github.io/ghdl/.

- Analyze a VHDL source file and produce an object file:

```
ghdl -a {{filename.vhdl}}
```

- Elaborate a design (where `design` is the name of a configuration unit, entity unit, or architecture unit):

```
ghdl -e {{design}}
```

- Run an elaborated design:

```
ghdl -r {{design}}
```

- Run an elaborated design and dump output to a waveform file:

```
ghdl -r {{design}} --wave={{output.ghw}}
```

- Check the syntax of a VHDL source file:

```
ghdl -s {{filename.vhdl}}
```

- Display help:

```
ghdl --help
```

ghost

A blogging platform and headless CMS.

More information: https://docs.ghost.org/ghost-cli.

- Install Ghost in the current directory:

```
ghost install
```

- Start an instance of Ghost:

```
ghost start
```

- Restart the Ghost instance:

```
ghost restart
```

- Check the system for any potential hiccups while installing or updating Ghost:

```
ghost doctor
```

- View the logs of a Ghost instance:

```
ghost log {{name}}
```

- Run a Ghost instance directly (used by process managers and for debugging):

```
ghost run
```

- View running Ghost processes:

```
ghost ls
```

- View or edit Ghost configuration:

```
ghost config {{key}} {{value}}
```

ghostty

A fast, feature-rich, and cross-platform terminal emulator that uses platform-native UI and GPU acceleration.

Note: All options from the configuration file can also be used on the command-line (using **`--option=argument`**).

More information: https://ghostty.org/docs/config/reference.

- Open a new Ghostty window (not supported on macOS):

  ```
  ghostty
  ```

- Run a specific command in a new Ghostty window (not supported on macOS):

  ```
  ghostty -e {{command}}
  ```

- List all default and configured keybindings:

  ```
  ghostty +list-keybinds
  ```

- List all actions (i.e. what can be triggered via keybindings):

  ```
  ghostty +list-actions
  ```

- Browse an interactive list of themes:

  ```
  ghostty +list-themes
  ```

- Print the default configuration (including comments):

  ```
  ghostty +show-config --default --docs
  ```

ghq

Manage remote repository clones organized by hostname and path.

More information: https://github.com/x-motemen/ghq.

- Clone a repository under the `ghq` root directory (default is `~/ghq`):

```
ghq get {{repository_url}}
```

- Clone a repository from a user/project format (defaults to GitHub):

```
ghq get {{user}}/{{project}}
```

- Clone a repository and `cd` into it:

```
ghq get {{repository_url}} --look
```

- Clone a repository via SSH:

```
ghq get {{user}}/{{project}} -p
```

- Update an existing repository to the latest version:

```
ghq get {{repository_url}} -u
```

- List all locally cloned repositories:

```
ghq list
```

- List locally cloned repositories with full paths:

```
ghq list --full-path
```

- Remove a locally cloned repository:

```
ghq rm {{user}}/{{project}}
```

gibo

Fetch gitignore boilerplates.

More information: https://github.com/simonwhitaker/gibo.

- List available boilerplates:

```
gibo list
```

- Write a boilerplate to `stdout`:

```
gibo dump {{boilerplate}}
```

- Write a boilerplate to `.gitignore`:

```
gibo dump {{boilerplate}} >>{{.gitignore}}
```

- Search for boilerplates containing a given string:

```
gibo search {{string}}
```

- Update available local boilerplates:

```
gibo update
```

gifdiff

Compare two GIFs for identical visual appearance.

See also: **`gifsicle`**.

More information: https://www.lcdf.org/gifsicle/.

- Check how GIFs differ:

```
gifdiff {{path/to/first.gif}} {{path/to/second.gif}}
```

- Check if GIFs differ:

```
gifdiff --brief {{path/to/first.gif}} {{path/to/second.gif}}
```

gifsicle

Create, edit, manipulate, and get information about GIF files.

More information: https://www.lcdf.org/gifsicle/.

- Optimize a GIF as a new file:

```
gifsicle {{path/to/input.gif}} {{[-O|--optimize=]}}3 {{[-o|--output]}} {{path/to/output.gif}}
```

- Use batch mode (modify each given file in place) and unoptimize a GIF:

```
gifsicle {{[-b|--batch]}} {{path/to/input.gif}} {{[-U|--unoptimize]}}
```

- Extract a frame from a GIF:

```
gifsicle {{path/to/input.gif}} '#{{0}}' > {{path/to/first_frame.gif}}
```

- Make a GIF animation from selected GIFs:

```
gifsicle {{*.gif}} {{[-d|--delay]}} {{10}} {{[-l|--loop]}} > {{path/to/output.gif}}
```

- Reduce file size using lossy compression:

```
gifsicle {{[-b|--batch]}} {{path/to/input.gif}} {{[-O|--optimize=]}}3 --lossy={{100}} {{[-k|--colors]}} {{16}} {{[-f|--dither]}}
```

- Delete the first 10 frames and all frames after frame 20 from a GIF:

```
gifsicle {{[-b|--batch]}} {{path/to/input.gif}} --delete '#{{0-9}}' '#{{20-}}'
```

- Modify all frames by cropping them to a rectangle, changing their scale, flipping them, and rotating them:

```
gifsicle {{[-b|--batch]}} --crop {{starting_x}},{{starting_y}}+{{rect_width}}x{{rect_height}} --scale {{0.25}} --flip-horizontal --rotate-{{90|180|270}} {{path/to/input.gif}}
```

giftopnm

Convert a GIF file into a PNM image.

More information: https://netpbm.sourceforge.net/doc/giftopnm.html.

- Convert a GIF image to a Netpbm image pixel-for-pixel:

```
giftopnm {{path/to/input.gif}} > {{path/to/output.pnm}}
```

- Display version:

```
giftopnm {{[-v|-version]}}
```

gimp

GNU image manipulation program.

See also: **krita**.

More information: https://docs.gimp.org/en/gimp-fire-up.html#gimp-concepts-running-command-line.

- Start GIMP:

```
gimp
```

- Open specific files:

```
gimp {{path/to/image1 path/to/image2 ...}}
```

- Open specific files in a new window:

```
gimp --new-instance {{path/to/image1 path/to/image2 ...}}
```

- Start without a splash screen:

```
gimp --no-splash
```

- Print errors and warnings to the console instead of showing them in a dialog box:

```
gimp --console-messages
```

- Enable debugging signal handlers:

```
gimp --debug-handlers
```

gist

Upload code to https://gist.github.com.

More information: https://github.com/defunkt/gist.

- Log in to gist on this computer:

```
gist --login
```

- Create a gist from any number of text files:

```
gist {{file.txt}} {{file2.txt}}
```

- Create a private gist with a description:

```
gist {{[-p|--private]}} {{[-d|--description]}} "{{A
meaningful description}}" {{file.txt}}
```

- Read contents from `stdin` and create a gist from it:

```
{{echo "hello world"}} | gist
```

- List your public and private gists:

```
gist {{[-l|--list]}}
```

- List all public gists for any user:

```
gist {{[-l|--list]}} {{username}}
```

- Update a gist using the ID from URL:

```
gist {{[-u|--update]}} {{GIST_ID}} {{file.txt}}
```

git abort

Abort an ongoing rebase, merge, or cherry-pick.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-abort.

- Abort a Git rebase, merge, or cherry-pick:

```
git abort
```

git add

Adds changed files to the index.

More information: https://git-scm.com/docs/git-add.

- Add a file to the index:

```
git add {{path/to/file}}
```

- Add all files (tracked and untracked):

```
git add {{[-A|--all]}}
```

- Add all files recursively starting from the current folder:

```
git add .
```

- Only add already tracked files:

```
git add {{[-u|--update]}}
```

- Also add ignored files:

```
git add {{[-f|--force]}}
```

- Interactively stage parts of files:

```
git add {{[-p|--patch]}}
```

- Interactively stage parts of a given file:

```
git add {{[-p|--patch]}} {{path/to/file}}
```

- Interactively stage a file:

```
git add {{[-i|--interactive]}}
```

git alias

Create shortcuts for Git commands.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-alias.

- List all aliases:

```
git alias
```

- Create a new alias:

```
git alias "{{name}}" "{{command}}"
```

- Search for an existing alias:

```
git alias ^{{name}}
```

git am

Apply patch files and create a commit. Useful when receiving commits via email.

See also: **`git format-patch`** which can generate patch files.

More information: https://git-scm.com/docs/git-am.

- Apply and commit changes following a local patch file:

```
git am {{path/to/file.patch}}
```

- Apply and commit changes following a remote patch file:

```
curl {{[-L|--location]}} {{https://example.com/file.patch}} |
git am
```

- Abort the process of applying a patch file:

```
git am --abort
```

- Apply as much of a patch file as possible, saving failed hunks to reject files:

```
git am --reject {{path/to/file.patch}}
```

git annex

Manage files with Git, without checking their contents in.

When a file is annexed, its content is moved into a key-value store, and a symlink is made that points to the content.

More information: https://git-annex.branchable.com/git-annex/.

- Initialize a repo with Git annex:

```
git annex init
```

- Add a file:

```
git annex add {{path/to/file_or_directory}}
```

- Show the current status of a file or directory:

```
git annex status {{path/to/file_or_directory}}
```

- Synchronize a local repository with a remote:

```
git annex {{remote}}
```

- Get a file or directory:

```
git annex get {{path/to/file_or_directory}}
```

- Display help:

```
git annex help
```

git annotate

Show commit hash and last author on each line of a file.

See **`git blame`**, which is preferred over **`git annotate`**.

`git annotate` is provided for those familiar with other version control systems.

More information: https://git-scm.com/docs/git-annotate.

- Print a file with the author name and commit hash prepended to each line:

```
git annotate {{path/to/file}}
```

- Print a file with the author email and commit hash prepended to each line:

```
git annotate {{[-e|--show-email]}} {{path/to/file}}
```

- Print only rows that match a `regex`:

```
git annotate -L :{{regexp}} {{path/to/file}}
```

git apply

Apply a patch to files and/or to the index without creating a commit.

See also: **`git am`** which applies a patch and also creates a commit.

More information: https://git-scm.com/docs/git-apply.

- Print messages about the patched files:

```
git apply {{[-v|--verbose]}} {{path/to/file}}
```

- Apply and add the patched files to the index:

```
git apply --index {{path/to/file}}
```

- Apply a remote patch file:

```
curl {{[-L|--location]}} {{https://example.com/file.patch}} |
git apply
```

- Output diffstat for the input and apply the patch:

```
git apply --stat --apply {{path/to/file}}
```

- Apply the patch in reverse:

```
git apply {{[-R|--reverse]}} {{path/to/file}}
```

- Store the patch result in the index without modifying the working tree:

```
git apply --cache {{path/to/file}}
```

git archive-file

Export all the files of the current Git branch into a Zip archive.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-archive-file.

- Pack the currently checked out commit into a Zip archive:

```
git archive-file
```

git archive

Create an archive of files from a tree.

More information: https://git-scm.com/docs/git-archive.

- Create a `.tar` archive from the contents of the current `HEAD` and print it to `stdout`:

```
git archive {{[-v|--verbose]}} HEAD
```

- Use the Zip format and report progress verbosely:

```
git archive {{[-v|--verbose]}} --format zip HEAD
```

- Output the Zip archive to a specific file:

```
git archive {{[-v|--verbose]}} {{[-o|--output]}} {{path/to/file.zip}} HEAD
```

- Create a `.tar` archive from the contents of the latest commit of a specific branch:

```
git archive {{[-o|--output]}} {{path/to/file.tar}} {{branch_name}}
```

- Use the contents of a specific directory:

```
git archive {{[-o|--output]}} {{path/to/file.tar}} HEAD:{{path/to/directory}}
```

- Prepend a path to each file to archive it inside a specific directory:

```
git archive {{[-o|--output]}} {{path/to/file.tar}} --prefix {{path/to/prepend}}/ HEAD
```

git authors

Generate a list of committers of a Git repository.

Part of **`git-extras`**.

More information: https://manned.org/git-authors.

- Print a full list of committers to `stdout` instead of to the `AUTHORS` file:

  ```
  git authors {{[-l|--list]}}
  ```

- Append the list of committers to the `AUTHORS` file and open it in the default editor:

  ```
  git authors
  ```

- Append the list of committers, excluding emails, to the `AUTHORS` file and open it in the default editor:

  ```
  git authors --no-email
  ```

git bisect

Use binary search to find the commit that introduced a bug.

Git automatically jumps back and forth in the commit graph to progressively narrow down the faulty commit.

More information: https://git-scm.com/docs/git-bisect.

- Start a bisect session on a commit range bounded by a known buggy commit, and a known clean (typically older) one:

```
git bisect start {{bad_commit}} {{good_commit}}
```

- For each commit that `git bisect` selects, mark it as "bad" or "good" after testing it for the issue:

```
git bisect {{good|bad}}
```

- End the bisect session and return to the previous branch:

```
git bisect reset
```

- Skip a commit during a bisect (e.g. one that fails the tests due to a different issue):

```
git bisect skip
```

- Start a bisect session considering only commits that modify a specific file or directory:

```
git bisect start {{bad_commit}} {{good_commit}} -- {{path/to/file_or_directory}}
```

- Automate the bisect process using a test script that `exit`s with 0 for "good" and non-zero for "bad":

```
git bisect run {{path/to/test_script}} {{optional_script_arguments}}
```

- Display a log of what has been done so far:

```
git bisect log
```

- Show remaining candidate commits to be checked:

```
git bisect visualize
```

git blame-someone-else

Blame someone else for your bad code.

More information: https://github.com/jayphelps/git-blame-someone-else.

- Change the committer and author of a commit:

```
git blame-someone-else "{{author
<someone@example.com>}}" {{commit}}
```

git blame

Show commit hash and last author on each line of a file.

More information: https://git-scm.com/docs/git-blame.

- Print file with author name and commit hash on each line:

```
git blame {{path/to/file}}
```

- Print file with author email and commit hash on each line:

```
git blame {{[-e|--show-email]}} {{path/to/file}}
```

- Print file with author name and commit hash on each line at a specific commit:

```
git blame {{commit}} {{path/to/file}}
```

- Print file with author name and commit hash on each line before a specific commit:

```
git blame {{commit}}~ {{path/to/file}}
```

- Jump to the parent of a specific commit and track a specific text and 10 of its following lines:

```
git blame -L '/{{text}}/',+10 {{a82812aa}}^ {{path/to/file}}
```

- Print author name and commit hash information for a specific line range:

```
git blame -L {{start_line}},{{end_line}} {{path/to/file}}
```

- Ignore whitespaces and line moves:

```
git blame -w -C -C -C {{path/to/file}}
```

git branch

Main Git command for working with branches.

More information: https://git-scm.com/docs/git-branch.

- List all branches (local and remote; the current branch is highlighted by *):

```
git branch {{[-a|--all]}}
```

- List which branches include a specific Git commit in their history:

```
git branch {{[-a|--all]}} --contains {{commit_hash}}
```

- Show the name of the current branch:

```
git branch --show-current
```

- Create new branch based on the current commit:

```
git branch {{branch_name}}
```

- Create new branch based on a specific commit:

```
git branch {{branch_name}} {{commit_hash}}
```

- Rename a branch (you must switch to a different branch before doing this):

```
git branch {{[-m|--move]}} {{old_branch_name}}
{{new_branch_name}}
```

- Delete a local branch (you must switch to a different branch before doing this):

```
git branch {{[-d|--delete]}} {{branch_name}}
```

- Delete a remote branch:

```
git push {{remote_name}} {{[-d|--delete]}}
{{remote_branch_name}}
```

git browse-ci

Open the current Git repository's CI website in the default web browser.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-browse-ci.

- Open the current repository's CI configuration on its upstream website:

  ```
  git browse-ci
  ```

- Open the current repository's CI configuration on its upstream website for a specific remote:

  ```
  git browse-ci {{remote}}
  ```

git browse

View an upstream repository in the default browser.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-browse.

- Open the first upstream in the default browser:

```
git browse
```

- Open a specific upstream in the default browser:

```
git browse {{upstream}}
```

git brv

Print a list of branches, sorted by last commit date.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-brv.

- List each branch showing date, latest commit hash, and message:

```
git brv
```

git bug

A distributed bug tracker that uses Git's internal storage, so no files are added in your project.

You may submit your problems to the same Git remote you use to interact with others, much like commits and branches.

More information: https://github.com/git-bug/git-bug/blob/master/doc/md/git-bug.md.

- Create a new identity:

```
git bug user create
```

- Create a new bug:

```
git bug add
```

- Push a new bug entry to a remote:

```
git bug push
```

- Pull for updates:

```
git bug pull
```

- List existing bugs:

```
git bug ls
```

- Filter and sort bugs using a query:

```
git bug ls "{{status}}:{{open}} {{sort}}:{{edit}}"
```

- Search for bugs by text content:

```
git bug ls "{{search_query}}" baz
```

git bugreport

Capture debug information from the system and user, generating a text file to aid in the reporting of a bug in Git.

More information: https://git-scm.com/docs/git-bugreport.

- Create a new bug report file in the current directory:

```
git bugreport
```

- Create a new bug report file in the specified directory, creating it if it does not exist:

```
git bugreport {{[-o|--output-directory]}} {{path/to/directory}}
```

- Create a new bug report file with the specified filename suffix in `strftime` format:

```
git bugreport {{[-s|--suffix]}} {{%m%d%y}}
```

git bulk

Execute operations on multiple Git repositories.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-bulk.

- Register the current directory as a workspace:

```
git bulk --addcurrent {{workspace_name}}
```

- Register a workspace for bulk operations:

```
git bulk --addworkspace {{workspace_name}} /{{path/to/repository}}
```

- Clone a repository inside a specific directory, then register the repository as a workspace:

```
git bulk --addworkspace {{workspace_name}} /{{path/to/parent_directory}} --from {{remote_repository_location}}
```

- Clone repositories from a newline-separated list of remote locations, then register them as workspaces:

```
git bulk --addworkspace {{workspace_name}} /{{path/to/root_directory}} --from /{{path/to/file}}
```

- List all registered workspaces:

```
git bulk --listall
```

- Run a Git command on the repositories of the current workspace:

```
git bulk {{command}} {{command_arguments}}
```

- Remove a specific workspace:

```
git bulk --removeworkspace {{workspace_name}}
```

- Remove all workspaces:

```
git bulk --purge
```

git bundle

Package objects and references into an archive.

More information: https://git-scm.com/docs/git-bundle.

- Create a bundle file that contains all objects and references of a specific branch:

```
git bundle create {{path/to/file.bundle}} {{branch_name}}
```

- Create a bundle file of all branches:

```
git bundle create {{path/to/file.bundle}} --all
```

- Create a bundle file of the last 5 commits of the current branch:

```
git bundle create {{path/to/file.bundle}} -5 {{HEAD}}
```

- Create a bundle file of the latest 7 days:

```
git bundle create {{path/to/file.bundle}} --since 7.days {{HEAD}}
```

- Verify that a bundle file is valid and can be applied to the current repository:

```
git bundle verify {{path/to/file.bundle}}
```

- Print to `stdout` the list of references contained in a bundle:

```
git bundle unbundle {{path/to/file.bundle}}
```

- Unbundle a specific branch from a bundle file into the current repository:

```
git pull {{path/to/file.bundle}} {{branch_name}}
```

- Create a new repository from a bundle:

```
git clone {{path/to/file.bundle}}
```

git cat-file

Provide content or type and size information for Git repository objects.

More information: https://git-scm.com/docs/git-cat-file.

- Get the [s]ize of the HEAD commit in bytes:

```
git cat-file -s HEAD
```

- Get the [t]ype (blob, tree, commit, tag) of a given Git object:

```
git cat-file -t {{8c442dc3}}
```

- Pretty-[p]rint the contents of a given Git object based on its type:

```
git cat-file -p {{HEAD~2}}
```

git changelog

Generate a changelog report from repository commits and tags.

Part of **`git-extras`**.

More information: https://manned.org/git-changelog.

- Update existing file or create a new `History.md` file with the commit messages since the latest Git tag:

```
git changelog
```

- List commits from the current version:

```
git changelog {{[-l|--list]}}
```

- List a range of commits from the tag named `2.1.0` to now:

```
git changelog {{[-l|--list]}} {{[-s|--start-tag]}} 2.1.0
```

- List pretty formatted range of commits between the tag `0.5.0` and the tag `1.0.0`:

```
git changelog {{[-s|--start-tag]}} 0.5.0 {{[-f|--final-tag]}} 1.0.0
```

- List pretty formatted range of commits between the commit `0b97430` and the tag `1.0.0`:

```
git changelog --start-commit 0b97430 {{[-f|--final-tag]}} 1.0.0
```

- Specify `CHANGELOG.md` as the output file:

```
git changelog CHANGELOG.md
```

- Replace contents of current changelog file entirely:

```
git changelog {{[-p|--prune-old]}}
```

git check-attr

For every pathname, list if each attribute is unspecified, set, or unset as a gitattribute on that pathname.

More information: https://git-scm.com/docs/git-check-attr.

- Check the values of all attributes on a file:

```
git check-attr {{[-a|--all]}} {{path/to/file}}
```

- Check the value of a specific attribute on a file:

```
git check-attr {{attribute}} {{path/to/file}}
```

- Check the values of all attributes on specific files:

```
git check-attr {{[-a|--all]}} {{path/to/file1 path/to/
file2 ...}}
```

- Check the value of a specific attribute on one or more files:

```
git check-attr {{attribute}} {{path/to/file1 path/to/
file2 ...}}
```

git check-ignore

Analyze and debug Git ignore/exclude (**`.gitignore`**) files.

More information: https://git-scm.com/docs/git-check-ignore.

- Check whether a file or directory is ignored:

```
git check-ignore {{path/to/file_or_directory}}
```

- Check whether multiple files or directories are ignored:

```
git check-ignore {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}}
```

- Use pathnames, one per line, from `stdin`:

```
git < {{path/to/file_list}} check-ignore --stdin
```

- Do not check the index (used to debug why paths were tracked and not ignored):

```
git check-ignore --no-index {{path/to/file_or_directory1
path/to/file_or_directory2 ...}}
```

- Include details about the matching pattern for each path:

```
git check-ignore {{[-v|--verbose]}} {{path/to/
file_or_directory1 path/to/file_or_directory2 ...}}
```

git check-mailmap

Show canonical names and email addresses of contacts.

More information: https://git-scm.com/docs/git-check-mailmap.

- Look up the canonical name associated with an email address:

```
git check-mailmap "<{{email@example.com}}>"
```

git check-ref-format

Check if a reference name is acceptable, and exit with a non-zero status if it is not.

More information: https://git-scm.com/docs/git-check-ref-format.

- Check the format of the specified reference name:

```
git check-ref-format {{refs/head/refname}}
```

- Print the name of the last branch checked out:

```
git check-ref-format --branch @{-1}
```

- Normalize a refname:

```
git check-ref-format --normalize {{refs/head/refname}}
```

git checkout-index

Copy files from the index to the working tree.

More information: https://git-scm.com/docs/git-checkout-index.

- Restore any files deleted since the last commit:

```
git checkout-index {{[-a|--all]}}
```

- Restore any files deleted or changed since the last commit:

```
git checkout-index {{[-a|--all]}} {{[-f|--force]}}
```

- Restore any files changed since the last commit, ignoring any files that were deleted:

```
git checkout-index {{[-a|--all]}} {{[-f|--force]}} {{[-n|--no-create]}}
```

- Export a copy of the entire tree at the last commit to the specified directory (the trailing slash is important):

```
git checkout-index {{[-a|--all]}} {{[-f|--force]}} --prefix {{path/to/export_directory}}/
```

git checkout

Checkout a branch or paths to the working tree.

More information: https://git-scm.com/docs/git-checkout.

- Create and switch to a new branch:

```
git checkout -b {{branch_name}}
```

- Create and switch to a new branch based on a specific reference (branch, remote/branch, tag are examples of valid references):

```
git checkout -b {{branch_name}} {{reference}}
```

- Switch to an existing local branch:

```
git checkout {{branch_name}}
```

- Switch to the previously checked out branch:

```
git checkout -
```

- Switch to an existing remote branch:

```
git checkout {{[-t|--track]}} {{remote_name}}/{{branch_name}}
```

- Discard all unstaged changes in the current directory (see `git reset` for more undo-like commands):

```
git checkout .
```

- Discard unstaged changes to a given file:

```
git checkout {{path/to/file}}
```

- Replace a file in the current directory with the version of it committed in a given branch:

```
git checkout {{branch_name}} -- {{path/to/file}}
```

git cherry-pick

Apply the changes introduced by existing commits to the current branch.

To apply changes to another branch, first use **`git checkout`** to switch to the desired branch.

More information: https://git-scm.com/docs/git-cherry-pick.

- Apply a commit to the current branch:

  ```
  git cherry-pick {{commit}}
  ```

- Apply a range of commits to the current branch (see also: `git rebase --onto`):

  ```
  git cherry-pick {{start_commit}}~..{{end_commit}}
  ```

- Apply multiple (non-sequential) commits to the current branch:

  ```
  git cherry-pick {{commit1 commit2 ...}}
  ```

- Add the changes of a commit to the working directory, without creating a commit:

  ```
  git cherry-pick {{[-n|--no-commit]}} {{commit}}
  ```

git cherry

Find commits that have yet to be applied upstream.

More information: https://git-scm.com/docs/git-cherry.

- Show commits (and their messages) with equivalent commits upstream:

```
git cherry {{[-v|--verbose]}}
```

- Specify a different upstream and topic branch:

```
git cherry {{origin}} {{topic}}
```

- Limit commits to those within a given limit:

```
git cherry {{origin}} {{topic}} {{base}}
```

git clean

Remove files not tracked by Git from the working tree.

More information: https://git-scm.com/docs/git-clean.

- Interactively delete untracked files:

```
git clean {{[-i|--interactive]}}
```

- Show which files would be deleted without actually deleting them:

```
git clean {{[-n|--dry-run]}}
```

- Immediately force deletion of all untracked files:

```
git clean {{[-f|--force]}}
```

- Delete untracked [d]irectories:

```
git clean {{[-f|--force]}} -d
```

- Delete only untracked files matching specific paths or glob patterns:

```
git clean {{[-f|--force]}} -- {{path/to/directory}}
'{{*.ext}}'
```

- Delete untracked files except those matching the given patterns:

```
git clean {{[-f|--force]}} {{[-e|--exclude]}}
'{{*.ext}}' {{[-e|--exclude]}} {{path/to/directory}}/
```

- Delete untracked files and e[x]cluded files (those listed in `.gitignore` and `.git/info/exclude`):

```
git clean {{[-f|--force]}} -x
```

git clear-soft

Clear a Git working directory as if it was freshly cloned with the current branch excluding files in **`.gitignore`**.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-clear-soft.

- Reset all tracked files and delete all untracked files:

```
git clear-soft
```

git clear

Clear a Git working directory as if it was freshly cloned with the current branch including files in **`.gitignore`**.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-clear.

- Reset all tracked files and delete all untracked files even if they are included in the `.gitignore`:

```
git clear
```

git cliff

A highly customizable changelog generator.

More information: https://git-cliff.org/docs/usage/args/.

- Generate a changelog from all commits in a Git repository and save it to `CHANGELOG.md`:

```
git cliff > {{CHANGELOG.md}}
```

- Generate a changelog from commits starting from the latest tag and print it to `stdout`:

```
git cliff {{[-l|--latest]}}
```

- Generate a changelog from commits that belong to the current tag (use `git checkout` on a tag before this):

```
git cliff --current
```

- Generate a changelog from commits that do not belong to a tag:

```
git cliff {{[-u|--unreleased]}}
```

- Write the default config file to `cliff.toml` in the current directory:

```
git cliff {{[-i|--init]}}
```

git clone

Clone an existing repository.

More information: https://git-scm.com/docs/git-clone.

- Clone an existing repository into a new directory (the default directory is the repository name):

```
git clone {{remote_repository_location}} {{path/to/directory}}
```

- Clone an existing repository and its submodules:

```
git clone --recursive {{remote_repository_location}}
```

- Clone only the `.git` directory of an existing repository:

```
git clone {{[-n|--no-checkout]}} {{remote_repository_location}}
```

- Clone a local repository:

```
git clone {{[-l|--local]}} {{path/to/local_repository}}
```

- Clone quietly:

```
git clone {{[-q|--quiet]}} {{remote_repository_location}}
```

- Clone an existing repository only fetching the 10 most recent commits on the default branch (useful to save time):

```
git clone --depth 10 {{remote_repository_location}}
```

- Clone an existing repository only fetching a specific branch:

```
git clone {{[-b|--branch]}} {{name}} --single-branch {{remote_repository_location}}
```

- Clone an existing repository using a specific SSH command:

```
git clone {{[-c|--config]}} core.sshCommand="{{ssh -i path/to/private_ssh_key}}" {{remote_repository_location}}
```

git coauthor

Add another author to the latest commit. Since this command rewrites the Git history, **`--force`** will be needed when pushing next time.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-coauthor.

- Insert an additional author to the last Git commit:

```
git coauthor {{name}} {{name@example.com}}
```

git cola

A powerful Git GUI with a slick and intuitive user interface.

More information: https://git-cola.readthedocs.io/en/latest/git-cola.html.

- Start the GUI:

```
git cola
```

- Start the GUI in amend mode:

```
git cola --amend
```

- Prompt for a Git repository. Defaults to the current directory:

```
git cola --prompt
```

- Open the Git repository at mentioned path:

```
git cola {{[-r|--repo]}} {{path/to/git-repository}}
```

- Apply the path filter to the status widget:

```
git cola {{[-s|--status-filter]}} {{filter}}
```

git column

Display data in columns.

More information: https://git-scm.com/docs/git-column.

- Format `stdin` as multiple columns:

```
ls | git column --mode={{column}}
```

- Format `stdin` as multiple columns with a maximum width of `100`:

```
ls | git column --mode=column --width={{100}}
```

- Format `stdin` as multiple columns with a maximum padding of `30`:

```
ls | git column --mode=column --padding={{30}}
```

git commit-graph

Write and verify Git commit-graph files.

More information: https://git-scm.com/docs/git-commit-graph.

- Write a commit-graph file for the packed commits in the repository's local `.git` directory:

```
git commit-graph write
```

- Write a commit-graph file containing all reachable commits:

```
git show-ref {{[-s|--hash]}} | git commit-graph write --stdin-commits
```

- Write a commit-graph file containing all commits in the current commit-graph file along with those reachable from `HEAD`:

```
git rev-parse {{HEAD}} | git commit-graph write --stdin-commits --append
```

git commit-tree

Low level utility to create commit objects.

See also: **`git commit`**.

More information: https://git-scm.com/docs/git-commit-tree.

- Create a commit object with the specified message:

```
git commit-tree {{tree}} -m "{{message}}"
```

- Create a commit object reading the message from a file (use `-` for `stdin`):

```
git commit-tree {{tree}} -F {{path/to/file}}
```

- Create a GPG-signed commit object:

```
git commit-tree {{tree}} -m "{{message}}" {{[-S|--gpg-sign]}}
```

- Create a commit object with the specified parent commit object:

```
git commit-tree {{tree}} -m "{{message}}" -p
{{parent_commit_sha}}
```

git commit

Commit files to the repository.

More information: https://git-scm.com/docs/git-commit.

- Commit staged files to the repository with a message:

```
git commit {{[-m|--message]}} "{{message}}"
```

- Commit staged files with a message read from a file:

```
git commit {{[-F|--file]}} {{path/to/commit_message_file}}
```

- Auto stage all modified and deleted files and commit with a message:

```
git commit {{[-a|--all]}} {{[-m|--message]}} "{{message}}"
```

- Commit staged files and sign them with the specified GPG key (or the one defined in the configuration file if no argument is specified):

```
git commit {{[-S|--gpg-sign]}} {{key_id}} {{[-m|--message]}} "{{message}}"
```

- Update the last commit by adding the currently staged changes, changing the commit's hash:

```
git commit --amend
```

- Commit only specific (already staged) files:

```
git commit {{path/to/file1 path/to/file2 ...}}
```

- Create a commit, even if there are no staged files:

```
git commit {{[-m|--message]}} "{{message}}" --allow-empty
```

git commits-since

Display commits since a time or date.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-commits-since.

- Display commits since yesterday:

```
git commits-since {{yesterday}}
```

- Display commits since last week:

```
git commits-since {{last week}}
```

- Display commits since last month:

```
git commits-since {{last month}}
```

- Display commits since yesterday 2pm:

```
git commits-since {{yesterday 2pm}}
```

git config

Manage custom configuration options for Git repositories.

These configurations can be local (for the current repository) or global (for the current user).

More information: https://git-scm.com/docs/git-config.

- Globally set your name or email (this information is required to commit to a repository and will be included in all commits):

```
git config --global {{user.name|user.email}} "{{Your Name|email@example.com}}"
```

- List local, global, or system configuration entries and show their file location:

```
git config {{[-l|--list]}} --{{local|global|system}} --show-origin
```

- Set the global value of a given configuration entry (in this case an alias):

```
git config --global {{alias.unstage}} "reset HEAD --"
```

- Get the value of a given configuration entry:

```
git config {{alias.unstage}}
```

- Use an alias:

```
git {{unstage}}
```

- Revert a global configuration entry to its default value:

```
git config --global --unset {{alias.unstage}}
```

- Edit the local Git configuration (`.git/config`) in the default editor:

```
git config {{[-e|--edit]}}
```

- Edit the global Git configuration (`~/.gitconfig` by default or `$XDG_CONFIG_HOME/git/config` if such a file exists) in the default editor:

```
git config --global {{[-e|--edit]}}
```

git continue

This command is an alias of **`git abort`**.

- View documentation for the original command:

```
tldr git abort
```

git contrib

Display commits from an author.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-contrib.

- Display all commit hashes and their corresponding commit messages from a specific author:

```
git contrib {{author}}
```

git count-objects

Count the number of unpacked objects and their disk consumption.

More information: https://git-scm.com/docs/git-count-objects.

- Count all objects and display the total disk usage:

```
git count-objects
```

- Display a count of all objects and their total disk usage, displaying sizes in human-readable units:

```
git count-objects {{[-H|--human-readable]}}
```

- Display more verbose information:

```
git count-objects {{[-v|--verbose]}}
```

- Display more verbose information, displaying sizes in human-readable units:

```
git count-objects {{[-H|--human-readable]}} {{[-v|--verbose]}}
```

git count

Print the total number of commits.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-count.

- Print the total number of commits:

```
git count
```

- Print the number of commits per contributor and the total number of commits:

```
git count --all
```

git cp

Copy an existing file to a new location, preserving history.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-cp.

- Copy an existing file in a Git repo, staying in the same directory:

```
git cp {{file}} {{new_file}}
```

- Copy an existing file in a Git repo and place it elsewhere:

```
git cp {{path/to/file}} {{path/to/new_file}}
```

git create-branch

Create a Git branch in a repository.

Part of **`git-extras`**.

More information: https://manned.org/git-create-branch.

- Create a local branch:

```
git create-branch {{branch_name}}
```

- Create a branch locally and on origin:

```
git create-branch {{[-r|--remote]}} {{branch_name}}
```

- Create a branch locally and on upstream (through forks):

```
git create-branch {{[-r|--remote]}} upstream {{branch_name}}
```

git credential-cache

Git helper to temporarily store passwords in memory.

More information: https://git-scm.com/docs/git-credential-cache.

- Store Git credentials for a specific amount of time:

```
git config credential.helper 'cache --
timeout={{time_in_seconds}}'
```

git credential-store

Git helper to store passwords on disk.

More information: https://git-scm.com/docs/git-credential-store.

- Store Git credentials in a specific file:

```
git config credential.helper 'store --file={{path/to/file}}'
```

git credential

Retrieve and store user credentials.

More information: https://git-scm.com/docs/git-credential.

- Display credential information, retrieving the username and password from configuration files:

```
echo "{{url=http://example.com}}" | git credential fill
```

- Send credential information to all configured credential helpers to store for later use:

```
echo "{{url=http://example.com}}" | git credential approve
```

- Erase the specified credential information from all the configured credential helpers:

```
echo "{{url=http://example.com}}" | git credential reject
```

git cvsexportcommit

Export a single **Git** commit to a CVS checkout.

More information: https://git-scm.com/docs/git-cvsexportcommit.

- Merge a specific patch into CVS:

```
git cvsexportcommit -v -c -w {{path/to/project_cvs_checkout}}
{{commit_sha1}}
```

git daemon

A really simple server for Git repositories.

More information: https://git-scm.com/docs/git-daemon.

- Launch a Git daemon with a whitelisted set of directories:

```
git daemon --export-all {{path/to/directory1 path/to/directory2 ...}}
```

- Launch a Git daemon with a specific base directory and allow pulling from all sub-directories that look like Git repositories:

```
git daemon --base-path={{path/to/directory}} --export-all --reuseaddr
```

- Launch a Git daemon for the specified directory, verbosely printing log messages and allowing Git clients to write to it:

```
git daemon {{path/to/directory}} --enable=receive-pack --informative-errors --verbose
```

git delete-branch

Delete local and remote Git branches.

Part of **`git-extras`**. If deleting the checked out branch, only the remote branch will be deleted.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-delete-branch.

- Delete one or more local and remote Git branches:

```
git delete-branch {{branch_name1 branch_name2 ...}}
```

git delete-merged-branches

Delete branches that are listed in **`git branch --merged`** excluding master.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-delete-merged-branches.

- Delete merged branches:

```
git delete-merged-branches
```

git delete-squashed-branches

Delete branches that have been "squashed-merged" into a specified branch and checkout. If no branch is specified, default to the currently checked out branch.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-delete-squashed-branches.

- Delete all branches that were "squash-merged" into the current checked out branch:

```
git delete-squashed-branches
```

- Delete all branches that were "squash-merged" into a specific branch:

```
git delete-squashed-branches {{branch_name}}
```

git delete-submodule

Delete a submodule from a Git repository.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-delete-submodule.

- Delete a specific submodule:

```
git delete-submodule {{path/to/submodule}}
```

git delete-tag

Delete existing local and remote tags.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-delete-tag.

- Delete a tag:

```
git delete-tag {{tag_version}}
```

git delta

List files that differ from another branch.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-delta.

- List files from the current checked out branch that differ from the `main` branch:

```
git delta {{main}}
```

- List files from a specific branch that differ from another specific branch:

```
git delta {{branch_1}} {{branch_2}}
```

git describe

Give an object a human-readable name based on an available ref.

More information: https://git-scm.com/docs/git-describe.

- Create a unique name for the current commit (the name contains the most recent annotated tag, the number of additional commits, and the abbreviated commit hash):

```
git describe
```

- Create a name with 4 digits for the abbreviated commit hash:

```
git describe --abbrev={{4}}
```

- Generate a name with the tag reference path:

```
git describe --all
```

- Describe a Git tag:

```
git describe {{v1.0.0}}
```

- Create a name for the last commit of a given branch:

```
git describe {{branch_name}}
```

git diff-files

Compare files using their sha1 hashes and modes.

More information: https://git-scm.com/docs/git-diff-files.

- Compare all changed files:

```
git diff-files
```

- Compare only specified files:

```
git diff-files {{path/to/file}}
```

- Show only the names of changed files:

```
git diff-files --name-only
```

- Output a summary of extended header information:

```
git diff-files --summary
```

git diff-index

Compare the working directory with a commit or tree object.

More information: https://git-scm.com/docs/git-diff-index.

- Compare the working directory with a specific commit:

```
git diff-index {{commit}}
```

- Compare a specific file or directory in working directory with a commit:

```
git diff-index {{commit}} {{path/to/file_or_directory}}
```

- Compare the working directory with the index (staging area) to check for staged changes:

```
git diff-index --cached {{commit}}
```

- Suppress output and return an exit status to check for differences:

```
git diff-index --quiet {{commit}}
```

git diff-tree

Compares the content and mode of blobs found via two tree objects.

More information: https://git-scm.com/docs/git-diff-tree.

- Compare two tree objects:

```
git diff-tree {{tree-ish1}} {{tree-ish2}}
```

- Show changes between two specific commits:

```
git diff-tree -r {{commit1}} {{commit2}}
```

- Display changes in patch format:

```
git diff-tree {{[-p|--patch]}} {{tree-ish1}} {{tree-ish2}}
```

- Filter changes by a specific path:

```
git diff-tree {{tree-ish1}} {{tree-ish2}} -- {{path/to/
file_or_directory}}
```

git diff

Show changes to tracked files.

More information: https://git-scm.com/docs/git-diff.

- Show unstaged changes:

```
git diff
```

- Show all uncommitted changes (including staged ones):

```
git diff HEAD
```

- Show only staged (added, but not yet committed) changes:

```
git diff --staged
```

- Show changes from all commits since a given date/time (a date expression, e.g. "1 week 2 days" or an ISO date):

```
git diff 'HEAD@{{{3 months|weeks|days|hours|seconds ago}}}'
```

- Show diff statistics, like files changed, histogram, and total line insertions/deletions:

```
git diff --stat {{commit}}
```

- Output a summary of file creations, renames, and mode changes since a given commit:

```
git diff --summary {{commit}}
```

- Compare a single file between two branches or commits:

```
git diff {{branch_1}}..{{branch_2}} {{path/to/file}}
```

- Compare different files from the current branch to another branch:

```
git diff {{other_branch}}:{{path/to/file2}} {{path/to/file1}}
```

git difftool

Show file changes using external diff tools. Accepts the same options and arguments as **`git diff`**.

See also: **`git diff`**.

More information: https://git-scm.com/docs/git-difftool.

- List available diff tools:

```
git difftool --tool-help
```

- Set the default diff tool to meld:

```
git config --global diff.tool "{{meld}}"
```

- Use the default diff tool to show staged changes:

```
git difftool --staged
```

- Use a specific tool (opendiff) to show changes since a given commit:

```
git difftool {{[-t|--tool]}} {{opendiff}} {{commit}}
```

git effort

Display how much activity a file has had, showing commits per file and "active days" i.e. total number of days that contributed to the file.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-effort.

- Display each file in the repository, showing commits and active days:

```
git effort
```

- Display files modified by a specific number of commits or more, showing commits and active days:

```
git effort --above {{5}}
```

- Display files modified by a specific author, showing commits and active days:

```
git effort -- --author="{{username}}"
```

- Display files modified since a specific time/date, showing commits and active days:

```
git effort -- --since="{{last month}}"
```

- Display only the specified files or directories, showing commits and active days:

```
git effort {{path/to/file_or_directory1 path/to/
file_or_directory2 ...}}
```

- Display all files in a specific directory, showing commits and active days:

```
git effort {{path/to/directory/*}}
```

git extras

Git extension pack.

More information: https://manned.org/git-extras.

- Install or upgrade `git-extras` commands:

```
git extras update
```

- Display help:

```
git extras {{[-h|--help]}}
```

- Display version:

```
git extras {{[-v|--version]}}
```

git fame

Pretty-print Git repository contributions.

More information: https://manned.org/git-fame.

- Calculate contributions for the current Git repository:

```
git fame
```

- Exclude files/directories that match the specified `regex`:

```
git fame --excl "{{regex}}"
```

- Calculate contributions made after the specified date:

```
git fame --since "{{3 weeks ago|2021-05-13}}"
```

- Display contributions in the specified format:

```
git fame --format {{pipe|yaml|json|csv|tsv}}
```

- Display contributions per file extension:

```
git fame {{[-t|--bytype]}}
```

- Ignore whitespace changes:

```
git fame {{[-w|--ignore-whitespace]}}
```

- Detect inter-file line moves and copies:

```
git fame -C
```

- Detect intra-file line moves and copies:

```
git fame -M
```

git fast-export

Export the contents and history of a Git repository in a streamable, plain-text format.

More information: https://manned.org/git-fast-export.

- Export the entire Git repository history to `stdout`:

```
git fast-export --all
```

- Export the entire repository to a file:

```
git fast-export --all > {{path/to/file}}
```

- Export a specific branch only:

```
git fast-export {{main}}
```

- Export with `progress` statements every `n` objects (for showing progress during `git fast-import`):

```
git fast-export --progress {{n}} --all > {{path/to/file}}
```

- Export only a specific subdirectory's history:

```
git fast-export --all -- {{path/to/directory}} > {{path/to/file}}
```

git feature

Create or merge feature branches.

Feature branches obey the format feature/name.

More information: https://manned.org/git-feature.

- Create and switch to a new feature branch:

```
git feature {{feature_branch}}
```

- Merge a feature branch into the current branch creating a merge commit:

```
git feature finish {{feature_branch}}
```

- Merge a feature branch into the current branch squashing the changes into one commit:

```
git feature finish --squash {{feature_branch}}
```

- Send changes from a specific feature branch to its remote counterpart:

```
git feature {{feature_branch}} {{[-r|--remote]}} {{remote_name}}
```

git fetch

Download objects and refs from a remote repository.

More information: https://git-scm.com/docs/git-fetch.

- Fetch the latest changes from the default remote upstream repository (if set):

```
git fetch
```

- Fetch new branches from a specific remote upstream repository:

```
git fetch {{remote_name}}
```

- Fetch the latest changes from all remote upstream repositories:

```
git fetch --all
```

- Also fetch tags from the remote upstream repository:

```
git fetch {{[-t|--tags]}}
```

- Delete local references to remote branches that have been deleted upstream:

```
git fetch {{[-p|--prune]}}
```

- Deepen current shallow branch by 2 commits:

```
git fetch --deepen 2
```

- Update the `main` branch without switching to it (equivalent to `git pull`):

```
git fetch {{origin}} main:main
```

git filter-branch

Change branch history, like removing files.

More information: https://git-scm.com/docs/git-filter-branch.

- Remove a file from all commits:

```
git filter-branch --tree-filter 'rm {{[-f|--force]}}
{{file}}' HEAD
```

- Update author email:

```
git filter-branch --env-filter
'GIT_AUTHOR_EMAIL={{new_email}}' HEAD
```

- Delete a folder from history:

```
git filter-branch --tree-filter 'rm {{[-rf|--recursive --
force]}} {{folder}}' HEAD
```

git filter-repo

A versatile tool for rewriting Git history.

See also: **`bfg`**.

More information: https://github.com/newren/git-filter-repo.

- Replace a sensitive string in all files:

```
git filter-repo --replace-text <(echo '{{find}}
==>{{replacement}}')
```

- Extract a single folder, keeping history:

```
git filter-repo --path {{path/to/folder}}
```

- Remove a single folder, keeping history:

```
git filter-repo --path {{path/to/folder}} --invert-paths
```

- Move everything from sub-folder one level up:

```
git filter-repo --path-rename {{path/to/folder}}/:
```

git flow

A collection of Git extensions to provide high-level repository operations.

More information: https://github.com/nvie/gitflow.

- Initialize it inside an existing Git repository:

```
git flow init
```

- Start developing on a feature branch based on `develop`:

```
git flow feature start {{feature}}
```

- Finish development on a feature branch, merging it into the `develop` branch and deleting it:

```
git flow feature finish {{feature}}
```

- Publish a feature to the remote server:

```
git flow feature publish {{feature}}
```

- Get a feature published by another user:

```
git flow feature pull origin {{feature}}
```

git for-each-ref

List and optionally format references (branches, tags) in a Git repository.

More information: https://git-scm.com/docs/git-for-each-ref.

- List all refs (branches and tags):

```
git for-each-ref
```

- List only branches:

```
git for-each-ref refs/heads/
```

- List only tags:

```
git for-each-ref refs/tags/
```

- Show branches merged into `HEAD`:

```
git for-each-ref --merged HEAD refs/heads/
```

- List short names of all refs:

```
git for-each-ref --format "%(refname:short)"
```

- Sort refs by committer date (most recent first):

```
git for-each-ref --sort -committerdate
```

- Sort refs by committer date (oldest first):

```
git for-each-ref --sort committerdate
```

- Limit output to a specified number of refs:

```
git for-each-ref --count {{count}}
```

git for-each-repo

Run a Git command on a list of repositories.

Note: This command is experimental and may change.

More information: https://git-scm.com/docs/git-for-each-repo.

- Run maintenance on each of a list of repositories stored in the `maintenance.repo` user configuration variable:

  ```
  git for-each-repo --config maintenance.repo {{maintenance run}}
  ```

- Run `git pull` on each repository listed in a global configuration variable:

  ```
  git for-each-repo --config {{global_configuration_variable}} {{pull}}
  ```

git force-clone

Get the basic functionality of **`git clone`**, but if the destination Git repository already exists it will force-reset it to resemble a clone of the remote.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-force-clone.

- Clone a Git repository into a new directory:

```
git force-clone {{remote_repository_location}} {{path/to/directory}}
```

- Clone a Git repository into a new directory, checking out an specific branch:

```
git force-clone {{[-b|--branch]}} {{branch_name}} {{remote_repository_location}} {{path/to/directory}}
```

- Clone a Git repository into an existing directory of a Git repository, performing a force-reset to resemble it to the remote and checking out an specific branch:

```
git force-clone {{[-b|--branch]}} {{branch_name}} {{remote_repository_location}} {{path/to/directory}}
```

git fork

Fork a GitHub repo. Like **`git clone`** but forks first.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-fork.

- Fork and clone a GitHub repository by its URL:

```
git fork {{https://github.com/tldr-pages/tldr}}
```

- Fork and clone a GitHub repository by its slug:

```
git fork {{tldr-pages/tldr}}
```

git format-patch

Prepare **`.patch`** files. Useful when emailing commits elsewhere.

See also: **`git am`**.

More information: https://git-scm.com/docs/git-format-patch.

- Create an auto-named `.patch` file for all the unpushed commits:

```
git format-patch {{origin}}
```

- Write a `.patch` file for all the commits between 2 revisions to `stdout`:

```
git format-patch {{revision_1}}..{{revision_2}}
```

- Write a `.patch` file for the `n` latest commits:

```
git format-patch -{{n}}
```

git fresh-branch

Create an empty local branch.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-fresh-branch.

- Create an empty local branch:

```
git fresh-branch {{branch_name}}
```

git fsck

Verify the validity and connectivity of nodes in a Git repository index.

Does not make any modifications.

See also: **`git gc`** for cleaning up dangling blobs.

More information: https://git-scm.com/docs/git-fsck.

- Check the current repository:

```
git fsck
```

- List all tags found:

```
git fsck --tags
```

- List all root nodes found:

```
git fsck --root
```

- Show all unreachable and dangling objects, ignore reflogs, and perform a full integrity check:

```
git fsck --dangling --no-reflogs --unreachable --full
```

- Check connectivity only (skip object integrity verification):

```
git fsck --connectivity-only
```

git gc

Optimise the local repository by cleaning unnecessary files.

More information: https://git-scm.com/docs/git-gc.

- Optimise the repository:

```
git gc
```

- Aggressively optimise, takes more time:

```
git gc --aggressive
```

- Do not prune loose objects (prunes by default):

```
git gc --no-prune
```

- Suppress all output:

```
git gc --quiet
```

- Display help:

```
git gc --help
```

git get-tar-commit-id

Extract commit ID from an archive created using **`git archive`**.

More information: https://git-scm.com/docs/git-get-tar-commit-id.

- Extract commit hash ID or quietly exit with a return code of 1:

```
git < {{path/to/archive.tar}} get-tar-commit-id
```

git gh-pages

Create a new branch inside the current repository called **gh-pages**.

Part of **git-extras**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-gh-pages.

- Create the GitHub pages branch inside the repository in the current directory:

```
git gh-pages
```

git graft

Merge commits from a branch into another branch and delete the source branch.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-graft.

- Merge all commits not present on the target branch from the source branch to target branch, and delete the source branch:

```
git graft {{source_branch}} {{target_branch}}
```

git grep

Find strings inside tracked files in a repository.

Accepts a lot of the same flags as regular **`grep`**.

More information: https://git-scm.com/docs/git-grep.

- Search for a string in files in the current `HEAD`:

```
git grep "{{search_string}}"
```

- Search for a string in files matching a glob pattern in the current `HEAD`:

```
git grep "{{search_string}}" -- "{{*.ext}}"
```

- Search for a string, including submodules:

```
git grep --recurse-submodules "{{search_string}}"
```

- Search for a string at a specific point in history:

```
git grep "{{search_string}}" {{HEAD~2}}
```

- Search for a string across all branches and all of history:

```
git grep "{{search_string}}" $(git rev-list --all)
```

git gui

A GUI for Git to manage branches, commits, and remotes, and perform local merges.

See also: **`git-cola`**, **`gitk`**.

More information: https://git-scm.com/docs/git-gui.

- Launch the GUI:

```
git gui
```

- Show a specific file with author name and commit hash on each line:

```
git gui blame {{path/to/file}}
```

- Open `git gui blame` in a specific revision:

```
git gui blame {{revision}} {{path/to/file}}
```

- Open `git gui blame` and scroll the view to center on a specific line:

```
git gui blame --line={{line}} {{path/to/file}}
```

- Open a window to make one commit and return to the shell when it is complete:

```
git gui citool
```

- Open `git gui citool` in the "Amend Last Commit" mode:

```
git gui citool --amend
```

- Open `git gui citool` in a read-only mode:

```
git gui citool --nocommit
```

- Show a browser for the tree of a specific branch, opening the blame tool when clicking on the files:

```
git gui browser maint
```

git guilt

Show total blame count for files with unstaged changes or calculate the change in blame between two revisions.

Part of **`git-extras`**.

More information: https://manned.org/git-guilt.

- Show total blame count:

```
git guilt
```

- Calculate the change in blame between two revisions:

```
git guilt {{first_revision}} {{last_revision}}
```

- Show author emails instead of names:

```
git guilt {{[-e|--email]}}
```

- Ignore whitespace only changes when attributing blame:

```
git guilt {{[-w|--ignore-whitespace]}}
```

- Find blame delta over the last three weeks:

```
git guilt 'git log --until "3 weeks ago" --format "%H" {{[-
n|--max-count]}} 1'
```

- Find blame delta over the last three weeks (git 1.8.5+):

```
git guilt @{3.weeks.ago}
```

git hash-object

Computes the unique hash key of content and optionally creates an object with specified type.

More information: https://git-scm.com/docs/git-hash-object.

- Compute the object ID without storing it:

```
git hash-object {{path/to/file}}
```

- Compute the object ID and store it in the Git database:

```
git hash-object -w {{path/to/file}}
```

- Compute the object ID specifying the object type:

```
git hash-object -t {{blob|commit|tag|tree}} {{path/to/file}}
```

- Compute the object ID from `stdin`:

```
cat {{path/to/file}} | git hash-object --stdin
```

git help

Display help information about Git.

More information: https://git-scm.com/docs/git-help.

- Display help about a specific Git subcommand:

```
git help {{subcommand}}
```

- Display help about a specific Git subcommand in a web browser:

```
git help {{[-w|--web]}} {{subcommand}}
```

- Display a list of all available Git subcommands:

```
git help {{[-a|--all]}}
```

- List the available guides:

```
git help {{[-g|--guides]}}
```

- List all possible configuration variables:

```
git help {{[-c|--config]}}
```

git ignore-io

Generate **`.gitignore`** files from predefined templates.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-ignore-io.

- List available templates:

```
git ignore-io list
```

- Generate a `.gitignore` template:

```
git ignore-io {{item_a,item_b,...}}
```

git ignore

Show/update **`.gitignore`** files.

Part of **`git-extras`**.

See also: **`git ignore-io`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-ignore.

- Show the content of all global and local `.gitignore` files:

```
git ignore
```

- Ignore file(s) privately, updating `.git/info/exclude` file:

```
git ignore {{file_pattern}} {{[-p|--private]}}
```

- Ignore file(s) locally, updating local `.gitignore` file:

```
git ignore {{file_pattern}}
```

- Ignore file(s) globally, updating global `.gitignore` file:

```
git ignore {{file_pattern}} {{[-g|--global]}}
```

git imerge

Perform a merge or rebase between two Git branches incrementally.

Conflicts between branches are tracked down to pairs of individual commits, to simplify conflict resolution.

More information: https://github.com/mhagger/git-imerge.

- Start imerge-based rebase (checkout the branch to be rebased, first):

```
git imerge rebase {{branch_to_rebase_onto}}
```

- Start imerge-based merge (checkout the branch to merge into, first):

```
git imerge merge {{branch_to_be_merged}}
```

- Show ASCII diagram of in-progress merge or rebase:

```
git imerge diagram
```

- Continue imerge operation after resolving conflicts (`git add` the conflicted files, first):

```
git imerge continue --no-edit
```

- Wrap up imerge operation, after all conflicts are resolved:

```
git imerge finish
```

- Abort imerge operation, and return to the previous branch:

```
git imerge remove && git checkout {{previous_branch}}
```

git info

Display Git repository information.

Part of **`git-extras`**.

More information: https://manned.org/git-info.

- Display remote locations, remote and local branches, most recent commit data, and `.git/config` settings:

```
git info
```

- Display remote locations, remote and local branches, and most recent commit data:

```
git info --no-config
```

git init

Initialize a new local Git repository.

More information: https://git-scm.com/docs/git-init.

- Initialize a new local repository:

```
git init
```

- Initialize a repository with the specified name for the initial branch:

```
git init {{[-b|--initial-branch]}} {{branch_name}}
```

- Initialize a repository using SHA256 for object hashes (requires Git version 2.29+):

```
git init --object-format sha256
```

- Initialize a barebones repository, suitable for use as a remote over SSH:

```
git init --bare
```

git instaweb

Helper to launch a GitWeb server.

More information: https://git-scm.com/docs/git-instaweb.

- Launch a GitWeb server for the current Git repository:

```
git instaweb --start
```

- Listen only on localhost:

```
git instaweb --start {{[-l|--local]}}
```

- Listen on a specific port:

```
git instaweb --start {{[-p|--port]}} {{1234}}
```

- Use a specified HTTP daemon:

```
git instaweb --start {{[-d|--httpd]}} {{lighttpd|apache2|
mongoose|plackup|webrick}}
```

- Also auto-launch a web browser:

```
git instaweb --start {{[-b|--browser]}}
```

- Stop the currently running GitWeb server:

```
git instaweb --stop
```

- Restart the currently running GitWeb server:

```
git instaweb --restart
```

git-lfs-transfer

Server-side implementation of the Git LFS pure SSH transfer protocol.

Allows Git LFS to upload and download large files over SSH instead of HTTPS.

More information: https://github.com/charmbracelet/git-lfs-transfer#usage.

- Upload large files tracked by Git LFS to a repository:

  ```
  git-lfs-transfer {{path/to/repo.git}} upload
  ```

- Download large files tracked by Git LFS from a repository:

  ```
  git-lfs-transfer {{path/to/repo.git}} download
  ```

git lfs

Work with large files in Git repositories.

More information: https://github.com/git-lfs/git-lfs/tree/main/docs.

- Initialize Git LFS:

```
git lfs install
```

- Track files that match a glob:

```
git lfs track '{{*.bin}}'
```

- Change the Git LFS endpoint URL (useful if the LFS server is separate from the Git server):

```
git config {{[-f|--file]}} .lfsconfig lfs.url
{{lfs_endpoint_url}}
```

- List tracked patterns:

```
git lfs track
```

- List tracked files that have been committed:

```
git lfs ls-files
```

- Push all Git LFS objects to the remote server (useful if errors are encountered):

```
git lfs push --all {{remote_name}} {{branch_name}}
```

- Fetch all Git LFS objects:

```
git lfs fetch
```

- Replace pointer files with actual Git LFS objects:

```
git lfs checkout
```

git local-commits

Show local commits that haven't been pushed to origin. Any additional arguments will be passed directly to **`git log`**.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-local-commits.

- Show commits that haven't been pushed:

```
git local-commits
```

git lock

Lock a file in a Git repository from being modified by a commit.

Part of **`git-extras`**.

See also: **`git-unlock`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-lock.

- Disable the ability to commit changes of a local file:

```
git lock {{path/to/file}}
```

git locked

List locked files in a Git repository.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-locked.

- List all local locked files:

```
git locked
```

git log

Show a history of commits.

More information: https://git-scm.com/docs/git-log.

- Show the sequence of commits starting from the current one, in reverse chronological order of the Git repository in the current working directory:

```
git log
```

- Show the history of a particular file or directory, including differences:

```
git log {{[-p|--patch]}} {{path/to/file_or_directory}}
```

- Show an overview of which file(s) changed in each commit:

```
git log --stat
```

- Show a graph of commits in the current branch using only the first line of each commit message:

```
git log --oneline --graph
```

- Show a graph of all commits, tags, and branches in the entire repo:

```
git log --oneline --decorate --all --graph
```

- Show only commits with messages that include a specific string, ignoring case:

```
git log {{[-i|--regexp-ignore-case]}} --grep
{{search_string}}
```

- Show the last `n` number of commits from a certain author:

```
git log {{[-n|--max-count]}} {{n}} --author "{{author}}"
```

- Show commits between two dates (yyyy-mm-dd):

```
git log --before "{{2017-01-29}}" --after "{{2017-01-17}}"
```

git ls-files

Show information about files in the index and the working tree.

More information: https://git-scm.com/docs/git-ls-files.

- Show deleted files:

```
git ls-files {{[-d|--deleted]}}
```

- Show modified and deleted files:

```
git ls-files {{[-m|--modified]}}
```

- Show ignored and untracked files:

```
git ls-files {{[-o|--others]}}
```

- Show untracked files, not ignored:

```
git ls-files {{[-o|--others]}} --exclude-standard
```

git ls-remote

Git command for listing references in a remote repository based on name or URL.

If no name or URL are given, then the configured upstream branch will be used, or remote origin if the former is not configured.

More information: https://git-scm.com/docs/git-ls-remote.

- Show all references in the default remote repository:

```
git ls-remote
```

- Show only heads references in the default remote repository:

```
git ls-remote --heads
```

- Show only tags references in the default remote repository:

```
git ls-remote {{[-t|--tags]}}
```

- Show all references from a remote repository based on name or URL:

```
git ls-remote {{repository_url}}
```

- Show references from a remote repository filtered by a pattern:

```
git ls-remote {{repository_name}} "{{pattern}}"
```

git ls-tree

List the contents of a tree object.

More information: https://git-scm.com/docs/git-ls-tree.

- List the contents of the tree on a branch:

```
git ls-tree {{branch_name}}
```

- List the contents of the tree on a commit, recursing into subtrees:

```
git ls-tree -r {{commit_hash}}
```

- List only the filenames of the tree on a commit:

```
git ls-tree --name-only {{commit_hash}}
```

- Print the filenames of the current branch head in a tree structure (Note: `tree --fromfile` is not supported on Windows):

```
git ls-tree -r --name-only HEAD | tree --fromfile
```

git magic

Automate add, commit, and push routines.

Part of **`git-extras`**.

More information: https://manned.org/git-magic.

- Commit changes with a generated message:

```
git magic
```

- [a]dd untracked files and commit changes with a generated message:

```
git magic -a
```

- Commit changes with a custom [m]essage:

```
git magic -m "{{custom_commit_message}}"
```

- [e]dit the commit [m]essage before committing:

```
git magic -em "{{custom_commit_message}}"
```

- Commit changes and [p]ush to remote:

```
git magic -p
```

- Commit changes with a [f]orce [p]ush to remote:

```
git magic -fp
```

git mailinfo

Extract patch and authorship information from a single email message.

More information: https://git-scm.com/docs/git-mailinfo.

- Extract the patch and author data from an email message:

```
git mailinfo {{message|patch}}
```

- Extract but remove leading and trailing whitespace:

```
git mailinfo -k {{message|patch}}
```

- Remove everything from the body before a scissors line (e.g. "-->* --") and retrieve the message or patch:

```
git mailinfo --scissors {{message|patch}}
```

git maintenance

Run tasks to optimize Git repository data.

More information: https://git-scm.com/docs/git-maintenance.

- Register the current repository in the user's list of repositories to daily have maintenance run:

```
git maintenance register
```

- Schedule maintenance tasks to run on the current repository every hour:

```
git maintenance start
```

- Halt the background maintenance schedule for the current repository:

```
git maintenance stop
```

- Remove the current repository from the user's maintenance repository list:

```
git maintenance unregister
```

- Run a specific maintenance task on the current repository:

```
git maintenance run --task {{commit-graph|gc|incremental-repack|loose-objects|pack-refs|prefetch}}
```

git merge-base

Find a common ancestor of two commits.

More information: https://git-scm.com/docs/git-merge-base.

- Print the best common ancestor of two commits:

```
git merge-base {{commit_1}} {{commit_2}}
```

- Print all best common ancestors of two commits:

```
git merge-base {{[-a|--all]}} {{commit_1}} {{commit_2}}
```

- Check if a commit is an ancestor of a specific commit:

```
git merge-base --is-ancestor {{ancestor_commit}} {{commit}}
```

git merge-index

Run a merge program on files that need merging.

More information: https://git-scm.com/docs/git-merge-index.

- Merge all files needing resolution using the standard helper:

```
git merge-index git-merge-one-file -a
```

- Merge a specific file:

```
git merge-index git-merge-one-file -- {{path/to/file}}
```

- Merge multiple files, continuing on failures:

```
git merge-index -o git-merge-one-file -- {{path/to/file1
path/to/file2 ...}}
```

- Quietly merge all files with a custom program:

```
git merge-index -q {{merge-program}} -a
```

- Inspect merge inputs for a file using `cat`:

```
git merge-index cat -- {{path}}
```

git merge-into

Merge one branch into another branch.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-merge-into.

- Merge a source branch into a specific destination branch:

```
git merge-into {{source_branch}} {{destination_branch}}
```

- Merge current branch into a specific destination branch:

```
git merge-into {{destination_branch}}
```

git merge-one-file

Resolve a single file merge after a trivial merge.

More information: https://git-scm.com/docs/git-merge-one-file.

- Resolve a simple merge conflict for a file:

```
git merge-one-file {{path/to/file}}
```

- Use as a helper in merge-index for a file:

```
git merge-index git-merge-one-file {{path/to/file}}
```

- Handle a binary file merge:

```
git merge-one-file -p {{path/to/file}}
```

- Apply after read-tree in a scripted merge:

```
git read-tree -m {{branch1}} {{branch2}} && git merge-index
git-merge-one-file {{path/to/file}}
```

git merge-repo

Merge two repository histories.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-merge-repo.

- Merge a repository's branch into the current repository's directory:

```
git merge-repo {{path/to/repo}} {{branch_name}} {{path/to/directory}}
```

- Merge a remote repository's branch into the current repository's directory, not preserving history:

```
git merge-repo {{path/to/remote_repo}} {{branch_name}} .
```

git merge-tree

Merge branches without changing files.

More information: https://git-scm.com/docs/git-merge-tree.

- Show the result of a merge between two branches:

```
git merge-tree {{branch1}} {{branch2}}
```

- Perform a merge and write the resulting tree:

```
git merge-tree --write-tree {{branch1}} {{branch2}}
```

git merge

Merge branches.

More information: https://git-scm.com/docs/git-merge.

- Merge a branch into your current branch:

```
git merge {{branch_name}}
```

- Edit the merge message:

```
git merge {{[-e|--edit]}} {{branch_name}}
```

- Merge a branch and create a merge commit:

```
git merge --no-ff {{branch_name}}
```

- Abort a merge in case of conflicts:

```
git merge --abort
```

- Merge using a specific strategy:

```
git merge {{[-s|--strategy]}} {{strategy}} {{[-X|--strategy-option]}} {{strategy_option}} {{branch_name}}
```

git mergetool

Run merge conflict resolution tools to resolve merge conflicts.

More information: https://git-scm.com/docs/git-mergetool.

- Launch the default merge tool to resolve conflicts:

```
git mergetool
```

- List valid merge tools:

```
git mergetool --tool-help
```

- Launch the merge tool identified by a name:

```
git mergetool {{[-t|--tool]}} {{tool_name}}
```

- Don't prompt before each invocation of the merge tool:

```
git mergetool {{[-y|--no-prompt]}}
```

- Explicitly use the GUI merge tool (see the `merge.guitool` configuration variable):

```
git mergetool {{[-g|--gui]}}
```

- Explicitly use the regular merge tool (see the `merge.tool` configuration variable):

```
git mergetool --no-gui
```

git missing

Show commits which aren't shared between two branches.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-missing.

- Show commits which aren't shared between the currently checked-out branch and another branch:

```
git missing {{branch}}
```

- Show commits which aren't shared between two branches:

```
git missing {{branch_1}} {{branch_2}}
```

git mktree

Build a tree object using **`ls-tree`** formatted text.

More information: https://git-scm.com/docs/git-mktree.

- Build a tree object and verify that each tree entry's hash identifies an existing object:

```
git mktree
```

- Allow missing objects:

```
git mktree --missing
```

- Read the NUL ([z]ero character) terminated output of the tree object (`git ls-tree -z`):

```
git mktree -z
```

- Allow the creation of multiple tree objects:

```
git mktree --batch
```

- Sort and build a tree from `stdin` (non-recursive `git ls-tree` output format is required):

```
git < {{path/to/tree.txt}} mktree
```

git mr

Check out GitLab merge requests locally.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-mr.

- Check out a specific merge request:

```
git mr {{mr_number}}
```

- Check out a merge request from a specific remote:

```
git mr {{mr_number}} {{remote}}
```

- Checkout a merge request from its URL:

```
git mr {{url}}
```

- Clean up old merge request branches:

```
git mr clean
```

git mv

Move or rename files and update the Git index.

More information: https://git-scm.com/docs/git-mv.

- Move a file inside the repo and add the movement to the next commit:

```
git mv {{path/to/file}} {{path/to/destination}}
```

- Rename a file or directory and add the renaming to the next commit:

```
git mv {{path/to/file_or_directory}} {{path/to/destination}}
```

- Overwrite the file or directory in the target path if it exists:

```
git mv {{[-f|--force]}} {{path/to/file_or_directory}} {{path/to/destination}}
```

git name-rev

Describe a commit using existing ref names.

More information: https://git-scm.com/docs/git-name-rev.

- Show the name for `HEAD`:

```
git name-rev HEAD
```

- Show only the name:

```
git name-rev --name-only HEAD
```

- Enumerate all matching ref names:

```
git name-rev --all
```

- Use only tags to name the commit:

```
git name-rev --tags HEAD
```

- Exit with a non-zero status code instead of printing `undefined` for unknown commits:

```
git name-rev --no-undefined {{commit-ish}}
```

- Show names for multiple commits:

```
git name-rev HEAD~1 HEAD~2 main
```

- Restrict names to branch refs:

```
git name-rev --refs refs/heads/ {{commit-ish}}
```

- Read commit IDs from `stdin`:

```
echo "{{commit-ish}}" | git name-rev --annotate-stdin
```

git notes

Add or inspect object notes.

More information: https://git-scm.com/docs/git-notes.

- List all notes and the objects they are attached to:

```
git notes list
```

- List all notes attached to a given object (defaults to HEAD):

```
git notes list [{{object}}]
```

- Show the notes attached to a given object (defaults to HEAD):

```
git notes show [{{object}}]
```

- Append a note to a specified object (opens the default text editor):

```
git notes append {{object}}
```

- Append a note to a specified object, specifying the message:

```
git notes append --message="{{message_text}}"
```

- Edit an existing note (defaults to HEAD):

```
git notes edit [{{object}}]
```

- Copy a note from one object to another:

```
git notes copy {{source_object}} {{target_object}}
```

- Remove all the notes added to a specified object:

```
git notes remove {{object}}
```

git obliterate

Delete files and erase their history from a Git repository.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-obliterate.

- Erase the existence of specific files:

```
git obliterate {{file_1 file_2 ...}}
```

- Erase the existence of specific files between 2 commits:

```
git obliterate {{file_1 file_2 ...}} -- {{commit_hash_1}}..{{commit_hash_2}}
```

git p4

Import from and submit to Perforce repositories.

More information: https://git-scm.com/docs/git-p4.

- Clone a Perforce depot into a new Git repository:

```
git p4 clone {{path/to/p4_depot}}
```

- Sync changes from Perforce into the current Git repository:

```
git p4 sync {{path/to/p4_depot}}
```

- Rebase local commits on top of the latest Perforce changes:

```
git p4 rebase
```

- Submit Git changes back to Perforce:

```
git p4 submit
```

- Clone the full Perforce history instead of only the latest changelist:

```
git p4 clone {{path/to/p4_depot}}@all
```

git paste

Send commits to a pastebin site using **`pastebinit`**.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-paste.

- Send the patches between the current branch and its upstream to a pastebin using `pastebinit`:

```
git paste
```

- Pass options to `git format-patch` in order to select a different set of commits (`@^` selects the parent of `HEAD`, and so the currently checked out commit is sent):

```
git paste {{@^}}
```

git pr

Check out GitHub pull requests locally.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-pr.

- Check out a specific pull request:

```
git pr {{pr_number}}
```

- Check out a pull request from a specific remote:

```
git pr {{pr_number}} {{remote}}
```

- Check out a pull request from its URL:

```
git pr {{url}}
```

- Clean up old pull request branches:

```
git pr clean
```

git prune

Git command for pruning all unreachable objects from the object database.

This command is often not used directly but as an internal command that is used by Git gc.

More information: https://git-scm.com/docs/git-prune.

- Report what would be removed by Git prune without removing it:

```
git prune {{[-n|--dry-run]}}
```

- Prune unreachable objects and display what has been pruned to `stdout`:

```
git prune {{[-v|--verbose]}}
```

- Prune unreachable objects while showing progress:

```
git prune --progress
```

git psykorebase

Rebase a branch on top of another using a merge commit and only one conflict handling.

Part of **`git-extras`**.

More information: https://manned.org/git-psykorebase.

- Rebase the current branch on top of another using a merge commit and only one conflict handling:

```
git psykorebase {{upstream_branch}}
```

- Continue after conflicts have been handled:

```
git psykorebase --continue
```

- Specify the branch to rebase:

```
git psykorebase {{upstream_branch}} {{target_branch}}
```

git pull-request

Create a pull request for a project on GitHub.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-pull-request.

- Create a pull request for a project on GitHub:

```
git pull-request {{target_branch}}
```

git pull

Fetch branch from a remote repository and merge it to local repository.

More information: https://git-scm.com/docs/git-pull.

- Download changes from default remote repository and merge it:

```
git pull
```

- Download changes from default remote repository and use fast-forward:

```
git pull {{[-r|--rebase]}}
```

- Download changes from given remote repository and branch, then merge them into `HEAD`:

```
git pull {{remote_name}} {{branch}}
```

git push

Push commits to a remote repository.

More information: https://git-scm.com/docs/git-push.

- Send local changes in the current branch to its default remote counterpart:

```
git push
```

- Send changes from a specific local branch to its remote counterpart:

```
git push {{remote_name}} {{local_branch}}
```

- Send changes from a specific local branch to its remote counterpart, and set the remote one as the default push/pull target of the local one:

```
git push {{[-u|--set-upstream]}} {{remote_name}} {{local_branch}}
```

- Send changes from a specific local branch to a specific remote branch:

```
git push {{remote_name}} {{local_branch}}:{{remote_branch}}
```

- Send changes on all local branches to their counterparts in a given remote repository:

```
git push --all {{remote_name}}
```

- Delete a branch in a remote repository:

```
git push {{remote_name}} {{[-d|--delete]}} {{remote_branch}}
```

- Remove remote branches that don't have a local counterpart:

```
git push --prune {{remote_name}}
```

- Publish tags that aren't yet in the remote repository:

```
git push --tags
```

git range-diff

Compare two commit ranges (e.g. two versions of a branch).

More information: https://git-scm.com/docs/git-range-diff.

- Diff the changes of two individual commits:

```
git range-diff {{commit_1}}^! {{commit_2}}^!
```

- Diff the changes of ours and theirs from their common ancestor, e.g. after an interactive rebase:

```
git range-diff {{theirs}}...{{ours}}
```

- Diff the changes of two commit ranges, e.g. to check whether conflicts have been resolved appropriately when rebasing commits from `base1` to `base2`:

```
git range-diff {{base1}}..{{rev1}} {{base2}}..{{rev2}}
```

git reauthor

Change details about an author identity. Since this command rewrites the Git history, **`--force`** will be needed when pushing next time.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-reauthor.

- Change an author's email and name across the whole Git repository:

```
git reauthor {{[-o|--old-email]}} {{old@example.com}} {{[-e|--correct-email]}} {{new@example.com}} {{[-n|--correct-name]}} "{{name}}"
```

- Change the email and name to the ones defined in the Git config:

```
git reauthor {{[-o|--old-email]}} {{old@example.com}} {{[-c|--use-config]}}
```

- Change the email and name of all commits, regardless of their original author:

```
git reauthor {{[-a|--all]}} {{[-e|--correct-email]}} {{name@example.com}} {{[-n|--correct-name]}} {{name}}
```

git rebase-patch

Find the commit the patch applies to and do a rebase.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-rebase-patch.

- Find the commit the patch applies to and do a rebase:

```
git rebase-patch {{patch_file}}
```

git rebase

Reapply commits from one branch on top of another branch.

Commonly used to "move" an entire branch to another base, creating copies of the commits in the new location.

More information: https://git-scm.com/docs/git-rebase.

- Rebase the current branch on top of another specified branch:

```
git rebase {{new_base_branch}}
```

- Start an interactive rebase, which allows the commits to be reordered, omitted, combined, or modified:

```
git rebase {{[-i|--interactive]}}
{{target_base_branch_or_commit_hash}}
```

- Continue a rebase that was interrupted by a merge failure, after editing conflicting files:

```
git rebase --continue
```

- Continue a rebase that was paused due to merge conflicts, by skipping the conflicted commit:

```
git rebase --skip
```

- Abort a rebase in progress (e.g. if it is interrupted by a merge conflict):

```
git rebase --abort
```

- Move part of the current branch onto a new base, providing the old base to start from:

```
git rebase --onto {{new_base}} {{old_base}}
```

- Reapply the last 5 commits in-place, stopping to allow them to be reordered, omitted, combined, or modified:

```
git rebase {{[-i|--interactive]}} {{HEAD~5}}
```

- Auto-resolve any conflicts by favoring the working branch version (`theirs` keyword has reversed meaning in this case):

```
git rebase {{[-X|--strategy-option]}} theirs {{branch_name}}
```

git reflog

Show a log of changes to local references like HEAD, branches, or tags.

More information: https://git-scm.com/docs/git-reflog.

- Show the reflog for `HEAD`:

```
git reflog
```

- Show the reflog for a given branch:

```
git reflog {{branch_name}}
```

- Show only the 5 latest entries in the reflog:

```
git reflog {{[-n|--max-count]}} 5
```

git release

Create a Git tag for a release.

Part of **`git-extras`**.

More information: https://manned.org/git-release.

- Create and push a release:

```
git release {{tag_name}}
```

- Create and push a signed release:

```
git release {{tag_name}} -s
```

- Create and push a release with a message:

```
git release {{tag_name}} -m "{{message}}"
```

git remote

Manage set of tracked repositories ("remotes").

More information: https://git-scm.com/docs/git-remote.

- List existing remotes with their names and URLs:

```
git remote {{[-v|--verbose]}}
```

- Show information about a remote:

```
git remote show {{remote_name}}
```

- Add a remote:

```
git remote add {{remote_name}} {{remote_url}}
```

- Change the URL of a remote (use `--add` to keep the existing URL):

```
git remote set-url {{remote_name}} {{new_url}}
```

- Show the URL of a remote:

```
git remote get-url {{remote_name}}
```

- Remove a remote:

```
git remote remove {{remote_name}}
```

- Rename a remote:

```
git remote rename {{old_name}} {{new_name}}
```

git rename-branch

Rename a Git branch.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-rename-branch.

- Rename the branch you are currently on:

```
git rename-branch {{new_branch_name}}
```

- Rename a specific branch:

```
git rename-branch {{old_branch_name}} {{new_branch_name}}
```

git rename-remote

Change remote for pulling and pushing.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-rename-remote.

- Change the upstream remote to origin:

```
git rename-remote {{upstream}} {{origin}}
```

git rename-tag

Rename a Git tag.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-rename-tag.

- Rename an existing Git tag locally and remotely:

```
git rename-tag {{old_tag_name}} {{new_tag_name}}
```

git repack

Pack unpacked objects in a Git repository.

More information: https://git-scm.com/docs/git-repack.

- Pack unpacked objects in the current directory:

```
git repack
```

- Remove redundant objects after packing:

```
git repack -d
```

- Repack all objects into a single pack:

```
git repack -a
```

- Limit the repack to local objects only:

```
git repack -l
```

git repl

Git REPL (read-evaluate-print-loop) - an interactive Git shell.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-repl.

- Start an interactive Git shell:

```
git repl
```

- Run a Git command while in the interactive Git shell:

```
{{git_subcommand}} {{command_arguments}}
```

- Run an external (non-Git) command while in the interactive Git shell:

```
!{{command}} {{command_arguments}}
```

- Exit the interactive Git shell (or press `<Ctrl d>`):

```
exit
```

git replace

Create, list, and delete refs to replace objects.

More information: https://git-scm.com/docs/git-replace.

- Replace any commit with a different one, leaving other commits unchanged:

```
git replace {{object}} {{replacement}}
```

- Delete existing replace refs for the given objects:

```
git replace {{[-d|--delete]}} {{object}}
```

- Edit an object's content interactively:

```
git replace --edit {{object}}
```

git request-pull

Generate a request asking the upstream project to pull changes into its tree.

More information: https://git-scm.com/docs/git-request-pull.

- Produce a request summarizing the changes between the v1.1 release and a specified branch:

```
git request-pull {{v1.1}} {{https://example.com/project}} {{branch_name}}
```

- Produce a request summarizing the changes between the v0.1 release on the `foo` branch and the local `bar` branch:

```
git request-pull {{v0.1}} {{https://example.com/project}} {{foo:bar}}
```

git rerere

Reuse fixes for merge conflicts.

More information: https://git-scm.com/docs/git-rerere.

- Enable rerere globally:

```
git config --global rerere.enabled true
```

- Forget a file's recorded resolution:

```
git rerere forget {{path/to/file}}
```

- Check the status of recorded resolutions:

```
git rerere status
```

git reset-file

Revert a file to **HEAD** or a commit.

Part of **git-extras**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-reset-file.

- Reset a file to HEAD:

```
git reset-file {{path/to/file}}
```

- Reset a file to a specific commit:

```
git reset-file {{path/to/file}} {{commit_hash}}
```

git reset

Undo commits or unstage changes by resetting the current Git HEAD to the specified state.

If a path is passed, it works as "unstage"; if a commit hash or branch is passed, it works as "uncommit".

More information: https://git-scm.com/docs/git-reset.

- Unstage everything:

```
git reset
```

- Unstage specific file(s):

```
git reset {{path/to/file1 path/to/file2 ...}}
```

- Interactively unstage portions of a file:

```
git reset {{[-p|--patch]}} {{path/to/file}}
```

- Undo the last commit, keeping its changes (and any further uncommitted changes) in the filesystem:

```
git reset HEAD~
```

- Undo the last two commits, adding their changes to the index, i.e. staged for commit:

```
git reset --soft HEAD~2
```

- Discard any uncommitted changes, staged or not (for only unstaged changes, use `git checkout`):

```
git reset --hard
```

- Reset the repository to a given commit, discarding committed, staged, and uncommitted changes since then:

```
git reset --hard {{commit}}
```

git restore

Restore working tree files. Requires Git version 2.23+.

See also: **`git checkout`**, **`git reset`**.

More information: https://git-scm.com/docs/git-restore.

- Restore an unstaged file to the staged version:

```
git restore {{path/to/file}}
```

- Restore an unstaged file to the version of a specific commit:

```
git restore {{[-s|--source]}} {{commit}} {{path/to/file}}
```

- Discard all unstaged changes to tracked files:

```
git restore :/
```

- Unstage a file:

```
git restore {{[-S|--staged]}} {{path/to/file}}
```

- Unstage all files:

```
git restore {{[-S|--staged]}} :/
```

- Discard all changes to files, both staged and unstaged:

```
git restore {{[-W|--worktree]}} {{[-S|--staged]}} :/
```

- Interactively select sections of files to restore:

```
git restore {{[-p|--patch]}}
```

git rev-list

List revisions (commits) in reverse chronological order.

More information: https://git-scm.com/docs/git-rev-list.

- List all commits on the current branch:

```
git rev-list {{HEAD}}
```

- Print the latest commit that changed (add/edit/remove) a specific file on the current branch:

```
git rev-list {{[-n|--max-count]}} 1 HEAD -- {{path/to/file}}
```

- List commits more recent than a specific date, on a specific branch:

```
git rev-list --since "{{2019-12-01
00:00:00}}" {{branch_name}}
```

- List all merge commits on a specific commit:

```
git rev-list --merges {{commit}}
```

- Print the number of commits since a specific tag:

```
git rev-list {{tag_name}}..HEAD --count
```

git rev-parse

Display metadata related to revisions.

More information: https://git-scm.com/docs/git-rev-parse.

- Get the commit hash of a branch:

```
git rev-parse {{branch_name}}
```

- Get the current branch name:

```
git rev-parse --abbrev-ref {{HEAD}}
```

- Get the absolute path to the root directory:

```
git rev-parse --show-toplevel
```

git revert

Create new commits which reverse the effect of earlier ones.

More information: https://git-scm.com/docs/git-revert.

- Revert the most recent commit:

```
git revert {{HEAD}}
```

- Revert the 5th last commit:

```
git revert HEAD~{{4}}
```

- Revert a specific commit:

```
git revert {{0c01a9}}
```

- Revert multiple commits:

```
git revert {{branch_name~5..branch_name~2}}
```

- Don't create new commits, just change the working tree:

```
git revert {{[-n|--no-commit]}} {{0c01a9..9a1743}}
```

- Cancel a Git revert after a merge conflict:

```
git revert --abort
```

git rm

Remove files from repository index and local filesystem.

More information: https://git-scm.com/docs/git-rm.

- Remove file from repository index and filesystem:

```
git rm {{path/to/file}}
```

- Remove directory:

```
git rm -r {{path/to/directory}}
```

- Remove file from repository index but keep it untouched locally:

```
git rm --cached {{path/to/file}}
```

git root

Print the root directory of the current Git repository.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-root.

- Print the absolute path of the current Git repository:

```
git root
```

- Print the current working directory relative to the root of the current Git repository:

```
git root {{[-r|--relative]}}
```

git rscp

Reverse **`git scp`** - copy files from the working directory of a remote repository to the current working tree.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-scp.

- Copy specific files from a remote:

```
git rscp {{remote_name}} {{path/to/file1 path/to/file2 ...}}
```

- Copy a specific directory from a remote:

```
git rscp {{remote_name}} {{path/to/directory}}
```

git scp

Copy files from the current working tree to the working directory of a remote repository.

Part of **`git-extras`**. Uses **`rsync`** to transfer files.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-scp.

- Copy unstaged files to a specific remote:

```
git scp {{remote_name}}
```

- Copy staged and unstaged files to a remote:

```
git scp {{remote_name}} HEAD
```

- Copy files that has been changed in the last commit and any staged or unstaged files to a remote:

```
git scp {{remote_name}} HEAD~1
```

- Copy specific files to a remote:

```
git scp {{remote_name}} {{path/to/file1 path/to/file2 ...}}
```

- Copy a specific directory to a remote:

```
git scp {{remote_name}} {{path/to/directory}}
```

git secret

Stores private data inside a Git repository. Written in Bash.

More information: https://github.com/sobolevn/git-secret.

- Initialize `git-secret` in a local repository:

```
git secret init
```

- Grant access to the current Git user's email:

```
git secret tell -m
```

- Grant access by email:

```
git secret tell {{email}}
```

- Revoke access by email:

```
git secret killperson {{email}}
```

- List emails with access to secrets:

```
git secret whoknows
```

- Register a secret file:

```
git secret add {{path/to/file}}
```

- Encrypt secrets:

```
git secret hide
```

- Decrypt secret files:

```
git secret reveal
```

git sed

Replace patterns in git-controlled files using sed.

Part of **`git-extras`**.

More information: https://manned.org/git-sed.

- Replace the specified text in the current repository:

```
git sed '{{find_text}}' '{{replace_text}}'
```

- Replace the specified text and then commit the resulting changes with a standard commit message:

```
git sed -c '{{find_text}}' '{{replace_text}}'
```

- Replace the specified text, using `regex`:

```
git sed -f g '{{find_text}}' '{{replace_text}}'
```

- Replace a specific text in all files under a given directory:

```
git sed '{{find_text}}' '{{replace_text}}' -- {{path/to/directory}}
```

git send-email

Send a collection of patches as emails.

Patches can be specified as files, directions, or a revision list.

More information: https://git-scm.com/docs/git-send-email.

- Send the last commit in the current branch interactively:

```
git send-email -1
```

- Send a given commit:

```
git send-email -1 {{commit}}
```

- Send multiple (e.g. 10) commits in the current branch:

```
git send-email {{-10}}
```

- Send an introductory email message for the patch series:

```
git send-email -{{number_of_commits}} --compose
```

- Review and edit the email message for each patch you're about to send:

```
git send-email -{{number_of_commits}} --annotate
```

git setup

Create a Git repository in a directory and commit all files.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-setup.

- Create a Git repository in the current directory and commit all files:

```
git setup
```

- Create a Git repository in a specific directory and commit all files:

```
git setup {{path/to/directory}}
```

git shortlog

Summarizes the **`git log`** output.

More information: https://git-scm.com/docs/git-shortlog.

- View a summary of all the commits made, grouped alphabetically by author name:

```
git shortlog
```

- View a summary of all the commits made, sorted by the number of commits made:

```
git shortlog {{[-n|--numbered]}}
```

- View a summary of all the commits made, grouped by the committer identities (name and email):

```
git shortlog {{[-c|--committer]}}
```

- View a summary of the last 5 commits (i.e. specify a revision range):

```
git shortlog HEAD~5..HEAD
```

- View all users, emails, and the number of commits in the current branch:

```
git shortlog {{[-s|--summary]}} {{[-n|--numbered]}} {{[-e|--email]}}
```

- View all users, emails, and the number of commits in all branches:

```
git shortlog {{[-s|--summary]}} {{[-n|--numbered]}} {{[-e|--email]}} --all
```

git show-branch

Show branches and their commits.

More information: https://git-scm.com/docs/git-show-branch.

- Show a summary of the latest commit on a branch:

```
git show-branch {{branch_name|ref|commit}}
```

- Compare commits in the history of multiple commits or branches:

```
git show-branch {{branch_name1|ref1|commit1 branch_name2|
ref2|commit2 ...}}
```

- Compare all remote tracking branches:

```
git show-branch {{[-r|--remotes]}}
```

- Compare both local and remote tracking branches:

```
git show-branch {{[-a|--all]}}
```

- List the latest commits in all branches:

```
git show-branch {{[-a|--all]}} --list
```

- Compare a given branch with the current branch:

```
git show-branch --current {{commit|branch_name|ref}}
```

- Display the commit name instead of the relative name:

```
git show-branch --sha1-name --current {{current|branch_name|
ref}}
```

- Keep going a given number of commits past the common ancestor:

```
git show-branch --more {{5}} {{branch_name1|ref1|commit1
branch_name2|ref2|commit2 ...}}
```

git show-index

Show the packed archive index of a Git repository.

More information: https://git-scm.com/docs/git-show-index.

- Read an IDX file for a Git packfile and dump its contents to `stdout`:

```
git show-index {{path/to/file.idx}}
```

- Specify the hash algorithm for the index file (experimental):

```
git show-index --object-format {{sha1|sha256}} {{path/to/file}}
```

git show-merged-branches

Print all branches which are merged into the current head.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-show-merged-branches.

- Print all branches which are merged into the current head:

```
git show-merged-branches
```

git show-ref

Git command for listing references.

More information: https://git-scm.com/docs/git-show-ref.

- Show all refs in the repository:

```
git show-ref
```

- Show only heads references:

```
git show-ref --branches
```

- Show only tags references:

```
git show-ref --tags
```

- Verify that a given reference exists:

```
git show-ref --verify {{path/to/ref}}
```

git show-tree

Show a decorated tree graph with all branches of a Git repository, showing annotations.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-show-tree.

- Show a decorated tree graph for all branches annotated with tags and branch names:

```
git show-tree
```

git show-unmerged-branches

Print all branches which are not merged into the current **`HEAD`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-show-unmerged-branches.

- Print all branches which are not merged into the current `HEAD`:

```
git show-unmerged-branches
```

git show

Show various types of Git objects (commits, tags, etc.).

More information: https://git-scm.com/docs/git-show.

- Show information about the latest commit (hash, message, changes, and other metadata):

```
git show
```

- Show information about a specific commit, tag, or branch (such as `HEAD` for the latest commit):

```
git show {{commit|tag|branch}}
```

- Show only the list of added, renamed, or deleted files:

```
git show --summary {{commit}}
```

- Show information about the 3rd commit from the `HEAD` of a branch:

```
git show {{branch}}~{{3}}
```

- Show a commit's message in a single line, suppressing the diff output:

```
git show --oneline {{[-s|--no-patch]}} {{commit}}
```

- Show only statistics (added/removed characters) about the changed files:

```
git show --stat {{commit}}
```

- Show a simplified list of all files changed in a commit (modified, added, and deleted):

```
git show --name-only {{commit}}
```

- Show the contents of a file as it was at a given revision (e.g. branch, tag, or commit):

```
git show {{revision}}:{{path/to/file}}
```

git-sizer

Computes various Git repository size metrics and alerts you to any that might cause problems or inconvenience.

More information: https://github.com/github/git-sizer.

- Report only statistics that have a level of concern greater than 0:

```
git-sizer
```

- Report all statistics:

```
git-sizer -v
```

- See additional options:

```
git-sizer -h
```

git sparse-checkout

Check out only part of a repository's files instead of cloning or checking out everything.

More information: https://manned.org/git-sparse-checkout.

- Enable sparse checkout:

```
git sparse-checkout init
```

- Disable sparse-checkout and restore full repository:

```
git sparse-checkout disable
```

- Specify which directories (or files) to include:

```
git sparse-checkout set {{path/to/directory}}
```

- Add more paths later:

```
git sparse-checkout add {{path/to/directory}}
```

git squash

Squash multiple commits into a single commit.

Part of **`git-extras`**.

More information: https://manned.org/git-squash.

- Merge all commits from a specific branch into the current branch as a single commit:

```
git squash {{source_branch}}
```

- Squash all commits starting with a specific commit on the current branch:

```
git squash {{commit}}
```

- Squash the n latest commits and commit with a message:

```
git squash HEAD~{{n}} "{{message}}"
```

- Squash the n latest commits and commit concatenating all individual messages:

```
git squash --squash-msg HEAD~{{n}}
```

git stage

This command is an alias of **`git add`**.

- View documentation for the original command:

```
tldr git add
```

git stamp

Stamp the last commit message, with the possibility to reference the issues numbers from your bug tracker or link to its review page.

Part of **`git-extras`**.

More information: https://manned.org/git-stamp.

- Stamp the last commit message referencing it with the issue number from your bug tracker:

```
git stamp {{issue_number}}
```

- Stamp the last commit message linking it to its review page:

```
git stamp {{Review https://example.org/path/to/review}}
```

- Stamp the last commit message replacing previous issues with a new one:

```
git stamp {{[-r|--replace]}} {{issue_number}}
```

git standup

See commits from a specified user.

Part of **`git-extras`**.

More information: https://manned.org/git-standup.

- Show a given author's commits from the last 10 days:

```
git standup -a {{name|email}} -d {{10}}
```

- Show a given author's commits from the last 10 days and whether they are GPG signed:

```
git standup -a {{name|email}} -d {{10}} -g
```

- Show all the commits from all contributors for the last 10 days:

```
git standup -a all -d {{10}}
```

- Display help:

```
git standup -h
```

git stash

Stash local Git changes in a temporary area.

More information: https://git-scm.com/docs/git-stash.

- Stash current changes with a message, except new (untracked) files:

```
git stash push {{[-m|--message]}} {{stash_message}}
```

- Stash current changes, including new untracked files:

```
git stash {{[-u|--include-untracked]}}
```

- Interactively select parts of changed files for stashing:

```
git stash {{[-p|--patch]}}
```

- List all stashes (shows stash name, related branch and message):

```
git stash list
```

- Show the changes as a patch between the stash (default is `stash@{0}`) and the commit back when stash entry was first created:

```
git stash show {{[-p|--patch]}} {{stash@{0}}}
```

- Apply a stash (default is the latest, named `stash@{0}`):

```
git stash apply {{optional_stash_name_or_commit}}
```

- Drop or apply a stash (default is `stash@{0}`) and remove it from the stash list if applying doesn't cause conflicts:

```
git stash pop {{optional_stash_name}}
```

- Drop all stashes:

```
git stash clear
```

git status

Show the changes to files in a Git repository.

List changed, added, and deleted files compared to the currently checked-out commit.

More information: https://git-scm.com/docs/git-status.

- Show changed files which are not yet added for commit:

```
git status
```

- Give output in short format:

```
git status {{[-s|--short]}}
```

- Show verbose information on changes in both the staging area and working directory:

```
git status {{[-vv|--verbose --verbose]}}
```

- Show the branch and tracking info:

```
git status {{[-b|--branch]}}
```

- Show output in short format along with branch info:

```
git status {{[-sb|--short --branch]}}
```

- Show the number of entries currently stashed away:

```
git status --show-stash
```

- Don't show untracked files in the output:

```
git status {{[-uno|--untracked-files=no]}}
```

git stripspace

Read text (e.g. commit messages, notes, tags, and branch descriptions) from **`stdin`** and clean it into the manner used by Git.

More information: https://git-scm.com/docs/git-stripspace.

- Trim whitespace from a file:

```
cat {{path/to/file}} | git stripspace
```

- Trim whitespace and Git comments from a file:

```
cat {{path/to/file}} | git stripspace {{[-s|--strip-comments]}}
```

- Convert all lines in a file into Git comments:

```
git < {{path/to/file}} stripspace {{[-c|--comment-lines]}}
```

git submodule

Inspect, update, and manage submodules.

More information: https://git-scm.com/docs/git-submodule.

- View existing submodules and the checked-out commit for each one:

```
git submodule
```

- Install a repository's submodules (listed in `.gitmodules`):

```
git submodule update --init --recursive
```

- Add a Git repository as a submodule of the current one:

```
git submodule add {{repository_url}}
```

- Add a Git repository as a submodule of the current one, at a specific directory:

```
git submodule add {{repository_url}} {{path/to/directory}}
```

- Update submodules to their latest commits:

```
git submodule update --remote
```

- Change the URL of a submodule:

```
git submodule set-url {{path/to/submodule}} {{new_url}}
```

- Unregister a submodule (e.g. before removing it from the repository with `git rm`):

```
git submodule deinit {{path/to/submodule}}
```

git subtree

Merge subtrees together or split repository into subtrees.

More information: https://manned.org/git-subtree.

- Add a Git repository as a subtree and squash the commits together:

```
git subtree add {{[-P|--prefix]}} {{path/to/directory}} --
squash {{repository_url}} {{branch_name}}
```

- Update subtree repository to its latest commit:

```
git subtree pull {{[-P|--prefix]}} {{path/to/directory}}
{{repository_url}} {{branch_name}}
```

- Merge recent changes up to the latest subtree commit into the subtree:

```
git subtree merge {{[-P|--prefix]}} {{path/to/directory}} --
squash {{repository_url}} {{branch_name}}
```

- Push commits to a subtree repository:

```
git subtree push {{[-P|--prefix]}} {{path/to/directory}}
{{repository_url}} {{branch_name}}
```

- Extract a new project history from the history of a subtree:

```
git subtree split {{[-P|--prefix]}} {{path/to/directory}}
{{repository_url}} {{[-b|--branch]}} {{branch_name}}
```

git summary

Display information about a Git repository.

Part of **`git-extras`**.

More information: https://manned.org/git-summary.

- Display data about a Git repository:

```
git summary
```

- Display data about a Git repository since a commit-ish:

```
git summary {{commit|branch_name|tag_name}}
```

- Display data about a Git repository, merging committers using different emails into 1 statistic for each author:

```
git summary --dedup-by-email
```

- Display data about a Git repository, showing the number of lines modified by each contributor:

```
git summary --line
```

git svn

Bidirectional operation between a Subversion repository and Git.

More information: https://git-scm.com/docs/git-svn.

- Clone an SVN repository:

```
git svn clone {{https://example.com/subversion_repo}} {{local_directory}}
```

- Clone an SVN repository starting at a given revision number:

```
git svn clone {{[-r|--revision]}} {{1234}}:HEAD {{https://svn.example.net/subversion/repo}} {{local_directory}}
```

- Update local clone from the remote SVN repository:

```
git svn rebase
```

- Fetch updates from the remote SVN repository without changing the Git `HEAD`:

```
git svn fetch
```

- Commit back to the SVN repository:

```
git svn commit
```

git switch

Switch between Git branches. Requires Git version 2.23+.

See also: **`git checkout`**.

More information: https://git-scm.com/docs/git-switch.

- Switch to an existing branch:

```
git switch {{branch_name}}
```

- Create a new branch and switch to it:

```
git switch {{[-c|--create]}} {{branch_name}}
```

- Create a new branch based on an existing commit and switch to it:

```
git switch {{[-c|--create]}} {{branch_name}} {{commit}}
```

- Switch to the previous branch:

```
git switch -
```

- Switch to a branch and update all submodules to match:

```
git switch --recurse-submodules {{branch_name}}
```

- Switch to a branch and automatically merge the current branch and any uncommitted changes into it:

```
git switch {{[-m|--merge]}} {{branch_name}}
```

- Switch to a tag:

```
git switch {{[-d|--detach]}} {{tag}}
```

git symbolic-ref

Read, change, or delete files that store references.

More information: https://git-scm.com/docs/git-symbolic-ref.

- Store a reference by a name:

```
git symbolic-ref refs/{{name}} {{ref}}
```

- Store a reference by name, including a message with a reason for the update:

```
git symbolic-ref -m "{{message}}" refs/{{name}} refs/heads/{{branch_name}}
```

- Read a reference by name:

```
git symbolic-ref refs/{{name}}
```

- Delete a reference by name:

```
git symbolic-ref {{[-d|--delete]}} refs/{{name}}
```

- For scripting, hide errors with `--quiet` and use `--short` to simplify ("refs/heads/X" prints as "X"):

```
git symbolic-ref {{[-q|--quiet]}} --short refs/{{name}}
```

git sync

Sync local branches with remote branches.

Part of **`git-extras`**.

More information: https://manned.org/git-sync.

- Sync the current local branch with its remote branch:

```
git sync
```

- Sync the current local branch with the remote main branch:

```
git sync origin main
```

- Sync without cleaning untracked files:

```
git sync {{[-s|--soft]}} {{remote_name}} {{branch_name}}
```

git tag

Create, list, delete, or verify tags.

A tag is a static reference to a commit.

More information: https://git-scm.com/docs/git-tag.

- List all tags:

```
git tag
```

- Create a tag with the given name pointing to the current commit:

```
git tag {{tag_name}}
```

- Create a tag with the given name pointing to a given commit:

```
git tag {{tag_name}} {{commit}}
```

- Create an annotated tag with the given message:

```
git tag {{tag_name}} {{[-m|--message]}} {{tag_message}}
```

- Delete the tag with the given name:

```
git tag {{[-d|--delete]}} {{tag_name}}
```

- Get updated tags from remote:

```
git fetch {{[-t|--tags]}}
```

- Push a tag to remote:

```
git push origin tag {{tag_name}}
```

- List all tags which contain a given commit (`HEAD` if not specified):

```
git tag --contains {{commit}}
```

git touch

Create new files and add them to the index.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-touch.

- Create new files and add them to the index:

```
git touch {{path/to/file1 path/to/file2 ...}}
```

git undo

Undo recent commits.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-undo.

- Remove the most recent commit:

```
git undo
```

- Remove a specific number of the most recent commits:

```
git undo {{3}}
```

git unlock

Unlock a file in a Git repository so it can be modified by a commit.

Part of **`git-extras`**.

See also: **`git lock`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-unlock.

- Enable the ability to commit changes of a previously-locked local file:

```
git unlock {{path/to/file}}
```

git unpack-file

Create a temporary file with a blob's contents.

More information: https://git-scm.com/docs/git-unpack-file.

- Create a file holding the contents of the blob specified by its ID then print the name of the temporary file:

```
git unpack-file {{blob_id}}
```

git update-index

Git command for manipulating the index.

More information: https://git-scm.com/docs/git-update-index.

- Pretend that a modified file is unchanged (`git status` will not show this as changed):

```
git update-index --skip-worktree {{path/to/modified_file}}
```

git update-ref

Git command for creating, updating, and deleting Git refs.

More information: https://git-scm.com/docs/git-update-ref.

- Delete a ref, useful for soft resetting the first commit:

```
git update-ref -d {{HEAD}}
```

- Update ref with a message:

```
git update-ref -m {{message}} {{HEAD}} {{4e95e05}}
```

git utimes

Change files modification time to their last commit date. Does not touch files that are in the working tree or index.

Part of **`git-extras`**.

More information: https://github.com/tj/git-extras/blob/main/Commands.md#git-utimes.

- Change all files modification time to their last commit date:

  ```
  git utimes
  ```

- Change files modification time that are newer than their last commit date, preserving original modification time of files that were committed from the local repository:

  ```
  git utimes --newer
  ```

git var

Print a Git logical variable's value.

See **`git config`**, which is preferred over **`git var`**.

More information: https://git-scm.com/docs/git-var.

- Print the value of a Git logical variable:

```
git var {{GIT_AUTHOR_IDENT|GIT_COMMITTER_IDENT|GIT_EDITOR|
GIT_PAGER}}
```

- [l]ist all Git logical variables:

```
git var -l
```

git verify-commit

Check for GPG verification of commits.

If no commits are verified, nothing will be printed, regardless of options specified.

More information: https://git-scm.com/docs/git-verify-commit.

- Check commits for a GPG signature:

```
git verify-commit {{commit_hash1 optional_commit_hash2 ...}}
```

- Check commits for a GPG signature and show details of each commit:

```
git verify-commit {{commit_hash1 optional_commit_hash2 ...}}
{{[-v|--verbose]}}
```

- Check commits for a GPG signature and print the raw details:

```
git verify-commit {{commit_hash1 optional_commit_hash2 ...}}
--raw
```

git verify-pack

Verify packed Git archive files.

More information: https://git-scm.com/docs/git-verify-pack.

- Verify a packed Git archive file:

```
git verify-pack {{path/to/pack-file}}
```

- Verify a packed Git archive file and show verbose details:

```
git verify-pack {{[-v|--verbose]}} {{path/to/pack-file}}
```

- Verify a packed Git archive file and only display the statistics:

```
git verify-pack {{[-s|--stat-only]}} {{path/to/pack-file}}
```

git verify-tag

Check for GPG verification of tags.

If a tag wasn't signed, an error will occur.

More information: https://git-scm.com/docs/git-verify-tag.

- Check tags for a GPG signature:

```
git verify-tag {{tag1 optional_tag2 ...}}
```

- Check tags for a GPG signature and show details for each tag:

```
git verify-tag {{tag1 optional_tag2 ...}} {{[-v|--verbose]}}
```

- Check tags for a GPG signature and print the raw details:

```
git verify-tag {{tag1 optional_tag2 ...}} --raw
```

git whatchanged

Show what has changed with recent commits or files.

See also: **`git log`**.

More information: https://git-scm.com/docs/git-whatchanged.

- Display logs and changes for recent commits:

```
git whatchanged
```

- Display logs and changes for recent commits within the specified time frame:

```
git whatchanged --since "{{2 hours ago}}"
```

- Display logs and changes for recent commits for specific files or directories:

```
git whatchanged {{path/to/file_or_directory}}
```

git worktree

Manage multiple working trees attached to the same repository.

More information: https://git-scm.com/docs/git-worktree.

- Create a new directory with the specified branch checked out into it:

```
git worktree add {{path/to/directory}} {{branch}}
```

- Create a new directory with a new branch checked out into it:

```
git worktree add {{path/to/directory}} -b {{new_branch}}
```

- List all the working directories attached to this repository:

```
git worktree list
```

- Remove a worktree (after deleting worktree directory):

```
git worktree prune
```

git write-tree

Low level utility to create a tree object from the current index.

More information: https://git-scm.com/docs/git-write-tree.

- Create a tree object from the current index:

```
git write-tree
```

- Create a tree object without checking whether objects referenced by the directory exist in the object database:

```
git write-tree --missing-ok
```

- Create a tree object that represents a subdirectory (used to write the tree object for a subproject in the named subdirectory):

```
git write-tree --prefix {{subdirectory}}/
```

git

Distributed version control system.

Some subcommands such as **`commit`**, **`add`**, **`branch`**, **`switch`**, **`push`**, etc. have their own usage documentation.

More information: https://git-scm.com/docs/git.

- Create an empty Git repository:

```
git init
```

- Clone a remote Git repository from the internet:

```
git clone {{https://example.com/repo.git}}
```

- View the status of the local repository:

```
git status
```

- Stage all changes for a commit:

```
git add {{[-A|--all]}}
```

- Commit changes to version history:

```
git commit {{[-m|--message]}} {{message_text}}
```

- Push local commits to a remote repository:

```
git push
```

- Pull any changes made to a remote:

```
git pull
```

- Reset everything the way it was in the latest commit:

```
git reset --hard; git clean {{[-f|--force]}}
```

gitea

Administer Gitea, a lightweight Git hosting server.

Requires a configured **`app.ini`** file or environment variables.

More information: https://docs.gitea.com/administration/command-line.

- Run the Gitea web server using the default configuration:

  ```
  gitea web
  ```

- Create the necessary database schema and tables:

  ```
  gitea migrate
  ```

- Run administrative subcommands for user management or authentication management:

  ```
  gitea admin {{user list}}
  ```

- Display help for a specific subcommand:

  ```
  gitea {{admin}} --help
  ```

- Display help:

  ```
  gitea help
  ```

- Display version:

  ```
  gitea --version
  ```

github-label-sync

Synchronize GitHub labels.

More information: https://github.com/Financial-Times/github-label-sync.

- Synchronize labels using a local `labels.json` file:

```
github-label-sync --access-token {{token}}
{{repository_name}}
```

- Synchronize labels using a specific labels JSON file:

```
github-label-sync --access-token {{token}} --labels {{url|
path/to/json_file}} {{repository_name}}
```

- Perform a dry run instead of actually synchronizing labels:

```
github-label-sync --access-token {{token}} --dry-run
{{repository_name}}
```

- Keep labels that aren't in `labels.json`:

```
github-label-sync --access-token {{token}} --allow-added-
labels {{repository_name}}
```

- Synchronize using the `$GITHUB_ACCESS_TOKEN` environment variable:

```
github-label-sync {{repository_name}}
```

gitk

Browse Git repositories graphically.

See also: **`git-gui`**, **`git-cola`**, **`tig`**.

More information: https://git-scm.com/docs/gitk.

- Show the repository browser for the current Git repository:

```
gitk
```

- Show repository browser for a specific file or directory:

```
gitk {{path/to/file_or_directory}}
```

- Show commits made since 1 week ago:

```
gitk --since="1 week ago"
```

- Show commits older than 1/1/2015:

```
gitk --until="1/1/2015"
```

- Show at most 100 changes in all branches:

```
gitk --max-count=100 --all
```

gitlab-backup

Manage backups for a GitLab Omnibus installation.

See also: **`gitlab-ctl`**, **`gitlab-runner`**.

More information: https://docs.gitlab.com/administration/backup_restore/backup_gitlab/.

- Create a full backup (default strategy):

```
sudo gitlab-backup create
```

- Create a full backup using the copy strategy:

```
sudo gitlab-backup create STRATEGY={{copy}}
```

- Restore a backup by specifying its ID:

```
sudo gitlab-backup restore BACKUP={{backup_id}}
```

- Restore a backup while skipping specific components:

```
sudo gitlab-backup restore BACKUP={{backup_id}}
SKIP={{db,uploads,...}}
```

gitlab-ctl

Manage the GitLab omnibus.

More information: https://docs.gitlab.com/omnibus/maintenance/.

- Display the status of every service:

```
sudo gitlab-ctl status
```

- Display the status of a specific service:

```
sudo gitlab-ctl status {{nginx}}
```

- Restart every service:

```
sudo gitlab-ctl restart
```

- Restart a specific service:

```
sudo gitlab-ctl restart {{nginx}}
```

- Display the logs of every service and keep reading until `<Ctrl c>` is pressed:

```
sudo gitlab-ctl tail
```

- Display the logs of a specific service:

```
sudo gitlab-ctl tail {{nginx}}
```

- Send the SIGKILL signal to specific service:

```
sudo gitlab-ctl kill {{nginx}}
```

- Reconfigure the application:

```
sudo gitlab-ctl reconfigure
```

gitlab-runner

Manage GitLab runners.

More information: https://docs.gitlab.com/runner/.

- Register a runner:

```
sudo gitlab-runner register --url {{https://
gitlab.example.com}} --registration-token {{token}} --name
{{name}}
```

- Register a runner with a Docker executor:

```
sudo gitlab-runner register --url {{https://
gitlab.example.com}} --registration-token {{token}} --name
{{name}} --executor {{docker}}
```

- Unregister a runner:

```
sudo gitlab-runner unregister --name {{name}}
```

- Display the status of the runner service:

```
sudo gitlab-runner status
```

- Restart the runner service:

```
sudo gitlab-runner restart
```

- Check if the registered runners can connect to GitLab:

```
sudo gitlab-runner verify
```

gitlab

Ruby wrapper for the GitLab API.

Some subcommands such as **`ctl`** have their own usage documentation.

More information: https://narkoz.github.io/gitlab/.

- Create a new project:

  ```
  gitlab create_project {{project_name}}
  ```

- Get info about a specific commit:

  ```
  gitlab commit {{project_name}} {{commit_hash}}
  ```

- Get info about jobs in a CI pipeline:

  ```
  gitlab pipeline_jobs {{project_name}} {{pipeline_id}}
  ```

- Start a specific CI job:

  ```
  gitlab job_play {{project_name}} {{job_id}}
  ```

gitleaks

Detect secrets and API keys leaked in Git repositories.

More information: https://github.com/gitleaks/gitleaks#usage.

- Scan a remote repository:

```
gitleaks detect --repo-url {{https://github.com/username/repository.git}}
```

- Scan a local directory:

```
gitleaks detect {{[-s|--source]}} {{path/to/repository}}
```

- Output scan results to a JSON file:

```
gitleaks detect {{[-s|--source]}} {{path/to/repository}} --report {{path/to/report.json}}
```

- Use a custom rules file:

```
gitleaks detect {{[-s|--source]}} {{path/to/repository}} --config-path {{path/to/config.toml}}
```

- Start scanning from a specific commit:

```
gitleaks detect {{[-s|--source]}} {{path/to/repository}} --log-opts {{--since=commit_id}}
```

- Scan uncommitted changes before a commit:

```
gitleaks protect --staged
```

- Display verbose output indicating which parts were identified as leaks during the scan:

```
gitleaks protect --staged --verbose
```

gitlint

Git commit message linter checks your commit messages for style.

More information: https://jorisroovers.com/gitlint/.

- Check the last commit message:

```
gitlint
```

- The range of commits to lint:

```
gitlint --commits {{single_refspec_argument}}
```

- Path to a directory or Python module with extra user-defined rules:

```
gitlint --extra-path {{path/to/directory}}
```

- Start a specific CI job:

```
gitlint --target {{path/to/target_directory}}
```

- Path to a file containing a commit-msg:

```
gitlint --msg-filename {{path/to/file}}
```

- Read staged commit meta-info from the local repository:

```
gitlint --staged
```

gitmoji

Interactively insert emojis on commits.

More information: https://github.com/carloscuesta/gitmoji-cli.

- Start the commit wizard:

```
gitmoji --commit
```

- Initialize the Git hook (so `gitmoji` will be run every time `git commit` is run):

```
gitmoji --init
```

- Remove the Git hook:

```
gitmoji --remove
```

- List all available emojis and their descriptions:

```
gitmoji --list
```

- Search emoji list for a list of keywords:

```
gitmoji --search {{keyword1}} {{keyword2}}
```

- Update cached list of emojis from main repository:

```
gitmoji --update
```

- Configure global preferences:

```
gitmoji --config
```

gitsome

A terminal-based interface for GitHub, accessed via the **`gh`** command.

It also provides menu-style autocomplete suggestions for **`git`** commands.

More information: https://github.com/donnemartin/gitsome#index.

- Enter the gitsome shell (optional), to enable autocompletion and interactive help for Git (and gh) commands:

```
gitsome
```

- Setup GitHub integration with the current account:

```
gh configure
```

- List notifications for the current account (as would be seen in https://github.com/notifications):

```
gh notifications
```

- List the current account's starred repos, filtered by a given search string:

```
gh starred "{{python 3}}"
```

- View the recent activity feed of a given GitHub repository:

```
gh feed {{tldr-pages/tldr}}
```

- View the recent activity feed for a given GitHub user, using the default pager (e.g. `less`):

```
gh feed {{torvalds}} {{[-p|--pager]}}
```

gitstats

Git repository statistics generator.

More information: https://gitstats.readthedocs.io/en/stable/getting-started.html#command-line-usage.

- Generate statistics for a local repository:

```
gitstats {{path/to/git_repo/.git}} {{path/to/output_folder}}
```

- View generated statistics in a web browser on Windows (PowerShell)/macOS/Linux:

```
{{Invoke-Item|open|xdg-open}} {{path/to/output_folder/index.html}}
```

- Display help:

```
gitstats {{[-h|--help]}}
```

gitui

A lightweight keyboard-only TUI for Git.

See also: **`tig`**, **`git-gui`**.

More information: https://github.com/gitui-org/gitui.

- Start `gitui` for the repository in the current directory:

```
gitui
```

- Specify the filename of the color theme loaded from the config directory (defaults to `theme.ron`):

```
gitui {{[-t|--theme]}} {{theme2.ron}}
```

- Store logging output into a specific file:

```
gitui --logfile {{path/to/file}}
```

- Inspect a specific file inside the repository in the current directory:

```
gitui {{[-f|--file]}} {{path/to/file}}
```

- Use notify-based file system watcher instead of tick-based update:

```
gitui --watcher
```

- Generate a bug report:

```
gitui --bugreport
```

- Use a specific Git directory:

```
gitui {{[-d|--directory]}} {{path/to/directory}}
```

- Use a specific working directory:

```
gitui {{[-w|--workdir]}} {{path/to/directory}}
```

gitwatch

Automatically commit file or directory changes to a Git repository.

More information: https://github.com/gitwatch/gitwatch.

- Automatically commit any changes made to a file or directory:

```
gitwatch {{path/to/file_or_directory}}
```

- Automatically commit changes and push them to a remote repository:

```
gitwatch -r {{remote_name}} {{path/to/file_or_directory}}
```

- Automatically commit changes and push them to a specific branch of a remote repository:

```
gitwatch -r {{remote_name}} -b {{branch_name}} {{path/to/file_or_directory}}
```

gixy

Analyze nginx configuration files.

More information: https://github.com/yandex/gixy.

- Analyze nginx configuration (default path: `/etc/nginx/nginx.conf`):

```
gixy
```

- Analyze nginx configuration but skip specific tests:

```
gixy --skips {{http_splitting}}
```

- Analyze nginx configuration with the specific severity level:

```
gixy {{-l|-ll|-lll}}
```

- Analyze nginx configuration files on the specific path:

```
gixy {{path/to/configuration_file_1}} {{path/to/
configuration_file_2}}
```

glab alias

Manage GitLab CLI command aliases.

More information: https://gitlab.com/gitlab-org/cli/-/blob/main/docs/source/alias/_index.md.

- List all the aliases `glab` is configured to use:

```
glab alias list
```

- Create a `glab` subcommand alias:

```
glab alias set {{mrv}} '{{mr view}}'
```

- Set a shell command as a `glab` subcommand:

```
glab alias set {{[-s|--shell]}} {{alias_name}} {{command}}
```

- Delete a command shortcut:

```
glab alias delete {{alias_name}}
```

- Display the subcommand help:

```
glab alias
```

glab auth

Authenticate with a GitLab host.

More information: https://gitlab.com/gitlab-org/cli/-/blob/main/docs/source/auth/_index.md.

- Log in with interactive prompt:

```
glab auth login
```

- Log in with a token:

```
glab auth login {{[-t|--token]}} {{token}}
```

- Check authentication status:

```
glab auth status
```

- Log in to a specific GitLab instance:

```
glab auth login {{[-h|--hostname]}} {{gitlab.example.com}}
```

glab issue

Manage GitLab issues.

More information: https://gitlab.com/gitlab-org/cli/-/blob/main/docs/source/issue/_index.md.

- Display a specific issue:

```
glab issue view {{issue_number}}
```

- Display a specific issue in the default web browser:

```
glab issue view {{issue_number}} {{[-w|--web]}}
```

- Create a new issue in the default web browser:

```
glab issue create --web
```

- List the last 10 issues with the bug label:

```
glab issue list {{[-P|--per-page]}} {{10}} {{[-l|--label]}} "{{bug}}"
```

- List closed issues made by a specific user:

```
glab issue list {{[-c|--closed]}} --author {{username}}
```

- Reopen a specific issue:

```
glab issue reopen {{issue_number}}
```

glab mr create

Manage GitLab merge requests.

More information: https://gitlab.com/gitlab-org/cli/-/blob/main/docs/source/mr/create.md.

- Interactively create a merge request:

```
glab mr create
```

- Create a merge request, determining the title and description from the commit messages of the current branch:

```
glab mr create {{[-f|--fill]}}
```

- Create a draft merge request:

```
glab mr create --draft
```

- Create a merge request specifying the target branch, title, and description:

```
glab mr create {{[-b|--target-branch]}} {{target_branch}}
{{[-t|--title]}} "{{title}}" {{[-d|--description]}}
"{{description}}"
```

- Start opening a merge request in the default web browser:

```
glab mr create {{[-w|--web]}}
```

glab mr merge

Merge GitLab merge requests.

More information: https://gitlab.com/gitlab-org/cli/-/blob/main/docs/source/mr/merge.md.

- Merge the merge request associated with the current branch interactively:

```
glab mr merge
```

- Merge the specified merge request, interactively:

```
glab mr merge {{mr_number}}
```

- Merge the merge request, removing the branch on both the local and the remote:

```
glab mr merge {{[-d|--remove-source-branch]}}
```

- Squash the current merge request into one commit with the message body and merge:

```
glab mr merge {{[-s|--squash]}} {{[-m|--message]}} "{{commit_message_body}}"
```

- Display help:

```
glab mr merge --help
```

glab mr

Manage GitLab merge requests.

Some subcommands such as **`create`** have their own usage documentation.

More information: https://gitlab.com/gitlab-org/cli/-/blob/main/docs/source/mr/_index.md.

- Create a merge request:

```
glab mr create
```

- Check out a specific merge request locally:

```
glab mr checkout {{mr_number}}
```

- View the changes made in the merge request:

```
glab mr diff
```

- Approve the merge request for the current branch:

```
glab mr approve
```

- Merge the merge request associated with the current branch interactively:

```
glab mr merge
```

- Edit a merge request interactively:

```
glab mr update
```

- Edit the target branch of a merge request:

```
glab mr update --target-branch {{branch_name}}
```

glab pipeline

List, view, and run GitLab CI/CD pipelines.

More information: https://gitlab.com/gitlab-org/cli/-/blob/main/docs/source/_index.md.

- View a running pipeline on the current branch:

```
glab pipeline status
```

- View a running pipeline on a specific branch:

```
glab pipeline status --branch {{branch_name}}
```

- Get the list of pipelines:

```
glab pipeline list
```

- Run a manual pipeline on the current branch:

```
glab pipeline run
```

- Run a manual pipeline on a specific branch:

```
glab pipeline run --branch {{branch_name}}
```

glab release

Manage GitLab releases.

More information: https://gitlab.com/gitlab-org/cli/-/blob/main/docs/source/release/_index.md.

- List releases in a Gitlab repository, limited to 30 items:

```
glab release list
```

- Display information about a specific release:

```
glab release view {{tag}}
```

- Create a new release:

```
glab release create {{tag}}
```

- Delete a specific release:

```
glab release delete {{tag}}
```

- Download assets from a specific release:

```
glab release download {{tag}}
```

- Upload assets to a specific release:

```
glab release upload {{tag}} {{path/to/file1 path/to/file2 ...}}
```

glab repo

Work with GitLab repositories.

More information: https://gitlab.com/gitlab-org/cli/-/blob/main/docs/source/repo/_index.md.

- Create a new repository (if the repository name is not set, the default name will be the name of the current directory):

```
glab repo create {{name}}
```

- Clone a repository:

```
glab repo clone {{owner}}/{{repository}}
```

- Fork and clone a repository:

```
glab repo fork {{owner}}/{{repository}} {{[-c|--clone]}}
```

- View a repository in the default web browser:

```
glab repo view {{owner}}/{{repository}} {{[-w|--web]}}
```

- Search some repositories in the GitLab instance:

```
glab repo search {{[-s|--search]}} {{search_string}}
```

glab

Work seamlessly with GitLab.

Some subcommands such as **`config`** have their own usage documentation.

More information: https://gitlab.com/gitlab-org/cli/-/tree/main/docs/source.

- Clone a GitLab repository locally:

```
glab repo clone {{owner}}/{{repository}}
```

- Create a new issue:

```
glab issue create
```

- View and filter the open issues of the current repository:

```
glab issue list
```

- View an issue in the default browser:

```
glab issue view {{[-w|--web]}} {{issue_number}}
```

- Create a merge request:

```
glab mr create
```

- View a pull request in the default web browser:

```
glab mr view {{[-w|--web]}} {{pr_number}}
```

- Check out a specific pull request locally:

```
glab mr checkout {{pr_number}}
```

gladtex

A LaTeX formula preprocessor for HTML files.

It converts LaTeX formulas to images.

More information: https://manned.org/gladtex.

- Convert to HTML:

```
gladtex {{path/to/input.htex}}
```

- Save the converted file to a specific [o]utput file:

```
gladtex {{path/to/input.htex}} -o {{path/to/output.html}}
```

- Save the generated images to a specific [d]irectory:

```
gladtex {{path/to/input.htex}} -d {{path/to/
image_output_directory}}
```

- Set image [r]esolution (in dpi, default is 100):

```
gladtex {{path/to/input.htex}} -r {{resolution}}
```

- [k]eep LaTeX files after conversion:

```
gladtex {{path/to/input.htex}} -k
```

- Set [b]ackground and [f]oreground color of the images:

```
gladtex {{path/to/input.htex}} -b {{background_color}} -f
{{foreground_color}}
```

- Convert Markdown to HTML using `pandoc` and `gladtex`:

```
pandoc {{[-s|--standalone]}} {{[-t|--to]}} html --gladtex
{{path/to/input.md}} | gladtex -o {{path/to/output.html}}
```

glances

A cross-platform system monitoring tool.

See also: **`htop`**, **`atop`**, **`top`**, **`btm`**, **`btop`**.

More information: https://nicolargo.github.io/glances/.

- Run in terminal:

```
glances
```

- Run in web server mode to show results in browser:

```
glances {{[-w|--webserver]}}
```

- Run in server mode to allow connections from other Glances clients:

```
glances {{[-s|--server]}}
```

- Connect to a Glances server:

```
glances {{[-c|--client]}} {{hostname}}
```

- Require a password in (web) server mode:

```
glances {{[-s|--server]}} --password
```

- Exit Glances:

```
<q>
```

- Display help:

```
glances {{[-h|--help]}}
```

gleam

The compiler, build tool, package manager, and code formatter for Gleam, "a friendly language for building type-safe systems that scale!".

More information: https://gleam.run/writing-gleam/command-line-reference/.

- Create a new gleam project:

  ```
  gleam new {{project_name}}
  ```

- Build and run a gleam project:

  ```
  gleam run
  ```

- Build the project:

  ```
  gleam build
  ```

- Run a project for a particular platform and runtime:

  ```
  gleam run --target {{platform}} --runtime {{runtime}}
  ```

- Add a hex dependency to your project:

  ```
  gleam add {{dependency_name}}
  ```

- Run project tests:

  ```
  gleam test
  ```

- Format source code:

  ```
  gleam format
  ```

- Type check the project:

  ```
  gleam check
  ```

glib-compile-resources

Compiles resource files (e.g. images) into a binary resource bundle.

These may be linked into GTK applications using the GResource API.

More information: https://manned.org/glib-compile-resources.

- Compile resources referenced in `file.gresource.xml` to a `.gresource` binary:

```
glib-compile-resources {{file.gresource.xml}}
```

- Compile resources referenced in `file.gresource.xml` to a C source file:

```
glib-compile-resources --generate-source
{{file.gresource.xml}}
```

- Compile resources in `file.gresource.xml` to a chosen target file, with `.c`, `.h` or `.gresource` extension:

```
glib-compile-resources --generate --target={{file.ext}}
{{file.gresource.xml}}
```

- Print a list of resource files referenced in `file.gresource.xml`:

```
glib-compile-resources --generate-dependencies
{{file.gresource.xml}}
```

glow

Render Markdown in the terminal.

More information: https://manned.org/glow.

- Run glow and select a file to view:

```
glow
```

- Render a Markdown file to the terminal:

```
glow {{path/to/file}}
```

- View a Markdown file using a paginator:

```
glow {{[-p|--pager]}} {{path/to/file}}
```

- View a file from a URL:

```
glow {{https://example.com/file.md}}
```

- View a GitHub/GitLab README:

```
glow {{github.com/owner/repository}}
```

glxgears

Test OpenGL rendering.

See also: **vkcube**.

More information: https://manned.org/glxgears.

- Run an OpenGL test window:

```
glxgears
```

- Display OpenGL renderer information:

```
glxgears -info
```

- Display help:

```
glxgears -h
```

gml2gv

Convert a graph from **`gml`** to **`gv`** format.

Converters: **`gml2gv`**, **`gv2gml`**, **`gv2gxl`**, **`gxl2gv`**, **`graphml2gv`** & **`mm2gv`**.

More information: https://graphviz.org/pdf/gml2gv.1.pdf.

- Convert a graph from `gml` to `gv` format:

```
gml2gv -o {{output.gv}} {{input.gml}}
```

- Convert a graph using `stdin` and `stdout`:

```
cat {{input.gml}} | gml2gv > {{output.gv}}
```

- Display help:

```
gml2gv -?
```

gmssl

GmSSL is a crypto toolkit supporting SM1, SM2, SM3, SM4, SM9, and ZUC/ZUC256.

More information: http://gmssl.org/english.html.

- Generate an SM3 hash for a file:

```
gmssl sm3 {{path/to/file}}
```

- Encrypt a file using the SM4 cipher:

```
gmssl sms4 -e -in {{path/to/file}} -out {{path/to/file.sms4}}
```

- Decrypt a file using the SM4 cipher:

```
gmssl sms4 -d -in {{path/to/file.sms4}}
```

- Generate an SM2 private key:

```
gmssl sm2 -genkey -out {{path/to/file.pem}}
```

- Generate an SM2 public key from an existing private key:

```
gmssl sm2 -pubout -in {{path/to/file.pem}} -out {{path/to/
file.pem.pub}}
```

- Encrypt a file using the ZUC cipher:

```
gmssl zuc -e -in {{path/to/file}} -out {{path/to/file.zuc}}
```

- Decrypt a file using the ZUC cipher:

```
gmssl zuc -d -in {{path/to/file.zuc}}
```

- Display version:

```
gmssl version
```

gnatmake

A low-level build tool for Ada programs (part of the GNAT toolchain).

More information: https://gcc.gnu.org/onlinedocs/gnat_ugn/Switches-for-gnatmake.html.

- Compile an executable:

```
gnatmake {{source_file1.adb source_file2.adb ...}}
```

- Set a custom [o]utput executable name:

```
gnatmake -o {{executable_name}} {{source_file.adb}}
```

- [f]orce recompilation:

```
gnatmake -f {{source_file.adb}}
```

gnatprep

Preprocessor for Ada source code files (part of the GNAT toolchain).

More information: https://gcc.gnu.org/onlinedocs/gnat_ugn/Preprocessing-with-gnatprep.html.

- Use symbol definitions from a file:

```
gnatprep {{source_file}} {{target_file}} {{definitions_file}}
```

- Specify symbol values in the command-line:

```
gnatprep -D{{name}}={{value}} {{source_file}} {{target_file}}
```

gnmic get

Get a snapshot of a gnmi network device operation data.

More information: https://gnmic.openconfig.net/cmd/get/.

- Get a snapshot of the device state at a specific path:

```
gnmic {{[-a|--address]}} {{ip:port}} get --path {{path}}
```

- Query the device state at multiple paths:

```
gnmic {{[-a|--address]}} {{ip:port}} get --path {{path/to/
file_or_directory1}} --path {{path/to/file_or_directory2}}
```

- Query the device state at multiple paths with a common prefix:

```
gnmic {{[-a|--address]}} {{ip:port}} get --prefix {{prefix}}
--path {{path/to/file_or_directory1}} --path {{path/to/
file_or_directory2}}
```

- Query the device state and specify response encoding (json_ietf):

```
gnmic {{[-a|--address]}} {{ip:port}} get --path {{path}} {{[-
e|--encoding]}} json_ietf
```

gnmic set

Modify gnmi network device configuration.

More information: https://gnmic.openconfig.net/cmd/set/.

- Update the value of a path:

```
gnmic {{[-a|--address]}} {{ip:port}} set --update-path
{{path/to/directory}} --update-value {{value}}
```

- Update the value of a path to match the contents of a JSON file:

```
gnmic {{[-a|--address]}} {{ip:port}} set --update-path
{{path/to/directory}} --update-file {{path/to/file}}
```

- Replace the value of a path to match the contents of a JSON file:

```
gnmic {{[-a|--address]}} {{ip:port}} set --replace-path
{{path/to/directory}} --replace-file {{path/to/file}}
```

- Delete the node at a given path:

```
gnmic {{[-a|--address]}} {{ip:port}} set --delete {{path/to/
directory}}
```

gnmic sub

This command is an alias of **`gnmic subscribe`**.

- View documentation for the original command:

```
tldr gnmic subscribe
```

gnmic subscribe

Subscribe to a gnmic network device state updates.

More information: https://gnmic.openconfig.net/cmd/subscribe/.

- Subscribe to target state updates under the subtree of a specific path:

```
gnmic {{[-a|--address]}} {{ip:port}} {{[sub|subscribe]}} --
path {{path}}
```

- Subscribe to a target with a sample interval of 30s (default is 10s):

```
gnmic {{[-a|--address]}} {{ip:port}} {{[sub|subscribe]}} --
path {{path}} --sample-interval 30s
```

- Subscribe to a target with sample interval and updates only on change:

```
gnmic {{[-a|--address]}} {{ip:port}} {{[sub|subscribe]}} --
path {{path}} --stream-mode on-change --heartbeat-interval
{{1m}}
```

- Subscribe to a target for only one update:

```
gnmic {{[-a|--address]}} {{ip:port}} {{[sub|subscribe]}} --
path {{path}} --mode once
```

- Subscribe to a target and specify response encoding (json_ietf):

```
gnmic {{[-a|--address]}} {{ip:port}} {{[sub|subscribe]}} --
path {{path}} {{[-e|--encoding]}} json_ietf
```

gnmic

A gNMI client.

Manage gNMI network device configuration and view operational data.

More information: https://gnmic.openconfig.net/user_guide/configuration_flags/.

- Request device capabilities:

```
gnmic {{[-a|--address]}} {{ip:port}} capabilities
```

- Provide a username and password to fetch device capabilities:

```
gnmic {{[-a|--address]}} {{ip:port}} {{[-u|--username]}}
{{username}} {{[-p|--password]}} {{password}} capabilities
```

- Get a snapshot of the device state at a specific path:

```
gnmic {{[-a|--address]}} {{ip:port}} get --path {{path}}
```

- Update device state at a specific path:

```
gnmic {{[-a|--address]}} {{ip:port}} set --update-path
{{path}} --update-value {{value}}
```

- Subscribe to target state updates under the subtree at a specific path:

```
gnmic {{[-a|--address]}} {{ip:port}} {{[sub|subscribe]}} --
path {{path}}
```

gnomon

Utility to annotate console logging statements with timestamps and find slow processes.

More information: https://github.com/paypal/gnomon#options.

- Use UNIX (or DOS) pipes to pipe `stdout` of any command through gnomon:

```
{{npm test}} | gnomon
```

- Show number of seconds since the start of the process:

```
{{npm test}} | gnomon {{[-t|--type]}} elapsed-total
```

- Show an absolute timestamp in UTC:

```
{{npm test}} | gnomon {{[-t|--type]}} absolute
```

- Use a high threshold of 0.5 seconds, exceeding which the timestamp will be colored bright red:

```
{{npm test}} | gnomon {{[-h|--high]}} 0.5
```

- Use a medium threshold of 0.2 seconds, exceeding which the timestamp will be colored bright yellow:

```
{{npm test}} | gnomon {{[-m|--medium]}} 0.2
```

gnucash-cli

A command-line version of GnuCash.

More information: https://gnucash.org/viewdoc.phtml?rev=5&lang=C&doc=help.

- Get quotes for currencies and stocks specified in a file and print them:

```
gnucash-cli {{[-Q|--quotes]}} get {{path/to/file.gnucash}}
```

- Generate a financial report of a specific type, specified by `--name`:

```
gnucash-cli --report run --name "{{Balance Sheet}}" {{path/to/file.gnucash}}
```

gnucash

Personal and small-business financial-accounting software.

More information: https://manned.org/gnucash.

- Launch GnuCash and load the previously opened file:

```
gnucash
```

- Launch GnuCash and load the specified file:

```
gnucash {{path/to/file.gnucash}}
```

- Launch GnuCash and load an empty file:

```
gnucash --nofile
```

gnuplot

A graph plotter that outputs in several formats.

More information: https://manned.org/gnuplot.

- Start the interactive graph plotting shell:

```
gnuplot
```

- Plot the graph for the specified graph definition file:

```
gnuplot {{path/to/definition.plt}}
```

- Set the output format by executing a command before loading the definition file:

```
gnuplot -e "{{set output "path/to/file.png" size
1024,768}}" {{path/to/definition.plt}}
```

- Persist the graph plot preview window after gnuplot exits:

```
gnuplot {{[-p|--persist]}} {{path/to/definition.plt}}
```

go bug

Report a bug.

More information: https://pkg.go.dev/cmd/go#hdr-Start_a_bug_report.

- Open a web page to start a bug report:

```
go bug
```

go build

Compile Go sources.

More information: https://pkg.go.dev/cmd/go#hdr-Compile_packages_and_dependencies.

- Compile a 'package main' file (output will be the filename without extension):

```
go build {{path/to/main.go}}
```

- Compile, specifying the output filename:

```
go build -o {{path/to/binary}} {{path/to/source.go}}
```

- Compile a package:

```
go build -o {{path/to/binary}} {{path/to/package}}
```

- Compile a main package into an executable, enabling data race detection:

```
go build -race -o {{path/to/executable}} {{path/to/
main_package}}
```

go clean

Remove object files and cached files.

More information: https://pkg.go.dev/cmd/go#hdr-Remove_object_files_and_cached_files.

- Print the remove commands instead of actually removing anything:

```
go clean -n
```

- Delete the build cache:

```
go clean -cache
```

- Delete all cached test results:

```
go clean -testcache
```

- Delete the module cache:

```
go clean -modcache
```

go doc

View documentation for a package or symbol.

More information: https://pkg.go.dev/cmd/go#hdr-Show_documentation_for_package_or_symbol.

- View documentation for the current package:

```
go doc
```

- Show package documentation and exported symbols:

```
go doc {{encoding/json}}
```

- Show also documentation of symbols:

```
go doc -all {{encoding/json}}
```

- Show also sources:

```
go doc -all -src {{encoding/json}}
```

- Show a specific symbol:

```
go doc -all -src {{encoding/json.Number}}
```

go env

Manage environment variables used by the Go toolchain.

More information: https://pkg.go.dev/cmd/go#hdr-Print_Go_environment_information.

- Show all environment variables:

```
go env
```

- Show a specific environment variable:

```
go env {{GOPATH}}
```

- Set an environment variable to a value:

```
go env -w {{GOBIN}}={{path/to/directory}}
```

- Reset an environment variable's value:

```
go env -u {{GOBIN}}
```

go fix

Update packages to use new APIs.

More information: https://pkg.go.dev/cmd/go#hdr-Update_packages_to_use_new_APIs.

- Update packages to use new APIs:

```
go fix {{packages}}
```

go fmt

Format Go source files, printing the changed filenames.

More information: https://pkg.go.dev/cmd/go#hdr-Gofmt__reformat__package_sources.

- Format Go source files in the current directory:

```
go fmt
```

- Format a specific Go package in your import path (`$GOPATH/src`):

```
go fmt {{path/to/package}}
```

- Format the package in the current directory and all subdirectories (note the `...`):

```
go fmt {{./...}}
```

- Print what format commands would've been run, without modifying anything:

```
go fmt -n
```

- Print which format commands are run as they are run:

```
go fmt -x
```

go generate

Generate Go files by running commands within source files.

More information: https://pkg.go.dev/cmd/go#hdr-Generate_Go_files_by_processing_source.

- Generate Go files by running commands within source files:

```
go generate
```

go get

Add a dependency package, or download packages in legacy GOPATH mode.

More information: https://pkg.go.dev/cmd/go#hdr-Add_dependencies_to_current_module_and_install_them.

- Add a specified package to `go.mod` in module-mode or install the package in GOPATH-mode:

  ```
  go get {{example.com/pkg}}
  ```

- Modify the package with a given version in module-aware mode:

  ```
  go get {{example.com/pkg}}@{{v1.2.3}}
  ```

- Remove a specified package:

  ```
  go get {{example.com/pkg}}@{{none}}
  ```

go install

Compile and install packages named by the import paths.

More information: https://pkg.go.dev/cmd/go#hdr-Compile_and_install_packages_and_dependencies.

- Compile and install the current package:

```
go install
```

- Compile and install a specific local package:

```
go install {{path/to/package}}
```

- Install the latest version of a program, ignoring `go.mod` in the current directory:

```
go install {{golang.org/x/tools/gopls}}@{{latest}}
```

- Install a program at the version selected by `go.mod` in the current directory:

```
go install {{golang.org/x/tools/gopls}}
```

go list

List packages or modules.

More information: https://pkg.go.dev/cmd/go#hdr-List_packages_or_modules.

- List packages:

```
go list ./...
```

- List standard packages:

```
go list std
```

- List packages in JSON format:

```
go list -json time net/http
```

- List module dependencies and available updates:

```
go list -m -u all
```

go mod

Module maintenance.

More information: https://pkg.go.dev/cmd/go#hdr-Module_maintenance.

- Initialize new module in current directory:

```
go mod init {{moduleName}}
```

- Download modules to local cache:

```
go mod download
```

- Add missing and remove unused modules:

```
go mod tidy
```

- Verify dependencies have expected content:

```
go mod verify
```

- Copy sources of all dependencies into the vendor directory:

```
go mod vendor
```

go run

Compile and run Go code without saving a binary.

More information: https://pkg.go.dev/cmd/go#hdr-Compile_and_run_Go_program.

- Run a Go file:

```
go run {{path/to/file.go}}
```

- Run a main Go package:

```
go run {{path/to/package}}
```

go test

Test Go packages (files have to end with **`_test.go`**).

More information: https://pkg.go.dev/cmd/go#hdr-Testing_flags.

- Test the package found in the current directory:

```
go test
```

- [v]erbosely test the package in the current directory:

```
go test -v
```

- Test the packages in the current directory and all subdirectories (note the `...`):

```
go test -v ./...
```

- Test the package in the current directory and run all benchmarks:

```
go test -v -bench .
```

- Test the package in the current directory and run all benchmarks for 50 seconds:

```
go test -v -bench . -benchtime 50s
```

- Test the package with coverage analysis:

```
go test -cover
```

go tool

Run a Go tool or command.

Execute a Go command as a stand-alone binary, typically for debugging.

More information: https://pkg.go.dev/cmd/go#hdr-Run_specified_go_tool.

- List available tools:

```
go tool
```

- Run the go link tool:

```
go tool link {{path/to/main.go}}
```

- Print the command that would be executed, but do not execute it (similar to `whereis`):

```
go tool -n {{command}} {{arguments}}
```

- View documentation for a specified tool:

```
go tool {{command}} --help
```

- List all available cross-compilation targets:

```
go tool dist list
```

go version

Display Go version.

More information: https://pkg.go.dev/cmd/go#hdr-Print_Go_version.

- Display version:

```
go version
```

- Display the Go version used to build a specific executable file:

```
go version {{path/to/executable}}
```

go vet

Check Go source code and report suspicious constructs (e.g. lint your Go source files).

Go vet returns a non-zero exit code if problems are found; returns a zero exit code if no problems are found.

More information: https://pkg.go.dev/cmd/vet.

- Check the Go package in the current directory:

```
go vet
```

- Check the Go package in the specified path:

```
go vet {{path/to/file_or_directory}}
```

- List available checks that can be run with go vet:

```
go tool vet help
```

- View details and flags for a particular check:

```
go tool vet help {{check_name}}
```

- Display offending lines plus n lines of surrounding context:

```
go vet -c={{n}}
```

- Output analysis and errors in JSON format:

```
go vet -json
```

go

Manage Go source code.

Some subcommands such as **`build`** have their own usage documentation.

More information: https://pkg.go.dev/cmd/go.

- Download and install a package, specified by its import path:

```
go get {{path/to/package}}
```

- Compile and run a source file (it has to contain a `main` package):

```
go run {{file}}.go
```

- Compile a source file into a named executable:

```
go build -o {{executable}} {{file}}.go
```

- Compile the package present in the current directory:

```
go build
```

- Execute all test cases of the current package (files have to end with `_test.go`):

```
go test
```

- Compile and install the current package:

```
go install
```

- Initialize a new module in the current directory:

```
go mod init {{module_name}}
```

gobuster

Brute-forces hidden paths on web servers and more.

More information: https://github.com/OJ/gobuster#modes.

- Discover directories and files that match in the wordlist:

```
gobuster dir {{[-u|--url]}} {{https://example.com/}} {{[-w|--wordlist]}} {{path/to/file}}
```

- Discover subdomains:

```
gobuster dns {{[-d|--domain]}} {{example.com}} {{[-w|--wordlist]}} {{path/to/file}}
```

- Discover Amazon S3 buckets:

```
gobuster s3 {{[-w|--wordlist]}} {{path/to/file}}
```

- Discover other virtual hosts on the server:

```
gobuster vhost {{[-u|--url]}} {{https://example.com/}} {{[-w|--wordlist]}} {{path/to/file}}
```

- Fuzz the value of a parameter:

```
gobuster fuzz {{[-u|--url]}} {{https://example.com/?parameter=FUZZ}} {{[-w|--wordlist]}} {{path/to/file}}
```

- Fuzz the name of a parameter:

```
gobuster fuzz {{[-u|--url]}} {{https://example.com/?FUZZ=value}} {{[-w|--wordlist]}} {{path/to/file}}
```

gocr

Optical Character Recognition tool.

Recognize characters using its engine, and prompt the user for unknown patterns to store them in a database.

More information: https://manned.org/gocr.

- Recognize characters in the [i]nput image and [o]utput it in the given file. Put the database ([p]) in `path/to/db_directory` (verify that the folder exists or DB usage will silently be skipped). [m]ode 130 means create + use + extend database:

```
gocr -m 130 -p {{path/to/db_directory}} -i {{path/to/
input_image.png}} -o {{path/to/output_file.txt}}
```

- Recognize characters and assume all [C]haracters are numbers:

```
gocr -m 130 -p {{path/to/db_directory}} -i {{path/to/
input_image.png}} -o {{path/to/output_file.txt}} -C
"{{0..9}}"
```

- Recognize characters with a cert[a]inty of 100% (characters have a higher chance to be treated as unknown):

```
gocr -m 130 -p {{path/to/db_directory}} -i {{path/to/
input_image.png}} -o {{path/to/output_file.txt}} -a 100
```

gocryptfs

Encrypted overlay filesystem written in Go.

More information: https://github.com/rfjakob/gocryptfs#use.

- Initialize an encrypted filesystem:

```
gocryptfs -init {{path/to/cipher_directory}}
```

- Mount an encrypted filesystem:

```
gocryptfs {{path/to/cipher_directory}} {{path/to/
mount_point}}
```

- Mount with the explicit master key instead of password:

```
gocryptfs --masterkey {{path/to/cipher_directory}} {{path/to/
mount_point}}
```

- Change the password:

```
gocryptfs --passwd {{path/to/cipher_directory}}
```

- Make an encrypted snapshot of a plain directory:

```
gocryptfs --reverse {{path/to/plain_directory}} {{path/to/
cipher_directory}}
```

godoc

View documentation for go packages.

More information: https://pkg.go.dev/golang.org/x/tools/cmd/godoc.

- Display help for a specific package:

```
godoc {{fmt}}
```

- Display help for the function "Printf" of "fmt" package:

```
godoc {{fmt}} {{Printf}}
```

- Serve documentation as a web server on port 6060:

```
godoc -http=:{{6060}}
```

- Create an index file:

```
godoc -write_index -index_files={{path/to/file}}
```

- Use the given index file to search the docs:

```
godoc -http=:{{6060}} -index -index_files={{path/to/file}}
```

godot

An open source 2D and 3D game engine.

More information: https://docs.godotengine.org/en/stable/tutorials/editor/command_line_tutorial.html.

- Run a project if the current directory contains a `project.godot` file, otherwise open the project manager:

  ```
  godot
  ```

- Edit a project (the current directory must contain a `project.godot` file):

  ```
  godot {{[-e|--editor]}}
  ```

- Open the project manager even if the current directory contains a `project.godot` file:

  ```
  godot {{[-p|--project-manager]}}
  ```

- Export a project for release using a given export preset (the preset must be defined in the project):

  ```
  godot --export-release {{preset}} {{output_path}}
  ```

- Execute a standalone GDScript file (the script must inherit from `SceneTree` or `MainLoop`):

  ```
  godot {{[-s|--script]}} {{script.gd}}
  ```

goenv

Install, uninstall, or switch between Golang versions.

Supports version numbers like "1.16.15" or "1.22.8" etc.

More information: https://github.com/go-nv/goenv.

- List all available goenv commands:

  ```
  goenv commands
  ```

- Install a specific version of Golang:

  ```
  goenv install {{go_version}}
  ```

- Use a specific version of Golang in the current project:

  ```
  goenv local {{go_version}}
  ```

- Set the default Golang version:

  ```
  goenv global {{go_version}}
  ```

- List all available Golang versions and highlight the default one:

  ```
  goenv versions
  ```

- Uninstall a given Go version:

  ```
  goenv uninstall {{go_version}}
  ```

- Run an executable with the selected Go version:

  ```
  goenv exec go run {{go_version}}
  ```

gofmt

Format Go source code.

More information: https://pkg.go.dev/cmd/gofmt.

- Format a file and display the result to the console:

```
gofmt {{source.go}}
```

- Format a file, overwriting the original file in-place:

```
gofmt -w {{source.go}}
```

- Format a file, and then simplify the code, overwriting the original file:

```
gofmt -s -w {{source.go}}
```

- Print all (including spurious) errors:

```
gofmt -e {{source.go}}
```

gofumpt

Strictly format Go files.

See also: **`gofmt`**.

More information: https://github.com/mvdan/gofumpt#gofumpt.

- Format Go files:

```
gofumpt -w {{path/to/directory}}
```

- [l]ist files whose formatting differs from `gofumpt`:

```
gofumpt -l {{path/to/directory}}
```

- Report all [e]rrors:

```
gofumpt -e {{path/to/directory}}
```

- Display [d]iffs:

```
gofumpt -d {{path/to/directory}}
```

- Format Go files with stricter rules:

```
gofumpt -extra {{path/to/directory}}
```

- Display [d]iffs with stricter rules:

```
gofumpt -extra -d {{path/to/directory}}
```

- Display help:

```
gofumpt {{[-h|--help]}}
```

goimports

Update Go import lines, adding missing ones and removing unreferenced ones.

More information: https://pkg.go.dev/golang.org/x/tools/cmd/goimports.

- Display the completed import source file:

```
goimports {{path/to/file.go}}
```

- Write the result back to the source file instead of `stdout`:

```
goimports -w {{path/to/file.go}}
```

- Display diffs and write the result back to the source file:

```
goimports -w -d {{path/to/file.go}}
```

- Set the import prefix string after 3rd-party packages (comma-separated list):

```
goimports -local {{path/to/package1,path/to/package2,...}}
{{path/to/file.go}}
```

golangci-lint

Parallelized, smart, and fast Go linters runner that integrates with all major IDEs and supports YAML configuration.

More information: https://golangci-lint.run/welcome/quick-start/.

- Run linters in the current folder:

  ```
  golangci-lint run
  ```

- List enabled and disabled linters (Note: Disabled linters are shown last, do not mistake them for enabled ones):

  ```
  golangci-lint linters
  ```

- Enable a specific linter for this run:

  ```
  golangci-lint run {{[-E|--enable]}} {{linter}}
  ```

gomi

Manage the trashcan.

See also: **`trash`**, **`rm`**.

More information: https://github.com/babarot/gomi.

- Safely delete specific files or folders:

```
gomi {{path/to/file1 path/to/file2 path/to/folder1 path/to/folder2 ...}}
```

- Open an interactive menu to restore one or more files:

```
gomi {{[-b|--restore]}}
```

- Remove files that have been in the trashcan longer than the specified time ([d]ay, [w]eek, [m]onth, [y]ear):

```
gomi --prune {{1d|1w|1m|1y|...}}
```

- Remove orphaned `.trashinfo` files:

```
gomi --prune {{orphans}}
```

google-chrome

This command is an alias of **`chromium`**.

More information: https://www.google.com/chrome/.

- View documentation for the original command:

```
tldr chromium
```

googler

Search Google from the command-line.

More information: https://github.com/jarun/googler#usage.

- Search Google for a keyword:

```
googler {{keyword}}
```

- Search Google and open the first result in web browser:

```
googler {{[-j|--first]}} {{keyword}}
```

- Show n search results (default: 10):

```
googler {{[-n|--count]}} {{n}} {{keyword}}
```

- Disable automatic spelling correction:

```
googler {{[-x|--exact]}} {{keyword}}
```

- Search one site for a keyword:

```
googler {{[-w|--site]}} {{site}} {{keyword}}
```

- Show Google search result in JSON format:

```
googler --json {{keyword}}
```

- Perform in-place self-upgrade:

```
googler {{[-u|--upgrade]}}
```

- Display help in interactive mode:

```
<?>
```

gopass

Standard Unix Password Manager for Teams. Written in Go.

More information: https://github.com/gopasspw/gopass/tree/master/docs/commands.

- Initialize the configuration settings:

```
gopass init
```

- Create a new entry:

```
gopass new
```

- Show all stores:

```
gopass mounts
```

- Mount a shared Git store:

```
gopass mounts add {{store_name}} {{git_repo_url}}
```

- Search interactively using a keyword:

```
gopass show {{keyword}}
```

- Search using a keyword:

```
gopass find {{keyword}}
```

- Sync all mounted stores:

```
gopass sync
```

- Show a particular password entry:

```
gopass {{store_name|path/to/directory|email@email.com}}
```

gops

List and diagnose Go processes currently running on your system.

More information: https://github.com/google/gops.

- Print all go processes running locally:

```
gops
```

- Print more information about a process:

```
gops {{pid}}
```

- Display a process tree:

```
gops tree
```

- Print the current stack trace from a target program:

```
gops stack {{pid|addr}}
```

- Print the current runtime memory statistics:

```
gops memstats {{pid|addr}}
```

goreload

Live reload utility for Go programs.

More information: https://github.com/acoshift/goreload#basic-usage.

- Watch a binary file (defaults to `.goreload`):

```
goreload {{[-b|--bin]}} {{path/to/binary}} {{path/to/file.go}}
```

- Set a custom log prefix (defaults to `goreload`):

```
goreload --logPrefix {{prefix}} {{path/to/file.go}}
```

- Reload whenever any file changes:

```
goreload --all
```

gotelemetry

Manage Go telemetry data and settings.

More information: https://telemetry.go.dev/privacy#collection.

- Enable telemetry uploading:

```
gotelemetry on
```

- Disable telemetry uploading:

```
gotelemetry off
```

- Run a Web Viewer for local telemetry data:

```
gotelemetry view
```

- Print the current telemetry environment:

```
gotelemetry env
```

- Display help for a specific subcommand:

```
gotelemetry help {{subcommand}}
```

gotty

Share your terminal as a web application.

More information: https://github.com/yudai/gotty#usage.

- Share result of command:

```
gotty {{command}}
```

- Share with write permission:

```
gotty {{[-w|--permit-write]}} {{shell}}
```

- Share with credential (Basic Auth):

```
gotty {{[-w|--permit-write]}} {{[-c|--credential]}}
{{username}}:{{password}} {{shell}}
```

gouldtoppm

Convert a Gould scanner file to a PPM image.

More information: https://netpbm.sourceforge.net/doc/gouldtoppm.html.

- Convert a Gould scanner file to a PPM image:

```
gouldtoppm {{path/to/file.gould}} > {{path/to/output.ppm}}
```

gource

Renders an animated tree diagram of Git, SVN, Mercurial, and Bazaar repositories.

It shows files and directories being created, modified, or removed over time.

More information: https://manned.org/gource.

- Run gource in a directory (if it isn't the repository's root directory, the root is sought up from there):

```
gource {{path/to/repository}}
```

- Run gource in the current directory, with a custom output resolution:

```
gource -{{width}}x{{height}}
```

- Specify how long each day should be in the animation (this combines with -c, if provided):

```
gource {{[-s|--seconds-per-day]}} {{seconds}}
```

- Use fullscreen mode and a custom background color:

```
gource {{[-f|--fullscreen]}} {{[-b|--background-colour]}} {{hex_color_code}}
```

- Specify the animation title:

```
gource --title {{title}}
```

- Pause the animation:

```
<Space>
```

- Adjust simulation speed:

```
<{{+|-}}>
```

- Display help:

```
gource {{[-h|--help]}}
```

gow

Watches Go files and restarts the app on changes.

More information: https://github.com/mitranim/gow.

- Start and watch the current directory:

```
gow run .
```

- Start the application with the specified arguments:

```
gow run . {{argument1 argument2 ...}}
```

- Watch subdirectories in verbose mode:

```
gow -v -w={{path/to/directory1,path/to/directory2,...}} run .
```

- Watch the specified file extensions:

```
gow -e={{go,html}} run .
```

- Display help:

```
gow -h
```

gox

Cross-compile Go programs.

More information: https://github.com/mitchellh/gox.

- Compile Go program in the current directory for all operating systems and architecture combinations:

```
gox
```

- Download and compile a Go program from a remote URL:

```
gox {{url_1 url_2 ...}}
```

- Compile current directory for a particular operating system:

```
gox -os="{{os}}"
```

- Compile current directory for a single operating system and architecture combination:

```
gox -osarch="{{os}}/{{arch}}"
```

gpg-card

Administrate OpenPGP and PIV smart cards.

Similar to **`gpg --card-edit`**.

More information: https://manned.org/gpg-card.

- Start in interactive mode:

```
gpg-card
```

- Invoke one or more commands non-interactively:

```
gpg-card {{command1}} -- {{command2}} -- {{command3}}
```

- Show information about a smart card:

```
gpg-card list
```

- Retrieve the public key using the URL stored on an OpenPGP card:

```
gpg-card fetch
```

- Set the URL used by the `fetch` command:

```
gpg-card url
```

- Change or unblock PINs (uses the default action for the card in non-interactive mode):

```
gpg-card passwd
```

- Toggle the forcesig flag of an OpenPGP card (i.e. require entering the user PIN for signing):

```
gpg-card forcesig
```

- Factory reset a smart card (i.e. delete all data and reset PINs):

```
gpg-card factory-reset
```

gpg-tui

Terminal user interface for GNU Privacy Guard.

More information: https://github.com/orhun/gpg-tui.

- Start `gpg-tui`:

  `gpg-tui`

- Start `gpg-tui` with color and ASCII armored output:

  `gpg-tui --style {{colored}} --armor`

- Quit `gpg-tui`:

  `<q>`

- Interactively generate a new key:

  `<g>`

- Export the selected key:

  `<x>`

- Set the detail level for the selected key:

  `<1>|<2>|<3>`

- Refresh `gpg-tui`:

  `<r>`

- Display help in `gpg-tui`:

  `<?>`

gpg-zip

Encrypt files and directories in an archive using GPG.

More information: https://www.gnupg.org/documentation/manuals/gnupg/gpg_002dzip.html.

- Encrypt a directory into `archive.gpg` using a passphrase:

```
gpg-zip {{[-c|--symmetric]}} {{[-o|--output]}} {{archive.gpg}} {{path/to/directory}}
```

- Decrypt `archive.gpg` into a directory of the same name:

```
gpg-zip {{[-d|--decrypt]}} {{path/to/archive.gpg}}
```

- List the contents of the encrypted `archive.gpg`:

```
gpg-zip --list-archive {{path/to/archive.gpg}}
```

gpg

GNU Privacy Guard, an OpenPGP encryption and signing tool.

More information: https://gnupg.org/documentation/manuals/gnupg/Invoking-GPG.html.

- Create a GPG public and private key interactively:

```
gpg {{[--full-gen-key|--full-generate-key]}}
```

- List all keys from the public keyring:

```
gpg {{[-k|--list-keys]}}
```

- Sign `doc.txt` without encryption (writes output to `doc.txt.asc`):

```
gpg --clearsign {{doc.txt}}
```

- Encrypt and sign `doc.txt` for `alice@example.com` and `bob@example.com` (output to `doc.txt.gpg`):

```
gpg {{[-es|--encrypt --sign]}} {{[-r|--recipient]}}
{{alice@example.com}} {{[-r|--recipient]}}
{{bob@example.com}} {{doc.txt}}
```

- Encrypt `doc.txt` with only a passphrase (output to `doc.txt.gpg`):

```
gpg {{[-c|--symmetric]}} {{doc.txt}}
```

- Decrypt `doc.txt.gpg` (output to `stdout`):

```
gpg {{[-d|--decrypt]}} {{doc.txt.gpg}}
```

- Import a public key:

```
gpg --import {{public.gpg}}
```

- Export the public/private key for `alice@example.com` (output to `stdout`):

```
gpg {{--export|--export-secret-keys}} {{[-a|--armor]}}
{{alice@example.com}}
```

gpg2

This command is an alias of **gpg**.

- View documentation for the original command:

```
tldr gpg
```

gpgconf

Modify **`.gnupg`** home directories.

More information: https://www.gnupg.org/documentation/manuals/gnupg/gpgconf.html.

- List all components:

```
gpgconf --list-components
```

- List the directories used by gpgconf:

```
gpgconf {{[-L|--list-dirs]}}
```

- List all options of a component:

```
gpgconf --list-options {{component}}
```

- List programs and test whether they are runnable:

```
gpgconf --check-programs
```

- Reload a component:

```
gpgconf --reload {{component}}
```

gpgv

Verify OpenPGP signatures.

Note: **`gpgv`** reads trusted pubkeys from **`~/.gnupg/trustedkeys.kbx`** in absence of the **`--keyring`** option.

See also: **`gpg`**.

More information: https://www.gnupg.org/documentation/manuals/gnupg/gpgv.html.

- Verify a clearsigned or inline-signed file (the signature is embedded in the file itself):

```
gpgv {{path/to/file.asc}}
```

- Verify a detached signature (`.asc` or `.sig`) against its corresponding data file:

```
gpgv {{path/to/signature.asc}} {{path/to/data_file}}
```

- Verify a detached signature using a specific public keyring or exported public key file (`.gpg` or `.kbx`):

```
gpgv --keyring {{path/to/pubkey_or_keyring.gpg}} {{path/to/signature.asc}} {{path/to/data_file}}
```

- Verify a detached signature using a specific public key file in plain text format (`.txt`):

```
gpg --dearmor {{[-o|--output]}} {{path/to/pubkey.gpg}} {{path/to/pubkey.txt}} && gpgv --keyring {{path/to/pubkey.gpg}} {{path/to/signature.asc}} {{path/to/data_file}}
```

gprbuild

A high-level build tool for projects written in Ada and other languages (C/C++/Fortran).

More information: https://docs.adacore.com/gprbuild-docs/html/gprbuild_ug.html.

- Build a project (assuming only one `*.gpr` file exists in the current directory):

```
gprbuild
```

- Build a specific [P]roject file:

```
gprbuild -P {{project_name}}
```

- Clean up the build workspace:

```
gprclean
```

- Install compiled binaries:

```
gprinstall --prefix {{path/to/installation_directory}}
```

gprof

Performance analysis tool for many programming languages.

It profiles the function executions of a program.

More information: https://ftp.gnu.org/old-gnu/Manuals/gprof/html_mono/gprof.html.

- Compile binary to default `a.out` with gprof information and run it to get `gmon.out`:

```
gcc {{[-p|-pg]}} {{program.c}} && ./a.out
```

- Run gprof on default `a.out` and `gmon.out` to obtain profile output:

```
gprof
```

- Run gprof on a named binary:

```
gprof {{path/to/binary}} {{path/to/gmon.out}}
```

- Suppress profile field's description:

```
gprof {{[-b|--brief]}}
```

- Display routines that have zero usage:

```
gprof {{[-bz|--brief --display-unused-functions]}}
```

gradle build

Build a project using Gradle.

More information: https://docs.gradle.org/current/userguide/gradle_basics.html.

- Build the project:

```
gradle build
```

- Perform a clean build:

```
gradle clean build
```

- Build the project while skipping tests:

```
gradle build {{[-x|--exclude-task]}} test
```

- Build with more detailed logging:

```
gradle build {{[-i|--info]}}
```

gradle

An open source build automation system.

More information: https://manned.org/gradle.

- Compile a package:

```
gradle build
```

- Exclude test task:

```
gradle build {{[-x|--exclude-task]}} {{test}}
```

- Run in offline mode to prevent Gradle from accessing the network during builds:

```
gradle build --offline
```

- Clear the build directory:

```
gradle clean
```

- Build an Android Package (APK) in release mode:

```
gradle assembleRelease
```

- List the main tasks:

```
gradle tasks
```

- List all the tasks:

```
gradle tasks --all
```

grafana-cli

A small executable that is bundled with Grafana serve.

More information: https://grafana.com/docs/grafana/latest/administration/cli/.

- Install, update, or remove specific plugins:

```
grafana-cli plugins {{install|update|remove}} {{plugin_id1 plugin_id2 ...}}
```

- List all installed plugins:

```
grafana-cli plugins ls
```

grap

A charting preprocessor for the groff (GNU Troff) document formatting system.

See also: **`pic`**, **`groff`**.

More information: https://manned.org/grap.

- Process a `grap` file and save the output file for future processing with `pic` and `groff`:

```
grap {{path/to/input.grap}} > {{path/to/output.pic}}
```

- Typeset a `grap` file to PDF using the [me] macro package, saving the output to a file:

```
grap {{path/to/input.grap}} | pic -T {{pdf}} | groff -{{me}} -T {{pdf}} > {{path/to/output.pdf}}
```

graphml2gv

Convert a graph from **`graphml`** to **`gv`** format.

Converters: **`gml2gv`**, **`gv2gml`**, **`gv2gxl`**, **`gxl2gv`**, **`graphml2gv`** & **`mm2gv`**.

More information: https://graphviz.org/pdf/graphml2gv.1.pdf.

- Convert a graph from `gml` to `gv` format:

```
graphml2gv -o {{output.gv}} {{input.gml}}
```

- Convert a graph using `stdin` and `stdout`:

```
cat {{input.gml}} | graphml2gv > {{output.gv}}
```

- Display help:

```
graphml2gv -?
```

>

Redirect output.

More information: https://gnu.org/software/bash/manual/bash.html#Redirecting-Output.

- Redirect `stdout` to a file:

```
{{command}} > {{path/to/file}}
```

- Append to a file:

```
{{command}} >> {{path/to/file}}
```

- Redirect both `stdout` and `stderr` to a file:

```
{{command}} &> {{path/to/file}}
```

- Redirect `stderr` to `/dev/null` to keep the terminal output clean:

```
{{command}} 2> /dev/null
```

- Clear the file contents or create a new empty file:

```
> {{path/to/file}}
```

- Redirect `stderr` to `stdout` for piping them together:

```
{{command1}} 2>&1 | {{command2}}
```

- Open a persistent file descriptor:

```
exec {{3}}>{{path/to/file}}
```

- Write to a custom file descriptor:

```
{{echo text}} >&{{3}}
```

grep

Find patterns in files using **regex**es.

See also: **regex**.

More information: https://www.gnu.org/software/grep/manual/grep.html.

- Search for a pattern within files:

```
grep "{{search_pattern}}" {{path/to/file1 path/to/file2 ...}}
```

- Search for an exact string (disables regexes):

```
grep {{[-F|--fixed-strings]}} "{{exact_string}}" {{path/to/file}}
```

- Search for a pattern in all files recursively in a directory, ignoring binary files:

```
grep {{[-rI|--recursive --binary-files=without-match]}} "{{search_pattern}}" {{path/to/directory}}
```

- Print 3 lines of [C]ontext around, [B]efore, or [A]fter each match:

```
grep {{--context|--before-context|--after-context}} 3 "{{search_pattern}}" {{path/to/file}}
```

- Print file name and line number for each match with color output:

```
grep {{[-Hn|--with-filename --line-number]}} --color=always "{{search_pattern}}" {{path/to/file}}
```

- Print only the matched text:

```
grep {{[-o|--only-matching]}} "{{search_pattern}}" {{path/to/file}}
```

- Read data from stdin and do not print lines that match a pattern:

```
cat {{path/to/file}} | grep {{[-v|--invert-match]}} "{{search_pattern}}"
```

- Use extended regexes (supports ?, +, {}, (), and |), in case-insensitive mode:

```
grep {{[-Ei|--extended-regexp --ignore-case]}} "{{search_pattern}}" {{path/to/file}}
```

grex

Generate **regex**s.

More information: https://github.com/pemistahl/grex#5-how-to-use.

- Generate a simple regex:

```
grex {{string1 string2 ...}}
```

- Generate a case-insensitive regex:

```
grex {{[-i|--ignore-case]}} {{string1 string2 ...}}
```

- Replace digits with \d:

```
grex {{[-d|--digits]}} {{string1 string2 ...}}
```

- Replace Unicode word character with \w:

```
grex {{[-w|--words]}} {{string1 string2 ...}}
```

- Replace spaces with \s:

```
grex {{[-s|--spaces]}} {{string1 string2 ...}}
```

- Detect repeating patterns in the input and shorten them using {min,max} quantifiers:

```
grex {{[-r|--repetitions]}} {{string1 string2 ...}}
```

- Generate regex of test cases (separated by newline) from a file:

```
grex {{[-f|--file]}} {{path/to/file}}
```

- Do not generate anchors and non-capture groups:

```
grex --no-anchors {{[-g|--capture-groups]}} {{string1
string2 ...}}
```

grip

Preview GitHub-flavored Markdown files locally.

More information: https://manned.org/grip.

- Start the server and serve the rendered `README` file of a current directory:

```
grip
```

- Start the server and serve a specific Markdown file:

```
grip {{path/to/file.md}}
```

- Start the server and open the `README` file of the current directory in the browser:

```
grip {{[-b|--browser]}}
```

- Start the server in the specified port and serve the rendered `README` file of the current directory:

```
grip {{port}}
```

groff

GNU replacement for the **`troff`** and **`nroff`** typesetting utilities.

More information: https://www.gnu.org/software/groff/manual/groff.html.node/Groff-Options.html.

- Format output for a PostScript printer, saving the output to a file:

```
groff {{path/to/input.roff}} > {{path/to/output.ps}}
```

- Render a man page using the ASCII output device, and display it using a pager:

```
groff -man -T ascii {{path/to/manpage.1}} | less --RAW-CONTROL-CHARS
```

- Render a man page into an HTML file:

```
groff -man -T html {{path/to/manpage.1}} > {{path/to/manpage.html}}
```

- Typeset a roff file containing [t]ables and [p]ictures, using the [me] macro set, to PDF, saving the output:

```
groff {{-t}} {{-p}} -{{me}} -T {{pdf}} {{path/to/input.me}} > {{path/to/output.pdf}}
```

- Run a `groff` command with preprocessor and macro options guessed by the `grog` utility:

```
eval "$(grog -T utf8 {{path/to/input.me}})"
```

gron

Transform **JSON** into individual assignments for easier management.

More information: https://manned.org/gron.

- Process JSON file into individual assignments:

```
gron {{path/to/file|url}}
```

- Don't sort output data:

```
gron --no-sort {{path/to/file|url}}
```

- Disable certificate validation:

```
gron {{[-k|--insecure]}} {{url}}
```

- Display values of gron assignments:

```
gron {{[-v|--values]}} {{path/to/file|url}}
```

- Turn assignments converted with gron back into JSON:

```
gron {{[-u|--ungron]}} {{path/to/file|url}}
```

- Process individual lines of input as separate JSON objects:

```
gron {{[-s|--stream]}} {{path/to/file|url}}
```

- Represent processed data as a JSON stream:

```
gron {{[-j|--json]}} {{path/to/file|url}}
```

groups

Print group memberships for a user.

See also: **`groupadd`**, **`groupdel`**, **`groupmod`**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/groups-invocation.html.

- Print group memberships for the current user:

```
groups
```

- Print group memberships for a list of users:

```
groups {{username1 username2 ...}}
```

grpcurl

Interact with gRPC servers.

Like **`curl`**, but for gRPC.

More information: https://github.com/fullstorydev/grpcurl.

- Send an empty request:

```
grpcurl {{grpc.server.com:443}} {{my.custom.server.Service/Method}}
```

- Send a request with a header and a body:

```
grpcurl -H "{{Authorization: Bearer $token}}" -d '{{{"foo": "bar"}}}' {{grpc.server.com:443}} {{my.custom.server.Service/Method}}
```

- List all services exposed by a server:

```
grpcurl {{grpc.server.com:443}} list
```

- List all methods in a particular service:

```
grpcurl {{grpc.server.com:443}} list {{my.custom.server.Service}}
```

grumphp

A PHP Composer plugin that enables source code quality checks.

More information: https://github.com/phpro/grumphp#commands.

- Register the Git hooks:

  ```
  grumphp git:init
  ```

- Trigger the pre-commit hook manually:

  ```
  grumphp git:pre-commit
  ```

- Check every versioned file:

  ```
  grumphp run
  ```

grunt

A JavaScript task runner for automating processes.

More information: https://github.com/gruntjs/grunt-cli.

- Run the default task process:

```
grunt
```

- Run one or more tasks:

```
grunt {{task1 task2 ...}}
```

- Specify an alternative configuration file:

```
grunt --gruntfile {{path/to/file}}
```

- Specify an alternative base path for relative files:

```
grunt --base {{path/to/directory}}
```

- Specify an additional directory to scan for tasks in:

```
grunt --tasks {{path/to/directory}}
```

- Perform a dry-run without writing any files:

```
grunt --no-write
```

- Display help:

```
grunt --help
```

gst-device-monitor-1.0

List devices detected by GStreamer.

More information: https://manned.org/gst-device-monitor-1.0.

- List all current devices:

```
gst-device-monitor-1.0
```

- List all current devices and monitor for any changes:

```
gst-device-monitor-1.0 {{[-f|--follow]}}
```

- List devices of a specific type:

```
gst-device-monitor-1.0 {{Audio|Video}}/{{Source|Sink}}
```

gst-discoverer-1.0

Display file metadata and stream information.

More information: https://manned.org/gst-discoverer-1.0.

- Print file metadata:

```
gst-discoverer-1.0 {{path/to/file}}
```

gst-inspect-1.0

Print information on GStreamer plugins.

More information: https://gstreamer.freedesktop.org/documentation/tools/gst-inspect.html.

- Print information on a plugin:

```
gst-inspect-1.0 {{plugin}}
```

- List hardware transcoding capabilities of your device:

```
gst-inspect-1.0 {{vaapi|nvcodec|...}}
```

- List available container plugins:

```
gst-inspect-1.0 {{matroska|avi|ogg|isomp4|...}}
```

- List available audio codecs:

```
gst-inspect-1.0 {{opus|vorbis|flac|...}}
```

- List GStreamer core elements:

```
gst-inspect-1.0 coreelements
```

- List plugins that utilize graphics APIs:

```
gst-inspect-1.0 {{vulkan|opengl|...}}
```

- List available image codecs:

```
gst-inspect-1.0 {{png|jpeg|...}}
```

- List all available plugins:

```
gst-inspect-1.0
```

gst-launch-1.0

Build and run a GStreamer pipeline.

See also: **`gst-inspect-1.0`**, **`ffmpeg`**.

More information: https://gstreamer.freedesktop.org/documentation/tools/gst-launch.html.

- Play test video in a window:

```
gst-launch-1.0 videotestsrc ! autovideosink
```

- Play test audio:

```
gst-launch-1.0 audiotestsrc ! autoaudiosink
```

- Play a media file in a window:

```
gst-launch-1.0 playbin uri={{protocol}}://{{host}}/{{path/to/file}}
```

- Re-encode a media file:

```
gst-launch-1.0 filesrc location={{path/to/file}} ! {{file_type}}demux ! {{codec_type}}dec ! {{codec_type}}enc ! {{file_type}}mux ! filesink location={{path/to/file}}
```

- Stream a file to an RTSP server:

```
gst-launch-1.0 filesrc location={{path/to/file}} ! rtspclientsink location=rtsp://{{host_IP}}/{{path/to/file}}
```

- Force an End Of Stream event if the pipeline is shut down with `<Ctrl c>` for containers that require finalization such as `mp4`:

```
gst-launch-1.0 {{[-e|--eos-on-shutdown]}} videotestsrc ! x264enc ! mp4mux ! filesink location={{path/to/file.mp4}}
```

- Multiplex together test video and test audio into a file:

```
gst-launch-1.0 {{[-e|--eos-on-shutdown]}} videotestsrc ! x264enc ! {{element_name}}. audiotestsrc ! opusenc ! {{element_name}}. matroskamux name={{element_name}} ! filesink location={{path/to/file.mkv}}
```

- Dump a pipeline into a `.dot` file which can then be rendered with tools like `dot`:

```
GST_DEBUG_DUMP_DOT_DIR={{path/to/directory}} gst-launch-1.0
{{pipeline}}
```

gsutil

Access Google Cloud Storage.

You can use **`gsutil`** to do a wide range of bucket and object management tasks.

More information: https://docs.cloud.google.com/storage/docs/gsutil.

- List all buckets in a project you are logged into:

```
gsutil ls
```

- List the objects in a bucket:

```
gsutil ls -r 'gs://{{bucket_name}}/{{prefix}}**'
```

- Download an object from a bucket:

```
gsutil cp gs://{{bucket_name}}/{{object_name}} {{path/to/
save_location}}
```

- Upload an object to a bucket:

```
gsutil cp {{object_location}} gs://
{{destination_bucket_name}}/
```

- Rename or move objects in a bucket:

```
gsutil mv gs://{{bucket_name}}/{{old_object_name}} gs://
{{bucket_name}}/{{new_object_name}}
```

- Create a new bucket in the project you are logged into:

```
gsutil mb gs://{{bucket_name}}
```

- Delete a bucket and remove all the objects in it:

```
gsutil rm -r gs://{{bucket_name}}
```

gt

Create and manage sequences of dependent code changes (stacks) for Git and GitHub.

More information: https://graphite.com/docs/get-started.

- Initialize `gt` for the repository in the current directory:

```
gt init
```

- Create a new branch stacked on top of the current branch and commit staged changes:

```
gt create {{branch_name}}
```

- Create a new commit and fix upstack branches:

```
gt modify -cam {{commit_message}}
```

- Force push all branches in the current stack to GitHub and create or update PRs:

```
gt stack submit
```

- Checkout different branch (prompts interactive mode when branch name is omitted):

```
gt co {{branch_name}}
```

- Sync stack with remote version (also deletes merged branches):

```
gt sync
```

- Log all tracked stacks:

```
gt log short
```

- Display help for a specified subcommand:

```
gt {{subcommand}} --help
```

gtop

System monitoring dashboard for the terminal.

More information: https://github.com/aksakalli/gtop.

- Show the system stats dashboard:

  ```
  gtop
  ```

- Sort by CPU usage:

  ```
  <c>
  ```

- Sort by memory usage:

  ```
  <m>
  ```

guacd

Apache Guacamole proxy daemon.

Support loader for client plugins to interface between the Guacamole protocol and any arbitrary remote desktop protocol (e.g. RDP, VNC, Other).

More information: https://manned.org/guacd.

- Bind to a specific port on localhost:

```
guacd -b {{127.0.0.1}} -l {{4823}}
```

- Start in debug mode, keeping the process in the foreground:

```
guacd -f -L {{debug}}
```

- Start with TLS support:

```
guacd -C {{my-cert.crt}} -K {{my-key.pem}}
```

- Write the PID to a file:

```
guacd -p {{path/to/file.pid}}
```

guetzli

JPEG image compression utility.

More information: https://manned.org/guetzli.

- Compress a JPEG image:

```
guetzli {{input.jpg}} {{output.jpg}}
```

- Create a compressed JPEG from a PNG:

```
guetzli {{input.png}} {{output.jpg}}
```

- Compress a JPEG with the desired visual quality (84-100):

```
guetzli --quality {{quality_value}} {{input.jpg}}
{{output.jpg}}
```

guile

Guile Scheme interpreter.

More information: https://www.gnu.org/software/guile/manual/guile.html#Invoking-Guile.

- Start a REPL (interactive shell):

```
guile
```

- Execute the script in a given Scheme file:

```
guile {{script.scm}}
```

- Execute a Scheme expression:

```
guile -c "{{expression}}"
```

- Listen on a port or a Unix domain socket (the default is port 37146) for remote REPL connections:

```
guile --listen={{port_or_socket}}
```

gulp

JavaScript task runner and streaming build system.

Tasks are defined within **`gulpfile.js`** at the project root.

More information: https://github.com/gulpjs/gulp-cli.

- Run the default task:

  ```
  gulp
  ```

- Run individual tasks:

  ```
  gulp {{task}} {{othertask}}
  ```

- Print the task dependency tree for the loaded gulpfile:

  ```
  gulp --tasks
  ```

gum

Make glamorous shell scripts.

See also: **`whiptail`**, **`dialog`**.

More information: https://github.com/charmbracelet/gum#tutorial.

- Interactively pick a specific option to print to `stdout`:

```
gum choose {{"option1" "option2" "..."}}
```

- Open an interactive prompt for the user to input a string with a specific placeholder:

```
gum input --placeholder "{{value}}"
```

- Open an interactive confirmation prompt and exit with either `<0>` or `<1>`:

```
gum confirm "{{Continue?}}" --default=false --affirmative
"{{Yes}}" --negative "{{No}}" {{&& echo "Yes selected" ||
echo "No selected"}}
```

- Show a spinner while a command is taking place with text alongside:

```
gum spin {{[-s|--spinner]}} {{dot|line|minidot|jump|pulse|
points|globe|moon|monkey|meter|hamburger}} --title
"{{loading...}}" {{command}}
```

- Format text to include emojis:

```
gum format {{[-t|--type]}} {{emoji}} "{{:smile: :heart:
hello}}"
```

- Interactively prompt for multi-line text and write the input to a file:

```
gum write > {{path/to/file}}
```

gunicorn

Python WSGI HTTP Server.

More information: https://docs.gunicorn.org/en/latest/run.html.

- Run Python web app:

```
gunicorn {{import.path:app_object}}
```

- Listen on port 8080 on localhost:

```
gunicorn {{[-b|--bind]}} {{localhost}}:{{8080}}
{{import.path:app_object}}
```

- Turn on live reload:

```
gunicorn --reload {{import.path:app_object}}
```

- Use 4 worker processes for handling requests:

```
gunicorn {{[-w|--workers]}} {{4}} {{import.path:app_object}}
```

- Use 4 worker threads for handling requests:

```
gunicorn --threads {{4}} {{import.path:app_object}}
```

- Run app over HTTPS:

```
gunicorn --certfile {{cert.pem}} --keyfile {{key.pem}}
{{import.path:app_object}}
```

gunzip

This command is an alias of **`gzip --decompress`**.

- View documentation for the original command:

  ```
  tldr gzip
  ```

gv2gml

Convert a graph from **`gv`** to **`gml`** format.

Converters: **`gml2gv`**, **`gv2gml`**, **`gv2gxl`**, **`gxl2gv`**, **`graphml2gv`** & **`mm2gv`**.

More information: https://graphviz.org/pdf/gml2gv.1.pdf.

- Convert a graph from `gv` to `gml` format:

```
gv2gml -o {{output.gml}} {{input.gv}}
```

- Convert a graph using `stdin` and `stdout`:

```
cat {{input.gv}} | gv2gml > {{output.gml}}
```

- Display help:

```
gv2gml -?
```

gv2gxl

Convert a graph from **`gv`** to **`gxl`** format.

Converters: **`gml2gv`**, **`gv2gml`**, **`gv2gxl`**, **`gxl2gv`**, **`graphml2gv`** & **`mm2gv`**.

More information: https://graphviz.org/pdf/gxl2gv.1.pdf.

- Convert a graph from `gv` to `gxl` format:

```
gv2gxl -o {{output.gxl}} {{input.gv}}
```

- Convert a graph using `stdin` and `stdout`:

```
cat {{input.gv}} | gv2gxl > {{output.gxl}}
```

- Display help:

```
gv2gxl -?
```

gvcolor

Colorize a ranked digraph with a range of colors.

Graphviz filters: **`acyclic`**, **`bcomps`**, **`comps`**, **`edgepaint`**, **`gvcolor`**, **`gvpack`**, **`mingle`**, **`nop`**, **`sccmap`**, **`tred`**, & **`unflatten`**.

More information: https://graphviz.org/pdf/gvcolor.1.pdf.

- Colorize one or more ranked digraph (that were already processed by `dot`):

```
gvcolor {{path/to/layout1.gv path/to/layout2.gv ...}} > {{path/to/output.gv}}
```

- Lay out a graph and colorize it, then convert to a PNG image:

```
dot {{path/to/input.gv}} | gvcolor | dot -T {{png}} > {{path/to/output.png}}
```

- Display help:

```
gvcolor -?
```

gvedit

Simple Graphviz graph editor and viewer.

More information: https://graphviz.org/pdf/gvedit.1.pdf.

- Open a Graphviz file in the editor:

```
gvedit {{path/to/graph.gv}}
```

- [s]cale coordinates from points to inches (useful for layouts generated by Graphviz tools):

```
gvedit -s {{path/to/graph.gv}}
```

- Enable [v]erbose mode:

```
gvedit -v {{path/to/graph.gv}}
```

- Display help:

```
gvedit -?
```

gvgen

Generate simple, structured abstract graphs.

More information: https://graphviz.org/pdf/gvgen.1.pdf.

- Generate a [c]ycle with 10 vertices and edges and write it to `stdout`:

```
gvgen -c {{10}}
```

- Generate a 4×3 [g]rid:

```
gvgen -g {{4,3}}
```

- Generate a binary [t]ree of height 5:

```
gvgen -t {{5}}
```

- Generate a complete [b]ipartite graph with 3 and 4 vertices:

```
gvgen -b {{3,4}}
```

- Create a [r]andom graph and [o]utput it to a file:

```
gvgen -r {{10,5}} -o {{random.gv}}
```

- Generate a [d]irected graph with [v]erbose output:

```
gvgen -d -v -c {{6}}
```

- Display help:

```
gvgen -?
```

gvim

A Graphical User Interface version of Vim (Vi IMproved), a command-line text editor.

See also: **`vimdiff`**, **`vimtutor`**, **`nvim`**, **`vim`**.

More information: https://www.vim.org/.

- Open `gvim`:

```
gvim
```

- Open a specific file:

```
gvim {{path/to/file}}
```

gvmap

Find clusters and creates a geographical map highlighting clusters.

More information: https://graphviz.org/pdf/gvmap.1.pdf.

- Generate a clustered map layout from a DOT format graph:

```
gvmap {{graph.gv}} -o {{output.xdot}}
```

- Generate a map using existing cluster subgraphs from the input:

```
gvmap -D {{graph.gv}}
```

- Include graph edges in the [o]utput map:

```
gvmap -e {{graph.gv}} -o {{output.xdot}}
```

- Specify a [c]olor scheme (1: pastel, 2: blue-yellow, 3: white-red, etc.):

```
gvmap -c {{1|2|3|...}} {{graph.gv}} -o {{output.xdot}}
```

- Set the maximum number of [C]lusters (by default 0, meaning there is no limit):

```
gvmap -C {{10}} {{graph.gv}} -o {{output.xdot}}
```

- Only draw cluster 2 (by default, all clusters are drawn):

```
gvmap -highlight={{2}} {{graph.gv}} -o {{output.xdot}}
```

gvpack

Combine several graph layouts (that already have layout information).

Graphviz filters: **`acyclic`**, **`bcomps`**, **`comps`**, **`edgepaint`**, **`gvcolor`**, **`gvpack`**, **`mingle`**, **`nop`**, **`sccmap`**, **`tred`**, & **`unflatten`**.

More information: https://graphviz.org/pdf/gvpack.1.pdf.

- Combine several graph layouts (that already have layout information):

```
gvpack {{path/to/layout1.gv path/to/layout2.gv ...}} >
{{path/to/output.gv}}
```

- Combine several graph layouts at the graph level, keeping graphs separate:

```
gvpack -g {{path/to/layout1.gv path/to/layout2.gv ...}} >
{{path/to/output.gv}}
```

- Combine several graph layouts at the node level, ignoring clusters:

```
gvpack -n {{path/to/layout1.gv path/to/layout2.gv ...}} >
{{path/to/output.gv}}
```

- Combine several graph layouts without packing:

```
gvpack -u {{path/to/layout1.gv path/to/layout2.gv ...}} >
{{path/to/output.gv}}
```

- Display help:

```
gvpack -?
```

gxl2gv

Convert a graph from **`gxl`** to **`gv`** format.

Converters: **`gml2gv`**, **`gv2gml`**, **`gv2gxl`**, **`gxl2gv`**, **`graphml2gv`** & **`mm2gv`**.

More information: https://graphviz.org/pdf/gxl2gv.1.pdf.

- Convert a graph from `gxl` to `gv` format:

```
gxl2gv -o {{output.gv}} {{input.gxl}}
```

- Convert a graph using `stdin` and `stdout`:

```
cat {{input.gxl}} | gxl2gv > {{output.gv}}
```

- Display help:

```
gxl2gv -?
```

gyb

Locally back up Gmail messages using Gmail's API over HTTPS.

More information: https://github.com/GAM-team/got-your-back.

- Estimate the number and the size of all emails on your Gmail account:

```
gyb --email {{email@gmail.com}} --action estimate
```

- Backup a Gmail account to a specific directory:

```
gyb --email {{email@gmail.com}} --action backup --local-folder {{path/to/directory}}
```

- Backup only important or starred emails from a Gmail account to the default local folder:

```
gyb --email {{email@gmail.com}} --search "{{is:important OR is:starred}}"
```

- Restore from a local folder to a Gmail account:

```
gyb --email {{email@gmail.com}} --action restore --local-folder {{path/to/directory}}
```

gzip

Compress/uncompress files with **`gzip`** compression (LZ77).

More information: https://www.gnu.org/software/gzip/manual/gzip.html.

- Compress a file, replacing it with a `gzip` archive:

```
gzip {{path/to/file}}
```

- Decompress a file, replacing it with the original uncompressed version:

```
gzip {{[-d|--decompress]}} {{path/to/file.gz}}
```

- Display the name and reduction percentage for each file compressed:

```
gzip {{[-v|--verbose]}} {{path/to/file.gz}}
```

- Compress a file, keeping the original file:

```
gzip {{[-k|--keep]}} {{path/to/file}}
```

- Compress a file, specifying the output filename:

```
gzip {{[-c|--stdout]}} {{path/to/file}} > {{path/to/
compressed_file.gz}}
```

- Decompress a `gzip` archive specifying the output filename:

```
gzip {{[-cd|--stdout --decompress]}} {{path/to/file.gz}} >
{{path/to/uncompressed_file}}
```

- Specify the compression level. 1 is the fastest (low compression), 9 is the slowest (high compression), 6 is the default:

```
gzip -{{1..9}} {{[-c|--stdout]}} {{path/to/file}} > {{path/
to/compressed_file.gz}}
```

- List the contents of a compressed file:

```
gzip {{[-l|--list]}} {{path/to/file.txt.gz}}
```

hadolint

Dockerfile linter.

More information: https://github.com/hadolint/hadolint#cli.

- Lint a Dockerfile:

```
hadolint {{path/to/Dockerfile}}
```

- Lint a Dockerfile, displaying the output in JSON format:

```
hadolint {{[-f|--format]}} {{json}} {{path/to/Dockerfile}}
```

- Lint a Dockerfile, displaying the output in a specific format:

```
hadolint {{[-f|--format]}} {{tty|json|checkstyle|codeclimate|
codacy}} {{path/to/Dockerfile}}
```

- Lint a Dockerfile ignoring specific rules:

```
hadolint --ignore {{DL3006}} --ignore {{DL3008}} {{path/to/
Dockerfile}}
```

- Lint multiple Dockerfiles using specific trusted registries:

```
hadolint --trusted-registry {{docker.io}} --trusted-registry
{{example.com}}:{{5000}} {{path/to/Dockerfile1 path/to/
Dockerfile2 ...}}
```

hakyll-init

Generate a new Hakyll sample blog.

More information: https://github.com/jaspervdj/hakyll-init.

- Generate a new Hakyll sample blog:

```
hakyll-init {{path/to/directory}}
```

- Display help:

```
hakyll-init --help
```

handbrakecli

Command-line interface to the HandBrake video conversion and DVD ripping tool.

More information: https://handbrake.fr/docs/en/latest/cli/command-line-reference.html.

- Convert a video file to MKV (AAC 160kbit audio and x264 CRF20 video):

```
handbrakecli {{[-i|--input]}} {{input.avi}} {{[-o|--output]}} {{output.mkv}} {{[-e|--encoder]}} x264 {{[-q|--quality]}} 20 {{[-B|--ab]}} 160
```

- Resize a video file to 320x240:

```
handbrakecli {{[-i|--input]}} {{input.mp4}} {{[-o|--output]}} {{output.mp4}} {{[-w|--width]}} 320 {{[-l|--height]}} 240
```

- List available presets:

```
handbrakecli {{[-z|--preset-list]}}
```

- Convert an AVI video to MP4 using the Android preset:

```
handbrakecli {{[-Z|--preset]}} "Android" {{[-i|--input]}} {{input.ext}} {{[-o|--output]}} {{output.mp4}}
```

- Print the content of a DVD, getting the CSS keys in the process:

```
handbrakecli {{[-i|--input]}} {{/dev/sr0}} {{[-t|--title]}} 0
```

- Rip the first track of a DVD in the specified device. Audiotracks and subtitle languages are specified as lists:

```
handbrakecli {{[-i|--input]}} {{/dev/sr0}} {{[-t|--title]}} 1 {{[-o|--output]}} {{out.mkv}} {{[-f|--format]}} av_mkv {{[-e|--encoder]}} x264 {{[-s|--subtitle]}} {{1,4,5}} {{[-a|--audio]}} {{1,2}} {{[-E|--aencoder]}} copy {{[-q|--quality]}} {{23}}
```

hangups

Third party client for Google Hangouts.

More information: https://github.com/tdryer/hangups.

- Start `hangups`:

  ```
  hangups
  ```

- Set a refresh token for hangups:

  ```
  hangups --token-path {{path/to/token}}
  ```

- Display troubleshooting information and help:

  ```
  hangups -h
  ```

hardhat

A development environment for Ethereum software.

More information: https://hardhat.org/hardhat-runner/docs/getting-started#quick-start.

- List available subcommands (or create a new project if no configuration exists):

  ```
  hardhat
  ```

- Compile the current project and build all artifacts:

  ```
  hardhat compile
  ```

- Run a user-defined script after compiling the project:

  ```
  hardhat run {{path/to/script.js}}
  ```

- Run Mocha tests:

  ```
  hardhat test
  ```

- Run all given test files:

  ```
  hardhat test {{path/to/file1.js path/to/file2.js ...}}
  ```

- Start a local Ethereum JSON-RPC node for development:

  ```
  hardhat node
  ```

- Start a local Ethereum JSON-RPC node with a specific hostname and port:

  ```
  hardhat node --hostname {{hostname}} --port {{port}}
  ```

- Clean the cache and all artifacts:

  ```
  hardhat clean
  ```

hash

View cached executable locations.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-hash.

- View cached command locations for the current shell:

```
hash
```

- Clear the hash table:

```
hash -r
```

- Delete a specific command from the hash table:

```
hash -d {{command}}
```

- Print the full path of `command`:

```
hash -t {{command}}
```

- Display help:

```
hash --help
```

hashcat

Fast and advanced password recovery tool.

More information: https://hashcat.net/wiki/doku.php?id=hashcat.

- Perform a brute-force attack (mode 3) with the default hashcat mask:

```
hashcat --hash-type {{hash_type_id}} --attack-mode {{3}} {{hash_value}}
```

- Perform a brute-force attack (mode 3) with a known pattern of 4 digits:

```
hashcat --hash-type {{hash_type_id}} --attack-mode {{3}} {{hash_value}} "{{?d?d?d?d}}"
```

- Perform a brute-force attack (mode 3) using at most 8 of all printable ASCII characters:

```
hashcat --hash-type {{hash_type_id}} --attack-mode {{3}} --increment {{hash_value}} "{{?a?a?a?a?a?a?a?a}}"
```

- Perform a dictionary attack (mode 0) using the RockYou wordlist of a Kali Linux box:

```
hashcat --hash-type {{hash_type_id}} --attack-mode {{0}} {{hash_value}} {{/usr/share/wordlists/rockyou.txt}}
```

- Perform a rule-based dictionary attack (mode 0) using the RockYou wordlist mutated with common password variations:

```
hashcat --hash-type {{hash_type_id}} --attack-mode {{0}} --rules-file {{/usr/share/hashcat/rules/best64.rule}} {{hash_value}} {{/usr/share/wordlists/rockyou.txt}}
```

- Perform a combination attack (mode 1) using the concatenation of words from two different custom dictionaries:

```
hashcat --hash-type {{hash_type_id}} --attack-mode {{1}} {{hash_value}} /{{path/to/dictionary1.txt}} /{{path/to/dictionary2.txt}}
```

- Show result of an already cracked hash:

```
hashcat --show {{hash_value}}
```

- Show all example hashes:

```
hashcat --example-hashes
```

hashid

Python3 program that identifies data and password hashes.

More information: https://github.com/psypanda/hashID#usage.

- Identify hashes from `stdin` (through typing, copying and pasting, or piping the hash into the program):

```
hashid
```

- Identify one or more hashes:

```
hashid {{hash1 hash2 ...}}
```

- Identify hashes on a file (one hash per line):

```
hashid {{path/to/hashes.txt}}
```

- Show all possible hash types (including salted hashes):

```
hashid {{[-e|--extended]}} {{hash}}
```

- Show `hashcat`'s mode number and `john`'s format string of the hash types:

```
hashid {{[-m|--mode]}} {{[-j|--john]}} {{hash}}
```

- Save output to a file instead of printing to `stdout`:

```
hashid {{[-o|--outfile]}} {{path/to/output.txt}} {{hash}}
```

hatch

Modern, extensible Python project manager.

See also: **`poetry`**.

More information: https://hatch.pypa.io/latest/cli/reference/.

- Create a new Hatch project:

  ```
  hatch new {{project_name}}
  ```

- Initialize Hatch for an existing project:

  ```
  hatch new --init
  ```

- Build a Hatch project:

  ```
  hatch build
  ```

- Remove build artifacts:

  ```
  hatch clean
  ```

- Create a default environment with dependencies defined in the `pyproject.toml` file:

  ```
  hatch env create
  ```

- Show environment dependencies as a table:

  ```
  hatch dep show table
  ```

haxelib

Haxe Library Manager.

More information: https://lib.haxe.org/documentation/using-haxelib/.

- Search for a Haxe library:

  ```
  haxelib search {{keyword}}
  ```

- Install a Haxe library:

  ```
  haxelib install {{libname}}
  ```

- Install a specific version of a Haxe library:

  ```
  haxelib install {{libname}} {{version}}
  ```

- Upgrade all installed Haxe libraries:

  ```
  haxelib upgrade
  ```

- Install the development version of a library from a Git repository:

  ```
  haxelib git {{libname}} {{git_url}}
  ```

- Uninstall a Haxe library:

  ```
  haxelib remove {{libname}}
  ```

- Print a tree of locally installed Haxe libraries:

  ```
  haxelib list
  ```

hcloud

Show how to use the CLI for Hetzner Cloud.

More information: https://github.com/hetznercloud/cli/blob/main/docs/reference/manual/hcloud.md.

- Show available commands and flags:

  ```
  hcloud
  ```

- Show available commands and flags for `hcloud` contexts:

  ```
  hcloud context
  ```

- Display help:

  ```
  hcloud -h
  ```

hd

This command is an alias of **hexdump**.

- View documentation for the original command:

```
tldr hexdump
```

head

Output the first part of files.

More information: https://manned.org/head.1p.

- Output the first few lines of a file:

```
head -n {{count}} {{path/to/file}}
```

helix

Helix, A post-modern text editor, provides several modes for different kinds of text manipulation.

Pressing **<i>** enters insert mode. **<Esc>** enters normal mode, which enables the use of Helix commands.

More information: https://manpages.debian.org/testing/hx/editor.1.en.html.

- Open a file:

```
helix {{path/to/file}}
```

- Open files and show them one next each other:

```
helix --vsplit {{path/to/file1 path/to/file2}}
```

- Show the tutorial to learn Helix (or access it within Helix by pressing <Esc> and typing <:>tutor<Enter>):

```
helix --tutor
```

- Change the Helix theme:

```
<:>theme {{theme_name}}
```

- Save and Quit:

```
<:>wq<Enter>
```

- Force-quit without saving:

```
<:>q!<Enter>
```

- Undo the last operation:

```
<u>
```

- Search for a pattern in the file (press <n>/<N> to go to next/previous match):

```
</>{{search_pattern}}<Enter>
```

hello

Print "Hello, world!", "hello, world", or a customizable text.

More information: https://www.gnu.org/software/hello/manual/hello.html#Invoking-hello.

- Print "Hello, world!":

```
hello
```

- Print "hello, world", the traditional type:

```
hello {{[-t|--traditional]}}
```

- Print a text message:

```
hello {{[-g|--greeting]}} "{{greeting_text}}"
```

helm install

Install a helm chart.

More information: https://helm.sh/docs/intro/using_helm/#helm-install-installing-a-package.

- Install a helm chart:

```
helm install {{name}} {{repository_name}}/{{chart_name}}
```

- Install a helm chart from an unpacked chart directory:

```
helm install {{name}} {{path/to/source_directory}}
```

- Install a helm chart from a URL:

```
helm install {{package_name}} {{https://example.com/charts/packagename-1.2.3.tgz}}
```

- Install a helm chart and generate a name:

```
helm install {{repository_name}}/{{chart_name}} {{[-g|--generate-name]}}
```

- Perform a dry run:

```
helm install {{name}} {{repository_name}}/{{chart_name}} --dry-run
```

- Install a helm chart with custom values:

```
helm install {{name}} {{repository_name}}/{{chart_name}} --set {{parameter1}}={{value1}},{{parameter2}}={{value2}}
```

- Install a helm chart passing a custom values file:

```
helm install {{name}} {{repository_name}}/{{chart_name}} {{[-f|--values]}} {{path/to/values.yaml}}
```

helm

A package manager for Kubernetes.

Some subcommands such as **`install`** have their own usage documentation.

More information: https://helm.sh/docs/helm/.

- Create a helm chart:

```
helm create {{chart_name}}
```

- Add a new helm repository:

```
helm repo add {{repository_name}}
```

- List helm repositories:

```
helm repo {{[ls|list]}}
```

- Update helm repositories:

```
helm repo {{[up|update]}}
```

- Delete a helm repository:

```
helm repo {{[rm|remove]}} {{repository_name}}
```

- Install a helm chart:

```
helm install {{name}} {{repository_name}}/{{chart_name}}
```

- Download helm chart as a `.tar` archive:

```
helm get {{chart_release_name}}
```

- Update helm dependencies:

```
helm {{[dep|dependency]}} {{[up|update]}}
```

help

Display information about Bash builtin commands.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-help.

- Display the full list of builtin commands:

```
help
```

- Print instructions on how to use the `while` loop construct:

```
help while
```

- Print instructions on how to use the `for` loop construct:

```
help for
```

- Print instructions on how to use `[[ ]]` for conditional commands:

```
help [[
```

- Print instruction on how to use `(( ))` to evaluate arithmetic expressions:

```
help \(
```

- Print instructions on how to use the `cd` command:

```
help cd
```

help2man

Produce simple man pages from an executable's **`--help`** and **`--version`** output.

More information: https://www.gnu.org/software/help2man/#Invoking-help2man.

- Generate a man page for an executable:

```
help2man {{executable}}
```

- Specify the "name" paragraph in the man page:

```
help2man {{executable}} {{[-n|--name]}} {{name}}
```

- Specify the section for the man page (defaults to 1):

```
help2man {{executable}} {{[-s|--section]}} {{section}}
```

- Output to a file instead of `stdout`:

```
help2man {{executable}} {{[-o|--output]}} {{path/to/file}}
```

- Display help:

```
help2man --help
```

heroku

Create and manage Heroku apps.

More information: https://devcenter.heroku.com/articles/heroku-cli#get-started-with-the-heroku-cli.

- Log in to your Heroku account:

```
heroku login
```

- Create a Heroku app:

```
heroku create
```

- Show logs for an app:

```
heroku logs --app {{app_name}}
```

- Run a one-off process inside a dyno (Heroku virtual machine):

```
heroku run {{process_name}} --app {{app_name}}
```

- List dynos (Heroku virtual machines) for an app:

```
heroku ps --app {{app_name}}
```

- Permanently destroy an app:

```
heroku destroy --app {{app_name}}
```

hexdump

Display file contents in hexadecimal, decimal, octal, or ASCII.

Useful for inspecting dump file, binary data, or debug output.

See also: **`hexyl`**, **`od`**, **`xxd`**.

More information: https://manned.org/man/freebsd/hexdump.1.

- Print the hexadecimal representation of a file, replacing duplicate lines by *:

```
hexdump {{path/to/file}}
```

- Display the input offset in hexadecimal and its ASCII representation in two columns:

```
hexdump -C {{path/to/file}}
```

- Display the hexadecimal representation of a file, but interpret only a specific number of bytes of the input:

```
hexdump -C -n {{number_of_bytes}} {{path/to/file}}
```

- Verbose - no suppression by * on duplicate lines:

```
hexdump -v {{path/to/file}}
```

- Format output using printf-like format string:

```
hexdump -e '{{element_format .. end_format}}' {{path/to/file}}
```

hexedit

File editor for hexadecimal and ASCII content.

More information: https://manned.org/hexedit.

- Open file:

```
hexedit {{path/to/file}}
```

- Display file with sectors:

```
hexedit {{[-s|--sector]}} {{path/to/file}}
```

- Maximize file display:

```
hexedit {{[-m|--maximize]}} {{path/to/file}}
```

- Display help:

```
hexedit {{[-h|--help]}}
```

hexo

A fast, simple & powerful blog framework.

More information: https://hexo.io/docs/commands.

- Initialize a website:

  `hexo init {{path/to/directory}}`

- Create a new article:

  `hexo new {{layout}} {{title}}`

- Generate static files:

  `hexo generate`

- Start a local server:

  `hexo server`

- Deploy the website:

  `hexo deploy`

- Clean the cache file (`db.json`) and generated files (`public/`):

  `hexo clean`

hexyl

A simple hex viewer for the terminal. Uses colored output to distinguish different categories of bytes.

See also: **od**, **xxd**, **hexdump**.

More information: https://github.com/sharkdp/hexyl/blob/master/doc/hexyl.1.md.

- Print the hexadecimal representation of a file:

```
hexyl {{path/to/file}}
```

- Print the hexadecimal representation of the first n bytes of a file:

```
hexyl {{[-n|--length]}} {{n}} {{path/to/file}}
```

hg add

Adds specified files to the staging area for the next commit in Mercurial.

More information: https://www.mercurial-scm.org/help/commands/add.

- Add files or directories to the staging area:

```
hg add {{path/to/file}}
```

- Add all unstaged files matching a specified pattern:

```
hg add {{[-I|--include]}} {{pattern}}
```

- Add all unstaged files, excluding those that match a specified pattern:

```
hg add {{[-X|--exclude]}} {{pattern}}
```

- Recursively add sub-repositories:

```
hg add {{[-S|--subrepos]}}
```

- Perform a test-run without performing any actions:

```
hg add {{[-n|--dry-run]}}
```

hg branch

Create or show a branch name.

More information: https://www.mercurial-scm.org/help/commands/branch.

- Show the name of the currently active branch:

```
hg branch
```

- Create a new branch for the next commit:

```
hg branch {{branch_name}}
```

hg clone

Create a copy of an existing repository in a new directory.

More information: https://www.mercurial-scm.org/help/commands/clone.

- Clone a repository to a specified directory:

```
hg clone {{remote_repository_source}} {{destination_path}}
```

- Clone a repository to the head of a specific branch, ignoring later commits:

```
hg clone {{[-b|--branch]}} {{branch}}
{{remote_repository_source}}
```

- Clone a repository with only the `.hg` directory, without checking out files:

```
hg clone {{[-U|--noupdate]}} {{remote_repository_source}}
```

- Clone a repository to a specific revision, tag, or branch, keeping the entire history:

```
hg clone {{[-u|--updaterev]}} {{revision}}
{{remote_repository_source}}
```

- Clone a repository up to a specific revision without any newer history:

```
hg clone {{[-r|--rev]}} {{revision}}
{{remote_repository_source}}
```

hg commit

Commit all staged or specified files to the repository.

More information: https://www.mercurial-scm.org/help/commands/commit.

- Commit staged files to the repository:

```
hg commit
```

- Commit a specific file or directory:

```
hg commit {{path/to/file_or_directory}}
```

- Commit with a specific message:

```
hg commit {{[-m|--message]}} {{message}}
```

- Commit all files matching a specified pattern:

```
hg commit {{[-I|--include]}} {{pattern}}
```

- Commit all files, excluding those that match a specified pattern:

```
hg commit {{[-X|--exclude]}} {{pattern}}
```

- Commit using the interactive mode:

```
hg commit {{[-i|--interactive]}}
```

hg init

Create a new repository in the specified directory.

More information: https://www.mercurial-scm.org/help/commands/init.

- Initialize a new repository in the current directory:

```
hg init
```

- Initialize a new repository in the specified directory:

```
hg init {{path/to/directory}}
```

hg log

Display the revision history of the repository.

More information: https://www.mercurial-scm.org/help/commands/log.

- Display the entire revision history of the repository:

```
hg log
```

- Display the revision history with an ASCII graph:

```
hg log {{[-G|--graph]}}
```

- Display the revision history with file names matching a specified pattern:

```
hg log {{[-I|--include]}} {{pattern}}
```

- Display the revision history, excluding file names that match a specified pattern:

```
hg log {{[-X|--exclude]}} {{pattern}}
```

- Display the log information for a specific revision:

```
hg log {{[-r|--rev]}} {{revision}}
```

- Display the revision history for a specific branch:

```
hg log {{[-b|--branch]}} {{branch}}
```

- Display the revision history for a specific date:

```
hg log {{[-d|--date]}} {{date}}
```

- Display revisions committed by a specific user:

```
hg log {{[-u|--user]}} {{user}}
```

hg pull

Pull changes from a specified repository to the local repository.

More information: https://www.mercurial-scm.org/help/commands/pull.

- Pull from the "default" source path:

```
hg pull
```

- Pull from a specified source repository:

```
hg pull {{path/to/source_repository}}
```

- Update the local repository to the head of the remote:

```
hg pull {{[-u|--update]}}
```

- Pull changes even when the remote repository is unrelated:

```
hg pull {{[-f|--force]}}
```

- Specify a specific revision changeset to pull up to:

```
hg pull {{[-r|--rev]}} {{revision}}
```

- Specify a specific branch to pull:

```
hg pull {{[-b|--branch]}} {{branch}}
```

- Specify a specific bookmark to pull:

```
hg pull {{[-B|--bookmark]}} {{bookmark}}
```

hg push

Push changes from the local repository to a specified destination.

More information: https://www.mercurial-scm.org/help/commands/push.

- Push changes to the "default" remote path:

```
hg push
```

- Push changes to a specified remote repository:

```
hg push {{path/to/destination_repository}}
```

- Push a new branch if it does not exist (disabled by default):

```
hg push --new-branch
```

- Specify a specific revision changeset to push:

```
hg push {{[-r|--rev]}} {{revision}}
```

- Specify a specific branch to push:

```
hg push {{[-b|--branch]}} {{branch}}
```

- Specify a specific bookmark to push:

```
hg push {{[-B|--bookmark]}} {{bookmark}}
```

hg remove

Remove specified files from the staging area.

More information: https://www.mercurial-scm.org/help/commands/remove.

- Remove files or directories from the staging area:

```
hg remove {{path/to/file}}
```

- Remove all staged files matching a specified pattern:

```
hg remove {{[-I|--include]}} {{pattern}}
```

- Remove all staged files, excluding those that match a specified pattern:

```
hg remove {{[-X|--exclude]}} {{pattern}}
```

- Recursively remove sub-repositories:

```
hg remove {{[-S|--subrepos]}}
```

- Remove files from the repository that have been physically removed:

```
hg remove {{[-A|--after]}}
```

hg root

Display the root location of a Hg repository.

More information: https://www.mercurial-scm.org/help/commands/root.

- Display the root location of the current repository:

```
hg root
```

- Display the root location of the specified repository:

```
hg root --cwd {{path/to/directory}}
```

hg serve

Start a standalone Mercurial web server for browsing repositories.

More information: https://www.mercurial-scm.org/help/commands/serve.

- Start a web server instance:

```
hg serve
```

- Start a web server instance on the specified port:

```
hg serve {{[-p|--port]}} {{port}}
```

- Start a web server instance on the specified listening address:

```
hg serve {{[-a|--address]}} {{address}}
```

- Start a web server instance with a specific identifier:

```
hg serve {{[-n|--name]}} {{name}}
```

- Start a web server instance using the specified theme (see the templates directory):

```
hg serve --style {{style}}
```

- Start a web server instance using the specified SSL certificate bundle:

```
hg serve --certificate {{path/to/certificate}}
```

hg status

Show files that have changed in the working directory.

More information: https://www.mercurial-scm.org/help/commands/status.

- Display the status of changed files:

```
hg status
```

- Display only modified files:

```
hg status {{[-m|--modified]}}
```

- Display only added files:

```
hg status {{[-a|--added]}}
```

- Display only removed files:

```
hg status {{[-r|--removed]}}
```

- Display only deleted (but tracked) files:

```
hg status {{[-d|--deleted]}}
```

- Display changes in the working directory compared to a specified changeset:

```
hg status --rev {{revision}}
```

- Display only files matching a specified glob pattern:

```
hg status {{[-I|--include]}} {{pattern}}
```

- Display files, excluding those that match a specified glob pattern:

```
hg status {{[-X|--exclude]}} {{pattern}}
```

hg update

Update the working directory to a specified changeset.

More information: https://www.mercurial-scm.org/help/commands/update.

- Update to the tip of the current branch:

```
hg update
```

- Update to the specified revision:

```
hg update {{[-r|--rev]}} {{revision}}
```

- Update and discard uncommitted changes:

```
hg update {{[-C|--clean]}}
```

- Update to the last commit matching a specified date:

```
hg update {{[-d|--date]}} {{dd-mm-yyyy}}
```

hg

Mercurial - a distributed source control management system.

Some subcommands such as **`commit`** have their own usage documentation.

More information: https://www.mercurial-scm.org/help/commands.

- Create an empty Mercurial repository:

```
hg init
```

- Clone a remote Mercurial repository from the internet:

```
hg clone {{https://example.com/repo}}
```

- View the status of a local repository:

```
hg status
```

- Add all new files to the next commit:

```
hg add
```

- Commit changes to version history:

```
hg commit {{[-m|--message]}} {{message_text}}
```

- Push local changes to a remote repository:

```
hg push
```

- Pull any changes made to a remote:

```
hg pull
```

- Reset everything the way it was in the latest commit:

```
hg update {{[-C|--clean]}}; hg purge
```

highlight

Output syntax-highlighted source code to a variety of formats.

More information: http://andre-simon.de/doku/highlight/en/highlight.php.

- Produce a complete HTML document from a source code file:

```
highlight {{[-o|--out-format]}} {{html}} {{[-s|--style]}}
{{theme_name}} {{[-S|--syntax]}} {{language}} {{path/to/
source_code}}
```

- Produce an HTML fragment, suitable for inclusion in a larger document:

```
highlight {{[-o|--out-format]}} {{html}} {{[-f|--fragment]}}
{{[-S|--syntax]}} {{language}} {{source_file}}
```

- Inline the CSS styling in every tag:

```
highlight {{[-o|--out-format]}} {{html}} --inline-css {{[-
S|--syntax]}} {{language}} {{source_file}}
```

- List all supported languages, themes, or plugins:

```
highlight --list-scripts {{langs|themes|plugins}}
```

- Print a CSS stylesheet for a theme:

```
highlight {{[-o|--out-format]}} {{html}} --print-style {{[-
s|--style]}} {{theme_name}} {{[-S|--syntax]}} {{language}} --
stdout
```

hipstopgm

Read a HIPS file as input and return a PGM image as output.

If the HIPS file contains more than one frame in sequence, **`hipstopgm`** will concatenate all the frames vertically.

More information: https://netpbm.sourceforge.net/doc/hipstopgm.html.

- Convert a HIPS file into a PGM image:

```
hipstopgm {{path/to/file.hips}}
```

- Suppress all informational messages:

```
hipstopgm {{[-q|-quiet]}}
```

- Display version:

```
hipstopgm {{[-v|-version]}}
```

history

Manage command-line history.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-history.

- Display the commands history list with line numbers:

```
history
```

- Display the last 20 commands (in Zsh it displays all commands starting from the 20th):

```
history 20
```

- Display history with timestamps in different formats (only available in Zsh):

```
history -{{d|f|i|E}}
```

- [c]lear the commands history list:

```
history -c
```

- Over[w]rite history file with history of current Bash shell (often combined with `history -c` to purge history):

```
history -w
```

- [d]elete the history entry at the specified offset:

```
history -d {{offset}}
```

- Add a command to history without running it:

```
history -s {{command}}
```

- Run a command without adding it to history by adding a leading space:

```
<Space>{{command}}
```

hive

Tool for Apache Hive.

More information: https://cwiki.apache.org/confluence/display/Hive/LanguageManual+Cli.

- Start a Hive interactive shell:

```
hive
```

- Run HiveQL:

```
hive -e "{{hiveql_query}}"
```

- Run a HiveQL file with a variable substitution:

```
hive {{[-d|--define]}} {{key}}={{value}} -f {{path/to/file.sql}}
```

- Run a HiveQL with HiveConfig (e.g. `mapred.reduce.tasks=32`):

```
hive --hiveconf {{conf_name}}={{conf_value}}
```

hledger accounts

List account names.

More information: https://hledger.org/hledger.html#accounts.

- Show all accounts used or declared in the default journal file:

```
hledger {{[acc|accounts]}}
```

- Show accounts used by transactions:

```
hledger {{[acc|accounts]}} {{[-u|--used]}}
```

- Show accounts declared with account directives:

```
hledger {{[acc|accounts]}} {{[-d|--declared]}}
```

- Add new account directives, for accounts used but not declared, to the journal:

```
hledger {{[acc|accounts]}} --undeclared --directives >>
{{2024-accounts.journal}}
```

- Show accounts with `asset` in their name, and their declared/inferred types:

```
hledger {{[acc|accounts]}} asset --types
```

- Show accounts of the `Asset` type:

```
hledger {{[acc|accounts]}} type:A
```

- Show the first two levels of the accounts hierarchy:

```
hledger {{[acc|accounts]}} {{[-t|--tree]}} {{[-2|--depth 2]}}
```

hledger add

Record new transactions with interactive prompting in the console.

More information: https://hledger.org/hledger.html#add.

- Record new transactions, saving to the default journal file:

```
hledger add
```

- Add transactions to `2024.journal`, but also load `2023.journal` for completions:

```
hledger add {{[-f|--file]}} {{path/to/2024.journal}} {{[-f|--file]}} {{path/to/2023.journal}}
```

- Provide answers for the first four prompts:

```
hledger add {{today}} '{{best buy}}' {{expenses:supplies}} '{{$20}}'
```

- Show `add`'s options and documentation with `$PAGER`:

```
hledger add {{[-h|--help]}}
```

- Show `add`'s documentation with `info` or `man` if available:

```
hledger help add
```

hledger aregister

Show the transactions and running balances in one account, with each transaction on one line.

More information: https://hledger.org/hledger.html#aregister.

- Show transactions and running balance in the `assets:bank:checking` account:

```
hledger {{[areg|aregister]}} assets:bank:checking
```

- Show transactions and running balance in the first account named `*savings*`:

```
hledger {{[areg|aregister]}} savings
```

- Show the checking account's cleared transactions, with a specified width:

```
hledger {{[areg|aregister]}} checking {{[-C|--cleared]}} {{[-w|--width]}} {{120}}
```

- Show the checking register, including transactions from forecast rules:

```
hledger {{[areg|aregister]}} checking --forecast
```

hledger balance

A flexible, general purpose "summing" report that shows accounts with some kind of numeric data.

This can be balance changes per period, end balances, budget performance, unrealised capital gains, etc.

More information: https://hledger.org/hledger.html#balance.

- Show the balance change in all accounts from all postings over all time:

  ```
  hledger {{[bal|balance]}}
  ```

- Show the balance change in accounts named `*expenses*`, as a tree, summarising the top two levels only:

  ```
  hledger {{[bal|balance]}} {{expenses}} {{[-t|--tree]}}
  {{[-2|--depth 2]}}
  ```

- Show expenses each month, and their totals and averages, sorted by total; and their monthly budget goals:

  ```
  hledger {{[bal|balance]}} {{expenses}} {{[-M|--monthly]}}
  {{[-T|--row-total]}} {{[-A|--average]}} {{[-S|--sort-
  amount]}} --budget
  ```

- Similar to the above, matching accounts by `Expense` type, as a two level tree without squashing boring accounts:

  ```
  hledger {{[bal|balance]}} type:{{X}} {{[-MTAS|--monthly --
  row-total --average --sort-amount]}} --budget {{[-t|--tree]}}
  {{[-2|--depth 2]}} --no-elide
  ```

- Show end balances (including from postings before the start date), quarterly in 2024, in accounts named `*assets*` or `*liabilities*`:

  ```
  hledger {{[bal|balance]}} {{[-H|--historical]}} {{[-p|--
  period]}} '{{quarterly in 2024}}' {{assets}} {{liabilities}}
  ```

- Similar to the above, also show zero balances, sort by total and summarise to three levels:

```
hledger {{[bal|balance]}} {{[-HQ|--historical --quarterly]}}
date:{{2024}} type:{{AL}} {{[-ES|--empty --sort-amount]}}
{{[-3|--depth 3]}}
```

- Show investment assets' market [V]alue in base currency at the end of each quarter:

```
hledger {{[bal|balance]}} {{[-HVQ|--historical --market --
quarterly]}} {{assets:investments}}
```

- Show unrealised capital gains/losses from market price changes in each quarter, for non-cryptocurrency investment assets:

```
hledger {{[bal|balance]}} --gain {{[-Q|--quarterly]}}
{{assets:investments}} not:{{cryptocurrency}}
```

hledger balancesheet

Show the end balances in asset and liability accounts.

Amounts are shown with normal positive sign, as in conventional financial statements.

More information: https://hledger.org/hledger.html#balancesheet.

- Show the current balances in `Asset` and `Liability` accounts, excluding zeros:

  ```
  hledger {{[bs|balancesheet]}}
  ```

- Show just the liquid assets (`Cash` account type):

  ```
  hledger {{[bs|balancesheet]}} type:C
  ```

- Include accounts with zero balances, and show the account hierarchy:

  ```
  hledger {{[bs|balancesheet]}} {{[-E|--empty]}} {{[-t|--tree]}}
  ```

- Show the balances at the end of each month:

  ```
  hledger {{[bs|balancesheet]}} {{[-M|--monthly]}}
  ```

- Show the balances' market value in home currency at the end of each month:

  ```
  hledger {{[bs|balancesheet]}} {{[-M|--monthly]}} {{[-V|--market]}}
  ```

- Show quarterly balances, with just the top two levels of account hierarchy:

  ```
  hledger {{[bs|balancesheet]}} {{[-Qt|--quarterly --tree]}} {{[-2|--depth 2]}}
  ```

- Same as above above, and generate HTML output in `bs.html`:

  ```
  hledger {{[bs|balancesheet]}} {{[-Qt|--quarterly --tree]}} {{[-2|--depth 2]}} {{[-o|--output-file]}} bs.html
  ```

hledger import

Import new transactions from one or more data files to the main journal.

More information: https://hledger.org/hledger.html#import.

- Import new transactions from `bank.csv`, using `bank.csv.rules` to convert:

```
hledger import {{path/to/bank.csv}}
```

- Show what would be imported from these two files, without doing anything:

```
hledger import {{path/to/bank1.csv}} {{path/to/bank2.csv}} --dry-run
```

- Import new transactions from all CSV files, using the same rules for all:

```
hledger import --rules-file {{common.rules}} *.csv
```

- Show conversion errors or results while editing `bank.csv.rules`:

```
watchexec -- hledger {{[-f|--file]}} {{path/to/bank.csv}} print
```

- Mark `bank.csv`'s current data as seen, as if already imported:

```
hledger import --catchup {{path/to/bank.csv}}
```

- Mark `bank.csv` as all new, as if not yet imported:

```
rm {{[-f|--force]}} .latest.bank.csv
```

hledger incomestatement

Show revenue inflows and expense outflows during the report period.

Amounts are shown with normal positive sign, as in conventional financial statements.

More information: https://hledger.org/hledger.html#incomestatement.

- Show revenues and expenses (changes in `Revenue` and `Expense` accounts):

```
hledger {{[is|incomestatement]}}
```

- Show revenues and expenses each month:

```
hledger {{[is|incomestatement]}} {{[-M|--monthly]}}
```

- Show monthly revenues/expenses/totals, largest first, summarised to 2 levels:

```
hledger {{[is|incomestatement]}} {{[-MTAS|--monthly --row-
total --average --sort-amount]}} {{[-2|--depth 2]}}
```

- Same as above, and generate HTML output in `is.html`:

```
hledger {{[is|incomestatement]}} {{[-MTAS|--monthly --row-
total --average --sort-amount]}} {{[-2|--depth 2]}} {{[-o|--
output-file]}} is.html
```

hledger print

Show full journal entries, representing transactions.

More information: https://hledger.org/hledger.html#print.

- Show all transactions in the default journal file:

```
hledger print
```

- Show transactions, with any implied amounts or costs made explicit:

```
hledger print {{[-x|--explicit]}} --infer-costs
```

- Show transactions from two specified files, with amounts converted to cost:

```
hledger print {{[-f|--file]}} {{path/to/2023.journal}} {{[-f|--file]}} {{path/to/2024.journal}} {{[-B|--cost]}}
```

- Show `$` transactions in `*food*` but not `*groceries*` accounts this month:

```
hledger print cur:\\$ food not:groceries date:thismonth
```

- Show transactions of amount 50 or more, with `whole foods` in their description:

```
hledger print amt:'>50' desc:'whole foods'
```

- Show cleared transactions, with `EUR` amounts rounded and with decimal commas:

```
hledger print {{[-C|--cleared]}} --commodity '1000, EUR' --round hard
```

- Write transactions from `foo.journal` as a CSV file:

```
hledger print {{[-f|--file]}} {{path/to/foo.journal}} {{[-o|--output-file]}} {{path/to/output_file.csv}}
```

hledger-ui

A terminal interface (TUI) for **`hledger`**, a robust, friendly plain text accounting app.

More information: https://hledger.org/hledger-ui.html.

- Start in the main menu screen, reading from the default journal file:

```
hledger-ui
```

- Start with a different color theme:

```
hledger-ui --theme {{terminal|greenterm|dark}}
```

- Start in the balance sheet accounts screen, showing hierarchy down to level 3:

```
hledger-ui --bs {{[-t|--tree]}} {{[-3|--depth 3]}}
```

- Start in this account's screen, showing cleared transactions, and reload on change:

```
hledger-ui --register {{assets:bank:checking}} {{[-C|--cleared]}} {{[-w|--watch]}}
```

- Read two journal files, and show amounts as current value when known:

```
hledger-ui {{[-f|--file]}} {{path/to/2024.journal}} {{[-f|--file]}} {{path/to/2024-prices.journal}} --value now
```

- Show the manual in Info format, if possible:

```
hledger-ui --info
```

- Display help:

```
hledger-ui {{[-h|--help]}}
```

hledger-web

A web interface and API for **hledger**, a robust, friendly plain text accounting app.

More information: https://hledger.org/hledger-web.html.

- Start the web app, and a browser if possible, for local viewing and adding only:

  ```
  hledger-web
  ```

- As above but with a specified file, and allow editing of existing data:

  ```
  hledger-web {{[-f|--file]}} {{path/to/file.journal}} --allow edit
  ```

- Start just the web app, and accept incoming connections to the specified host and port:

  ```
  hledger-web --serve --host {{my.host.name}} --port 8000
  ```

- Start just the web app's JSON API, and allow only read access:

  ```
  hledger-web --serve-api --host {{my.host.name}} --allow view
  ```

- Show amounts converted to current market value in your base currency when known:

  ```
  hledger-web --value now --infer-market-prices
  ```

- Show the manual in Info format if possible:

  ```
  hledger-web --info
  ```

- Display help:

  ```
  hledger-web {{[-h|--help]}}
  ```

hledger

A robust, friendly plain text accounting app.

See also: **`hledger-ui`** for TUI, **`hledger-web`** for web interface.

More information: https://hledger.org/hledger.html.

- Record new transactions interactively, saving to the default journal file:

  ```
  hledger add
  ```

- Import new transactions from `bank.csv`, using `bank.csv.rules` to convert:

  ```
  hledger import {{path/to/bank.csv}}
  ```

- Print all transactions, reading from multiple specified journal files:

  ```
  hledger print {{[-f|--file]}} {{path/to/prices-2024.journal}} {{[-f|--file]}} {{path/to/prices-2023.journal}}
  ```

- Show all accounts, as a hierarchy, and their types:

  ```
  hledger accounts {{[-t|--tree]}} --types
  ```

- Show asset and liability account balances, including zeros, hierarchically:

  ```
  hledger {{[bs|balancesheet]}} {{[-E|--empty]}} {{[-t|--tree]}} --no-elide
  ```

- Show monthly incomes/expenses/totals, largest first, summarised to 2 levels:

  ```
  hledger {{[is|incomestatement]}} {{[-M|--monthly]}} {{[-T|--row-total]}} {{[-A|--average]}} --sort {{[-2|--depth 2]}}
  ```

- Show the `assets:bank:checking` account's transactions and running balance:

  ```
  hledger {{[areg|aregister]}} assets:bank:checking
  ```

- Show the amount spent on food from the `assets:cash` account:

  ```
  hledger print assets:cash | hledger {{[-f|--file]}} - {{[-I|--ignore-assertions]}} aregister expenses:food
  ```

hn

Command-line interface for Hacker News.

More information: https://github.com/rafaelrinaldi/hn-cli#usage.

- View stories on Hacker News:

```
hn
```

- View number of stories on Hacker News:

```
hn {{[-l|--limit]}} {{number}}
```

- View stories on Hacker News, and keep the list open after selecting a link:

```
hn {{[-k|--keep-open]}}
```

- View stories on Hacker News sorted by submission date:

```
hn --latest
```

holehe

Check if an email is attached to an account on sites like Twitter, Instagram, Imgur, and over 120 others.

More information: https://github.com/megadose/holehe#-cli-example.

- Show status across all supported websites for the specified email address:

```
holehe {{username@example.org}}
```

- Show status for only sites where the specified email address is in use:

```
holehe {{username@example.org}} --only-used
```

home-manager

Manage a per-user environment using Nix, allowing declarative configuration of the user's home.

More information: https://github.com/nix-community/home-manager.

- Build the configuration defined in `~/.config/nixpkgs/home.nix` without applying it:

  ```
  home-manager build
  ```

- Build and apply (switch to) the new configuration:

  ```
  home-manager switch
  ```

- Roll back to a previous configuration generation:

  ```
  home-manager rollback
  ```

- List all existing configuration generations:

  ```
  home-manager generations
  ```

- When using flakes, run any operation that requires nix to run (build, switch, news) by passing the path to the flake:

  ```
  home-manager {{command}} --flake {{path/to/flake}}
  ```

host

Lookup Domain Name Server.

More information: https://manned.org/host.

- Lookup A, AAAA, and MX records of a domain:

```
host {{domain}}
```

- Lookup a field (CNAME, TXT, ...) of a domain:

```
host -t {{field}} {{domain}}
```

- Reverse lookup an IP:

```
host {{ip_address}}
```

- Specify an alternate DNS server to query:

```
host {{domain}} {{8.8.8.8}}
```

hostapd

Start an access point using a wireless interface.

More information: https://manned.org/hostapd.

- Start an access point:

```
sudo hostapd {{path/to/hostapd.conf}}
```

- Start an access point, forking into the background:

```
sudo hostapd -B {{path/to/hostapd.conf}}
```

hostess

Manage the **`/etc/hosts`** file.

More information: https://github.com/cbednarski/hostess.

- List domains, target IP addresses, and on/off status:

```
hostess list
```

- Add a domain pointing to your machine to your hosts file:

```
hostess add {{local.example.com}} {{127.0.0.1}}
```

- Remove a domain from your hosts file:

```
hostess del {{local.example.com}}
```

- Disable a domain (but don't remove it):

```
hostess off {{local.example.com}}
```

hostid

Print the numeric identifier for the current host (not necessarily the IP address).

More information: https://www.gnu.org/software/coreutils/manual/html_node/hostid-invocation.html.

- Display the numeric identifier for the current host in hexadecimal:

```
hostid
```

hostname

Show or set the system's host name.

More information: https://www.gnu.org/software/inetutils/manual/inetutils.html#hostname-invocation.

- Show current host name:

```
hostname
```

- Show the network address of the host name:

```
hostname {{[-i|--ip-address]}}
```

- Show the FQDN (Fully Qualified Domain Name):

```
hostname {{[-f|--fqdn]}}
```

- Set current host name:

```
hostname {{new_hostname}}
```

hping

This command is an alias of **`hping3`**.

- View documentation for the original command:

```
tldr hping3
```

hping3

Advanced ping utility which supports protocols such TCP, UDP, and raw IP.

Best run with elevated privileges.

More information: https://manned.org/hping3.

- Ping a destination with 4 ICMP ping requests:

```
hping3 {{[-1|--icmp]}} {{[-c|--count]}} 4 {{ip_or_hostname}}
```

- Ping an IP address over UDP on port 80:

```
hping3 {{[-2|--udp]}} {{[-p|--destport]}} 80 {{[-S|--syn]}}
{{ip_or_hostname}}
```

- Scan TCP port 80, scanning from the specific local source port 5090:

```
hping3 {{[-V|--verbose]}} {{[-S|--syn]}} {{[-p|--destport]}}
80 {{[-s|--baseport]}} 5090 {{ip_or_hostname}}
```

- Traceroute using a TCP scan to a specific destination port:

```
hping3 {{[-T|--traceroute]}} {{[-V|--verbose]}} {{[-S|--
syn]}} {{[-p|--destport]}} {{80}} {{ip_or_hostname}}
```

- Scan a set of TCP ports on a specific IP address:

```
hping3 {{[-8|--scan]}} {{80,3000,9000}} {{[-S|--syn]}}
{{ip_or_hostname}}
```

- Perform a TCP ACK scan to check if a given host is alive:

```
hping3 {{[-c|--count]}} {{2}} {{[-V|--verbose]}} {{[-p|--
destport]}} {{80}} {{[-A|--ack]}} {{ip_or_hostname}}
```

- Perform a charge test on port 80:

```
hping3 --flood {{[-p|--destport]}} 80 {{[-S|--syn]}}
{{ip_or_hostname}}
```

hr

Print a horizontal rule in the terminal.

More information: https://github.com/LuRsT/hr.

- Print a horizontal rule:

```
hr
```

- Print a horizontal rule with a custom string:

```
hr {{string}}
```

- Print a multiline horizontal rule:

```
hr {{string1 string2 ...}}
```

hsd-cli

The REST tool for the Handshake blockchain.

More information: https://handshake.org/.

- Retrieve information about the current server:

  ```
  hsd-cli info
  ```

- Broadcast a local transaction:

  ```
  hsd-cli broadcast {{transaction_hex}}
  ```

- Retrieve a mempool snapshot:

  ```
  hsd-cli mempool
  ```

- View a transaction by address or hash:

  ```
  hsd-cli tx {{address_or_hash}}
  ```

- View a coin by its hash index or address:

  ```
  hsd-cli coin {{hash_index_or_address}}
  ```

- View a block by height or hash:

  ```
  hsd-cli block {{height_or_hash}}
  ```

- Reset the chain to the specified block:

  ```
  hsd-cli reset {{height_or_hash}}
  ```

- Execute an RPC command:

  ```
  hsd-cli rpc {{command}} {{args}}
  ```

hsw-cli

The REST tool for the Handshake wallet.

More information: https://github.com/handshake-org/hs-client.

- Unlock the current wallet (timeout in seconds):

```
hsw-cli unlock {{passphrase}} {{timeout}}
```

- Lock the current wallet:

```
hsw-cli lock
```

- View the current wallet's details:

```
hsw-cli get
```

- View the current wallet's balance:

```
hsw-cli balance
```

- View the current wallet's transaction history:

```
hsw-cli history
```

- Send a transaction with the specified coin amount to an address:

```
hsw-cli send {{address}} {{1.05}}
```

- View the current wallet's pending transactions:

```
hsw-cli pending
```

- View details about a transaction:

```
hsw-cli tx {{transaction_hash}}
```

html5validator

Validate HTML5.

More information: https://github.com/svenkreiss/html5validator.

- Validate a specific file:

```
html5validator {{path/to/file}}
```

- Validate all HTML files in a specific directory:

```
html5validator --root {{path/to/directory}}
```

- Show warnings as well as errors:

```
html5validator --show-warnings {{path/to/file}}
```

- Match multiple files using a glob pattern:

```
html5validator --root {{path/to/directory}} --match "{{*.html
*.php}}"
```

- Ignore specific directory names:

```
html5validator --root {{path/to/directory}} --blacklist
"{{node_modules vendor}}"
```

- Output the results in a specific format:

```
html5validator --format {{gnu|xml|json|text}} {{path/to/
file}}
```

- Output the log at a specific verbosity level:

```
html5validator --root {{path/to/directory}} --log {{debug|
info|warning}}
```

htmlq

Use CSS selectors to extract content from HTML files.

More information: https://github.com/mgdm/htmlq#usage.

- Return all elements of class `card`:

```
cat {{path/to/file.html}} | htmlq '.card'
```

- Get the text content of the first paragraph:

```
cat {{path/to/file.html}} | htmlq {{[-t|--text]}} 'p:first-of-type'
```

- Find all the links in a page:

```
cat {{path/to/file.html}} | htmlq {{[-a|--attribute]}} href 'a'
```

- Remove all images and SVGs from a page:

```
cat {{path/to/file.html}} | htmlq {{[-r|--remove-nodes]}} 'img' {{[-r|--remove-nodes]}} 'svg'
```

- Pretty print and write the output to a file:

```
htmlq {{[-p|--pretty]}} {{[-f|--filename]}} {{path/to/input.html}} {{[-o|--output]}} {{path/to/output.html}}
```

htop

Display dynamic real-time information about running processes.

An enhanced version of **`top`**.

See also: **`top`**, **`atop`**, **`glances`**, **`btop`**, **`btm`**.

More information: https://manned.org/htop.

- Start `htop`:

```
htop
```

- Start `htop` displaying processes owned by a specific user:

```
htop {{[-u|--user]}} {{username}}
```

- Display processes hierarchically in a tree view to show the parent-child relationships:

```
htop {{[-t|--tree]}}
```

- Sort processes by a specified `sort_item` (use `htop --sort help` for available options):

```
htop {{[-s|--sort]}} {{sort_item}}
```

- Start `htop` with the specified delay between updates, in tenths of a second (i.e. 50 = 5 seconds):

```
htop {{[-d|--delay]}} {{50}}
```

- Disable all system and process changing features:

```
htop --readonly
```

- See interactive commands while running `htop`:

```
{{<F1>|<?>}}
```

- Switch to a different tab:

```
<Tab>
```

htpasswd

Create and manage htpasswd files to protect web server directories using basic authentication.

More information: https://httpd.apache.org/docs/current/programs/htpasswd.html.

- Create/overwrite htpasswd file:

```
htpasswd -c {{path/to/file}} {{username}}
```

- Add user to htpasswd file or update existing user:

```
htpasswd {{path/to/file}} {{username}}
```

- Add user to htpasswd file in batch mode without an interactive password prompt (for script usage):

```
htpasswd -b {{path/to/file}} {{username}} {{password}}
```

- Delete user from htpasswd file:

```
htpasswd -D {{path/to/file}} {{username}}
```

- Verify user password:

```
htpasswd -v {{path/to/file}} {{username}}
```

- Display a string with username (plain text) and password (md5):

```
htpasswd -nbm {{username}} {{password}}
```

http-server-upload

Zero-configuration HTTP server which provides a lightweight interface to upload files.

More information: https://github.com/crycode-de/http-server-upload.

- Start an HTTP server on the default port to upload files to the current directory:

```
http-server-upload
```

- Start an HTTP server with the specified maximum allowed file size for uploads in MiB (defaults to 200 MiB):

```
MAX_FILE_SIZE={{size_in_megabytes}} http-server-upload
```

- Start an HTTP server on a specific port to upload files to the current directory:

```
PORT={{port}} http-server-upload
```

- Start an HTTP server, storing the uploaded files in a specific directory:

```
UPLOAD_DIR={{path/to/directory}} http-server-upload
```

- Start an HTTP server using a specific directory to temporarily store files during the upload process:

```
UPLOAD_TMP_DIR={{path/to/directory}} http-server-upload
```

- Start an HTTP server accepting uploads with a specific token field in the HTTP post:

```
TOKEN={{secret}} http-server-upload
```

http-server

Simple static HTTP server to serve static files.

More information: https://github.com/http-party/http-server.

- Start an HTTP server listening on the default port to serve the current directory:

```
http-server
```

- Start an HTTP server on a specific port to serve a specific directory:

```
http-server {{path/to/directory}} {{[-p|--port]}} {{port}}
```

- Start an HTTP server using basic authentication:

```
http-server --username {{username}} --password {{password}}
```

- Start an HTTP server with directory listings disabled:

```
http-server -d {{false}}
```

- Start an HTTPS server on the default port using the specified certificate:

```
http-server {{[-S|--ssl]}} {{[-C|--cert]}} {{path/to/
cert.pem}} {{[-K|--key]}} {{path/to/key.pem}}
```

- Start an HTTP server and include the client's IP address in the output logging:

```
http-server --log-ip
```

- Start an HTTP server with CORS enabled by including the `Access-Control-Allow-Origin: *` header in all responses:

```
http-server --cors
```

- Start an HTTP server with logging disabled:

```
http-server {{[-s|--silent]}}
```

http

HTTPie: an HTTP client designed for testing, debugging, and generally interacting with APIs and HTTP servers.

More information: https://httpie.io/docs/cli/usage.

- Make a simple GET request (shows response headers and content):

```
http {{https://example.com}}
```

- Print specific parts of the content (H: request headers, B: request body, h: response headers, b: response body, m: response metadata):

```
http {{[-p|--print]}} {{H|B|h|b|m|Hh|Hhb|...}} {{https://example.com}}
```

- Specify the HTTP method when sending a request and use a proxy to intercept the request:

```
http {{GET|POST|HEAD|PUT|PATCH|DELETE|...}} --proxy {{http|https}}:{{http://localhost:8080|socks5://localhost:9050|...}} {{https://example.com}}
```

- Follow any 3xx redirects and specify additional headers in a request:

```
http {{[-F|--follow]}} {{https://example.com}} {{'User-Agent: Mozilla/5.0' 'Accept-Encoding: gzip'}}
```

- Authenticate to a server using different authentication methods:

```
http {{[-a|--auth]}} {{username:password|token}} {{[-A|--auth-type]}} {{basic|digest|bearer}} {{GET|POST|...}} {{https://example.com/auth}}
```

- Construct a request but do not send it (similar to a dry-run):

```
http --offline {{GET|DELETE|...}} {{https://example.com}}
```

- Use named sessions for persistent custom headers, auth credentials and cookies:

```
http --session {{session_name|path/to/session.json}} {{[-a|--auth]}} {{username}}:{{password}} {{https://example.com/auth}} {{API-KEY:xxx}}
```

- Upload a file to a form (the example below assumes that the form field is `<input type="file" name="cv" />`):

```
http {{[-f|--form]}} {{POST}} {{https://example.com/upload}}
{{cv@path/to/file}}
```

httpflow

A utility to capture and dump HTTP streams.

More information: https://github.com/six-ddc/httpflow.

- Capture traffic on all interfaces:

```
httpflow -i {{any}}
```

- Use a bpf-style capture to filter the results:

```
httpflow {{host httpbin.org or host baidu.com}}
```

- Use a `regex` to filter requests by URLs:

```
httpflow -u '{{regex}}'
```

- Read packets from PCAP format binary file:

```
httpflow -r {{out.cap}}
```

- Write the output to a directory:

```
httpflow -w {{path/to/directory}}
```

httpie

Management interface for HTTPie.

See also: **`http`**, the tool itself.

More information: https://httpie.io/docs/cli/plugin-manager.

- Check updates for `http`:

```
httpie cli check-updates
```

- List installed `http` plugins:

```
httpie cli plugins list
```

- Install/upgrade/uninstall plugins:

```
httpie cli plugins {{install|upgrade|uninstall}}
{{plugin_name}}
```

httping

Measure the latency and throughput of a web server.

More information: https://manned.org/httping.

- Ping the specified URL:

```
httping -g {{url}}
```

- Ping the web server on `host` and `port`:

```
httping -h {{host}} -p {{port}}
```

- Ping the web server on `host` using a TLS connection:

```
httping -l -g https://{{host}}
```

- Ping the web server on `host` using HTTP basic authentication:

```
httping -g http://{{host}} -U {{username}} -P {{password}}
```

httprobe

Take a list of domains and probe for working HTTP and HTTPS servers.

More information: https://github.com/tomnomnom/httprobe.

- Probe a list of domains from a text file:

```
cat {{input_file}} | httprobe
```

- Only check for HTTP if HTTPS is not working:

```
cat {{input_file}} | httprobe --prefer-https
```

- Probe additional ports with a given protocol:

```
cat {{input_file}} | httprobe -p {{https:2222}}
```

- Display help:

```
httprobe --help
```

httpry

A lightweight packet sniffer for displaying and logging HTTP traffic.

It can be run in real-time displaying the traffic as it is parsed, or as a daemon process that logs to an output file.

More information: https://dumpsterventures.com/jason/httpry/.

- Save output to a file:

```
httpry -o {{path/to/file.log}}
```

- Listen on a specific interface and save output to a binary PCAP format file:

```
httpry {{eth0}} -b {{path/to/file.pcap}}
```

- Filter output by a comma-separated list of HTTP verbs:

```
httpry -m {{get|post|put|head|options|delete|trace|connect|patch}}
```

- Read from an input capture file and filter by IP:

```
httpry -r {{path/to/file.log}} '{{host 192.168.5.25}}'
```

- Run as daemon process:

```
httpry -d -o {{path/to/file.log}}
```

https

This command is an alias of **`http`**.

- View documentation for the original command:

```
tldr http
```

httpx

A fast and multi-purpose HTTP toolkit written in Go to run multiple probes at once.

Note: Not to be confused with the unrelated Python's HTTPX which has the same command name.

More information: https://docs.projectdiscovery.io/opensource/httpx/running.

- Run a probe against a [u]RL, host, IP Address or subnet (CIDR notation) showing probe status:

```
httpx -probe {{[-u|-target]}} {{url|host|ipaddress|subnet_with_cidr}}
```

- Run a probe against multiple hosts showing status code with input from `subfinder`:

```
subfinder {{[-d|-domain]}} {{example.com}} | httpx {{[-sc|-status-code]}}
```

- Run a rate limited probe against a list of hosts from a file showing technology detected and response time:

```
httpx {{[-rl|-rate-limit]}} {{150}} {{[-l|-list]}} {{path/to/newline_separated_hosts_list}} {{[-td|-tech-detect]}} {{[-rt|-response-time]}}
```

- Run a probe against a [u]RL showing its webpage title, CDN/WAF in use, and page content hash:

```
httpx {{[-u|-target]}} {{url}} -title -cdn -hash {{sha256}}
```

- Run a probe against a list of hosts with custom defined ports and timeout after certain seconds:

```
httpx -probe {{[-u|-target]}} {{host1,host2,...}} {{[-p|-ports]}} http:{{80,8000-8080}},https:{{443,8443}} -timeout {{10}}
```

- Run a probe against a list of hosts filtering out codes of certain responses:

```
httpx {{[-u|-target]}} {{host1,host2,...}} {{[-fc|-filter-code]}} {{400,401,404}}
```

- Run a probe against a list of hosts matching codes of certain responses:

```
httpx {{[-u|-target]}} {{host1,host2,...}} {{[-mc|-match-
code]}} {{200,301,304}}
```

- Run a probe against a URL saving screenshots of certain paths, with screenshot timeouts (assets are saved in `output`):

```
httpx {{[-u|-target]}} {{https://www.github.com}} -path {{/
tldr-pages/tldr,/projectdiscovery/httpx}} {{[-ss|-
screenshot]}} {{[-st|-screenshot-timeout]}} {{10}}
```

hub branch

Create a branch or show current branch.

See also: **`git branch`**.

- Show the name of the currently active branch:

  ```
  hub branch
  ```

- Create a new branch:

  ```
  hub branch {{branch_name}}
  ```

hub browse

Open a GitHub repository in the browser or print the URL.

More information: https://hub.github.com/hub-browse.1.html.

- Open the homepage of the current repository in the default web browser:

  ```
  hub browse
  ```

- Open the homepage of a specific repository in the default web browser:

  ```
  hub browse {{owner}}/{{repository}}
  ```

- Open the subpage of a specific repository in the default web browser, subpage can be "wiki", "commits", "issues", or other (default: "tree"):

  ```
  hub browse {{owner}}/{{repository}} {{subpage}}
  ```

hub ci-status

Display status of GitHub checks.

More information: https://hub.github.com/hub-ci-status.1.html.

- Check the CI status for this branch:

```
hub ci-status {{[-v|--verbose]}}
```

- Display status of GitHub checks for a commit:

```
hub ci-status {{[-v|--verbose]}} {{commit_SHA}}
```

hub clone

Clone an existing repository.

More information: https://hub.github.com/hub-clone.1.html.

- Clone an existing repository to current directory (If run into authentication problem, try full SSH path):

```
hub clone {{remote_repository_location}}
```

hub create

Create a new repository on GitHub.

More information: https://hub.github.com/hub-create.1.html.

- Upload the current (local-only) repository to your GitHub account as public:

```
hub create
```

- Create a private repository and open the new repository in a web browser:

```
hub create {{[-p|--private]}} {{[-o|--browse]}}
```

hub delete

Delete an existing repository on GitHub.

More information: https://hub.github.com/hub-delete.1.html.

- Delete personal repo on GitHub:

```
hub delete {{repository}}
```

hub fork

Fork a GitHub repo. Like **`git fork`** from **`git-extras`**.

More information: https://hub.github.com/hub-fork.1.html.

- Fork a GitHub repository by its slug:

```
hub fork {{tldr-pages/tldr}}
```

- Fork a GitHub repository by its URL:

```
hub fork {{https://github.com/tldr-pages/tldr}}
```

- Fork current GitHub repository, set remote name to origin:

```
hub fork --remote-name {{origin}}
```

hub init

Initialize a new local Git repository.

More information: https://hub.github.com/hub-init.1.html.

- Initialize a new local repository:

```
hub init
```

hub issue

Manage Github issues.

More information: https://hub.github.com/hub-issue.1.html.

- List the last 10 issues with the bug label:

```
hub issue list {{[-L|--limit]}} {{10}} {{[-l|--labels]}}
"{{bug}}"
```

- Display a specific issue:

```
hub issue show {{issue_number}}
```

- List 10 closed issues assigneed to a specific user:

```
hub issue {{[-s|--state]}} {{closed}} {{[-a|--assignee]}}
{{username}} --limit {{10}}
```

hub

A wrapper for Git that adds commands for working with GitHub-based projects.

If set up as instructed by **`hub alias`**, one can use **`git`** to run **`hub`** commands.

More information: https://hub.github.com/hub.1.html.

- Clone a repository using its slug (owners can omit the username):

  ```
  hub clone {{username}}/{{repo_name}}
  ```

- Create a fork of the current repository (cloned from another user) under your GitHub profile:

  ```
  hub fork
  ```

- Push the current local branch to GitHub and create a PR for it in the original repository:

  ```
  hub push {{remote_name}} && hub pull-request
  ```

- Create a PR of the current (already pushed) branch, reusing the message from the first commit:

  ```
  hub pull-request --no-edit
  ```

- Create a new branch with the contents of a pull request and switch to it:

  ```
  hub pr checkout {{pr_number}}
  ```

- Upload the current (local-only) repository to your GitHub account:

  ```
  hub create
  ```

- Fetch Git objects from upstream and update local branches:

  ```
  hub sync
  ```

huggingface-cli

Interact with Hugging Face Hub.

Login, manage local cache, download, or upload files.

More information: https://huggingface.co/docs/huggingface_hub/guides/cli.

- Login to Hugging Face Hub:

```
huggingface-cli login
```

- Display the name of the logged in user:

```
huggingface-cli whoami
```

- Log out:

```
huggingface-cli logout
```

- Print information about the environment:

```
huggingface-cli env
```

- Download files from an repository and print out the path (omit filenames to download entire repository):

```
huggingface-cli download --repo-type {{repo_type}} {{repo_id}} {{filename1 filename2 ...}}
```

- Upload an entire folder or a file to Hugging Face:

```
huggingface-cli upload --repo-type {{repo_type}} {{repo_id}} {{path/to/local_file_or_directory}} {{path/to/repo_file_or_directory}}
```

- Scan cache to see downloaded repositories and their disk usage:

```
huggingface-cli scan-cache
```

- Delete the cache interactively:

```
huggingface-cli delete-cache
```

hugo server

Build and serve a site with Hugo's built-in webserver.

More information: https://gohugo.io/commands/hugo_server/.

- Build and serve a site:

```
hugo server
```

- Build and serve a site on a specified port number:

```
hugo server {{[-p|--port]}} {{port_number}}
```

- Build and serve a site while minifying supported output formats (HTML, XML, etc.):

```
hugo server --minify
```

- Build and serve a site in the production environment with full re-renders while minifying supported formats:

```
hugo server {{[-e|--environment]}} {{production}} --
disableFastRender --minify
```

- Display help:

```
hugo server {{[-h|--help]}}
```

hugo

Template-based static site generator.

Uses modules, components, and themes.

Some subcommands such as **`server`** have their own usage documentation.

More information: https://gohugo.io/commands/.

- Create a new Hugo site:

  ```
  hugo new site {{path/to/site}}
  ```

- Create a new Hugo theme (themes may also be downloaded from https://themes.gohugo.io/):

  ```
  hugo new theme {{theme_name}}
  ```

- Create a new page:

  ```
  hugo new {{section_name}}/{{page_name}}
  ```

- Build a site to the `public` directory:

  ```
  hugo
  ```

- Build a site including pages that are marked as a "draft":

  ```
  hugo {{[-D|--buildDrafts]}}
  ```

- Build a site on your local IP:

  ```
  hugo server --bind {{local_ip}} {{[-b|--baseURL]}} {{http://local_ip}}
  ```

- Build a site to a given directory:

  ```
  hugo {{[-d|--destination]}} {{path/to/destination}}
  ```

- Build a site, start up a webserver to serve it, and automatically reload when pages are edited:

  ```
  hugo server
  ```

hunspell

Check spelling.

More information: https://manned.org/hunspell.

- Check the spelling of a file:

```
hunspell {{path/to/file}}
```

- Check the spelling of a file with the en_US dictionary:

```
hunspell -d {{en_US}} {{path/to/file}}
```

- List misspelled words in a file:

```
hunspell -l {{path/to/file}}
```

husky

Native Git hooks made easy.

More information: https://typicode.github.io/husky/.

- Install Husky in the current directory:

```
husky install
```

- Install Husky into a specific directory:

```
husky install {{path/to/directory}}
```

- Set a specific command as a `pre-push` hook for Git:

```
husky set {{.husky/pre-push}} "{{command}}
{{command_arguments}}"
```

- Add a specific command to the current `pre-commit` hook:

```
husky add {{.husky/pre-commit}} "{{command}}
{{command_arguments}}"
```

- Uninstall Husky hooks from the current directory:

```
husky uninstall
```

- Display help:

```
husky
```

hut

A CLI tool for sourcehut.

More information: https://manned.org/hut.

- Initialize `hut`'s configuration file (this will prompt for an OAuth2 access token, which is required to use `hut`):

```
hut init
```

- List Git/Mercurial repositories:

```
hut {{git|hg}} list
```

- Create a public Git/Mercurial repository:

```
hut {{git|hg}} create {{name}}
```

- List jobs on https://builds.sr.ht:

```
hut builds list
```

- Show the status of a job:

```
hut builds show {{job_id}}
```

- SSH into a job container:

```
hut ssh {{job_id}}
```

hx

This command is an alias of **helix**.

- View documentation for the original command:

```
tldr helix
```

hydra

Online password guessing tool.

Protocols supported include FTP, HTTP(S), SMTP, SNMP, XMPP, SSH, and more.

More information: https://manned.org/hydra.

- Start Hydra's wizard:

```
hydra-wizard
```

- Guess SSH credentials using a given username and a list of passwords:

```
hydra -l {{username}} -P {{path/to/wordlist.txt}} {{host_ip}}
{{ssh}}
```

- Guess HTTPS webform credentials using two specific lists of usernames and passwords ("https_post_request" can be like "username=^USER^&password=^PASS^"):

```
hydra -L {{path/to/usernames.txt}} -P {{path/to/
wordlist.txt}} {{host_ip}} {{https-post-form}}
"{{url_without_host}}:{{https_post_request}}:
{{login_failed_string}}"
```

- Guess FTP credentials using usernames and passwords lists, specifying the number of threads:

```
hydra -L {{path/to/usernames.txt}} -P {{path/to/
wordlist.txt}} -t {{n_tasks}} {{host_ip}} {{ftp}}
```

- Guess MySQL credentials using a username and a passwords list, exiting when a username/password pair is found:

```
hydra -l {{username}} -P {{path/to/wordlist.txt}} -f
{{host_ip}} {{mysql}}
```

- Guess RDP credentials using a username and a passwords list, showing each attempt:

```
hydra -l {{username}} -P {{path/to/wordlist.txt}} -V {{rdp://
host_ip}}
```

- Guess IMAP credentials on a range of hosts using a list of colon-separated username/password pairs:

```
hydra -C {{path/to/username_password_pairs.txt}} {{imap://
[host_range_cidr]}}
```

- Guess POP3 credentials on a list of hosts using usernames and passwords lists, exiting when a username/password pair is found:

```
hydra -L {{path/to/usernames.txt}} -P {{path/to/
wordlist.txt}} -M {{path/to/hosts.txt}} -F {{pop3}}
```

hyperfine

A benchmarking tool.

More information: https://manned.org/hyperfine.

- Run a basic benchmark, performing at least 10 runs:

```
hyperfine '{{make}}'
```

- Run a comparative benchmark:

```
hyperfine '{{make target1}}' '{{make target2}}'
```

- Change minimum number of benchmarking runs:

```
hyperfine {{[-m|--min-runs]}} {{7}} '{{make}}'
```

- Perform benchmark with warmup:

```
hyperfine {{[-w|--warmup]}} {{5}} '{{make}}'
```

- Run a command before each benchmark run (to clear caches, etc.):

```
hyperfine {{[-p|--prepare]}} '{{make clean}}' '{{make}}'
```

- Run a benchmark where a single parameter changes for each run:

```
hyperfine {{[-p|--prepare]}} '{{make clean}}' {{[-P|--
parameter-scan]}} {{num_threads}} {{1}} {{10}} '{{make --jobs
{num_threads}}}'
```

i3-msg

Send messages to a running instance of i3 using IPC.

See https://i3wm.org/docs/userguide.html#list_of_commands for available commands.

More information: https://manned.org/i3-msg.

- Run an i3 command:

```
i3-msg {{command}}
```

- Print a list of workspaces in JSON:

```
i3-msg -t get_workspaces
```

- Print a layout tree of all open windows, containers, outputs, and workspaces in JSON:

```
i3-msg -t get_tree
```

i3-nagbar

Display an error/warning in a bar on top of a screen.

More information: https://manned.org/i3-nagbar.

- Display an error:

```
i3-nagbar {{[-m|--message]}} "{{error message}}"
```

- Display a warning:

```
i3-nagbar {{[-t|--type]}} warning {{[-m|--message]}}
"{{warning message}}"
```

- Use the specified font:

```
i3-nagbar {{[-f|--font]}} "{{pango:monospace bold 9}}" {{[-
m|--message]}} "{{error message}}"
```

- Create a button and run a command in a terminal on click:

```
i3-nagbar {{[-b|--button]}} "{{button text}}" {{command}}
{{[-m|--message]}} "{{error message}}"
```

- Create a button and run a command on click:

```
i3-nagbar {{[-B|--button-no-terminal]}} "{{button
text}}" {{command}} {{[-m|--message]}} "{{error message}}"
```

- Always open `i3-nagbar` on the primary monitor (default: focused monitor):

```
i3-nagbar {{[-pm|--primary --message]}} "{{error message}}"
```

i3

A tiling window manager for X11.

More information: https://i3wm.org/docs/userguide.html.

- Start `i3` (Note that a pre-existing window manager must not be open when this command is run):

  ```
  i3
  ```

- Open a new terminal window:

  ```
  <Super Enter>
  ```

- Move the focused window to a workspace:

  ```
  <Super Shift {{Number}}>
  ```

- Switch to a workspace:

  ```
  <Super {{Number}}>
  ```

- Split the next window horizontally:

  ```
  <Super h>
  ```

- Split the next window vertically:

  ```
  <Super v>
  ```

- Open an application launcher:

  ```
  <Super d>
  ```

i3lock

Simple screen locker built for the i3 window manager.

More information: https://manned.org/i3lock.

- Lock the screen showing a white background:

```
i3lock
```

- Lock the screen with a simple color background (rrggbb format):

```
i3lock {{[-c|--color]}} {{0000ff}}
```

- Lock the screen to a PNG background:

```
i3lock {{[-i|--image]}} {{path/to/file.png}}
```

- Lock the screen and disable the unlock indicator (removes feedback on keypress):

```
i3lock {{[-u|--no-unlock-indicator]}}
```

- Lock the screen and don't hide the mouse pointer:

```
i3lock {{[-p|--pointer]}} {{default}}
```

- Lock the screen to a PNG background tiled over all monitors:

```
i3lock {{[-i|--image]}} {{path/to/file.png}} {{[-t|--
tiling]}}
```

- Lock the screen and show the number of failed login attempts:

```
i3lock {{[-f|--show-failed-attempts]}}
```

ia

Tool to interact with **`archive.org`**.

More information: https://archive.org/developers/internetarchive/cli.html.

- Configure `ia` with API keys (some functions won't work without this step):

```
ia configure
```

- Upload one or more items to `archive.org`:

```
ia upload {{identifier}} {{path/to/file}} --
metadata="{{mediatype:data}}" --metadata="{{title:example}}"
```

- Download one or more items from `archive.org`:

```
ia download {{item}}
```

- Delete one or more items from `archive.org`:

```
ia delete {{identifier}} {{file}}
```

- Search on `archive.org`, returning results as JSON:

```
ia search '{{subject:"subject" collection:collection}}'
```

ibmcloud api

Set or view the IBM Cloud API endpoint.

More information: https://cloud.ibm.com/docs/cli?topic=cli-ibmcloud_cli#ibmcloud_api.

- View the current API endpoint:

```
ibmcloud api
```

- Set the API endpoint to `cloud.ibm.com`:

```
ibmcloud api cloud.ibm.com
```

- Set a private API endpoint:

```
ibmcloud api private.cloud.ibm.com
```

- Use a VPC connection for a private endpoint:

```
ibmcloud api private.cloud.ibm.com --vpc
```

- Bypass SSL validation of HTTP requests:

```
ibmcloud api https://cloud.ibm.com --skip-ssl-validation
```

- Remove the API endpoint setting:

```
ibmcloud api --unset
```

ibmcloud config

Modify or read out values in the IBM Cloud CLI configuration.

More information: https://cloud.ibm.com/docs/cli?topic=cli-ibmcloud_cli#ibmcloud_config.

- Set HTTP request timeout to 30 seconds:

```
ibmcloud config --http-timeout 30
```

- Enable trace output for HTTP requests:

```
ibmcloud config --trace true
```

- Trace HTTP requests to a specific file:

```
ibmcloud config --trace {{path/to/trace_file}}
```

- Disable color output:

```
ibmcloud config --color false
```

- Set the locale to a specific language:

```
ibmcloud config --locale {{zh_Hans}}
```

- Enable automatic SSO one-time passcode acceptance:

```
ibmcloud config --sso-otp auto
```

ibmcloud cr

Manage IBM Cloud Container Registry content and configuration.

More information: https://cloud.ibm.com/docs/cli?topic=cli-containerregcli.

- Set target region for IBM Cloud Container Registry:

  ```
  ibmcloud cr region-set
  ```

- List images available:

  ```
  ibmcloud cr {{[images|image-list]}}
  ```

- Inspect an image data:

  ```
  ibmcloud cr image-inspect {{image}}
  ```

- Run vulnerability assessment on an image:

  ```
  ibmcloud cr {{[va|vulnerability-assessment]}} {{image}}
  ```

- Log the local Docker or Podman client in to IBM Cloud Container Registry:

  ```
  ibmcloud cr login
  ```

- List all actions available under this command:

  ```
  ibmcloud cr help
  ```

ibmcloud iam

Manage identities and access to resources.

More information: https://cloud.ibm.com/docs/cli?topic=cli-ibmcloud_commands_iam.

- List service IDs in an account:

```
ibmcloud iam service-ids
```

- List all API keys for a service ID:

```
ibmcloud iam service-api-keys {{service_id}}
```

- Create an API key for a service ID with a description and without confirmation:

```
ibmcloud iam service-api-key-create {{api_key_name}} {{service_id}} {{[-d|--description]}} {{description}} {{[-f|--force]}}
```

- List all actions available under this command:

```
ibmcloud iam help
```

ibmcloud ks

Manage Kubernetes and OpenShift clusters in IBM Cloud.

More information: https://cloud.ibm.com/docs/cli?topic=cli-kubernetes-service-cli.

- View the details of a cluster:

```
ibmcloud ks cluster get {{[-c|--cluster]}} {{cluster_id}}
```

- View the rotation status of Cluster Authority certificates for a cluster:

```
ibmcloud ks cluster ca status {{[-c|--cluster]}}
{{cluster_id}}
```

- View worker pools of a cluster:

```
ibmcloud ks worker-pool ls {{[-c|--cluster]}} {{cluster_id}}
```

- Delete a worker node and replace it with a new one in the same worker pool:

```
ibmcloud ks worker replace {{[-c|--cluster]}} {{cluster_id}}
{{[-w|--worker]}} {{worker_id}}
```

- List all actions available under this command:

```
ibmcloud ks help
```

ibmcloud login

Log in to the IBM Cloud.

More information: https://cloud.ibm.com/docs/cli?topic=cli-ibmcloud_cli#ibmcloud_login.

- Log in by using an interactive prompt:

```
ibmcloud login
```

- Log in to a specific API endpoint (default is `cloud.ibm.com`):

```
ibmcloud login -a {{api_endpoint}}
```

- Log in by providing username, password, and the targeted region as parameters:

```
ibmcloud login -u {{username}} -p {{password}} -r {{us-south}}
```

- Log in with an API key, passing it as an argument:

```
ibmcloud login --apikey {{api_key_string}}
```

- Log in with an API key, passing it as a file:

```
ibmcloud login --apikey @{{path/to/api_key_file}}
```

- Log in with a federated ID (single sign-on):

```
ibmcloud login --sso
```

ibmcloud logout

Log out of the IBM Cloud CLI.

More information: https://cloud.ibm.com/docs/cli?topic=cli-ibmcloud_cli#ibmcloud_logout.

- Log out of the current session:

```
ibmcloud logout
```

ibmcloud regions

List all available regions on IBM Cloud.

More information: https://cloud.ibm.com/docs/cli?topic=cli-ibmcloud_cli#ibmcloud_regions.

- View information for all regions:

```
ibmcloud regions
```

ibmcloud target

Set or view the target account, region, or resource group.

More information: https://cloud.ibm.com/docs/cli?topic=cli-ibmcloud_cli#ibmcloud_target.

- View the current target account and region:

```
ibmcloud target
```

- Set the target account:

```
ibmcloud target -c {{account_id}}
```

- Switch to a specific region:

```
ibmcloud target -r {{region_name}}
```

- Set the target resource group:

```
ibmcloud target -g {{resource_group_name}}
```

- Clear the targeted region:

```
ibmcloud target --unset-region
```

- Clear the targeted resource group:

```
ibmcloud target --unset-resource-group
```

ibmcloud update

Update the IBM Cloud CLI to the latest available version.

More information: https://cloud.ibm.com/docs/cli?topic=cli-ibmcloud_cli#ibmcloud_update.

- Update CLI to the most recent version:

```
ibmcloud update
```

- Force an update without confirmation prompts:

```
ibmcloud update -f
```

ibmcloud version

Display the installed IBM Cloud CLI version.

More information: https://cloud.ibm.com/docs/cli?topic=cli-ibmcloud_cli#ibmcloud_version.

- Display version:

```
ibmcloud {{[v|version]}}
```

ibmcloud

Manage IBM Cloud apps and services.

More information: https://cloud.ibm.com/docs/cli?topic=cli-ibmcloud_cli.

- Update `ibmcloud` to the latest version:

  ```
  ibmcloud update
  ```

- List all available IBM Cloud regions:

  ```
  ibmcloud regions
  ```

- Display help:

  ```
  ibmcloud help
  ```

- Display help for a subcommand:

  ```
  ibmcloud help {{subcommand}}
  ```

- Display version:

  ```
  ibmcloud version
  ```

ic

This command is an alias of **ibmcloud**.

- View documentation for the original command:

```
tldr ibmcloud
```

ical

View Hirji/Islamic and Gregorian calendars and convert their dates.

More information: https://manned.org/ical.

- Display the current month's calendar:

```
ical
```

- Convert a Gregorian date to a Hijri date:

```
ical --gregorian {{yyyymmdd}}
```

- Convert a Hirji date to a Gregorian date:

```
ical --hijri {{yyyymmdd}}
```

icontopbm

This command has been superseded by **`sunicontopnm`**.

More information: https://netpbm.sourceforge.net/doc/icontopbm.html.

- View documentation for the current command:

```
tldr sunicontopnm
```

iconv

Convert text from one encoding to another.

More information: https://manned.org/iconv.

- Convert file to a specific encoding, and print to `stdout`:

```
iconv {{[-f|--from-code]}} {{from_encoding}} {{[-t|--to-code]}} {{to_encoding}} {{input_file}}
```

- Convert file to the current locale's encoding, and output to a file:

```
iconv {{[-f|--from-code]}} {{from_encoding}} {{input_file}} > {{output_file}}
```

- List supported encodings:

```
iconv {{[-l|--list]}}
```

id

Display current user and group identity.

See also: **`logname`**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/id-invocation.html.

- Display current user's ID (UID), group ID (GID), and groups to which they belong:

```
id
```

- Display the current user identity:

```
id {{[-un|--user --name]}}
```

- Display the current user identity as a number:

```
id {{[-u|--user]}}
```

- Display the current primary group identity:

```
id {{[-gn|--group --name]}}
```

- Display the current primary group identity as a number:

```
id {{[-g|--group]}}
```

- Display all groups the current user belongs to:

```
id {{[-Gn|--groups --name]}}
```

- Display an arbitrary user's ID (UID), group ID (GID), and groups to which they belong:

```
id {{username}}
```

- Skip name lookup and specify the UID number explicitly:

```
id +{{uid_number}}
```

id3tag

Read, write, and manipulate ID3v1 and ID3v2 tags of MP3 files.

More information: https://manned.org/id3tag.

- Set artist and song title tag of an MP3 file:

```
id3tag --artist {{artist}} --song {{song_title}} {{path/to/file.mp3}}
```

- Set album title of all MP3 files in the current directory:

```
id3tag --album {{album}} {{*.mp3}}
```

- Display help:

```
id3tag --help
```

idea

JetBrains Java and Kotlin IDE.

More information: https://www.jetbrains.com/help/idea/working-with-the-ide-features-from-command-line.html.

- Open the current directory in IntelliJ IDEA:

```
idea {{path/to/directory}}
```

- Open a specific file or directory in IntelliJ IDEA:

```
idea {{path/to/file_or_directory}}
```

- Open the diff viewer to compare up to 3 files:

```
idea diff {{path/to/file1 path/to/file2 path/to/optional_file3}}
```

- Open the merge dialog to perform a two-way file merge:

```
idea merge {{path/to/file1}} {{path/to/file2}} {{path/to/output}}
```

- Run code inspections on a project:

```
idea inspect {{path/to/project_directory}} {{path/to/inspection_profile}} {{path/to/output}}
```

ident

Identify RCS keyword strings in files.

See also: **`ci`**, **`co`**, **`rcs`**, **`rcsdiff`**, **`rlog`**.

More information: https://manned.org/ident.

- Display RCS identification strings in a file:

```
ident {{path/to/file}}
```

- Display RCS identification strings, suppressing warnings if no patterns are found:

```
ident -q {{path/to/file1 path/to/file2 ...}}
```

- Display RCS identification strings from `stdin`:

```
cat {{path/to/file}} | ident
```

identify

This command is an alias of **`magick identify`**.

- View documentation for the original command:

```
tldr magick identify
```

idevice_id

List attached iOS devices or print the device name of a given device.

More information: https://manned.org/idevice_id.

- List the UDIDs of all attached devices:

```
idevice_id --list
```

- List the UDIDs of all devices available via the network:

```
idevice_id --network
```

idevicebackup

Create or restore backups for iOS devices.

Note: This tool is outdated. Please see **`idevicebackup2`**.

More information: https://manned.org/idevicebackup.

- Create a backup of the device in the specified directory:

```
idevicebackup backup {{path/to/directory}}
```

- Restore a backup from the specified directory:

```
idevicebackup restore {{path/to/directory}}
```

idevicebackup2

Create or restore backups for devices running iOS 4 or later.

More information: https://manned.org/idevicebackup2.

- Create a backup of the device in the specified directory:

```
idevicebackup2 backup {{path/to/directory}}
```

- Restore a backup from the specified directory:

```
idevicebackup2 restore {{path/to/directory}}
```

- Enable encryption for backups:

```
idevicebackup2 encryption on {{password}}
```

- List the files in the last completed backup:

```
idevicebackup2 list
```

idevicecrashreport

Retrieve crash reports from an iOS device.

More information: https://manned.org/idevicecrashreport.

- Retrieve crash reports and move them to a specified directory:

```
idevicecrashreport {{path/to/directory}}
```

- Retrieve crash reports without removing them from the device:

```
idevicecrashreport --keep {{path/to/directory}}
```

- Extract crash reports into separate `.crash` files:

```
idevicecrashreport --extract {{path/to/directory}}
```

idevicedate

Display the current date or set it on an iOS device.

More information: https://manned.org/idevicedate.

- Display the current date and time:

```
idevicedate
```

- Set the date and time on the device to the system time:

```
idevicedate --sync
```

- Set the date and time to a specific timestamp:

```
idevicedate --set {{timestamp}}
```

idevicediagnostics

Interact with the diagnostics interface of an iOS device.

More information: https://manned.org/idevicediagnostics.

- Print diagnostics information:

```
idevicediagnostics diagnostics
```

- Print mobilegestalt key values:

```
idevicediagnostics mobilegestalt {{key1}} {{key2}}
```

- Shutdown, restart, or sleep the device:

```
idevicediagnostics {{shutdown|restart|sleep}}
```

ideviceimagemounter

Mount disk images on an iOS device.

More information: https://manned.org/ideviceimagemounter.

- Mount a disk image on the connected device:

```
ideviceimagemounter {{path/to/image_file}} {{path/to/signature_file}}
```

- List currently mounted disk images:

```
ideviceimagemounter --list
```

ideviceinfo

Show information about the first connected iOS device.

More information: https://manned.org/ideviceinfo.

- Display detailed information about the connected device:

```
ideviceinfo
```

- Show information about a specific device by UDID:

```
ideviceinfo --udid {{device_udid}}
```

idevicename

Display the device name or set it to a new name.

More information: https://manned.org/idevicename.

- Display the current device name:

```
idevicename
```

- Set a new device name:

```
idevicename {{new_name}}
```

idevicepair

Manage host pairings with iOS devices.

More information: https://manned.org/idevicepair.

- Pair a device with the host:

```
idevicepair pair
```

- List devices paired with the host:

```
idevicepair list
```

idevicescreenshot

Get a screenshot from the connected iOS device.

More information: https://manned.org/idevicescreenshot.

- Save a screenshot with the default file name as a TIFF image:

```
idevicescreenshot
```

- Save a screenshot with a specific file name:

```
idevicescreenshot {{path/to/file.tiff}}
```

idevicesetlocation

Simulate a location on an iOS device.

More information: https://manned.org/idevicesetlocation.

- Set a specific latitude and longitude:

```
idevicesetlocation {{latitude}} {{longitude}}
```

- Reset the simulated location:

```
idevicesetlocation reset
```

idevicesyslog

Relay syslog messages from a connected iOS device.

More information: https://manned.org/idevicesyslog.

- Relay syslog messages from the connected device:

```
idevicesyslog
```

- Suppress kernel messages and print everything else:

```
idevicesyslog --no-kernel
```

idnits

Check internet-drafts for submission nits.

Looks for violations of Section 2.1 and 2.2 of the requirements listed on https://www.ietf.org/id-info/checklist.

More information: https://github.com/ietf-tools/idnits.

- Check a file for nits:

```
idnits {{path/to/file.txt}}
```

- Count nits without displaying them:

```
idnits --nitcount {{path/to/file.txt}}
```

- Show extra information about offending lines:

```
idnits --verbose {{path/to/file.txt}}
```

- Expect the specified year in the boilerplate instead of the current year:

```
idnits --year {{2021}} {{path/to/file.txt}}
```

- Assume the document is of the specified status:

```
idnits --doctype {{standard|informational|experimental|bcp|ps|ds}} {{path/to/file.txt}}
```

iex

IEx is the interactive shell for Elixir.

More information: https://manned.org/iex.

- Start an interactive session:

  ```
  iex
  ```

- Start a session that remembers history:

  ```
  iex --erl "-kernel shell_history enabled"
  ```

- Start and load Mix project files:

  ```
  iex -S mix
  ```

if

Perform conditional processing in shell scripts.

See also: **`test`**, **`[`**.

More information: https://www.gnu.org/software/bash/manual/bash.html#Conditional-Constructs.

- Execute the specified commands if the condition command's exit status is zero:

```
if {{condition_command}}; then {{echo "Condition is true"}}; fi
```

- Execute the specified commands if the condition command's exit status is not zero:

```
if ! {{condition_command}}; then {{echo "Condition is true"}}; fi
```

- Execute the first specified commands if the condition command's exit status is zero otherwise execute the second specified commands:

```
if {{condition_command}}; then {{echo "Condition is true"}}; else {{echo "Condition is false"}}; fi
```

- Check whether a [f]ile exists:

```
if [[ -f {{path/to/file}} ]]; then {{echo "Condition is true"}}; fi
```

- Check whether a [d]irectory exists:

```
if [[ -d {{path/to/directory}} ]]; then {{echo "Condition is true"}}; fi
```

- Check whether a file or directory [e]xists:

```
if [[ -e {{path/to/file_or_directory}} ]]; then {{echo "Condition is true"}}; fi
```

- Check whether a variable is defined:

```
if [[ -n "${{variable}}" ]]; then {{echo "Condition is
true"}}; fi
```

- List all possible conditions (`test` is an alias to `[`; both are commonly used with `if`):

  ```
  man test
  ```

ifconfig

Network Interface Configurator.

More information: https://net-tools.sourceforge.io/man/ifconfig.8.html.

- View network settings of an interface:

```
ifconfig {{interface_name}}
```

- Display details of all interfaces, including disabled interfaces:

```
ifconfig -a
```

- Disable an interface:

```
ifconfig {{interface_name}} down
```

- Enable an interface:

```
ifconfig {{interface_name}} up
```

- Assign an IP address to an interface:

```
ifconfig {{interface_name}} {{ip_address}}
```

ifdata

Display information about a network interface.

More information: https://manned.org/ifdata.

- [p]rint the whole configuration of the specified interface:

```
ifdata -p {{eth0}}
```

- Indicate the [e]xistence of the specified interface via the exit code:

```
ifdata -e {{eth0}}
```

- [p]rint the IPv4 [a]dress and the [n]etmask of the specified interface:

```
ifdata -pa -pn {{eth0}}
```

- [p]rint the [N]etwork adress, the [b]roadcast adress, and the [m]TU of the specified interface:

```
ifdata -pN -pb -pm {{eth0}}
```

- Display help:

```
ifdata
```

ifne

Run a command depending on the emptyness of **`stdin`**.

More information: https://manned.org/ifne.

- Run the specified command if and only if `stdin` is not empty:

```
ifne {{command}} {{command_options}}
```

- Run the specified command if and only if `stdin` is empty, otherwise pass `stdin` to `stdout`:

```
ifne -n {{command}} {{command_options}}
```

IFS

`$IFS` (Internal Field Separator) is a special environment variable that defines the delimiter used for word splitting in Unix shells.

The default value of **`$IFS`** is a space, tab, and newline. The three characters serve as delimiters.

More information: https://www.gnu.org/software/bash/manual/bash.html#Word-Splitting.

- View the current `$IFS` value:

  ```
  echo "$IFS"
  ```

- Change the `$IFS` value:

  ```
  IFS="{{:}}"
  ```

- Reset `$IFS` to default:

  ```
  IFS=$' \t\n'
  ```

- Temporarily change the `$IFS` value in a subshell:

  ```
  (IFS="{{:}}"; echo "{{one:two:three}}")
  ```

ignite

A CLI for React Native boilerplates, plugins, generators, and more.

More information: https://infinite.red/ignite.

- Create a new React Native project:

  ```
  ignite new {{project_name}}
  ```

- Generate file from a plugin:

  ```
  ignite generate {{plugin_name}} {{path/to/file}}
  ```

- Add an Ignite plugin to the project:

  ```
  ignite add {{plugin_name}}
  ```

- Remove an Ignite plugin from the project:

  ```
  ignite remove {{plugin_name}}
  ```

ilbmtoppm

Convert an ILBM file to a PPM image.

More information: https://netpbm.sourceforge.net/doc/ilbmtoppm.html.

- Convert an ILBM file to a PPM image:

```
ilbmtoppm {{path/to/file.ilbm}} > {{path/to/file.ppm}}
```

- Use the specified color to "show through" where the image is transparent:

```
ilbmtoppm {{[-t|-transparent]}} {{color}} {{path/to/
file.ilbm}} > {{path/to/file.ppm}}
```

- Ignore the chunk with the specified chunk ID:

```
ilbmtoppm {{[-ig|-ignore]}} {{chunkID}} {{path/to/file.ilbm}}
> {{path/to/file.ppm}}
```

- Store the input's transparency information to the specified PBM file:

```
ilbmtoppm {{[-m|-maskfile]}} {{path/to/maskfile.pbm}} {{path/
to/file.ilbm}} > {{path/to/file.ppm}}
```

imapsync

Email IMAP tool for syncing, copying, and migrating email mailboxes between two IMAP servers, one way, and without duplicates.

More information: https://imapsync.lamiral.info/#doc.

- Synchronize IMAP account between host1 and host2:

```
imapsync --host1 {{host1}} --user1 {{user1}} --password1
{{secret1}} --host2 {{host2}} --user2 {{user2}} --password2
{{secret2}}
```

img2pdf

Losslessly convert raster images to a PDF file.

Some supported image formats are: GIF, JPEG, JPEG2000, PNG, GIF, and TIFF.

More information: https://gitlab.mister-muffin.de/josch/img2pdf.

- Convert one or more images to a single PDF, each image being on its own page:

```
img2pdf {{path/to/image1.ext path/to/image2.ext ...}} --output {{path/to/file.pdf}}
```

- Convert only the first frame of a multi-frame image to PDF:

```
img2pdf {{path/to/file.gif}} --first-frame-only --output {{path/to/file.pdf}}
```

- Auto orient the image, use a specific page size in landscape mode, and set a border of specific sizes horizontally and vertically:

```
img2pdf {{path/to/image.ext}} --auto-orient --pagesize {{A4^T}} --border {{2cm}}:{{5.1cm}} --output {{path/to/file.pdf}}
```

- Shrink only larger images to a rectangle of specified dimensions inside a page with a specific size:

```
img2pdf {{path/to/image.ext}} --pagesize {{30cm}}x{{20cm}} --imgsize {{10cm}}x{{15cm}} --fit {{shrink}} --output {{path/to/file.pdf}}
```

- Convert an image to PDF and specify metadata for the resulting file:

```
img2pdf {{path/to/image.ext}} --title {{title}} --author {{author}} --creationdate {{1970-01-31}} --keywords {{keyword1 keyword2}} --subject {{subject}} --output {{path/to/file.pdf}}
```

img2sixel

Convert images to the Sixel format for displaying in a terminal.

More information: https://manned.org/img2sixel.

- Display an image in the terminal:

```
img2sixel {{path/to/image}}
```

- Resize the image to the specified width and height before displaying it:

```
img2sixel {{[-w|--width]}} {{number}} {{[-h|--height]}} {{number}} {{path/to/image}}
```

imgcat

Display images.

Requires a compatible terminal such as iTerm2.

More information: https://github.com/danielgatis/imgcat#usage.

- Display an image on the command-line:

```
imgcat {{path/to/file}}
```

imgtoppm

Convert various image file formats to the PPM (Portable Pixmap) format.

More information: https://netpbm.sourceforge.net/doc/imgtoppm.html.

- Convert an input image to PPM format:

```
imgtoppm {{path/to/input}} > {{path/to/output.ppm}}
```

- Display version:

```
imgtoppm {{[-v|-version]}}
```

immich-go

Immich-Go is an open-source tool designed to streamline uploading large photo collections to your self-hosted Immich server.

See also: **immich**.

More information: https://github.com/simulot/immich-go.

- Upload a Google Photos takeout file to Immich server:

```
immich-go -server={{server_url}} -key={{server_key}} upload
{{path/to/takeout_file.zip}}
```

- Import photos captured on June 2019, while auto-generating albums:

```
immich-go -server={{server_url}} -key={{server_key}} upload -
create-albums -google-photos -date={{2019-06}} {{path/to/
takeout_file.zip}}
```

- Upload a takeout file using server and key from a configuration file:

```
immich-go -use-configuration={{~/.immich-go/immich-go.json}}
upload {{path/to/takeout_file.zip}}
```

- Examine Immich server content, remove less quality images, and preserve albums:

```
immich-go -server={{server_url}} -key={{server_key}}
duplicate -yes
```

- Delete all albums created with the pattern "YYYY-MM-DD":

```
immich-go -server={{server_url}} -key={{server_key}} tool
album delete {{\d{4}-\d{2}-\d{2}}}
```

immich

Manage Immich servers.

See also: **immich-go**.

More information: https://docs.immich.app/features/command-line-interface/.

- Authenticate to Immich server:

```
immich login {{server_url/api}} {{server_key}}
```

- Upload some image files:

```
immich upload {{file1.jpg file2.jpg ...}}
```

- Upload a directory including subdirectories:

```
immich upload {{[-r|--recursive]}} {{path/to/directory}}
```

- Create an album based on a directory:

```
immich upload {{[-r|--recursive]}} {{path/to/directory}} {{[-A|--album-name]}} "{{My summer holiday}}"
```

- Skip assets matching a glob pattern:

```
immich upload {{[-r|--recursive]}} {{path/to/directory}} {{[-i|--ignore]}} {{**/Raw/** **/*.tif}}
```

- Include hidden files:

```
immich upload {{[-r|--recursive]}} {{path/to/directory}} {{[-H|--include-hidden]}}
```

impacket-addcomputer

This command is an alias of **`addcomputer.py`**.

- View documentation for the original command:

  ```
  tldr addcomputer.py
  ```

impacket-GetADUsers

This command is an alias of **`GetADUsers.py`**.

- View documentation for the original command:

  ```
  tldr GetADUsers.py
  ```

impacket-getArch

This command is an alias of **`getArch.py`**.

- View documentation for the original command:

```
tldr getArch.py
```

impacket-GetNPUsers

This command is an alias of **`GetNPUsers.py`**.

- View documentation for the original command:

  ```
  tldr GetNPUsers.py
  ```

impacket-GetUserSPNs

This command is an alias of **`GetUserSPNs.py`**.

- View documentation for the original command:

  ```
  tldr GetUserSPNs.py
  ```

impacket-mqtt_check

This command is an alias of **`mqtt_check.py`**.

- View documentation for the original command:

```
tldr mqtt_check.py
```

impacket-mssqlclient

This command is an alias of **`mssqlclient.py`**.

- View documentation for the original command:

  ```
  tldr mssqlclient.py
  ```

impacket-ntfs-read

This command is an alias of **`ntfs-read.py`**.

- View documentation for the original command:

  ```
  tldr ntfs-read.py
  ```

impacket-ping

This command is an alias of **`ping.py`**.

- View documentation for the original command:

```
tldr ping.py
```

impacket-ping6

This command is an alias of **`ping6.py`**.

- View documentation for the original command:

```
tldr ping6.py
```

impacket-psexec

This command is an alias of **`psexec.py`**.

- View documentation for the original command:

  ```
  tldr psexec.py
  ```

impacket-rpcdump

This command is an alias of **`rpcdump.py`**.

- View documentation for the original command:

  ```
  tldr rpcdump.py
  ```

impacket-rpcmap

This command is an alias of **`rpcmap.py`**.

- View documentation for the original command:

```
tldr rpcmap.py
```

impacket-sambaPipe

This command is an alias of **`sambaPipe.py`**.

- View documentation for the original command:

  ```
  tldr sambaPipe.py
  ```

impacket-secretsdump

This command is an alias of **`secretsdump.py`**.

- View documentation for the original command:

  ```
  tldr secretsdump.py
  ```

impacket-smbclient

This command is an alias of **`smbclient.py`**.

- View documentation for the original command:

  ```
  tldr smbclient.py
  ```

impacket-smbserver

This command is an alias of **`smbserver.py`**.

- View documentation for the original command:

  ```
  tldr smbserver.py
  ```

impacket-sniff

This command is an alias of **`sniff.py`**.

- View documentation for the original command:

```
tldr sniff.py
```

impacket-sniffer

This command is an alias of **`sniffer.py`**.

- View documentation for the original command:

  ```
  tldr sniffer.py
  ```

import

This command is an alias of **`magick import`**.

- View documentation for the original command:

  ```
  tldr magick import
  ```

in-toto-record

Create a signed link metadata file to provide evidence for supply chain steps.

More information: https://in-toto.readthedocs.io/en/latest/command-line-tools/in-toto-record.html.

- Start the record (creates a preliminary link file):

```
in-toto-record start {{[-n|--step-name]}} {{path/to/
edit_file1 path/to/edit_file2 ...}} --signing-key {{path/to/
key_file}} {{[-m|--materials]}} {{.}}
```

- Stop the record (expects a preliminary link file):

```
in-toto-record stop {{[-n|--step-name]}} {{path/to/edit_file1
path/to/edit_file2 ...}} --signing-key {{path/to/key_file}}
{{[-p|--products]}} {{.}}
```

in-toto-run

Generating link metadata while carrying out a supply chain step.

More information: https://in-toto.readthedocs.io/en/latest/command-line-tools/in-toto-run.html.

- Tag a Git repo and signing the resulting link file:

```
in-toto-run {{[-n|--step-name]}} {{tag}} {{[-p|--products]}} {{.}} --signing-key {{key_file}} -- {{git tag v1.0}}
```

- Create a tarball, storing files as materials and the tarball as product:

```
in-toto-run {{[-n|--step-name]}} {{package}} {{[-m|--materials]}} {{project}} {{[-p|--products]}} {{project.tar.gz}} -- {{tar czf project.tar.gz project}}
```

- Generate signed attestations for review work:

```
in-toto-run {{[-n|--step-name]}} {{review}} --signing-key {{key_file}} {{[-m|--materials]}} {{document.pdf}} {{[-x|--no-command]}}
```

- Scan the image using Trivy and generate link file:

```
in-toto-run {{[-n|--step-name]}} {{scan}} --signing-key {{key_file}} {{[-p|--products]}} {{report.json}} -- /bin/sh -c "trivy --output report.json --format json {{path/to/image}}"
```

in-toto-sign

Sign in-toto link or layout metadata or verify their signatures.

More information: https://in-toto.readthedocs.io/en/latest/command-line-tools/in-toto-sign.html.

- Sign 'unsigned.layout' with two keys and write it to 'root.layout':

```
in-toto-sign {{[-f|--file]}} {{unsigned.layout}} {{[-k|--keep]}} {{priv_key1}} {{priv_key2}} {{[-o|--output]}} {{root.layout}}
```

- Replace signature in link file and write to default filename:

```
in-toto-sign {{[-f|--file]}} {{package.2f89b927.link}} {{[-k|--keep]}} {{priv_key}}
```

- Verify a layout signed with 3 keys:

```
in-toto-sign {{[-f|--file]}} {{root.layout}} {{[-k|--keep]}} {{pub_key0}} {{pub_key1}} {{pub_key2}} --verify
```

- Sign a layout with the default GPG key in default GPG keyring:

```
in-toto-sign {{[-f|--file]}} {{root.layout}} {{[-g|--gpg]}}
```

- Verify a layout with a GPG key identified by keyid '...439F3C2':

```
in-toto-sign {{[-f|--file]}} {{root.layout}} --verify {{[-g|--gpg]}} {{...439F3C2}}
```

in

This shell keyword is used with **`for`** to separate the iterator and items to iterate.

- View documentation for the `for` keyword:

  ```
  tldr for
  ```

in2csv

Convert various tabular data formats to CSV.

Included in csvkit.

More information: https://csvkit.readthedocs.io/en/latest/scripts/in2csv.html.

- Convert an XLS file to CSV:

```
in2csv {{data.xls}}
```

- Convert a DBF file to a CSV file:

```
in2csv {{data.dbf}} > {{data.csv}}
```

- Convert a specific sheet from an XLSX file to CSV:

```
in2csv --sheet={{sheet_name}} {{data.xlsx}}
```

- Pipe a JSON file to in2csv:

```
cat {{data.json}} | in2csv {{[-f|--format]}} json >
{{data.csv}}
```

incus

Modern, secure, and powerful system container and virtual machine manager.

More information: https://linuxcontainers.org/incus/docs/main/.

- List all containers and virtual machines (both running and stopped):

```
incus list
```

- Create a container from an image, with a custom name:

```
incus create {{image}} {{container_name}}
```

- Start or stop an existing container:

```
incus {{start|stop}} {{container_name}}
```

- Open a shell inside an already running container:

```
incus shell {{container_name}}
```

- Remove a stopped container:

```
incus delete {{container_name}}
```

- Pull an image from an image repository (remote) to local:

```
incus copy {{remote}}:{{image}} local:{{custom_image_name}}
```

- List all available images in the official `images:` remote:

```
incus image list images:
```

- List all images already downloaded to the `local:` remote:

```
incus image list local:
```

indent

Change the appearance of a C/C++ program by inserting or deleting whitespace.

More information: https://www.gnu.org/software/indent/manual/indent/Option-Summary.html.

- Format C/C++ source according to the Linux style guide, automatically back up the original files, and replace with the indented versions:

```
indent {{[-linux|--linux-style]}} {{path/to/source1.c path/to/source2.c ...}}
```

- Format C/C++ source according to the GNU style, saving the indented version to a different file:

```
indent {{[-gnu|--gnu-style]}} {{path/to/source.c}} -o {{path/to/indented_source.c}}
```

- Format C/C++ source according to the style of Kernighan & Ritchie (K&R), no tabs, 3 spaces per indent, and wrap lines at 120 characters:

```
indent {{[-kr|--k-and-r-style]}} {{[-il|--indent-level]}}3 {{[-nut|--no-tabs]}} {{[-l|--line-length]}}120 {{path/to/source.c}} -o {{path/to/indented_source.c}}
```

infection

A mutation testing framework for PHP.

More information: https://infection.github.io/guide/command-line-options.html.

- Analyze code using the configuration file (or create one if it does not exist):

```
infection
```

- Use a specific number of threads:

```
infection {{[-j|--threads]}} {{number_of_threads}}
```

- Specify a minimum Mutation Score Indicator (MSI):

```
infection --min-msi {{percentage}}
```

- Specify a minimum covered code MSI:

```
infection --min-covered-msi {{percentage}}
```

- Use a specific test framework (defaults to PHPUnit):

```
infection --test-framework {{phpunit|phpspec}}
```

- Only mutate lines of code that are covered by tests:

```
infection --only-covered
```

- Display the mutation code that has been applied:

```
infection {{[-s|--show-mutations]}}
```

- Specify the log verbosity:

```
infection --log-verbosity {{default|all|none}}
```

influx

InfluxDB v1 client.

More information: https://docs.influxdata.com/influxdb/v1/tools/influx-cli/use-influx-cli/.

- Connect to an InfluxDB running on localhost with no credentials:

```
influx
```

- Connect with a specific username (will prompt for a password):

```
influx -username {{username}} -password ""
```

- Connect to a specific host:

```
influx -host {{hostname}}
```

- Use a specific database:

```
influx -database {{database_name}}
```

- Execute a given command:

```
influx -execute "{{influxql_command}}"
```

- Return output in a specific format:

```
influx -execute "{{influxql_command}}" -format {{json|csv|column}}
```

info

Read documentation stored in the info format.

More information: https://manned.org/info.

- Start reading top-level directory menu:

```
info
```

- Start reading at given menu item node from top-level directory:

```
info {{menu_item}}
```

- Start reading at second menu item within first menu item manual:

```
info {{first_menu_item}} {{second_menu_item}}
```

initdb

Create a PostgreSQL database cluster on disk.

More information: https://www.postgresql.org/docs/current/app-initdb.html.

- Create a database cluster at `/usr/local/var/postgres`:

```
initdb {{[-D|--pgdata]}} /usr/local/var/postgres
```

inkmake

GNU Makefile-style SVG exporting using Inkscape's backend.

More information: https://github.com/wader/inkmake#usage.

- Export an SVG file executing the specified Inkfile:

```
inkmake {{path/to/Inkfile}}
```

- Execute an Inkfile and show detailed information:

```
inkmake {{[-v|--verbose]}} {{path/to/Inkfile}}
```

- Execute an Inkfile, specifying SVG input file(s) and an output file:

```
inkmake {{[-s|--svg]}} {{path/to/file.svg}} {{[-o|--out]}}
{{path/to/output_image}} {{path/to/Inkfile}}
```

- Use a custom Inkscape binary as the backend:

```
inkmake {{[-i|--inkscape]}} {{/Applications/Inkscape.app/
Contents/Resources/bin/inkscape}} {{path/to/Inkfile}}
```

- Display help:

```
inkmake {{[-h|--help]}}
```

inkscape

An SVG (Scalable Vector Graphics) editing program.

For Inkscape versions up to 0.92.x, use -e instead of -o.

More information: https://inkscape.org/doc/inkscape-man.html.

- Open an SVG file in the Inkscape GUI:

```
inkscape {{path/to/file.svg}}
```

- Export an SVG file into a bitmap with the default format (PNG) and the default resolution (96 DPI):

```
inkscape {{path/to/file.svg}} {{[-o|--export-filename]}} {{path/to/file.png}}
```

- Export an SVG file into a bitmap of 600x400 pixels (aspect ratio distortion may occur):

```
inkscape {{path/to/file.svg}} {{[-o|--export-filename]}} {{path/to/file.png}} {{[-w|--export-width]}} 600 {{[-h|--export-height]}} 400
```

- Export the drawing (bounding box of all objects) of an SVG file into a bitmap:

```
inkscape {{path/to/file.svg}} {{[-o|--export-filename]}} {{path/to/file.png}} {{[-D|--export-area-drawing]}}
```

- Export a single object, given its ID, into a bitmap:

```
inkscape {{path/to/file.svg}} {{[-i|--export-id]}} {{id}} {{[-o|--export-filename]}} {{object.png}}
```

- Export an SVG document to PDF, converting all texts to paths:

```
inkscape {{path/to/file.svg}} {{[-o|--export-filename]}} {{path/to/file.pdf}} {{[-T|--export-text-to-path]}}
```

- Duplicate the object with id="path123", rotate the duplicate 90 degrees, save the file, and quit Inkscape:

```
inkscape {{path/to/file.svg}} --select=path123 --verb="{{EditDuplicate;ObjectRotate90;FileSave;FileQuit}}"
```

inkview

Inkscape graphical SVG previewer.

Also functions as a slideshow viewer.

More information: https://wiki.inkscape.org/wiki/index.php/Inkview.

- Preview an SVG:

```
inkview {{path/to/file.svg}}
```

- Preview multiple SVGs (use `<ArrowKeys>` to navigate):

```
inkview {{path/to/file1.svg path/to/file2.svg ...}}
```

Install-NodeVersion

Install Node.js runtime versions for **`ps-nvm`**.

This command is part of **`ps-nvm`** and can only be run under PowerShell.

More information: https://github.com/aaronpowell/ps-nvm.

- Install a specific Node.js version:

```
Install-NodeVersion {{node_version}}
```

- Install multiple Node.js versions:

```
Install-NodeVersion {{node_version1 , node_version2 , ...}}
```

- Install latest available version of Node.js 20:

```
Install-NodeVersion ^20
```

- Install the x86 (x86 32-bit) / x64 (x86 64-bit) / arm64 (ARM 64-bit) version of Node.js:

```
Install-NodeVersion {{node_version}} -Architecture {{x86|x64|arm64}}
```

- Use a HTTP proxy to download Node.js:

```
Install-NodeVersion {{node-version}} -Proxy {{http://example.com}}
```

install-tl

TeX Live cross-platform installer.

More information: https://tug.org/texlive/.

- Start the text-based installer (default on Unix systems):

```
install-tl -no-gui
```

- Start the GUI installer (default on macOS and Windows, requires Tcl/Tk):

```
install-tl -gui
```

- Install TeX Live as defined in a specific profile file:

```
install-tl -profile {{path/to/texlive.profile}}
```

- Start the installer with the settings from a specific profile file:

```
install-tl -init-from-file {{path/to/texlive.profile}}
```

- Start the installer for installation on a portable device, like a USB stick:

```
install-tl -portable
```

- Display help:

```
install-tl -help
```

install

Copy files and set attributes.

Typically used by Makefiles.

More information: https://www.gnu.org/software/coreutils/manual/html_node/install-invocation.html.

- Copy files to the destination:

```
install {{path/to/source_file1 path/to/source_file2 ...}} {{path/to/destination}}
```

- Copy files to the destination, setting their ownership:

```
install {{[-o|--owner]}} {{user}} {{path/to/source_file1 path/to/source_file2 ...}} {{path/to/destination}}
```

- Copy files to the destination, setting their group ownership:

```
install {{[-g|--group]}} {{user}} {{path/to/source_file1 path/to/source_file2 ...}} {{path/to/destination}}
```

- Copy files to the destination, setting their `mode`:

```
install {{[-m|--mode]}} {{+x}} {{path/to/source_file1 path/to/source_file2 ...}} {{path/to/destination}}
```

- Copy files and apply access/modification times of source to the destination:

```
install {{[-p|--preserve-timestamps]}} {{path/to/source_file1 path/to/source_file2 ...}} {{path/to/destination}}
```

- Copy files and create the directories at the destination if they don't exist:

```
install -D {{path/to/source_file1 path/to/source_file2 ...}} {{path/to/destination}}
```

interdiff

Show differences between two diff files.

More information: https://sourceforge.net/directory/software-development/.

- Compare diff files:

```
interdiff {{old_file}} {{new_file}}
```

- Compare diff files, ignoring whitespace:

```
interdiff {{[-w|--ignore-all-space]}} {{old_file}}
{{new_file}}
```

ionic

A framework to build hybrid mobile apps.

More information: https://ionicframework.com/docs/cli.

- Create a new project:

```
ionic start
```

- Start a local dev server for app dev/testing:

```
ionic serve
```

- Generate new app component, directive, page, pipe, provider, or tabs:

```
ionic g {{page}}
```

- Run app on an Android/iOS device:

```
ionic cordova run {{android|ios}} --device
```

- Check the health of an Ionic app:

```
ionic doctor {{check}}
```

- Display versions of Ionic, Cordova, environment, etc.:

```
ionic info
```

ioping

Monitor I/O latency in real time.

More information: https://github.com/koct9i/ioping.

- Show disk I/O latency using the default values and the current directory:

```
ioping .
```

- Measure latency on /tmp using 10 requests of 1 megabyte each:

```
ioping {{[-c|-count]}} 10 {{[-s|-size]}} 1M /tmp
```

- Measure disk seek rate on `/dev/sdX`:

```
ioping {{[-R|-rapid]}} {{/dev/sdX}}
```

- Measure disk sequential speed on `/dev/sdX`:

```
ioping {{[-RL|-rapid -linear]}} {{/dev/sdX}}
```

iotop

Display a table of current I/O usage by processes or threads.

More information: https://manned.org/iotop.

- Start top-like I/O monitor:

```
sudo iotop
```

- Show only processes or threads actually doing I/O:

```
sudo iotop {{[-o|--only]}}
```

- Show I/O usage in non-interactive mode:

```
sudo iotop {{[-b|--batch]}}
```

- Show only I/O usage of processes (default is to show all threads):

```
sudo iotop {{[-P|--processes]}}
```

- Show I/O usage of given PID(s):

```
sudo iotop {{[-p|--pid]}} {{PID}}
```

- Show I/O usage of a given user:

```
sudo iotop {{[-u|--user]}} {{user}}
```

- Show accumulated I/O instead of bandwidth:

```
sudo iotop {{[-a|--accumulated]}}
```

ipaggcreate

Produce aggregate statistics of TCP/IP dumps.

More information: https://manned.org/ipaggcreate.

- Count the number of packets sent from each source address appearing in a PCAP file:

```
ipaggcreate --src {{path/to/file.pcap}}
```

- Group and count packets read from a network interface by IP packet length:

```
ipaggcreate --interface {{eth0}} --length
```

- Count the number of bytes sent between each address pair appearing in a PCAP file:

```
ipaggcreate --address-pairs --bytes {{path/to/file.pcap}}
```

ipaggmanip

Manipulate aggregate statistics produced by **`ipaggcreate`**.

More information: https://manned.org/ipaggmanip.

- Combine labels equal in their high-order bits:

```
ipaggmanip {{[-p|--prefix]}} {{16}} {{path/to/file}}
```

- Remove labels with a count smaller than a given number of bytes and output a random sample of such labels:

```
ipaggmanip --cut-smaller {{100}} --cull-labels {{5}} {{path/to/file}}
```

- Replace each label's count with 1 if it is non-zero:

```
ipaggmanip {{[-P|--posterize]}} {{path/to/file}}
```

ipcalc

Calculate IP information (subnet, broadcast, host range) from an IP address and netmask.

More information: https://manned.org/ipcalc.

- Display network info for an IP address:

```
ipcalc {{192.168.0.1}}
```

- Display network info using CIDR notation:

```
ipcalc {{192.168.0.1}}/{{24}}
```

- Display network info using a dotted decimal netmask:

```
ipcalc {{192.168.0.1}} {{255.255.255.0}}
```

- Suppress bitwise output:

```
ipcalc {{[-b|--nobinary]}} {{192.168.0.1}}
```

- Split a network into specified sized blocks:

```
ipcalc {{[-s|--split]}} {{size1 size2 size3 ...}}
{{192.168.0.1}}
```

- Display version:

```
ipcalc {{[-v|--version]}}
```

ipcs

Show information about the usage of XSI IPC facilities: shared memory segments, message queues, and semaphore arrays.

More information: https://manned.org/ipcs.1p.

- Show information about [a]ll the IPC:

```
ipcs -a
```

- Show information about active shared [m]emory segments, message [q]ueues or [s]empahore sets:

```
ipcs {{-m|-q|-s}}
```

- Show information on maximum allowable size in [b]ytes:

```
ipcs -b
```

- Show [c]reator's user name and group name for all IPC facilities:

```
ipcs -c
```

- Show the [p]ID of the last operators for all IPC facilities:

```
ipcs -p
```

- Show access [t]imes for all IPC facilities:

```
ipcs -t
```

- Show [o]utstanding usage for active message queues, and shared memory segments:

```
ipcs -o
```

iperf

Measure network bandwidth between computers.

More information: https://iperf.fr/iperf-doc.php.

- Run on server:

```
iperf {{[-s|--server]}}
```

- Run on server using UDP mode and set server port to listen on 5001:

```
iperf {{[-u|--udp]}} {{[-s|--server]}} {{[-p|--port]}}
{{5001}}
```

- Run on client:

```
iperf {{[-c|--client]}} {{server_address}}
```

- Run on client every 2 seconds:

```
iperf {{[-c|--client]}} {{server_address}} {{[-i|--
interval]}} {{2}}
```

- Run on client with 5 parallel threads:

```
iperf {{[-c|--client]}} {{server_address}} {{[-P|--
parallel]}} {{5}}
```

- Run on client using UDP mode:

```
iperf {{[-u|--udp]}} {{[-c|--client]}} {{server_address}}
{{[-p|--port]}} {{5001}}
```

iperf3

Traffic generator for testing network bandwidth.

More information: https://iperf.fr/iperf-doc.php.

- Run iperf3 as a server:

```
iperf3 {{[-s|--server]}}
```

- Run an iperf3 server on a specific port:

```
iperf3 {{[-s|--server]}} {{[-p|--port]}} {{port}}
```

- Start bandwidth test:

```
iperf3 {{[-c|--client]}} {{server}}
```

- Run iperf3 in multiple parallel streams:

```
iperf3 {{[-c|--client]}} {{server}} {{[-P|--parallel]}}
{{streams}}
```

- Reverse direction of the test. Server sends data to the client:

```
iperf3 {{[-c|--client]}} {{server}} {{[-R|--reverse]}}
```

ipfs

Inter Planetary File System.

A peer-to-peer hypermedia protocol. Aims to make the web more open.

More information: https://docs.ipfs.tech/reference/kubo/cli/.

- Add a file from local to the filesystem, pin it, and print the relative hash:

  ```
  ipfs add {{path/to/file}}
  ```

- Add a directory and its files recursively from local to the filesystem and print the relative hash:

  ```
  ipfs add {{[-r|--recursive]}} {{path/to/directory}}
  ```

- Save a remote file and give it a name but not pin it:

  ```
  ipfs get {{hash}} {{[-o|--output]}} {{path/to/file}}
  ```

- Pin a remote file locally:

  ```
  ipfs pin add {{hash}}
  ```

- Display pinned files:

  ```
  ipfs pin ls
  ```

- Unpin a file from the local storage:

  ```
  ipfs pin rm {{hash}}
  ```

- Remove unpinned files from local storage:

  ```
  ipfs repo gc
  ```

ipinfo

Official CLI for the IPinfo.io IP geolocation and network intelligence API.

Note: Some commands will require a token from IPinfo.io.

More information: https://github.com/ipinfo/cli#quick-start.

- Display details for your current IP address:

```
ipinfo myip
```

- Display details for a specific IP address:

```
ipinfo {{ip_address}}
```

- Display details for multiple IP addresses in bulk from a file:

```
ipinfo bulk {{path/to/ips.txt}}
```

- Display details for a CIDR or IP range:

```
ipinfo bulk {{cidr_range}}
```

- Display only specific fields from IP lookup results:

```
ipinfo {{ip_address}} {{[-f|--field]}}
{{hostname,country,org}}
```

- Summarize details for a group of IP addresses:

```
ipinfo summarize {{path/to/ips.txt}}
```

- Extract IP addresses from text and highlight them:

```
ipinfo grepip {{path/to/file.txt}}
```

- Display help:

```
ipinfo {{[-h|--help]}}
```

ipmitool

Interface with the Intelligent Platform Management Interface (IPMI).

More information: https://manned.org/ipmitool.

- Open IPMI shell on the local hardware:

```
sudo ipmitool shell
```

- Open IPMI shell on a remote host:

```
ipmitool -H {{ip_address}} -U {{user_name}} shell
```

ippeveprinter

A simple IPP Everywhere printer server.

More information: https://openprinting.github.io/cups/doc/man-ippeveprinter.html.

- Run the server with a specific service name:

```
ippeveprinter "{{service_name}}"
```

- Load printer attributes from a PPD file:

```
ippeveprinter -P {{path/to/file.ppd}} "{{service_name}}"
```

- Run the `file` command whenever a job is sent to the server:

```
ippeveprinter -c {{/usr/bin/file}} "{{service_name}}"
```

- Specify the directory that will hold the print files (by default, a directory under the user's temporary directory):

```
ippeveprinter -d {{spool_directory}} "{{service_name}}"
```

- Keep the print documents in the spool directory rather than deleting them:

```
ippeveprinter -k "{{service_name}}"
```

- Specify the printer speed in pages/minute unit (10 by default):

```
ippeveprinter -s {{speed}} "{{service_name}}"
```

ippfind

Find services registered with a DNS server or available through local devices.

See also: **`ipptool`**, **`ippeveprinter`**.

More information: https://openprinting.github.io/cups/doc/man-ippfind.html.

- List IPP printers registered on the network with their status:

```
ippfind {{[-l|--ls]}}
```

- Send a specific PostScript document to every PostScript printer on the network:

```
ippfind --txt-pdl application/postscript {{[-x|--exec]}}
ipptool -f {{path/to/document.ps}} '{}' print-job.test \;
```

- Send a PostScript test document to every PostScript printer on the network:

```
ippfind --txt-pdl application/postscript {{[-x|--exec]}}
ipptool -f onepage-letter.ps '{}' print-job.test \;
```

- Send a PostScript test document to every PostScript printer on the network, whose name matches a `regex`:

```
ippfind --txt-pdl application/postscript {{[-h|--host]}}
{{regex}} {{[-x|--exec]}} ipptool -f onepage-letter.ps '{}'
print-job.test \;
```

ipptool

Issue IPP requests and receive printer's/server's responses.

See also: **`ippfind`**, **`ippeveprinter`**.

More information: https://openprinting.github.io/cups/doc/man-ipptool.html.

- Get all attributes and their values supported by a printer:

```
ipptool ipp://{{printer_uri}} get-completed-jobs.test
```

- Get the list of completed jobs of a printer:

```
ipptool ipp://{{printer_uri}} get-completed-jobs.test
```

- Send an email notification when a printer changes:

```
ipptool -d recipient=mailto:{{email}} ipp://{{printer_uri}}
create-printer-subscription.test
```

iproxy

A proxy that binds local TCP ports to be forwarded to the specified ports on a usbmux device.

More information: https://manned.org/iproxy.

- Bind a local TCP port and forward it to a port on the connected USB device:

```
iproxy {{local_port}}:{{device_port}}
```

- Bind multiple local TCP ports and forward them to the respective ports on the connected USB device:

```
iproxy {{local_port1}}:{{device_port1}} {{local_port2}}:
{{device_port2}}
```

- Bind a local port and forward it to a specific device by UDID:

```
iproxy --udid {{device_udid}} {{local_port}}:{{device_port}}
```

- Bind a local port and forward it to a network-connected device with Wi-Fi sync enabled:

```
iproxy --network {{local_port}}:{{device_port}}
```

ipscan

A fast network scanner designed to be simple to use.

Also known as Angry IP Scanner.

More information: https://www.aldeid.com/wiki/Angry-IPScan#CLI.

- Scan a specific IP address:

```
ipscan {{192.168.0.1}}
```

- Scan a range of IP addresses:

```
ipscan {{192.168.0.1-254}}
```

- Scan a range of IP addresses and save the results to a file:

```
ipscan {{192.168.0.1-254}} -o {{path/to/output.txt}}
```

- Scan IPs with a specific set of ports:

```
ipscan {{192.168.0.1-254}} -p {{80,443,22}}
```

- Scan with a delay between requests to avoid network congestion:

```
ipscan {{192.168.0.1-254}} -d {{200}}
```

- Display help:

```
ipscan --help
```

ipsumdump

Summarise TCP/IP dumps into a human and machine readable ASCII format.

More information: https://manned.org/ipsumdump.

- Print the source and destination IP addresses of all packets in a PCAP file:

```
ipsumdump --src --dst {{path/to/file.pcap}}
```

- Print the timestamps, source address, source port, destination address, destination port and protocol of all packets read from a given network interface:

```
ipsumdump --interface {{eth0}} -tsSdDp
```

- Print the anonymized source address, anonymized destination address, and IP packet length of all packets in a PCAP file:

```
ipsumdump --src --dst --length --anonymize {{path/to/
file.pcap}}
```

ipython

A Python shell with automatic history, dynamic object introspection, easier configuration, command completion, access to the system shell and more.

More information: https://ipython.readthedocs.io/en/stable/config/options/index.html.

- Start a REPL (interactive shell):

```
ipython
```

- Enter an interactive IPython session after running a Python script:

```
ipython -i {{script.py}}
```

- Create default IPython profile:

```
ipython profile create
```

- Print the path to the directory for the default IPython profile:

```
ipython locate profile
```

- Clear the IPython history database, deleting all entries:

```
ipython history clear
```

irb

Interactive Ruby shell.

Evaluate Ruby code read from **`stdin`**.

More information: https://ruby.github.io/irb/.

- Start the interactive shell:

```
irb
```

irssi

Text based IRC client.

More information: https://manned.org/irssi.

- Open Irssi and connect to a server with a nickname:

```
irssi {{[-n|--nick]}} {{nickname}} {{[-c|--connect]}} {{irc.example.com}}
```

- Open Irssi and connect with a specific server on a given port:

```
irssi {{[-c|--connect]}} {{irc.example.com}} {{[-p|--port]}} {{port}}
```

- [Interactive] Join a channel:

```
/join {{#channelname}}
```

- [Interactive] Change active window (starts at 1):

```
/win {{window_number}}
```

- [Interactive] Exit the application cleanly and quitting any server(s):

```
/quit
```

- Display help:

```
irssi {{[-?|--help]}}
```

is-up

Check whether a website is up or down.

More information: https://github.com/sindresorhus/is-up-cli.

- Check the status of the specified website:

```
is-up {{example.com}}
```

isisdl

A downloading utility for ISIS of TU-Berlin. Download all your files and videos from ISIS.

More information: https://github.com/Emily3403/isisdl.

- Start the synchronization process:

```
isisdl
```

- Limit the download rate to 20 MiB/s and download with 5 threads:

```
isisdl --download-rate {{20}} --max-num-threads {{5}}
```

- Run the initialization configuration wizard:

```
isisdl --init
```

- Run the additional configuration wizard:

```
isisdl --config
```

- Initiate a full synchronization of the database and compute the checksum of every file:

```
isisdl --sync
```

- Start ffmpeg to compress downloaded videos:

```
isisdl --compress
```

ispell

Interactive spell checking.

More information: https://www.cs.hmc.edu/~geoff/ispell-man.html.

- Start an interactive session:

```
ispell
```

- Check for typos in the specified file and interactively apply suggestions:

```
ispell {{path/to/file}}
```

- Display version:

```
ispell -v
```

isutf8

Check whether text files contain valid UTF-8.

More information: https://manned.org/isutf8.

- Check whether the specified files contain valid UTF-8:

```
isutf8 {{path/to/file1 path/to/file2 ...}}
```

- Print errors using multiple lines:

```
isutf8 {{[-v|--verbose]}} {{path/to/file1 path/to/file2 ...}}
```

- Do not print anything to `stdout`, indicate the result merely with the exit code:

```
isutf8 {{[-q|--quiet]}} {{path/to/file1 path/to/file2 ...}}
```

- Only print the names of the files containing invalid UTF-8:

```
isutf8 {{[-l|--list]}} {{path/to/file1 path/to/file2 ...}}
```

- Same as `--list` but inverted, i.e., only print the names of the files containing valid UTF-8:

```
isutf8 {{[-i|--invert]}} {{path/to/file1 path/to/file2 ...}}
```

iverilog

Preprocesses and compiles Verilog HDL (IEEE-1364) code into executable programs for simulation.

More information: https://manned.org/iverilog.

- Compile a source file into an executable:

```
iverilog {{path/to/source.v}} -o {{path/to/executable}}
```

- Compile a source file into an executable while displaying all warnings:

```
iverilog {{path/to/source.v}} -Wall -o {{path/to/executable}}
```

- Compile and run explicitly using the VVP runtime:

```
iverilog -o {{path/to/executable}} -tvvp {{path/to/source.v}}
```

- Compile using Verilog library files from a different path:

```
iverilog {{path/to/source.v}} -o {{path/to/executable}} -
I{{path/to/library_directory}}
```

- Preprocess Verilog code without compiling:

```
iverilog -E {{path/to/source.v}}
```

ivpn

Interface for the IVPN client.

See also: **`fastd`**, **`mozillavpn`**, **`mullvad`**, **`warp-cli`**.

More information: https://www.ivpn.net/knowledgebase/general/command-line-client-faq/.

- Print the current state of IVPN, including the connection and firewall status:

```
ivpn status
```

- List available servers to connect to:

```
ivpn servers
```

j

This command is an alias of **autojump**.

- View documentation for the original command:

```
tldr autojump
```

jadx

Dex to Java decompiler.

Produces Java source code from Android Dex and APK files.

More information: https://github.com/skylot/jadx#usage.

- Decompile a Dex file into a directory:

```
jadx {{path/to/file}}
```

- Decompile a Dex file into a specific directory:

```
jadx {{[-d|--output-dir]}} {{path/to/directory}} {{path/to/file}}
```

jar

Java applications/libraries packager.

More information: https://docs.oracle.com/javase/tutorial/deployment/jar/basicsindex.html.

- Recursively archive all files in the current directory into a `.jar` file:

```
jar cf {{file.jar}} *
```

- Unzip `.jar`/`.war` file to the current directory:

```
jar -xvf {{file.jar}}
```

- List a `.jar`/`.war` file content:

```
jar tf {{path/to/file.jar}}
```

- List a `.jar`/`.war` file content with verbose output:

```
jar tvf {{path/to/file.jar}}
```

jarsigner

Sign and verify Java archive (**`.jar`**) files.

More information: https://docs.oracle.com/en/java/javase/25/docs/specs/man/jarsigner.html.

- Sign a `.jar` file:

```
jarsigner {{path/to/file.jar}} {{keystore_alias}}
```

- Sign a `.jar` file with a specific algorithm:

```
jarsigner -sigalg {{algorithm}} {{path/to/file.jar}} {{keystore_alias}}
```

- Verify the signature of a `.jar` file:

```
jarsigner -verify {{path/to/file.jar}}
```

java

Java application launcher.

More information: https://docs.oracle.com/en/java/javase/25/docs/specs/man/java.html.

- Execute a Java `.class` file that contains a main method by using just the class name:

```
java {{classname}}
```

- Execute a Java program and use additional third-party or user-defined classes:

```
java -classpath {{path/to/classes1}}:{{path/to/classes2}}:.
{{classname}}
```

- Execute a `.jar` program:

```
java -jar {{filename.jar}}
```

- Execute a `.jar` program with debug waiting to connect on port 5005:

```
java -
agentlib:jdwp=transport=dt_socket,server=y,suspend=y,address=*:
5005 -jar {{filename.jar}}
```

- Display JDK, JRE, and HotSpot versions:

```
java -version
```

- Display help:

```
java -help
```

javac

Java application compiler.

More information: https://docs.oracle.com/en/java/javase/25/docs/specs/man/javac.html.

- Compile a `.java` file:

```
javac {{path/to/file.java}}
```

- Compile several `.java` files:

```
javac {{path/to/file1.java path/to/file2.java ...}}
```

- Compile all `.java` files in current directory:

```
javac {{*.java}}
```

- Compile a `.java` file and place the resulting class file in a specific directory:

```
javac -d {{path/to/directory}} {{path/to/file.java}}
```

javadoc

Generate Java API documentation in HTML format from source code.

More information: https://docs.oracle.com/en/java/javase/25/docs/specs/man/javadoc.html.

- Generate documentation for Java source code and save the result in a directory:

```
javadoc -d {{path/to/directory}}/ {{path/to/java_source_code}}
```

- Generate documentation with a specific encoding:

```
javadoc -docencoding {{UTF-8}} {{path/to/java_source_code}}
```

- Generate documentation excluding some packages:

```
javadoc -exclude {{package_list}} {{path/to/java_source_code}}
```

javap

Disassemble class files and list them.

More information: https://docs.oracle.com/en/java/javase/25/docs/specs/man/javap.html.

- Disassemble and list one or more `.class` files:

```
javap {{path/to/file1.class path/to/file2.class ...}}
```

- Disassemble and list a built-in class file:

```
javap java.{{package}}.{{class}}
```

- Display help:

```
javap -help
```

- Display version:

```
javap -version
```

jbang

Easily create, edit, and run self-contained source-only Java programs.

See also: **`java`**.

More information: https://www.jbang.dev/documentation/jbang/latest/cli/jbang.html.

- Initialize a simple Java class:

```
jbang init {{path/to/file.java}}
```

- Initialize a Java class (useful for scripting):

```
jbang init --template={{cli}} {{path/to/file.java}}
```

- Use `jshell` to explore and use a script and any dependencies in a REPL editor:

```
jbang run --interactive
```

- Setup a temporary project to edit a script in an IDE:

```
jbang edit --open={{codium|code|eclipse|idea|netbeans|gitpod}} {{path/to/script.java}}
```

- Run a Java code snippet (Java 9 and later):

```
{{echo 'Files.list(Paths.get("/etc")).forEach(System.out::println);'}} | jbang -
```

- Run command-line application:

```
jbang {{path/to/file.java}} {{command}} {{arg1 arg2 ...}}
```

- Install a script on the user's `$PATH`:

```
jbang app install --name {{command_name}} {{path/to/script.java}}
```

- Install a specific version of JDK to be used with `jbang`:

```
jbang jdk install {{version}}
```

jc

Convert the output of multiple commands to JSON.

More information: https://github.com/kellyjonbrazil/jc#usage.

- Convert command output to JSON via pipe:

```
{{ifconfig}} | jc {{--ifconfig}}
```

- Convert command output to JSON via magic syntax:

```
jc {{ifconfig}}
```

- Output pretty JSON via pipe:

```
{{ifconfig}} | jc {{--ifconfig}} {{[-p|--pretty]}}
```

- Output pretty JSON via magic syntax:

```
jc {{[-p|--pretty]}} {{ifconfig}}
```

jc

jc can refer to multiple commands with the same name.

- View documentation for the JSON serializer:

  `tldr jc.json`

- View documentation for the autojump alias:

  `tldr autojump`

jcal

Display calendar information in the Jalali format, with the current day highlighted.

More information: https://www.nongnu.org/jcal/jcal.html.

- Display a calendar for the current month:

```
jcal
```

- Display the previous, current, and next months:

```
jcal -3
```

- Display a calendar for a specific year (4 digits):

```
jcal {{year}}
```

- Display a calendar for a specific month and year:

```
jcal {{year}} {{month}}
```

jco

This command is an alias of **autojump**.

- View documentation for the original command:

```
tldr autojump
```

jdeps

Java class dependency analyzer.

More information: https://docs.oracle.com/en/java/javase/25/docs/specs/man/jdeps.html.

- Analyze the dependencies of a `.jar` or `.class` file:

```
jdeps {{path/to/file.class}}
```

- Print a summary of all dependencies of a specific `.jar` file:

```
jdeps {{path/to/file.jar}} -summary
```

- Print all class-level dependencies of a `.jar` file:

```
jdeps {{path/to/file.jar}} -verbose
```

- Output the results of the analysis in a DOT file into a specific directory:

```
jdeps {{path/to/file.jar}} -dotoutput {{path/to/directory}}
```

- Display help:

```
jdeps --help
```

jdupes

A powerful duplicate file finder and an enhanced fork of **fdupes**.

More information: https://codeberg.org/jbruchon/jdupes#usage.

- Search a single directory:

```
jdupes {{path/to/directory}}
```

- Search multiple directories:

```
jdupes {{directory1 directory2 ...}}
```

- Search all directories recursively:

```
jdupes {{[-r|--recurse]}} {{path/to/directory}}
```

- Search directory recursively and let user choose files to preserve:

```
jdupes {{[-d|--delete]}} {{[-r|--recurse]}} {{path/to/
directory}}
```

- Search multiple directories and follow subdirectores under directory2, not directory1:

```
jdupes {{directory1}} {{[-R|--recurse:]}} {{directory2}}
```

- Search multiple directories and keep the directory order in result:

```
jdupes {{[-O|--param-order]}} {{directory1 directory2
directory3 ...}}
```

jekyll

A simple, blog-aware, static site generator.

More information: https://jekyllrb.com/docs/usage/.

- Generate a development server that will run at http://localhost:4000/:

```
jekyll serve
```

- Enable incremental regeneration:

```
jekyll serve --incremental
```

- Enable verbose output:

```
jekyll serve --verbose
```

- Generate the current directory into `./_site`:

```
jekyll build
```

- Clean the site (removes site output and `cache` directory) without building:

```
jekyll clean
```

jello

A JSON processor using Python syntax.

More information: https://github.com/kellyjonbrazil/jello#usage.

- Pretty-print JSON or JSON-Lines data from `stdin` to `stdout`:

```
cat {{file.json}} | jello
```

- Output a schema of JSON or JSON Lines data from `stdin` to `stdout` (useful for grep):

```
cat {{file.json}} | jello -s
```

- Output all elements from arrays (or all the values from objects) in JSON or JSON-Lines data from `stdin` to `stdout`:

```
cat {{file.json}} | jello -l
```

- Output the first element in JSON or JSON-Lines data from `stdin` to `stdout`:

```
cat {{file.json}} | jello _[0]
```

- Output the value of a given key of each element in JSON or JSON-Lines data from `stdin` to `stdout`:

```
cat {{file.json}} | jello '[i.{{key_name}} for i in _]'
```

- Output the value of multiple keys as a new JSON object (assuming the input JSON has the keys `key_name1` and `key_name2`):

```
cat {{file.json}} | jello '{{{"key1": _.key_name1, "key2":
_.key_name2, ...}}}'
```

- Output the value of a given key to a string (and disable JSON output):

```
cat {{file.json}} | jello -r '"{{some text}}: " + _.
{{key_name}}'
```

jenkins-cli

An open-source automation server that facilitates the automation of software development lifecycle.

More information: https://www.jenkins.io/doc/.

- Connect to jenkins CLI:

```
java -jar jenkins-cli.jar -s {{jenkins_server_url}} -auth {{username}}:{{api_token}}
```

- Restart jenkins:

```
java -jar jenkins-cli.jar -s {{jenkins_server_url}} restart
```

- Shutdown jenkins:

```
java -jar jenkins-cli.jar -s {{jenkins_server_url}} shutdown
```

- Display help:

```
java -jar jenkins-cli.jar -s {{jenkins_server_url}} help
```

- Display version:

```
java -jar jenkins-cli.jar -s {{jenkins_server_url}} version
```

jenv

Manage the **`$JAVA_HOME`** environment variable.

More information: https://github.com/jenv/jenv.

- Add a Java version to jEnv:

```
jenv add {{path/to/jdk_home}}
```

- Display the current JDK version used:

```
jenv version
```

- Display all managed JDKs:

```
jenv versions
```

- Set the global JDK version:

```
jenv global {{java_version}}
```

- Set the JDK version for the current shell session:

```
jenv shell {{java_version}}
```

- Enable a jEnv plugin:

```
jenv enable-plugin {{plugin_name}}
```

jest

A zero-configuration JavaScript testing platform.

More information: https://jestjs.io/docs/cli.

- Run all available tests:

```
jest
```

- Run the test suites from the given files:

```
jest {{path/to/file1 path/to/file2 ...}}
```

- Run the test suites from files within the current and subdirectories, whose paths match the given `regex`:

```
jest {{regex1 regex2 ...}}
```

- Run the tests whose names match the given `regex`:

```
jest --testNamePattern {{regex}}
```

- Run test suites related to a given source file:

```
jest --findRelatedTests {{path/to/source_file.js}}
```

- Run test suites related to all uncommitted files:

```
jest --onlyChanged
```

- Watch files for changes and automatically re-run related tests:

```
jest --watch
```

- Display help:

```
jest --help
```

jetifier

Jetifier AndroidX transition tool in npm format, with a react-native compatible style.

More information: https://github.com/mikehardy/jetifier.

- Migrate project dependencies to the AndroidX format:

  ```
  jetifier
  ```

- Migrate project dependencies from the AndroidX format:

  ```
  jetifier reverse
  ```

jf

Interact with JFrog products like Artifactory, Xray, Distribution, Pipelines, and Mission Control.

More information: https://jfrog.com/help/r/jfrog-applications-and-cli-documentation/jfrog-cli.

- Add a new configuration:

```
jf config add
```

- Show the current configuration:

```
jf config show
```

- Search for artifacts within the given repository and directory:

```
jf rt search --recursive {{repostiory_name}}/{{path}}/
```

jfrog

This command is an alias of **`jf`**.

- View documentation for the original command:

```
tldr jf
```

jhat

Java heap analysis tool.

More information: https://docs.oracle.com/javase/8/docs/technotes/tools/unix/jhat.html.

- Analyze a heap dump (from `jmap`), view via HTTP on port 7000:

```
jhat {{dump_file.bin}}
```

- Analyze a heap dump, specifying an alternate port for the HTTP server:

```
jhat {{[-p|-port]}} {{port}} {{dump_file.bin}}
```

- Analyze a dump letting `jhat` use up to 8 GB RAM (2-4x dump size recommended):

```
jhat -J-mx8G {{dump_file.bin}}
```

jhipster

Web application generator using either monolithic or microservices architecture.

More information: https://www.jhipster.tech/creating-an-app/#command-line-options.

- Generate a simple full-stack project (monolithic or microservices):

```
jhipster
```

- Generate a simple frontend project:

```
jhipster --skip-server
```

- Generate a simple backend project:

```
jhipster --skip-client
```

- Apply latest JHipster updates to the project:

```
jhipster upgrade
```

- Add a new entity to a generated project:

```
jhipster entity {{entity_name}}
```

- Import a JDL file to configure your application (see: https://start.jhipster.tech/jdl-studio/):

```
jhipster import-jdl {{file1.jh file2.jh ...}}
```

- Generate a CI/CD pipeline for your application:

```
jhipster ci-cd
```

- Generate a Kubernetes configuration for your application:

```
jhipster kubernetes
```

jhsdb

Attach to a Java process or launch a postmortem debugger to analyze the core dump from a crashed Java Virtual Machine.

More information: https://manned.org/jhsdb.

- Print stack and locks information of a Java process:

```
jhsdb jstack --pid {{pid}}
```

- Open a core dump in interactive debug mode:

```
jhsdb clhsdb --core {{path/to/core_dump}} --exe {{path/to/jdk_or_bin_or_java}}
```

- Start a remote debug server:

```
jhsdb debugd --pid {{pid}} --serverid {{optional_unique_id}}
```

- Connect to a process in interactive debug mode:

```
jhsdb clhsdb --pid {{pid}}
```

jigsaw

A Laravel-based static site builder for PHP.

More information: https://jigsaw.tighten.co/.

- Initialize a project:

  ```
  jigsaw init
  ```

- Initialize a project using a starter template:

  ```
  jigsaw init {{template_name}}
  ```

- Build the site for development:

  ```
  jigsaw build
  ```

- Preview the site from the "build_local" directory:

  ```
  jigsaw serve
  ```

- Build the site for production:

  ```
  jigsaw build production
  ```

- Preview the site from the "build_production" directory:

  ```
  jigsaw serve {{build_production}}
  ```

jira browse

This command is an alias of **`jira open`**.

- View documentation for the original command:

```
tldr jira open
```

jira issue

Manage issues in a Jira project.

More information: https://github.com/ankitpokhrel/jira-cli#issue.

- List recent issues:

```
jira issue {{[ls|list]}}
```

- List issues assigned to a specific user:

```
jira issue {{[ls|list]}} {{[-a|--assignee]}}
"{{email_or_display_name}}"
```

- List high priority issues assigned to me:

```
jira issue {{[ls|list]}} {{[-a|--assignee]}} $(jira me) {{[-
y|--priority]}} High
```

- Create an issue using an interactive prompt:

```
jira issue create
```

- Edit an issue using an interactive prompt:

```
jira issue edit
```

- Assign user to an issue using an interactive prompt:

```
jira issue {{[asg|assign]}}
```

- Move an issue to a certain state:

```
jira issue {{[mv|move]}} {{issue_id}} "{{In Progress}}"
```

- Open an issue in the terminal using `less`:

```
jira issue view {{issue_id}}
```

jira issues

This command is an alias of **`jira issue`**.

- View documentation for the original command:

```
tldr jira issue
```

jira me

Display the configured **`jira`** user.

More information: https://github.com/ankitpokhrel/jira-cli#commands.

- Display the configured `jira` user:

```
jira me
```

- List issues assigned to me:

```
jira issue {{[ls|list]}} {{[-a|--assignee]}} $(jira me)
```

- List issues from the current sprint, assigned to me:

```
jira sprint {{[ls|list]}} --current {{[-a|--assignee]}} $
(jira me)
```

- Display help:

```
jira me {{[-h|--help]}}
```

jira navigate

This command is an alias of **`jira open`**.

- View documentation for the original command:

```
tldr jira open
```

jira open

Open a Jira issue or project in the browser.

More information: https://github.com/ankitpokhrel/jira-cli#other-commands.

- Open the Jira project in the browser and print the URL:

```
jira open
```

- Open a specific issue in the browser and print the URL:

```
jira open {{issue_id}}
```

- Print the URL without opening in the browser:

```
jira open {{issue_id}} {{[-n|--no-browser]}}
```

- Display help:

```
jira open {{[-h|--help]}}
```

jira project

Manage Jira projects.

More information: https://github.com/ankitpokhrel/jira-cli#other-commands.

- List all projects:

```
jira project {{[ls|list]}}
```

- Display help:

```
jira project {{[-h|--help]}}
```

jira projects

This command is an alias of **`jira project`**.

- View documentation for the original command:

```
tldr jira project
```

jira sprint

Manage sprints in a Jira project board.

More information: https://github.com/ankitpokhrel/jira-cli#sprint.

- List sprints and their issues in an explorer view:

```
jira sprint {{[ls|list]}}
```

- List issues from the current sprint:

```
jira sprint {{[ls|list]}} --current
```

- List issues from the current sprint, assigned to me:

```
jira sprint {{[ls|list]}} --current {{[-a|--assignee]}} $
(jira me)
```

- List high priority issues from the current sprint assigned to me:

```
jira sprint {{[ls|list]}} --current {{[-a|--assignee]}} $
(jira me) {{[-y|--priority]}} High
```

- Add issues to a sprint using an interactive prompt:

```
jira sprint add
```

jira sprints

This command is an alias of **`jira sprint`**.

- View documentation for the original command:

```
tldr jira sprint
```

jira

Interface (third party) for interacting with Jira.

Note: Obtaining a Jira API token and exporting it to the shell as a **`$JIRA_API_TOKEN`** variable is required.

More information: https://github.com/ankitpokhrel/jira-cli#commands.

- Create a configuration file (required before using `jira`):

```
jira init
```

- List recent issues:

```
jira issue {{[ls|list]}}
```

- List unassigned issues with high priority:

```
jira issue {{[ls|list]}} {{[-a|--assignee]}} x {{[-y|--priority]}} High
```

- List issues from the current sprint, assigned to me:

```
jira sprint {{[ls|list]}} --current {{[-a|--assignee]}} $(jira me)
```

- Create a new issue with a parent issue:

```
jira issue create {{[-P|--parent]}} {{parent}}
```

- Open an issue in the browser:

```
jira open {{123}}
```

jj abandon

Abandon a revision, rebasing descendants onto its parent(s).

Abandoning a revision removes its associated change ID.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-abandon.

- Abandon revisions specified by given revsets (e.g. `B::D`, `A..D`, `B|C|D`, etc.):

  ```
  jj abandon {{revsets}}
  ```

- Abandon revisions, without deleting their bookmarks and moving them to the parent revisions instead:

  ```
  jj abandon --retain-bookmarks {{revsets}}
  ```

- Abandon revisions, without modifying the contents of their children:

  ```
  jj abandon --restore-descendants {{revsets}}
  ```

jj absorb

Split changes in the source revision and move each change to the closest mutable ancestor where the corresponding lines were modified last.

Changes that have zero or multiple matching regions in ancestral revisions won't be moved.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-absorb.

- Move all eligible and unambiguous changes from a revision to other revisions automatically:

```
jj absorb {{[-f|--from]}} {{revset}} {{[-t|--into]}} {{revsets}}
```

- Move only changes in given files from a revision to other revisions:

```
jj absorb {{[-f|--from]}} {{revset}} {{[-t|--into]}} {{revsets}} {{filesets}}
```

jj bookmark

Manage bookmarks in a **`jj`** repository.

When using a Git backend, bookmarks correspond to Git branches.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-bookmark.

- Create a new bookmark at the given revision:

```
jj {{[b|bookmark]}} {{[c|create]}} {{[-r|--revision]}} {{revision}} {{name}}
```

- List all existing bookmarks and their targets:

```
jj {{[b|bookmark]}} {{[l|list]}}
```

- Move an existing bookmark to another revision:

```
jj {{[b|bookmark]}} {{[m|move]}} {{[-t|--to]}} {{revision}} {{name}}
```

- Track given remote bookmarks:

```
jj {{[b|bookmark]}} {{[t|track]}} {{name}}@{{remote}}
```

- Delete a bookmark, and propagate the deletion to remotes on the next push:

```
jj {{[b|bookmark]}} {{[d|delete]}} {{name}}
```

- Forget a bookmark locally, without marking its deletion to be pushed:

```
jj {{[b|bookmark]}} {{[f|forget]}} {{name}}
```

jj commit

Update the description and create a new change on top.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-commit.

- Open editor to write the commit message and then create a new empty commit on top:

  ```
  jj commit
  ```

- Commit with the given message:

  ```
  jj commit {{[-m|--message]}} "{{message}}"
  ```

- Interactively choose which changes to include:

  ```
  jj commit {{[-i|--interactive]}}
  ```

jj describe

Update the change description or other metadata.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-describe.

- Update the description of the current change:

```
jj {{[desc|describe]}}
```

- Update the description of given revsets:

```
jj {{[desc|describe]}} {{revsets}}
```

- Update the description to the given message:

```
jj {{[desc|describe]}} {{[-m|--message]}} {{message}}
```

jj diff

Compare file contents between two revisions.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-diff.

- Show changes of current revision:

```
jj diff
```

- Show changes of given revsets (e.g. `B::D`, `A..D`, `B|C|D`, etc.):

```
jj diff {{[-r|--revisions]}} {{revsets}}
```

- Show changes from given revision to given revision:

```
jj diff {{[-f|--from]}} {{from_revset}} {{[-t|--to]}}
{{to_revset}}
```

- Show diff statistics:

```
jj diff --stat
```

- Show a Git-format diff:

```
jj diff --git
```

jj diffedit

Touch up the content changes in a revision with a diff editor.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-diffedit.

- Edit changes in the current revision with a diff editor:

```
jj diffedit
```

- Edit changes in a given revision:

```
jj diffedit {{[-r|--revision]}} {{revset}}
```

- Edit changes comparing a "from" revision to a "to" revision:

```
jj diffedit {{[-f|--from]}} {{from_revset}} {{[-t|--to]}} {{to_revset}}
```

- Edit only specific paths (unmatched paths remain unchanged):

```
jj diffedit {{filesets}}
```

- Use a specific diff editor:

```
jj diffedit --tool {{name}}
```

- Preserve content instead of diff when rebasing descendants:

```
jj diffedit --restore-descendants
```

jj duplicate

Create new changes with the same content as existing ones.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-duplicate.

- Duplicate the current revision onto its existing parent:

```
jj duplicate
```

- Duplicate a specific revision onto its existing parent:

```
jj duplicate {{revset}}
```

- Duplicate a revision onto a different parent:

```
jj duplicate --destination {{dest_revset}} {{revset}}
```

- Duplicate a revision and insert it after other revision(s):

```
jj duplicate --insert-after {{after_revset}} {{revset}}
```

- Duplicate a revision and insert it before other revision(s):

```
jj duplicate --insert-before {{before_revset}} {{revset}}
```

- Duplicate onto multiple parents (creates a merge commit):

```
jj duplicate --destination {{destination1}} --destination
{{destination2}} {{revset}}
```

- Duplicate multiple revisions:

```
jj duplicate {{revset1 revset2 ...}}
```

jj edit

Set the specified revision as the working-copy revision.

Note: It is generally recommended to instead use **`jj new`** and **`jj squash`**.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-edit.

- Set the given revision as the working copy:

  ```
  jj edit {{revset}}
  ```

jj evolog

Show how a change has evolved over time, listing the previous commits it has pointed to.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-evolog.

- Show how a revision has evolved over time:

```
jj evolog {{[-r|--revisions]}} {{revsets}}
```

- Show diff statistics in the evolution log:

```
jj evolog {{[-r|--revisions]}} {{revsets}} --stat
```

- Show summary of each change in the evolution log:

```
jj evolog {{[-r|--revisions]}} {{revsets}} {{[-s|--summary]}}
```

jj git clone

Create a new repo backed by a clone of a Git repo.

Note: Unless **`--colocate`** is used, it is not a valid Git repository and **`git`** commands can't be used on it.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-git-clone.

- Create a new repo backed by a clone of a Git repo into a new directory (the default directory is the repository name):

```
jj git clone {{source}} {{path/to/directory}}
```

- Create a clone and use the given name for newly created remote:

```
jj git clone --remote {{remote_name}} {{source}}
```

- Clone a Git repo, only fetching the 10 most recent commits:

```
jj git clone --depth {{10}} {{source}}
```

- Clone colocating the Jujutsu repo with the Git repo (allowing the use of both `jj` and `git` commands in the same directory):

```
jj git clone --colocate {{source}}
```

jj git fetch

Fetch from a Git remote, downloading objects and refs from the remote repository.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-git-fetch.

- Fetch the latest changes from the default remote repository:

```
jj git fetch
```

- Fetch the latest changes from a given remote repository:

```
jj git fetch --remote {{remote}}
```

- Fetch the latest changes only from given branches:

```
jj git fetch {{[-b|--branch]}} {{branch}}
```

- Fetch the latest changes from all remotes:

```
jj git fetch --all-remote
```

jj git init

Create a new Git backed Jujutsu repo.

Note: Unless **`--colocate`** is used, it is not a valid Git repository and **`git`** commands can't be used on it.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-git-init.

- Create a new Git backed repo in the current directory:

```
jj git init
```

- Create a new Git backed repo in the given directory:

```
jj git init {{path/to/directory}}
```

- Initialize the Jujutsu repository as a valid Git repository (allowing the use of both `jj` and `git` commands in the same directory):

```
jj git init --colocate
```

- Initialize the Jujutsu repository backed by an existing Git repository:

```
jj git init --git-repo {{git_repo}}
```

jj git push

Push to a Git remote.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-git-push.

- Push a bookmark to the given remote (defaults to `git.push` setting):

```
jj git push {{[-b|--bookmark]}} {{bookmark}} --remote {{remote}}
```

- Push a new bookmark:

```
jj git push {{[-b|--bookmark]}} {{bookmark}} {{[-N|--allow-new]}}
```

- Push all tracked bookmarks:

```
jj git push --tracked
```

- Push all bookmarks (including new bookmarks):

```
jj git push --all
```

- Push all bookmarks pointing to given revisions:

```
jj git push {{[-r|--revisions]}} {{revset}}
```

- Push changes/commits by creating new bookmarks (Name format is as per `templates.git_push_bookmark` setting, defaults to `"push-" ++ change_id.short()`):

```
jj git push {{[-c|--change]}} {{revset}}
```

- Push a revision with the given name:

```
jj git push --named {{name}}={{revision}}
```

jj git remote

Manage Git remotes.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-git-remote.

- List all Git remotes:

```
jj git remote list
```

- Add a Git remote:

```
jj git remote add {{remote}} {{url}}
```

- Change the URL of a Git remote:

```
jj git remote set-url {{remote}} {{url}}
```

- Remove a Git remote:

```
jj git remote remove {{remote}}
```

- Rename a Git remote:

```
jj git remote rename {{old_name}} {{new_name}}
```

jj git

Run Git-related commands for a **`jj`** repository.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-git.

- Create a new Git backed repository:

```
jj git init
```

- Create a new repository backed by a clone of a Git repository:

```
jj git clone {{source}}
```

- Fetch from a Git remote:

```
jj git fetch
```

- Push all tracked bookmarks to Git remote:

```
jj git push
```

- Push given bookmark to Git remote:

```
jj git push {{[-b|--bookmark]}} {{bookmark}}
```

jj interdiff

Compare changes of two revisions.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-interdiff.

- Compare changes from a revision to the working copy:

```
jj interdiff {{[-f|--from]}} {{revset}}
```

- Compare changes from a revision to another revision:

```
jj interdiff {{[-f|--from]}} {{from_revset}} {{[-t|--to]}} {{to_revset}}
```

- Compare changes in specific paths only:

```
jj interdiff {{[-f|--from]}} {{from_revset}} {{[-t|--to]}} {{to_revset}} {{filesets}}
```

- Show a summary of changes:

```
jj interdiff {{[-f|--from]}} {{revset}} {{[-s|--summary]}}
```

- Show diff statistics:

```
jj interdiff {{[-f|--from]}} {{revset}} --stat
```

- Show a Git-format diff:

```
jj interdiff {{[-f|--from]}} {{revset}} --git
```

- Show a word-level diff with changes indicated only by color:

```
jj interdiff {{[-f|--from]}} {{revset}} --color-words
```

jj log

Show revision history as a graph.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-log.

- Show revision history as a graph:

```
jj log
```

- Show only given revsets (e.g. `B::D`, `A..D`, `B|C|D`, etc.):

```
jj log {{[-r|--revisions]}} {{revsets}}
```

- Show log with a particular template for each line (e.g. 5 characters of commit hash and author):

```
jj log {{[-T|--template]}} 'commit_id.shortest(5) ++ " " ++ author'
```

jj new

Create a new empty change.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-new.

- Create a new empty change on top of current revision:

```
jj new
```

- Create a new empty change on top of specific revision:

```
jj new {{revision}}
```

- Create a new merge change on top of multiple revisions:

```
jj new {{revset1 revset2 ...}}
```

- Create a new empty change before and after specified revisions:

```
jj new {{[-B|--insert-before]}} {{revsets}} {{[-A|--insert-after]}} {{revsets}}
```

jj next

Move the working-copy commit to a child revision.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-next.

- Move the working-copy commit to the next child revision:

```
jj next
```

- Move the working-copy commit a number of revisions forward:

```
jj next {{offset}}
```

- Edit the child revision directly, instead of creating a new working-copy commit:

```
jj next {{[-e|--edit]}}
```

- Create a new working-copy commit instead of editing the child revision directly:

```
jj next {{[-n|--no-edit]}}
```

- Jump to the next conflicted child:

```
jj next --conflict
```

jj operation

Work with the operation log of a **`jj`** repository.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-operation.

- Show operation log:

```
jj {{[op|operation]}} log
```

- Undo the last operation:

```
jj {{[op|operation]}} undo
```

- Undo a given operation:

```
jj {{[op|operation]}} undo {{operation}}
```

- Restore the repository to its state at a given operation:

```
jj {{[op|operation]}} restore {{operation}}
```

- Show changes to the repository in an operation:

```
jj {{[op|operation]}} show {{operation}}
```

- Show stat, summary, and patch of modifications of an operation:

```
jj {{[op|operation]}} show {{--stat}} {{[-s|--summary]}} {{[-p|--patch]}} {{operation}}
```

jj parallelize

Parallelize revisions by making them siblings.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-parallelize.

- Parallelize given revisions:

```
jj parallelize {{revsets}}
```

jj prev

Move the working-copy commit to a parent revision.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-prev.

- Move the working-copy commit to the previous parent revision:

```
jj prev
```

- Move the working-copy commit a number of revisions backward:

```
jj prev {{offset}}
```

- Edit the parent revision directly, instead of creating a new working-copy commit:

```
jj prev {{[-e|--edit]}}
```

- Create a new working-copy commit instead of editing the parent revision directly:

```
jj prev {{[-n|--no-edit]}}
```

- Jump to the previous conflicted parent:

```
jj prev --conflict
```

jj rebase

Move revisions to different parent(s).

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-rebase.

- Move given revisions to a different parent(s):

```
jj rebase {{[-r|--revisions]}} {{revset}} {{[-d|--
destination]}} {{revset}}
```

- Move given revisions and all their descendants:

```
jj rebase {{[-s|--source]}} {{revset}} {{[-d|--destination]}}
{{revset}}
```

- Move all revisions in the branch containing given revisions:

```
jj rebase {{[-b|--branch]}} {{revset}} {{[-d|--destination]}}
{{revset}}
```

- Move revisions to before and/or after other revisions:

```
jj rebase {{[-r|--revisions]}} {{revset}} {{[-B|--insert-
before]}} {{revset}} {{[-A|--insert-after]}} {{revset}}
```

jj resolve

Resolve conflicted files with an external merge tool.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-resolve.

- Resolve all conflicts:

```
jj resolve
```

- List all conflicts:

```
jj resolve {{[-l|--list]}}
```

- Resolve conflicts in a given revision:

```
jj resolve {{[-r|--revision]}} {{revset}}
```

- Resolve conflicts in given files:

```
jj resolve {{file1 file2 ...}}
```

- Resolve accepting the incoming versions:

```
jj resolve --tool :theirs
```

- Resolve accepting the outgoing versions:

```
jj resolve --tool :ours
```

jj restore

Restore files from another revision.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-restore.

- Restore files from a revision into another revision:

```
jj restore {{[-f|--from]}} {{revset}} {{[-t|--into]}} {{revset}} {{filesets}}
```

- Undo the changes in a revision as compared to the merge of its parents:

```
jj restore {{[-c|--changes-in]}} {{revset}} {{filesets}}
```

- Interactively choose what parts to restore:

```
jj restore {{[-f|--from]}} {{revset}} {{[-t|--into]}} {{revset}} {{[-i|--interactive]}}
```

jj revert

Apply the reverse of the given revision(s).

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-revert.

- Apply the reverse of the revisions specified by the given revsets (e.g. `B::D`, `A..D`, `B|C|D`, etc.):

```
jj revert {{[-r|--revisions]}} {{revsets}}
```

- Apply the reverse on top of specified revisions:

```
jj revert {{[-r|--revisions]}} {{revsets}} {{[-d|--
destination]}} {{revsets}}
```

- Apply the reverse before and/or after specified revisions:

```
jj revert {{[-r|--revisions]}} {{revsets}} {{[-B|--insert-
before]}} {{revsets}} {{[-A|--insert-after]}} {{revsets}}
```

jj show

Show commit description and changes in a revision.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-show.

- Show commit description and changes in a revision:

```
jj show {{revset}}
```

- Show a summary of changes in a revision:

```
jj show {{[-s|--summary]}} {{revset}}
```

- Show a histogram of changes in a revision:

```
jj show --stat {{revset}}
```

jj simplify-parents

Simplify parent edges for the specified revision(s).

For example, "A -> B -> C | A -> C" gets simplified to "A -> B -> C".

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-simplify-parents.

- Simplify parent edges of given revisions:

```
jj simplify-parents {{[-r|--revisions]}} {{revsets}}
```

- Simplify parent edges of given revisions and trees of their descendants:

```
jj simplify-parents {{[-s|--source]}} {{revsets}}
```

jj split

Split a revision in two.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-split.

- Split the given revision into two interactively, putting the second revision on top of it:

```
jj split {{[-r|--revision]}} {{revision}}
```

- Split out matching files from the given revision:

```
jj split {{[-r|--revision]}} {{revision}} {{fileset}}
```

- Split the given revision, putting the second revision on top of given destination(s):

```
jj split {{[-r|--revision]}} {{revision}} {{[-d|--destination]}} {{revset}}
```

- Split the given revision, putting the second revision before and/or after other revision(s):

```
jj split {{[-r|--revision]}} {{revision}} {{[-B|--insert-before]}} {{revset}} {{[-A|--insert-after]}} {{revset}}
```

- Split the given revision into two parallel revisions:

```
jj split {{[-r|--revision]}} {{revision}} {{[-p|--parallel]}}
```

jj squash

Move changes from a revision into another revision.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-squash.

- Move all changes from current revision to its parent:

```
jj squash
```

- Move all changes from given revision to its parent:

```
jj squash {{[-r|--revision]}} {{revset}}
```

- Move all changes from given revision(s) to given other revision:

```
jj squash {{[-f|--from]}} {{revsets}} {{[-t|--into]}}
{{revset}}
```

- Interactively choose which parts to squash:

```
jj squash {{[-i|--interactive]}}
```

jj status

Show high-level repository status.

This includes the working copy commit and its parents, and a summary of the changes in the working copy and any existing conflicts in the working copy.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-status.

- Show high-level status of the repository:

```
jj {{[st|status]}}
```

jj undo

Undo the most recent recorded operation in a `jj` repository.

More information: https://jj-vcs.github.io/jj/latest/cli-reference/#jj-undo.

- Undo the last operation:

```
jj undo
```

jj

Jujutsu, a version control system.

Some subcommands such as **`log`**, **`desc`**, **`new`**, **`git`**, etc. have their own usage documentation.

More information: https://docs.jj-vcs.dev/latest/cli-reference/.

- Update description of the revisions specified by given revsets (e.g. `B::D`, `A..D`, `B|C|D`, etc.):

```
jj {{[desc|describe]}} {{[-m|--message]}} "{{message}}" {{[-r|--revision]}} {{revsets}}
```

- Create a new commit/revision on top of a given revision:

```
jj new {{revset}}
```

- Create a new merge commit on top of multiple revisions:

```
jj new {{revset1 revset2 ...}}
```

- Update the working copy to point to a revision:

```
jj edit {{revset}}
```

- Undo the previous command (which may itself have been `undo`):

```
jj undo
```

- Execute a jj subcommand without snapshotting the working copy:

```
jj --ignore-working-copy {{subcommand}}
```

- Execute a jj subcommand at an operation:

```
jj {{[--at-op|--at-operation]}} {{operation}} {{subcommand}}
```

- Display help for a specific subcommand (like `new`, `commit`, `desc`, etc.):

```
jj help {{subcommand}}
```

jmap

Java memory map tool.

More information: https://docs.oracle.com/en/java/javase/25/docs/specs/man/jmap.html.

- Print shared object mappings for a Java process (output like pmap):

```
jmap {{java_pid}}
```

- Print heap summary information:

```
jmap -heap {{filename.jar}} {{java_pid}}
```

- Print histogram of heap usage by type:

```
jmap -histo {{java_pid}}
```

- Dump contents of the heap into a binary file for analysis with jhat:

```
jmap -dump:format=b,file={{path/to/file}} {{java_pid}}
```

- Dump live objects of the heap into a binary file for analysis with jhat:

```
jmap -dump:live,format=b,file={{path/to/file}} {{java_pid}}
```

jmeter

Open source Java application designed for load testing functional behavior and measure performance.

More information: https://jmeter.apache.org/usermanual/get-started.html#options.

- Run a specific test plan in nongui mode:

```
jmeter {{[-n|--nongui]}} {{[-t|--testfile]}} {{path/to/file.jmx}}
```

- Run a test plan in nongui mode using a specific log file:

```
jmeter {{[-n|--nongui]}} {{[-t|--testfile]}} {{path/to/file.jmx}} {{[-l|--logfile]}} {{path/to/logfile.jtl}}
```

- Run a test plan in nongui mode using a specific proxy:

```
jmeter {{[-n|--nongui]}} {{[-t|--testfile]}} {{path/to/file.jmx}} {{[-H-|--proxyHost]}} {{127.0.0.1}} {{[-P|--proxyPort]}} {{8888}}
```

- Run a test plan in nongui mode using a specific JMeter property:

```
jmeter {{[-n|--nongui]}} {{[-t|--testfile]}} {{path/to/file.jmx}} {{[-J|--jmeterproperty]}} {{key}}='{{value}}'
```

jmtpfs

FUSE-based filesystem for accessing MTP devices.

More information: https://manned.org/jmtpfs.

- Mount an MTP device to a directory:

```
jmtpfs {{path/to/directory}}
```

- Set mount options:

```
jmtpfs -o {{allow_other,auto_unmount}} {{path/to/directory}}
```

- List available MTP devices:

```
jmtpfs {{[-l|--listDevices]}}
```

- If multiple devices are present, mount a specific device:

```
jmtpfs -device={{bus_id}},{{device_id}} {{path/to/directory}}
```

- Unmount MTP device:

```
fusermount -u {{path/to/directory}}
```

jo

This command is an alias of **autojump**.

- View documentation for the original command:

```
tldr autojump
```

jobs

Display status of jobs in the current session.

More information: https://manned.org/jobs.

- Show status of all jobs:

```
jobs
```

- Show status of a particular job:

```
jobs %{{job_id}}
```

- Show status and process IDs of all jobs:

```
jobs -l
```

- Show process IDs of all jobs:

```
jobs -p
```

joe

Joe's own text editor.

More information: https://joe-editor.sourceforge.io/4.6/man.html.

- Open a new file in JOE:

```
joe
```

- Open a specific file:

```
joe {{path/to/file}}
```

- Open a specific file, positioning the cursor at the specified line:

```
joe +{{line}} {{path/to/file}}
```

- Open a specific file in read-only mode:

```
joe -rdonly {{path/to/file}}
```

john

Password cracker.

More information: https://www.openwall.com/john/.

- Crack password hashes:

```
john {{path/to/hashes.txt}}
```

- Show passwords cracked:

```
john --show {{path/to/hashes.txt}}
```

- Display users' cracked passwords by user identifier from multiple files:

```
john --show --users={{user_ids}} {{path/to/hashes1.txt path/to/hashes2.txt ...}}
```

- Crack password hashes, using a custom wordlist:

```
john --wordlist={{path/to/wordlist.txt}} {{path/to/hashes.txt}}
```

- List available hash formats:

```
john --list=formats
```

- Crack password hashes, using a specific hash format:

```
john --format={{md5crypt}} {{path/to/hashes.txt}}
```

- Crack password hashes, enabling word mangling rules:

```
john --rules {{path/to/hashes.txt}}
```

- Restore an interrupted cracking session from a state file, e.g. `mycrack.rec`:

```
john --restore={{path/to/mycrack.rec}}
```

join

Join lines of two sorted files on a common field.

More information: https://www.gnu.org/software/coreutils/manual/html_node/join-invocation.html.

- Join two files on the first (default) field:

```
join {{path/to/file1}} {{path/to/file2}}
```

- Join two files using a comma (instead of a space) as the field separator:

```
join -t ',' {{path/to/file1}} {{path/to/file2}}
```

- Join field3 of file1 with field1 of file2:

```
join -1 {{3}} -2 {{1}} {{path/to/file1}} {{path/to/file2}}
```

- Produce a line for each unpairable line for file1:

```
join -a {{1}} {{path/to/file1}} {{path/to/file2}}
```

- Join a file from `stdin`:

```
cat {{path/to/file1}} | join - {{path/to/file2}}
```

josm

Extensible OpenStreetMap editor for Java 8+.

More information: https://manned.org/josm.

- Launch JOSM:

  ```
  josm
  ```

- Launch JOSM in maximized mode:

  ```
  josm --maximize
  ```

- Launch JOSM and set a specific language:

  ```
  josm --language {{de}}
  ```

- Launch JOSM and reset all preferences to their default values:

  ```
  josm --reset-preferences
  ```

- Launch JOSM and download a specific bounding box:

  ```
  josm --download {{minlat,minlon,maxlat,maxlon}}
  ```

- Launch JOSM and download a specific bounding box as raw GPS:

  ```
  josm --downloadgps {{minlat,minlon,maxlat,maxlon}}
  ```

- Launch JOSM without plugins:

  ```
  josm --skip-plugins
  ```

jp2a

Convert JPEG images to ASCII.

More information: https://manned.org/jp2a.

- Read JPEG image from a file and print in ASCII:

```
jp2a {{path/to/image.jpeg}}
```

- Read JPEG image from a URL and print in ASCII:

```
jp2a {{www.example.com/image.jpeg}}
```

- Colorize the ASCII output:

```
jp2a --colors {{path/to/image.jpeg}}
```

- Specify characters to be used for the ASCII output:

```
jp2a --chars='{{..-ooxx@@}}' {{path/to/image.jpeg}}
```

- Write the ASCII output into a file:

```
jp2a --output={{path/to/output_file.txt}} {{path/to/
image.jpeg}}
```

- Write the ASCII output in HTML file format, suitable for viewing in web browsers:

```
jp2a --html --output={{path/to/output_file.html}} {{path/to/
image.jpeg}}
```

jpegoptim

Optimise JPEG images.

More information: https://manned.org/jpegoptim.

- Optimise a set of JPEG images, retaining all associated data:

```
jpegoptim {{image1.jpeg image2.jpeg image3.jpeg ...}}
```

- Optimise JPEG images, stripping all non-essential data:

```
jpegoptim {{[-s|--strip-all]}} {{image1.jpeg image2.jpeg image3.jpeg ...}}
```

- Force the output images to be progressive:

```
jpegoptim --all-progressive {{image1.jpeg image2.jpeg image3.jpeg ...}}
```

- Force the output images to have a fixed maximum filesize:

```
jpegoptim {{[-S|--size]}} {{250k}} {{image1.jpeg image2.jpeg image3.jpeg ...}}
```

jpegtopnm

Convert a JPEG/JFIF file to the PPM or PGM format.

More information: https://netpbm.sourceforge.net/doc/jpegtopnm.html.

- Convert JPEG/JFIF image to a PPM or PGM image:

```
jpegtopnm {{path/to/file.jpg}} > {{path/to/file.pnm}}
```

- Display version:

```
jpegtopnm {{[-v|-version]}}
```

jps

Show JVM process status of current user.

More information: https://docs.oracle.com/en/java/javase/25/docs/specs/man/jps.html.

- List all JVM processes:

```
jps
```

- List all JVM processes with only PID:

```
jps -q
```

- Display the arguments passed to the processes:

```
jps -m
```

- Display the full package name of all processes:

```
jps -l
```

- Display the arguments passed to the JVM:

```
jps -v
```

jq

A JSON processor that uses a domain-specific language (DSL).

More information: https://jqlang.org/manual/.

- Execute a specific expression only using the `jq` binary (print a colored and formatted JSON output):

```
jq '.' {{path/to/file.json}}
```

- Execute a specific script:

```
{{cat path/to/file.json}} | jq {{[-f|--from-file]}} {{path/
to/script.jq}}
```

- Pass specific arguments:

```
{{cat path/to/file.json}} | jq {{--arg "name1" "value1" --arg
"name2" "value2" ...}} '{{. + $ARGS.named}}'
```

- Create new JSON object via old JSON objects from multiple files:

```
{{cat path/to/multiple_json_file_*.json}} | jq
'{{{newKey1: .key1, newKey2: .key2.nestedKey, ...}}}'
```

- Print specific array items:

```
{{cat path/to/file.json}} | jq '{{.[index1], .
[index2], ...}}'
```

- Print all array/object values:

```
{{cat path/to/file.json}} | jq '.[]'
```

- Print objects with 2-condition filter in array:

```
{{cat path/to/file.json}} | jq '.[] |
select((.key1=="value1") and .key2=="value2")'
```

- Add/remove specific keys:

```
{{cat path/to/file.json}} | jq '. {{+|-}} {{{"key1":
"value1", "key2": "value2", ...}}}'
```

jrnl

A simple journal application.

More information: https://jrnl.sh/en/stable/reference-command-line/.

- Insert a new entry with your editor:

```
jrnl
```

- Quickly insert a new entry:

```
jrnl {{today at 3am}}: {{title}}. {{content}}
```

- View the last ten entries:

```
jrnl -n {{10}}
```

- View everything that happened from the start of last year to the start of last march:

```
jrnl -from "{{last year}}" -until {{march}}
```

- Edit all entries tagged with "texas" and "history":

```
jrnl {{@texas}} -and {{@history}} --edit
```

json5

Convert JSON5 files to JSON.

More information: https://json5.org/#cli.

- Convert JSON5 `stdin` to JSON `stdout`:

```
echo {{input}} | json5
```

- Convert a JSON5 file to JSON and output to `stdout`:

```
json5 {{path/to/input_file.json5}}
```

- Convert a JSON5 file to the specified JSON file:

```
json5 {{path/to/input_file.json5}} {{[-o|--out-file]}} {{path/to/output_file.json}}
```

- Validate a JSON5 file:

```
json5 {{path/to/input_file.json5}} {{[-v|--validate]}}
```

- Specify the number of spaces to indent by (or "t" for tabs):

```
json5 {{[-s|--space]}} {{indent_amount}}
```

- Display help:

```
json5 {{[-h|--help]}}
```

jstack

Java stack trace tool.

More information: https://manned.org/jstack.

- Print Java stack traces for all threads in a Java process:

```
jstack {{java_pid}}
```

- Print mixed mode (Java/C++) stack traces for all threads in a Java process:

```
jstack -m {{java_pid}}
```

- Print stack traces from Java core dump:

```
jstack {{/usr/bin/java}} {{file.core}}
```

jtbl

Utility to print JSON and JSON Lines data as a table in the terminal.

More information: https://github.com/kellyjonbrazil/jtbl#usage.

- Print a table from JSON or JSON Lines input:

```
cat {{file.json}} | jtbl
```

- Print a table and specify the column width for wrapping:

```
cat {{file.json}} | jtbl --cols={{width}}
```

- Print a table and truncate rows instead of wrapping:

```
cat {{file.json}} | jtbl {{[-t|--truncate]}}
```

- Print a table and don't wrap or truncate rows:

```
cat {{file.json}} | jtbl {{[-n|--no-wrap]}}
```

julia

A high-level, high-performance dynamic programming language for technical computing.

More information: https://docs.julialang.org/en/v1/manual/getting-started/.

- Start a REPL (interactive shell):

```
julia
```

- Execute a Julia program and exit:

```
julia {{program.jl}}
```

- Execute a Julia program that takes arguments:

```
julia {{program.jl}} {{arguments}}
```

- Evaluate a string containing Julia code:

```
julia {{[-e|--eval]}} '{{julia_code}}'
```

- Evaluate a string of Julia code, passing arguments to it:

```
julia {{[-e|--eval]}} '{{for x in ARGS; println(x);
end}}' {{arguments}}
```

- Evaluate an expression and print the result:

```
julia {{[-E|--print]}} '{{(1 - cos(pi/4))/2}}'
```

- Start Julia in multithreaded mode, using `n` threads:

```
julia {{[-t|--threads]}} {{n}}
```

jupyter lab

Interactive development environment for Jupyter notebooks.

More information: https://jupyterlab.readthedocs.io/en/stable/.

- Start JupyterLab:

  ```
  jupyter lab
  ```

- Open a specific notebook:

  ```
  jupyter lab {{path/to/notebook.ipynb}}
  ```

- Start JupyterLab in a specific directory:

  ```
  jupyter lab --notebook-dir {{path/to/directory}}
  ```

- Start JupyterLab in debug mode:

  ```
  jupyter lab --debug
  ```

jupyter

Web application to create and share documents that contain code, visualizations, and notes.

Primarily used for data analysis, scientific computing, and machine learning.

More information: https://docs.jupyter.org/en/latest/.

- Start a Jupyter notebook server in the current directory:

```
jupyter notebook
```

- Open a specific Jupyter notebook:

```
jupyter notebook {{example.ipynb}}
```

- Export a specific Jupyter notebook into another format:

```
jupyter nbconvert --to {{html|markdown|pdf|script}}
{{example.ipynb}}
```

- Start a server on a specific port:

```
jupyter notebook --port {{port}}
```

- List currently running notebook servers:

```
jupyter notebook list
```

- Stop the currently running server:

```
jupyter notebook stop
```

- Start JupyterLab, if installed, in the current directory:

```
jupyter lab
```

jupyterlab

This command is an alias of **`jupyter lab`**.

- View documentation for the original command:

```
tldr jupyter lab
```

jupytext

Convert Jupyter notebooks to plain text documents, and back again.

More information: https://manned.org/jupytext.

- Turn a notebook into a paired `.ipynb`/`.py` notebook:

```
jupytext --set-formats ipynb,py {{notebook.ipynb}}
```

- Convert a notebook to a `.py` file:

```
jupytext --to py {{notebook.ipynb}}
```

- Convert a `.py` file to a notebook with no outputs:

```
jupytext --to notebook {{notebook.py}}
```

- Convert a `.md` file to a notebook and run it:

```
jupytext --to notebook --execute {{notebook.md}}
```

- Update the input cells in a notebook and preserve outputs and metadata:

```
jupytext --update --to notebook {{notebook.py}}
```

- Update all paired representations of a notebook:

```
jupytext {{[-s|--sync]}} {{notebook.ipynb}}
```

just

Save and run project-specific commands.

More information: https://manned.org/just.

- Run a recipe specified in the justfile:

```
just {{recipe}}
```

- Initialize new justfile in project root:

```
just --init
```

- Edit justfile in the default editor:

```
just {{[-e|--edit]}}
```

- List available recipes in the justfile:

```
just {{[-l|--list]}}
```

- Print justfile:

```
just --dump
```

just

`just` can refer to multiple commands with the same name.

- View documentation for the command runner:

```
tldr just.1
```

- View documentation for the V8 JavaScript runtime:

```
tldr just.js
```

jwt

Work with JSON Web Tokens (JWTs).

Encryption algorithms available are HS256, HS384, HS512, RS256, RS384, RS512, ES256, ES384.

More information: https://github.com/mike-engel/jwt-cli.

- Decode a JWT:

```
jwt decode {{jwt_string}}
```

- Decode a JWT as a JSON string:

```
jwt decode {{[-j|--json]}} {{jwt_string}}
```

- Encode a JSON string to a JWT:

```
jwt encode {{[-A|--alg]}} {{HS256}} {{[-S|--secret]}}
{{1234567890}} '{{json_string}}'
```

- Encode key pair payload to JWT:

```
jwt encode {{[-A|--alg]}} {{HS256}} {{[-S|--secret]}}
{{1234567890}} {{[-P|--payload]}} {{key=value}}
```

k3d

A wrapper to easily create k3s clusters inside Docker.

More information: https://k3d.io/stable/usage/commands/.

- Create a cluster:

```
k3d cluster create {{cluster_name}}
```

- Delete a cluster:

```
k3d cluster delete {{cluster_name}}
```

- Create a new containerized k3s node:

```
k3d node create {{node_name}}
```

- Import an image from Docker into a k3d cluster:

```
k3d image import {{image_name}} {{[-c|--cluster]}}
{{cluster_name}}
```

- Create a new registry:

```
k3d registry create {{registry_name}}
```

k3s

Install and manage lightweight Kubernetes clusters.

More information: https://docs.k3s.io/cli.

- Run the embedded `kubectl` command:

  ```
  k3s kubectl get nodes
  ```

- Take an etcd snapshot of the cluster:

  ```
  k3s etcd-snapshot save
  ```

- Rotate the CA certificate:

  ```
  k3s certificate rotate-ca
  ```

- Manage bootstrap tokens:

  ```
  k3s token list
  ```

- Uninstall K3s and remove all components:

  ```
  k3s-uninstall.sh
  ```

k6

Open source load testing tool and SaaS for engineering teams.

More information: https://grafana.com/docs/k6/latest/using-k6/k6-options/reference/.

- Run load test locally:

```
k6 run {{script.js}}
```

- Run load test locally with a given number of virtual users and duration:

```
k6 run {{[-u|--vus]}} {{10}} {{[-d|--duration]}} {{30s}} {{script.js}}
```

- Run load test locally with a given environment variable:

```
k6 run {{[-e|--env]}} {{HOSTNAME=example.com}} {{script.js}}
```

- Run load test locally using InfluxDB to store results:

```
k6 run {{[-o|--out]}} influxdb={{http://localhost:8086/k6db}} {{script.js}}
```

- Run load test locally and discard response bodies (significantly faster):

```
k6 run --discard-response-bodies {{script.js}}
```

- Run load test locally using the base JavaScript compatibility mode (significantly faster):

```
k6 run --compatibility-mode=base {{script.js}}
```

- Log in to cloud service using secret token:

```
k6 login cloud --token {{secret}}
```

- Run load test on cloud infrastructure:

```
k6 cloud {{script.js}}
```

k8s-unused-secret-detector

Detect unused Kubernetes secrets.

More information: https://github.com/dtan4/k8s-unused-secret-detector.

- Detect unused secrets:

```
k8s-unused-secret-detector
```

- Detect unused secrets in a specific namespace:

```
k8s-unused-secret-detector {{[-n|--namespace]}} {{namespace}}
```

- Delete unused secrets in a specific namespace:

```
k8s-unused-secret-detector {{[-n|--namespace]}} {{namespace}}
| kubectl delete secrets {{[-n|--namespace]}} {{namespace}}
```

k8sec

Manage Kubernetes secrets.

More information: https://github.com/dtan4/k8sec.

- List all secrets:

```
k8sec list
```

- List a specific secret as a base64-encoded string:

```
k8sec list {{secret_name}} --base64
```

- Set a secret's value:

```
k8sec set {{secret_name}} {{key=value}}
```

- Set a base64-encoded value:

```
k8sec set --base64 {{secret_name}} {{key=encoded_value}}
```

- Unset a secret:

```
k8sec unset {{secret_name}}
```

- Load secrets from a file:

```
k8sec load {{[-f|--filename]}} {{path/to/file}}
{{secret_name}}
```

- Dump secrets to a file:

```
k8sec dump {{[-f|--filename]}} {{path/to/file}}
{{secret_name}}
```

k9s

View and manage Kubernetes clusters.

More information: https://k9scli.io/topics/commands/.

- Manage a cluster using a kubeconfig context:

```
k9s --context {{kubeconfig_context_name}}
```

- Manage a cluster in read-only mode (disabling all commands that may cause modifications):

```
k9s --readonly --cluster {{cluster_name}}
```

- Manage a cluster using a given Kubernetes namespace:

```
k9s {{[-n|--namespace]}} {{kubernetes_namespace}} --cluster {{cluster_name}}
```

- Manage a cluster launching k9s in the pod view and enable debug logging:

```
k9s {{[-c|--command]}} {{pod}} {{[-l|--logLevel]}} debug --cluster {{cluster_name}}
```

kafkacat

This command is an alias of **kcat**.

- View documentation for the original command:

```
tldr kcat
```

kaggle competitions

Manage Kaggle competitions.

More information: https://github.com/Kaggle/kaggle-api/blob/main/docs/README.md#competitions.

- List all competitions:

```
kaggle {{[c|competitions]}} list
```

- Download competition data:

```
kaggle {{[c|competitions]}} download {{competition_name}}
```

- Download specific file:

```
kaggle {{[c|competitions]}} download {{competition_name}} {{[-f|--file]}} {{file}}
```

- Submit files to a competition:

```
kaggle {{[c|competitions]}} submit {{competition_name}} {{[-f|--file]}} {{path/to/file}} {{[-m|--message]}} "{{message}}"
```

- Show or download leaderboard:

```
kaggle {{[c|competitions]}} leaderboard {{competition_name}} {{--show|--download}}
```

- View submissions:

```
kaggle {{[c|competitions]}} submissions {{competition_name}}
```

kaggle config

Manage Kaggle configuration.

More information: https://github.com/Kaggle/kaggle-api/blob/main/docs/README.md#config.

- View current configuration values:

```
kaggle config view
```

- Set a configuration value:

```
kaggle config set {{[-n|--name]}} {{configuration_parameter}}
{{[-v|--value]}} {{parameter_value}}
```

- Clear a configuration value:

```
kaggle config unset {{[-n|--name]}}
{{configuration_parameter}}
```

kaggle datasets

Manage Kaggle datasets.

More information: https://github.com/Kaggle/kaggle-api/blob/main/docs/README.md#datasets.

- List all datasets owned by a user or organization:

```
kaggle {{[d|datasets]}} list --user {{username}}
```

- Search dataset by name:

```
kaggle {{[d|datasets]}} list {{[-s|--search]}} "{{dataset_name}}"
```

- Download a dataset:

```
kaggle {{[d|datasets]}} download "{{dataset_name}}"
```

- Create a public dataset:

```
kaggle {{[d|datasets]}} create {{[-p|--path]}} {{path/to/dataset}} {{[-u|--public]}}
```

- Download metadata of dataset:

```
kaggle {{[d|datasets]}} metadata {{dataset_name}}
```

- Initialize metadata for dataset:

```
kaggle {{[d|datasets]}} init {{[-p|--path]}} {{path/to/dataset}}
```

- Delete a dataset:

```
kaggle {{[d|datasets]}} delete {{dataset_name}}
```

kaggle kernels

Manage Kaggle kernels.

More information: https://github.com/Kaggle/kaggle-api/blob/main/docs/README.md#kernels.

- List all kernels:

```
kaggle {{[k|kernels]}} list
```

- List kernel output files:

```
kaggle {{[k|kernels]}} files {{kernel_name}}
```

- Initialize metadata file for a kernel (defaults to current directory):

```
kaggle {{[k|kernels]}} init {{[-p|--path]}} {{path/to/directory}}
```

- Push new code to a kernel and run the kernel:

```
kaggle {{[k|kernels]}} push {{[-p|--path]}} {{path/to/directory}}
```

- Pull a kernel:

```
kaggle {{[k|kernels]}} pull {{kernel_name}} {{[-p|--path]}} {{path/to/directory}}
```

- Get data output from the latest kernel run:

```
kaggle {{[k|kernels]}} output {{kernel_name}}
```

- Display the status of the latest kernel run:

```
kaggle {{[k|kernels]}} status {{kernel_name}}
```

kaggle models

Manage Kaggle models.

More information: https://github.com/Kaggle/kaggle-api/blob/main/docs/README.md#models.

- Get a model:

```
kaggle {{[m|models]}} get "{{model_name}}"
```

- List all models:

```
kaggle {{[m|models]}} list
```

- Initialize metadata file for model creation:

```
kaggle {{[m|models]}} init
```

- Create a new model:

```
kaggle {{[m|models]}} create
```

- Delete a model:

```
kaggle {{[m|models]}} delete "{{model_name}}"
```

- Update a model:

```
kaggle {{[m|models]}} update
```

kaggle

Official CLI for Kaggle implemented in Python 3.

More information: https://github.com/Kaggle/kaggle-api/blob/main/docs/README.md.

- View current configuration values:

```
kaggle config view
```

- Download a specific file from a competition dataset:

```
kaggle {{[c|competitions]}} download {{competition}} {{[-f|--file]}} {{path/to/file}}
```

- List competitions matching a search term:

```
kaggle {{[c|competitions]}} list {{[-s|--search]}} {{search_term}}
```

- List files available for a specific competition:

```
kaggle {{[c|competitions]}} files {{competition}}
```

- Submit a file to a competition with a message:

```
kaggle {{[c|competitions]}} submit {{competition}} {{[-f|--file]}} {{path/to/submission.csv}} {{[-m|--message]}} "{{message}}"
```

- List datasets matching a search term:

```
kaggle {{[d|datasets]}} list {{[-s|--search]}} {{search_term}}
```

- Download all files from a dataset:

```
kaggle {{[d|datasets]}} download {{owner}}/{{dataset_name}}
```

- List kernels (notebooks) matching a search term:

```
kaggle {{[k|kernels]}} list {{[-s|--search]}} {{search_term}}
```

kahlan

A unit and Behaviour Driven Development test framework for PHP.

More information: https://kahlan.github.io/docs/cli-options.html.

- Run all specifications in the "spec" directory:

  ```
  kahlan
  ```

- Run specifications using a specific configuration file:

  ```
  kahlan --config={{path/to/configuration_file}}
  ```

- Run specifications and output using a reporter:

  ```
  kahlan --reporter={{dot|bar|json|tap|verbose}}
  ```

- Run specifications with code coverage (detail can be between 0 and 4):

  ```
  kahlan --coverage={{detail_level}}
  ```

kak

Kakoune is a mode-based code editor implementing the "multiple selections" paradigm.

Data can be selected and simultaneously edited in different locations, using multiple selections; users can also connect to the same session for collaborative editing.

More information: https://manned.org/kak.

- Open a file and enter normal mode, to execute commands:

```
kak {{path/to/file}}
```

- Enter insert mode from normal mode, to write text into the file:

```
<i>
```

- Escape insert mode, to go back to normal mode:

```
<Esc>
```

- Replace all instances of "foo" in the current file with "bar":

```
%s{{foo}}<Enter>c{{bar}}<Esc>
```

- Unselect all secondary selections, and keep only the main one:

```
<Space>
```

- Search for numbers and select the first two:

```
/\d+<Enter>N
```

- Insert the contents of a file:

```
<!>cat {{path/to/file}}<Enter>
```

- Save the current file:

```
<:>w<Enter>
```

katana

A fast crawler focused on execution in automation pipelines offering both headless and non-headless crawling.

See also: **`gau`**, **`scrapy`**, **`waymore`**.

More information: https://docs.projectdiscovery.io/opensource/katana/usage.

- Crawl a list of URLs:

```
katana -list {{https://example.com,https://google.com,...}}
```

- Crawl a [u]RL using headless mode using Chromium:

```
katana -u {{https://example.com}} {{[-hl|-headless]}}
```

- Pass requests through a proxy (http/socks5) and use custom headers from a file:

```
katana -proxy {{http://127.0.0.1:8080}} {{[-H|-headers]}}
{{path/to/headers.txt}} -u {{https://example.com}}
```

- Specify the crawling strategy, depth of subdirectories to crawl, and rate limiting (requests per second):

```
katana {{[-s|-strategy]}} {{depth-first|breadth-first}} {{[-
d|-depth]}} {{value}} {{[-rl|-rate-limit]}} {{value}} -u
{{https://example.com}}
```

- Find subdomains using `subfinder`, crawl each for a maximum number of seconds, and write results to an output file:

```
subfinder {{[-dL|-list]}} {{path/to/domains.txt}} | katana
{{[-ct|-crawl-duration]}} {{value}} {{[-o|-output]}} {{path/
to/output.txt}}
```

kate

KDE's advanced text editor.

More information: https://docs.kde.org/stable/en/kate/kate/fundamentals.html#starting-from-the-command-line.

- Open specific files:

```
kate {{path/to/file1 path/to/file2 ...}}
```

- Open specific remote files:

```
kate {{https://example.com/path/to/file1 https://example.com/path/to/file2 ...}}
```

- Create a new editor instance even if one is already open:

```
kate {{[-n|--new]}}
```

- Open a file with the cursor at the specific line:

```
kate {{[-l|--line]}} {{line_number}} {{path/to/file}}
```

- Open a file with the cursor at the specific line and column:

```
kate {{[-l|--line]}} {{line_number}} {{[-c|--column]}} {{column_number}} {{path/to/file}}
```

- Create a file from `stdin`:

```
cat {{path/to/file}} | kate {{[-i|--stdin]}}
```

- Display help:

```
kate {{[-h|--help]}}
```

kcadm.sh

Perform administration tasks.

More information: https://www.keycloak.org/docs/latest/server_admin/#admin-cli.

- Start an authenticated session:

```
kcadm.sh config credentials --server {{host}} --realm
{{realm_name}} --user {{username}} --password {{password}}
```

- Create a user:

```
kcadm.sh create users -s username={{username}} -r
{{realm_name}}
```

- List all realms:

```
kcadm.sh get realms
```

- Update a realm with JSON config:

```
kcadm.sh update realms/{{realm_name}} -f {{path/to/
file.json}}
```

kcat

Apache Kafka producer and consumer tool.

More information: https://manned.org/kcat.

- Consume messages starting with the newest offset:

```
kcat -C -t {{topic}} -b {{brokers}}
```

- Consume messages starting with the oldest offset and exit after the last message is received:

```
kcat -C -t {{topic}} -b {{brokers}} -o beginning -e
```

- Consume messages as a Kafka consumer group:

```
kcat -G {{group_id}} {{topic}} -b {{brokers}}
```

- Publish message by reading from `stdin`:

```
echo {{message}} | kcat -P -t {{topic}} -b {{brokers}}
```

- Publish messages by reading from a file:

```
kcat -P -t {{topic}} -b {{brokers}} {{path/to/file}}
```

- List metadata for all topics and brokers:

```
kcat -L -b {{brokers}}
```

- List metadata for a specific topic:

```
kcat -L -t {{topic}} -b {{brokers}}
```

- Get offset for a topic/partition for a specific point in time:

```
kcat -Q -t {{topic}}:{{partition}}:{{unix_timestamp}} -b
{{brokers}}
```

kdash

A simple dashboard for Kubernetes.

More information: https://github.com/kdash-rs/kdash/#usage.

- Show dashboard:

```
kdash
```

- Show dashboard in debug mode and write logs to a file in the current directory:

```
kdash {{[-d|--debug]}}
```

- Set the tick rate:

```
kdash {{[-t|--tick-rate]}} {{100}}
```

- Set the polling rate (must be a multiple of the tick rate):

```
kdash {{[-t|--tick-rate]}} {{200}} {{[-p|--poll-rate]}} {{400}}
```

kdeconnect-cli

Use KDE Connect for sharing files or text to a device, ringing it, unlocking it, and much more.

More information: https://manned.org/kdeconnect-cli.

- List all devices:

```
kdeconnect-cli {{[-l|--list-devices]}}
```

- List available (paired and reachable) devices:

```
kdeconnect-cli --list-available
```

- Request pairing with a specific device, specifying its ID:

```
kdeconnect-cli --pair --device {{device_id}}
```

- Ring a device, specifying its name:

```
kdeconnect-cli --ring --name "{{device_name}}"
```

- Share an URL or file with a paired device, specifying its ID:

```
kdeconnect-cli --share {{url|path/to/file}} --device
{{device_id}}
```

- Send an SMS with an optional attachment to a specific number:

```
kdeconnect-cli --name "{{device_name}}" --send-sms
"{{message}}" --destination {{phone_number}} --attachment
{{path/to/file}}
```

- Unlock a specific device:

```
kdeconnect-cli --name "{{device_name}}" --unlock
```

- Simulate a key press on a specific device:

```
kdeconnect-cli --name "{{device_name}}" --send-keys {{key}}
```

kdenlive

KDE's non-linear video editor.

More information: https://manned.org/kdenlive.

- Start the video editor:

```
kdenlive
```

- Open a specific file:

```
kdenlive {{path/to/file.kdenlive}}
```

- Use a specific path for an MLT environment:

```
kdenlive --mlt-path {{path/to/directory}}
```

- Use a specific log level for an MLT environment:

```
kdenlive --mlt-log {{verbose|debug}}
```

- Display help:

```
kdenlive --help
```

- Display version:

```
kdenlive --version
```

kdig

Advanced DNS lookup utility.

More information: https://www.knot-dns.cz/docs/latest/html/man_kdig.html.

- Lookup the IP(s) associated with a hostname (A records):

```
kdig {{example.com}}
```

- Specify a specific DNS server to query (e.g. Google DNS):

```
kdig {{example.com}} @{{8.8.8.8}}
```

- Query a specific DNS record type associated with a given domain name:

```
kdig {{example.com}} {{A|AAAA|NS|SOA|DNSKEY|ANY}}
```

- Lookup the IP(s) associated with a hostname (A records) using DNS over TLS (DoT):

```
kdig -d @{{8.8.8.8}} +tls-ca +tls-host={{dns.google}} {{example.com}}
```

- Lookup the IP(s) associated with a hostname (A records) using DNS over HTTPS (DoH):

```
kdig -d @{{1.1.1.1}} +https +tls-hostname={{1dot1dot1dot1.cloudflare-dns.com}} {{example.com}}
```

keep-header

Keep first line untouched by a command, passing it directly to **`stdout`**.

More information: https://github.com/eBay/tsv-utils#keep-header.

- Sort a file and keep the first line at the top:

```
keep-header {{path/to/file}} -- sort
```

- Output first line directly to `stdout`, passing the remainder of the file through the specified command:

```
keep-header {{path/to/file}} -- {{command}}
```

- Read from `stdin`, sorting all except the first line:

```
cat {{path/to/file}} | keep-header -- {{command}}
```

- Grep a file, keeping the first line regardless of the search pattern:

```
keep-header {{path/to/file}} -- grep {{pattern}}
```

keepass2

A light-weight password manager.

More information: https://manned.org/keepass2.

- Start KeePass 2, opening the most recently opened password database:

```
keepass2
```

- Start KeePass 2, opening a specific password database:

```
keepass2 {{path/to/database.kbdx}}
```

- Use a specific key file to open a password database:

```
keepass2 {{path/to/database.kbdx}} -keyfile:{{path/to/
key_file.key}}
```

keepassxc-cli

Interface for KeePassXC.

More information: https://manned.org/keepassxc-cli.

- Search entries:

```
keepassxc-cli search {{path/to/database_file}} {{name}}
```

- List the contents of a folder:

```
keepassxc-cli ls {{path/to/database_file}} {{path/to/
directory}}
```

- Add an entry with an auto-generated password:

```
keepassxc-cli add {{[-g|--generate]}} {{path/to/
database_file}} {{entry_name}}
```

- Delete an entry:

```
keepassxc-cli rm {{path/to/database_file}} {{entry_name}}
```

- Copy an entry's password to the clipboard:

```
keepassxc-cli clip {{path/to/database_file}} {{entry_name}}
```

- Copy a TOTP code to the clipboard:

```
keepassxc-cli clip {{[-t|--totp]}} {{path/to/database_file}}
{{entry_name}}
```

- Generate a passphrase with 7 words:

```
keepassxc-cli diceware {{[-W|--words]}} 7
```

- Generate a password with 16 printable ASCII characters:

```
keepassxc-cli generate {{[-lUns|--lower --upper --numeric --
special]}} {{[-L|--length]}} 16
```

kerl

Build and install Erlang/OTP instances with ease.

More information: https://github.com/kerl/kerl.

- Build and install an Erlang/OTP version in a directory:

```
kerl build-install {{28.0}} {{28.0}} {{path/to/
installation_directory}}/{{28.0}}
```

- Activate an Erlang/OTP installation:

```
. {{path/to/installation}}/activate
```

- Deactivate the current Erlang/OTP installation:

```
kerl_deactivate
```

- List all available Erlang/OTP releases:

```
kerl list releases
```

- List installed Erlang/OTP builds:

```
kerl list installations
```

keybase

Key directory that maps social media identities to encryption keys in a publicly auditable manner.

More information: https://book.keybase.io/docs/cli.

- Follow another user:

```
keybase follow {{username}}
```

- Add a new proof:

```
keybase prove {{service}} {{service_username}}
```

- Sign a file:

```
keybase sign {{[-i|--infile]}} {{input_file}} {{[-o|--
outfile]}} {{output_file}}
```

- Verify a signed file:

```
keybase verify {{[-i|--infile]}} {{input_file}} {{[-o|--
outfile]}} {{output_file}}
```

- Encrypt a file:

```
keybase encrypt {{[-i|--infile]}} {{input_file}} {{[-o|--
outfile]}} {{output_file}} {{receiver}}
```

- Decrypt a file:

```
keybase decrypt {{[-i|--infile]}} {{input_file}} {{[-o|--
outfile]}} {{output_file}}
```

- Revoke current device, log out, and delete local data:

```
keybase deprovision
```

keychain

Re-use ssh-agent and/or gpg-agent between logins.

More information: https://www.funtoo.org/Keychain.

- Check for a running ssh-agent, and start one if needed:

```
keychain
```

- Also check for gpg-agent:

```
keychain --agents "{{gpg,ssh}}"
```

- List signatures of all active keys:

```
keychain --list
```

- List fingerprints of all active keys:

```
keychain --list-fp
```

- Add a timeout for identities added to the agent, in minutes:

```
keychain --timeout {{minutes}}
```

keytool

A certificate management utility included with Java.

More information: https://docs.oracle.com/en/java/javase/25/docs/specs/man/keytool.html.

- Create a keystore:

```
keytool -genkeypair -v -keystore {{path/to/file.keystore}} -alias {{key_name}}
```

- Change a keystore password:

```
keytool -storepasswd -keystore {{path/to/file.keystore}}
```

- Change a key's password inside a specific keystore:

```
keytool -keypasswd -alias {{key_name}} -keystore {{path/to/file.keystore}}
```

khal

A text-based calendar and scheduling application.

More information: https://lostpackets.de/khal/.

- Start Khal in interactive mode:

```
khal interactive
```

- Print all events scheduled in personal calendar for the next seven days:

```
khal list -a {{personal}} {{today}} {{7d}}
```

- Print all events scheduled not in personal calendar for tomorrow at 10:00:

```
khal at -d {{personal}} {{tomorrow}} {{10:00}}
```

- Print a calendar with a list of events for the next three months:

```
khal calendar
```

- Add new event to personal calendar:

```
khal new -a {{personal}} {{2020-09-08}} {{18:00}} {{18:30}}
"{{Dentist appointment}}"
```

kill

Send a signal to a process, usually related to stopping the process.

All signals except for SIGKILL and SIGSTOP can be intercepted by the process to perform a clean exit.

More information: https://manned.org/kill.1posix.

- Terminate a program using the default SIGTERM (terminate) signal:

```
kill {{process_id}}
```

- List available signal names (to be used without the `SIG` prefix):

```
kill -l
```

- Terminate a program using the SIGHUP (hang up) signal. Many daemons will reload instead of terminating:

```
kill -{{1|HUP}} {{process_id}}
```

- Terminate a program using the SIGINT (interrupt) signal. This is typically initiated by the user pressing `<Ctrl c>`:

```
kill -{{2|INT}} {{process_id}}
```

- Signal the operating system to immediately terminate a program (which gets no chance to capture the signal):

```
kill -{{9|KILL}} {{process_id}}
```

- Signal the operating system to pause a program until a SIGCONT ("continue") signal is received:

```
kill -{{17|STOP}} {{process_id}}
```

- Send a `SIGUSR1` signal to all processes with the given GID (group id):

```
kill -{{SIGUSR1}} -{{group_id}}
```

killall

Send kill signal to all instances of a process by name (must be exact name).

All signals except SIGKILL and SIGSTOP can be intercepted by the process, allowing a clean exit.

More information: https://manned.org/killall.

- Terminate a process using the default SIGTERM (terminate) signal:

```
killall {{process_name}}
```

- List available signal names (to be used without the `SIG` prefix):

```
killall {{[-l|--list]}}
```

- Interactively ask for confirmation before termination:

```
killall {{[-i|--interactive]}} {{process_name}}
```

- Terminate a process using the SIGINT (interrupt) signal, which is the same signal sent by pressing `<Ctrl c>`:

```
killall -INT {{process_name}}
```

- Force kill a process:

```
killall -KILL {{process_name}}
```

kind

Run local Kubernetes clusters using Docker container "nodes".

Designed for testing Kubernetes itself, but may be used for local development or continuous integration.

More information: https://github.com/kubernetes-sigs/kind.

- Create a local Kubernetes cluster:

  ```
  kind create cluster --name {{cluster_name}}
  ```

- Delete one or more clusters:

  ```
  kind delete clusters {{cluster_name}}
  ```

- Get details about clusters, nodes, or the kubeconfig:

  ```
  kind get {{clusters|nodes|kubeconfig}}
  ```

- Export the kubeconfig or the logs:

  ```
  kind export {{kubeconfig|logs}}
  ```

kinit

Authenticate a principal with a Kerberos server to gain and cache a ticket.

Note: A Kerberos principal can be either a user, service, or application.

More information: https://web.mit.edu/kerberos/krb5-latest/doc/user/user_commands/kinit.html.

- Authenticate a user and obtain a ticket-granting ticket:

```
kinit {{username}}
```

- Renew a ticket-granting ticket:

```
kinit -R
```

- Specify a lifetime for the ticket:

```
kinit -l {{5h}}
```

- Specify a total renewable lifetime for the ticket:

```
kinit -r {{1w}}
```

- Specify a different principal name to authenticate as:

```
kinit -p {{principal@REALM}}
```

- Specify a different keytab file to authenticate with:

```
kinit -t {{path/to/keytab}}
```

kismet

A wireless network and device detector, sniffer, wardriving tool, and WIDS (wireless intrusion detection) framework.

More information: https://www.kismetwireless.net/docs/readme/starting/commandline/.

- Capture packets from a specific wireless interface:

```
sudo kismet -c {{wlan0}}
```

- Monitor multiple channels on a wireless interface:

```
sudo kismet -c {{wlan0,wlan1}} -m
```

- Capture packets and save them to a specific directory:

```
sudo kismet -c {{wlan0}} -d {{path/to/output}}
```

- Start Kismet with a specific configuration file:

```
sudo kismet -c {{wlan0}} {{[-f|--config-file]}} {{path/to/config.conf}}
```

- Monitor and log data to an SQLite database:

```
sudo kismet -c {{wlan0}} --log-to-db
```

- Monitor using a specific data source:

```
sudo kismet -c {{wlan0}} --data-source={{rtl433}}
```

- Enable alerts for specific events:

```
sudo kismet -c {{wlan0}} --enable-alert={{new_ap}}
```

- Display detailed information about a specific AP's packets:

```
sudo kismet -c {{wlan0}} --info {{BSSID}}
```

kite

This command is an alias of **`kiterunner`**.

- View documentation for the original command:

  ```
  tldr kiterunner
  ```

kiterunner brute

A contextual web scanner for bruteforcing API paths and web endpoints using wordlists.

The **`brute`** subcommand targets one or multiple hosts.

More information: https://github.com/assetnote/kiterunner#usage.

- Bruteforce a target with an Assetnote wordlist (e.g., first 20,000 API routes):

```
kiterunner brute {{https://example.com}} {{[-A|--assetnote-wordlist]}} {{apiroutes-210328:20000}}
```

- Bruteforce a target with a custom wordlist:

```
kiterunner brute {{https://example.com}} {{[-w|--wordlist]}} {{path/to/wordlist.txt}}
```

- Bruteforce using a dirsearch-style wordlist with extension substitution:

```
kiterunner brute {{https://example.com}} {{[-w|--wordlist]}} {{path/to/dirsearch.txt}} {{[-D|--dirsearch-compat]}} {{[-e|--extensions]}} {{json,txt}}
```

- Bruteforce with specific file extensions appended and output in JSON format:

```
kiterunner brute {{https://example.com}} {{[-w|--wordlist]}} {{path/to/wordlist.txt}} {{[-e|--extensions]}} {{aspx,ashx}} {{[-o|--output]}} {{json}}
```

- Bruteforce a list of targets from a file with custom concurrency settings for performance:

```
kiterunner brute {{path/to/targets.txt}} {{[-w|--wordlist]}} {{path/to/wordlist.txt}} {{[-x|--max-connection-per-host]}} {{5}} {{[-j|--max-parallel-hosts]}} {{100}}
```

- Bruteforce and ignore specific content length responses:

```
kiterunner brute {{https://example.com}} {{[-w|--wordlist]}} {{path/to/wordlist.txt}} --ignore-length {{100-105}}
```

- Bruteforce with custom HTTP headers:

```
kiterunner brute {{https://example.com}} {{[-w|--wordlist]}}
{{path/to/wordlist.txt}} {{[-H|--header]}} "{{Authorization:
Bearer token}}"
```

- Bruteforce a list of targets from a file with fail status code filtering:

```
kiterunner brute {{path/to/targets.txt}} {{[-w|--wordlist]}}
{{path/to/wordlist.txt}} --fail-status-codes {{400,401,404}}
```

kiterunner kb

A contextual web scanner for manipulating kitebuilder schemas used in API and web endpoint discovery.

The **kb** subcommand handles schema compilation, conversion, parsing, and request replay.

More information: https://github.com/assetnote/kiterunner#usage.

- Compile a kitebuilder schema from JSON to a kite file:

```
kiterunner kb compile {{path/to/wordlist.json}} {{path/to/wordlist.kite}}
```

- Convert a kite file to a text wordlist:

```
kiterunner kb convert {{path/to/wordlist.kite}} {{path/to/wordlist.txt}}
```

- Convert a text wordlist to a kite file:

```
kiterunner kb convert {{path/to/wordlist.txt}} {{path/to/wordlist.kite}}
```

- Convert a kite file to a JSON schema:

```
kiterunner kb convert {{path/to/wordlist.kite}} {{path/to/wordlist.json}}
```

- Parse a kitebuilder schema and output prettified JSON data:

```
kiterunner kb parse {{path/to/wordlist.json}} {{[-o|--output]}} {{json}}
```

- Parse a kite file and output prettified text data:

```
kiterunner kb parse {{path/to/wordlist.kite}} {{[-o|--output]}} {{text}}
```

- Replay a specific request from a kitebuilder schema output:

```
kiterunner kb replay {{[-w|--kitebuilder-list]}} {{path/to/wordlist.kite}} "{{request_output}}"
```

- Replay a request through a proxy for inspection:

```
kiterunner kb replay {{[-w|--kitebuilder-list]}} {{path/to/
wordlist.kite}} {{[-p|--proxy]}} {{http://localhost:8080}}
"{{request_output}}"
```

kiterunner scan

A contextual web scanner for concurrently scanning API paths and web endpoints using kitebuilder wordlists.

The **scan** subcommand targets one or multiple hosts with structured API requests.

More information: https://github.com/assetnote/kiterunner#usage.

- Scan a target with an Assetnote wordlist (e.g., first 5000 API routes):

```
kiterunner scan {{https://example.com}} {{[-A|--assetnote-wordlist]}} {{apiroutes-210228:5000}}
```

- Scan a target with a kitebuilder wordlist:

```
kiterunner scan {{https://example.com}} {{[-w|--kitebuilder-list]}} {{path/to/wordlist.kite}}
```

- Scan multiple hosts from a file with a kitebuilder wordlist:

```
kiterunner scan {{path/to/hosts.txt}} {{[-w|--kitebuilder-list]}} {{path/to/wordlist.kite}}
```

- Scan with an Assetnote wordlist and JSON output:

```
kiterunner scan {{https://example.com}} {{[-A|--assetnote-wordlist]}} {{apiroutes-210228:5000}} -o {{json}}
```

- Scan with custom concurrency settings for performance:

```
kiterunner scan {{https://example.com}} {{[-w|--kitebuilder-list]}} {{path/to/wordlist.kite}} {{[-x|--max-connection-per-host]}} {{5}} {{[-j|--max-parallel-hosts]}} {{100}}
```

- Scan with a wordlist as a normal wordlist, disabling depth scanning:

```
kiterunner scan {{https://example.com}} {{[-w|--kitebuilder-list]}} {{path/to/rafter.txt}} {{[-d|--preflight-depth]}} {{0}}
```

- Scan with custom headers and ignore specific content length responses:

```
kiterunner scan {{https://example.com}} {{[-w|--kitebuilder-list]}} {{path/to/wordlist.kite}} {{[-H|--header]}} "{{Authorization: Bearer token}}" --ignore-length {{100-105}}
```

- Perform a full kitebuilder scan without phase scanning:

```
kiterunner scan {{https://example.com}} {{[-w|--kitebuilder-
list]}} {{path/to/wordlist.kite}} --kitebuilder-full-scan
```

kiterunner wordlist

A contextual web scanner for managing wordlists used in API and web endpoint discovery.

The **`wordlist`** subcommand handles listing and saving wordlists in **`~/.cache/kiterunner`**.

More information: https://github.com/assetnote/kiterunner#usage.

- List all cached and available Assetnote wordlists:

```
kiterunner wordlist list
```

- List wordlists with JSON output:

```
kiterunner wordlist list {{[-o|--output]}} {{json}}
```

- List wordlists with verbose debug output:

```
kiterunner wordlist list {{[-v|--verbose]}} {{debug}}
```

- Save a specific Assetnote wordlist by alias:

```
kiterunner wordlist save {{apiroutes-210328}}
```

- Save a specific Assetnote wordlist by full filename:

```
kiterunner wordlist save {{path/to/
httparchive_apiroutes_2024_05_28.txt}}
```

- Save multiple wordlists by alias:

```
kiterunner wordlist save {{apiroutes-210328,aspx-210328}}
```

- Save a wordlist with quiet mode to suppress output:

```
kiterunner wordlist save {{apiroutes-210328}} {{[-q|--
quiet]}}
```

kiterunner

A contextual web scanner for discovering API paths and web endpoints using wordlists and kitebuilder schemas.

More information: https://github.com/assetnote/kiterunner#usage.

- View documentation for bruteforcing API paths and web endpoints:

```
tldr kiterunner brute
```

- View documentation for concurrently scanning hosts with kitebuilder wordlists:

```
tldr kiterunner scan
```

- View documentation for manipulating kitebuilder schemas:

```
tldr kiterunner kb
```

- View documentation for managing cached and remote wordlists:

```
tldr kiterunner wordlist
```

kitex

Code generation tool provided by the Go RPC framework Kitex.

Kitex accepts both thrift and protobuf IDLs, and supports generating a skeleton of a server side project.

More information: https://www.cloudwego.io/docs/kitex/tutorials/code-gen/code_generation/#generate-code.

- Generate client codes when a project is in `$GOPATH`:

  ```
  kitex {{path/to/IDL_file.thrift}}
  ```

- Generate client codes when a project is not in `$GOPATH`:

  ```
  kitex -module {{github.com/xx-org/xx-name}} {{path/to/IDL_file.thrift}}
  ```

- Generate client codes with protobuf IDL:

  ```
  kitex -type protobuf {{path/to/IDL_file.proto}}
  ```

- Generate server codes:

  ```
  kitex -service {{svc_name}} {{path/to/IDL_file.thrift}}
  ```

kitty

A fast, feature-rich, GPU based terminal emulator.

More information: https://sw.kovidgoyal.net/kitty/.

- Open a new terminal:

```
kitty
```

- Open a terminal with the specified title for the window:

```
kitty --title "{{title}}"
```

- Start the theme-chooser builtin:

```
kitty +kitten themes
```

- Display an image in the terminal:

```
kitty +kitten icat {{path/to/image}}
```

- Copy the contents of `stdin` to the clipboard:

```
echo {{example}} | kitty +kitten clipboard
```

kiwi-ng

An OS image and appliance builder.

More information: https://osinside.github.io/kiwi/.

- Build an appliance:

```
kiwi-ng system build --description={{path/to/directory}} --target-dir={{path/to/directory}}
```

- Show build result of built appliance:

```
kiwi-ng result list --target-dir={{path/to/directory}}
```

- Display help:

```
kiwi-ng help
```

- Display version:

```
kiwi-ng -v
```

knife

Interact with a Chef server from a local Chef repo.

More information: https://docs.chef.io/workstation/knife/.

- Bootstrap a new node:

```
knife bootstrap {{fqdn_or_ip}}
```

- List all registered nodes:

```
knife node list
```

- Show a node:

```
knife node show {{node_name}}
```

- Edit a node:

```
knife node edit {{node_name}}
```

- Edit a role:

```
knife role edit {{role_name}}
```

- View a data bag:

```
knife data bag show {{data_bag_name}} {{data_bag_item}}
```

- Upload a local cookbook to the Chef server:

```
knife cookbook upload {{cookbook_name}}
```

knotc

Control knot DNS server.

More information: https://www.knot-dns.cz/docs/latest/html/man_knotc.html.

- Start editing a zone:

```
knotc zone-begin {{zone}}
```

- Set an A record with TTL of 3600:

```
knotc zone-set {{zone}} {{subdomain}} 3600 A {{ip_address}}
```

- Finish editing the zone:

```
knotc zone-commit {{zone}}
```

- Get the current zone data:

```
knotc zone-read {{zone}}
```

- Get the current server configuration:

```
knotc conf-read server
```

kodi-send

Send actions to Kodi.

More information: https://kodi.wiki/view/List_of_built-in_functions.

- Quit Kodi:

```
kodi-send {{[-a|--action]}} Quit
```

- Reboot the system:

```
kodi-send {{[-a|--action]}} Reboot
```

- Send an action to a remote host:

```
kodi-send --host {{192.168.0.1}} --port {{9777}} {{[-a|--
action]}} {{Quit}}
```

komac

Create WinGet manifests for the **`winget-pkgs`** repository.

More information: https://github.com/russellbanks/Komac.

- Create a new package from scratch:

```
komac new {{Package.Identifier}} {{[-v|--version]}} {{1.2.3}}
{{[-u|--urls]}} {{https://example.com/app.exe}}
```

- Update an existing package with a new version:

```
komac update {{Package.Identifier}} {{[-v|--version]}}
{{1.2.3}} {{[-u|--urls]}} {{https://example.com/app.exe}}
```

- Update a package with multiple URLs and automatically submit:

```
komac update {{Package.Identifier}} {{[-v|--version]}}
{{1.2.3}} {{[-u|--urls]}} {{https://example.com/app.exe
https://example.com/app.msi ...}} {{[-s|--submit]}}
```

- Remove a version from winget-pkgs:

```
komac remove {{Package.Identifier}} {{[-v|--version]}}
{{1.2.3}}
```

- List all versions for a package:

```
komac {{[list|list-versions]}} {{Package.Identifier}}
```

- Sync your fork of winget-pkgs with the upstream repository:

```
komac {{[sync|sync-fork]}}
```

- Update the stored GitHub token:

```
komac token {{[add|update]}} {{[-t|--token]}}
{{your_github_token}}
```

- Generate shell autocompletion script:

```
komac {{[complete|autocomplete]}} {{bash|elvish|fish|
powershell|zsh}}
```

kompose

Convert docker-compose applications to Kubernetes.

More information: https://github.com/kubernetes/kompose.

- Deploy a dockerized application to Kubernetes:

  ```
  kompose up {{[-f|--file]}} {{docker-compose.yml}}
  ```

- Delete instantiated services/deployments from Kubernetes:

  ```
  kompose down {{[-f|--file]}} {{docker-compose.yml}}
  ```

- Convert a docker-compose file into Kubernetes resources file:

  ```
  kompose convert {{[-f|--file]}} {{docker-compose.yml}}
  ```

kool

Build software development environments.

More information: https://kool.dev/docs/commands-reference/kool.

- Create a project using a specific preset:

  ```
  kool create {{preset}} {{project_name}}
  ```

- Run a specific script defined in the `kool.yml` file in the current directory:

  ```
  kool run {{script}}
  ```

- Start/stop services in the current directory:

  ```
  kool {{start|stop}}
  ```

- Display status of the services in the current directory:

  ```
  kool status
  ```

- Update to the latest version:

  ```
  kool self-update
  ```

- Print the completion script for the specified shell:

  ```
  kool completion {{bash|fish|powershell|zsh}}
  ```

kopia

Fast, secure open-source backup tool.

Supports encryption, compression, deduplication, and incremental snapshots.

More information: https://kopia.io/docs/reference/command-line/.

- Create a repository in the local filesystem:

```
kopia repository create filesystem --path {{path/to/
local_repository}}
```

- Create a repository on Amazon S3:

```
kopia repository create s3 --bucket {{bucket_name}} --access-
key {{AWS_access_key_id}} --secret-access-key
{{AWS_secret_access_key}}
```

- Connect to a repository:

```
kopia repository connect {{repository_type}} --path {{path/
to/repository}}
```

- Create a snapshot of a directory:

```
kopia snapshot create {{path/to/directory}}
```

- List snapshots:

```
kopia snapshot list
```

- Restore a snapshot to a specific directory:

```
kopia snapshot restore {{snapshot_id}} {{path/to/
target_directory}}
```

- Create a new policy:

```
kopia policy set --global --keep-latest
{{number_of_snapshots_to_keep}} --compression
{{compression_algorithm}}
```

- Ignore a specific file or folder from backups:

```
kopia policy set --global --add-ignore {{path/to/
file_or_folder}}
```

kops

Create, destroy, upgrade, and maintain Kubernetes clusters.

More information: https://kops.sigs.k8s.io/cli/kops/.

- Create a cluster from the configuration specification:

```
kops create cluster {{[-f|--filename]}} {{cluster_name.yaml}}
```

- Create a new SSH public key:

```
kops create sshpublickey {{key_name}} {{[-i|--ssh-public-
key]}} {{~/.ssh/id_rsa.pub}}
```

- Export the cluster configuration to the `~/.kube/config` file:

```
kops export kubecfg {{cluster_name}}
```

- Get the cluster configuration as YAML:

```
kops get cluster {{cluster_name}} {{[-o|--output]}} yaml
```

- Delete a cluster:

```
kops delete cluster {{cluster_name}} {{[-y|--yes]}}
```

- Validate a cluster:

```
kops validate cluster {{cluster_name}} --wait
{{wait_time_until_ready}} --count
{{num_required_validations}}
```

kosmorro

Compute the ephemerides and the events for a date at a position on Earth.

More information: https://github.com/Kosmorro/kosmorro/blob/master/manpage/kosmorro.1.md.

- Get ephemerides for Paris, France:

```
kosmorro {{[-la|--latitude]}} 48.7996 {{[-lo|--longitude]}} 2.3511
```

- Get ephemerides for Paris, France, in the UTC+2 timezone:

```
kosmorro {{[-la|--latitude]}} 48.7996 {{[-lo|--longitude]}} 2.3511 {{[-t|--timezone]}} 2
```

- Get ephemerides for Paris, France, on June 9th, 2020:

```
kosmorro {{[-la|--latitude]}} 48.7996 {{[-lo|--longitude]}} 2.3511 {{[-d|--date]}} 2020-06-09
```

- Generate a PDF (Note: TeXLive must be installed):

```
kosmorro {{[-f|--format]}} pdf {{[-o|--output]}} {{path/to/file.pdf}}
```

kotlin

Kotlin application launcher.

More information: https://kotlinlang.org/docs/command-line.html#compile-a-library.

- Run a jar file:

```
kotlin {{filename.jar}}
```

- Display Kotlin and JVM version:

```
kotlin -version
```

kotlinc

Kotlin compiler.

More information: https://kotlinlang.org/docs/compiler-reference.html#common-options.

- Start a REPL (interactive shell):

```
kotlinc
```

- Compile a Kotlin file:

```
kotlinc {{path/to/file.kt}}
```

- Compile several Kotlin files:

```
kotlinc {{path/to/file1.kt path/to/file2.kt ...}}
```

- Execute a specific Kotlin Script file:

```
kotlinc -script {{path/to/file.kts}}
```

- Compile a Kotlin file into a self contained jar file with the Kotlin runtime library included:

```
kotlinc {{path/to/file.kt}} -include-runtime -d {{path/to/file.jar}}
```

kr

This command is an alias of **`kiterunner`**.

- View documentation for the original command:

  ```
  tldr kiterunner
  ```

krita

A sketching and painting program designed for digital artists.

See also: **gimp**.

More information: https://docs.krita.org/en/reference_manual/linux_command_line.html.

- Start Krita:

```
krita
```

- Open specific files:

```
krita {{path/to/image1 path/to/image2 ...}}
```

- Start without a splash screen:

```
krita --nosplash
```

- Start with a specific workspace:

```
krita --workspace {{Animation}}
```

- Start in fullscreen mode:

```
krita --fullscreen
```

krunvm

Create MicroVMs from OCI images.

More information: https://github.com/containers/krunvm/blob/main/docs/krunvm.1.txt.

- Create MicroVM based on Fedora:

```
krunvm create {{docker.io/fedora}} --cpus {{number_of_vcpus}} --mem {{memory_in_megabytes}} --name "{{name}}"
```

- Start a specific image:

```
krunvm start "{{image_name}}"
```

- List images:

```
krunvm list
```

- Change a specific image:

```
krunvm changevm --cpus {{number_of_vcpus}} --mem {{memory_in_megabytes}} --name "{{new_vm_name}}" "{{current_vm_name}}"
```

- Delete a specific image:

```
krunvm delete "{{image_name}}"
```

ksh

Korn Shell, a Bash-compatible command-line interpreter.

See also: `!`, `^`.

More information: https://manned.org/ksh.

- Start an interactive shell session:

```
ksh
```

- Execute specific [c]ommands:

```
ksh -c "{{echo 'ksh is executed'}}"
```

- Execute a specific script:

```
ksh {{path/to/script.ksh}}
```

- Check a specific script for syntax errors without executing it:

```
ksh -n {{path/to/script.ksh}}
```

- E[x]ecute a specific script, printing each command in the script before executing it:

```
ksh -x {{path/to/script.ksh}}
```

kube-capacity

Provide an overview of resource requests, limits, and utilization in a Kubernetes cluster.

Combine the best parts of **`kubectl top`** and **`kubectl describe`** into a CLI focused on cluster resources.

More information: https://github.com/robscott/kube-capacity.

- List nodes including the total CPU and Memory resource requests and limits:

  ```
  kube-capacity
  ```

- Include pods:

  ```
  kube-capacity {{[-p|--pods]}}
  ```

- Include utilization:

  ```
  kube-capacity {{[-u|--util]}}
  ```

kube-fzf

Shell commands for command-line fuzzy searching of Kubernetes Pods.

See also: **`kubectl`** for related commands.

More information: https://github.com/thecasualcoder/kube-fzf.

- Get pod details (from current namespace):

```
findpod
```

- Get pod details (from all namespaces):

```
findpod -a
```

- Describe a pod:

```
describepod
```

- Tail pod logs:

```
tailpod
```

- Exec into a pod's container:

```
execpod {{shell_command}}
```

- Port-forward a pod:

```
pfpod {{port_number}}
```

kubeadm

Interface for creating and managing Kubernetes clusters.

More information: https://kubernetes.io/docs/reference/setup-tools/kubeadm/.

- Create a Kubernetes control plane:

```
kubeadm init
```

- Bootstrap a Kubernetes worker node and join it to a cluster:

```
kubeadm join --token {{token}}
```

- Create a new bootstrap token with a TTL of 12 hours:

```
kubeadm token create --ttl {{12h0m0s}}
```

- Check if the Kubernetes cluster is upgradeable and which versions are available:

```
kubeadm upgrade plan
```

- Upgrade Kubernetes cluster to a specified version:

```
kubeadm upgrade apply {{version}}
```

- View the kubeadm ConfigMap containing the cluster's configuration:

```
kubeadm config view
```

- Revert changes made to the host by 'kubeadm init' or 'kubeadm join':

```
kubeadm reset
```

kubectl annotate

Annotates Kubernetes resources.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_annotate/.

- Annotate a pod:

```
kubectl annotate {{[po|pods]}} {{pod_name}} {{key}}={{value}}
```

- Update a pod annotation by overwriting the existing value:

```
kubectl annotate {{[po|pods]}} {{pod_name}} {{key}}={{value}} --overwrite
```

- Annotate all pods in a namespace with a specific label selector:

```
kubectl annotate {{[po|pods]}} {{key}}={{value}} {{[-l|--selector]}} {{label_key}}={{label_value}}
```

- List all annotations a pod has:

```
kubectl annotate {{[po|pods]}} {{pod_name}} --list
```

- Remove the annotation from a pod:

```
kubectl annotate {{[po|pods]}} {{pod_name}} {{key}}-
```

kubectl api-resources

Print the supported API resources on the server.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_api-resources/.

- Print the supported API resources:

```
kubectl api-resources
```

- Print the supported API resources with more information:

```
kubectl api-resources {{[-o|--output]}} wide
```

- Print the supported API resources sorted by a column:

```
kubectl api-resources --sort-by {{name}}
```

- Print the supported namespaced resources:

```
kubectl api-resources --namespaced
```

- Print the supported non-namespaced resources:

```
kubectl api-resources --namespaced=false
```

- Print the supported API resources with a specific API group:

```
kubectl api-resources --api-group {{api_group}}
```

kubectl api-versions

Print the supported API versions on the server, in the form of "group/version".

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_api-versions/.

- Print the supported API versions on the server, in the form of "group/version":

```
kubectl api-versions
```

kubectl apply

Manage applications through files defining Kubernetes resources.

Create and update resources in a cluster.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_apply/.

- Apply a configuration to a resource by file name:

  ```
  kubectl apply {{[-f|--filename]}} {{path/to/file}}
  ```

- Apply a configuration to a resource from `kustomization.yaml` in a directory:

  ```
  kubectl apply {{[-k|--kustomize]}} {{path/to/directory}}
  ```

- Apply a configuration to a resource by `stdin`:

  ```
  {{cat pod.json}} | kubectl apply {{[-f|--filename]}} -
  ```

- Edit the latest last-applied-configuration annotations of resources from the default editor:

  ```
  kubectl apply edit-last-applied {{[-f|--filename]}} {{path/to/file}}
  ```

- Set the latest last-applied-configuration annotations by setting it to match the contents of a file:

  ```
  kubectl apply set-last-applied {{[-f|--filename]}} {{path/to/file}}
  ```

- View the latest last-applied-configuration annotations by type/name or file:

  ```
  kubectl apply view-last-applied {{[-f|--filename]}} {{path/to/file}}
  ```

kubectl attach

Attach to a process that is already running inside an existing container.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_attach/.

- Get output from a pod:

```
kubectl attach {{pod_name}}
```

- Get output from a container in the specified pod:

```
kubectl attach {{pod_name}} {{[-c|--container]}} {{container_name}}
```

- Get output from the first pod of a replica set:

```
kubectl attach {{[rs|replicaset]}}/{{replicaset_name}}
```

- Create an interactive session with a pod:

```
kubectl attach {{pod_name}} {{[-it|--stdin --tty]}}
```

- Create an interactive session with a specific container from a pod:

```
kubectl attach {{pod_name}} {{[-c|--container]}} {{container_name}} {{[-it|--stdin --tty]}}
```

kubectl auth

Inspect access permissions in a Kubernetes cluster.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_auth/.

- Check if the current user can perform all actions on all resources in a specific namespace:

```
kubectl auth can-i '*' '*' {{[-n|--namespace]}} {{namespace}}
```

- Check if the current user can perform a specific verb on a specific resource:

```
kubectl auth can-i {{verb}} {{resource}} {{[-n|--namespace]}} {{namespace}}
```

- Check if a specific user or service account can perform an action on a resource:

```
kubectl auth can-i {{verb}} {{resource}} {{[-n|--namespace]}} {{namespace}} --as {{user_or_sa}}
```

- List all actions the current user is allowed to perform in a namespace:

```
kubectl auth can-i --list {{[-n|--namespace]}} {{namespace}}
```

kubectl autoscale

Create an autoscaler to intelligently scale pod count based on kubernetes cluster demands.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_autoscale/.

- Auto scale a deployment with no target CPU utilization specified:

```
kubectl autoscale {{[deploy|deployment]}} {{deployment_name}}
--min {{min_replicas}} --max {{max_replicas}}
```

- Auto scale a deployment with target CPU utilization:

```
kubectl autoscale {{[deploy|deployment]}} {{deployment_name}}
--max {{max_replicas}} --cpu-percent {{target_cpu}}
```

kubectl certificate

Manage certificate signing requests.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_certificate/.

- Approve a certificate signing request by name:

```
kubectl certificate approve {{csr_name}}
```

- Deny a certificate signing request by name:

```
kubectl certificate deny {{csr_name}}
```

- Approve a certificate signing request defined in a manifest file:

```
kubectl certificate approve --filename {{path/to/csr.yaml}}
```

- Deny a certificate signing request defined in a manifest file:

```
kubectl certificate deny --filename {{path/to/csr.yaml}}
```

- Force reapproval of a certificate signing request that was previously denied:

```
kubectl certificate approve --force {{csr_name}}
```

kubectl cluster-info

Display endpoint information about the Kubernetes master and services in the cluster.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_cluster-info/.

- Show basic cluster information:

```
kubectl cluster-info
```

- Dump current cluster state to `stdout` (for debugging):

```
kubectl cluster-info dump
```

- Dump cluster state to a directory:

```
kubectl cluster-info dump --output-directory {{path/to/directory}}
```

- Use a specific kubeconfig context:

```
kubectl cluster-info --context {{context_name}}
```

kubectl completion

Generate shell completion code for **`kubectl`** commands.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_completion/.

- Print the completion script for Bash, Zsh, fish, or PowerShell:

```
kubectl completion {{bash|zsh|fish|powershell}}
```

- Load Bash or Zsh completions into the current shell session:

```
source <(kubectl completion {{bash|zsh}})
```

- Append Bash completion script to `~/.bashrc`:

```
kubectl completion bash >> ~/.bashrc
```

- Write Zsh completion script to a file in the `fpath`:

```
kubectl completion zsh > "${fpath[1]}/_kubectl"
```

- Load fish completions into the current shell session:

```
kubectl completion fish | source
```

- Persist fish completions:

```
kubectl completion fish > ~/.config/fish/completions/kubectl.fish
```

- Load PowerShell completions into the current shell session:

```
kubectl completion powershell | Out-String | Invoke-Expression
```

- Persist PowerShell completions:

```
kubectl completion powershell >> $PROFILE
```

kubectl config

Manage Kubernetes configuration (kubeconfig) files for accessing clusters via **`kubectl`** or the Kubernetes API.

By default, the Kubernetes will get its configuration from **`${HOME}/.kube/config`**.

See also: **`kubectx`**, **`kubens`**.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_config/.

- Get all contexts in the default kubeconfig file:

```
kubectl config get-contexts
```

- Get all clusters/contexts/users in a custom kubeconfig file:

```
kubectl config {{get-clusters|get-contexts|get-users}} --
kubeconfig {{path/to/kubeconfig.yaml}}
```

- Get the current context:

```
kubectl config current-context
```

- Set the default namespace of the current context:

```
kubectl config set-context --current --namespace
{{namespace}}
```

- Switch to another context:

```
kubectl config {{[use|use-context]}} {{context_name}}
```

- Delete clusters/contexts/users:

```
kubectl config {{delete-cluster|delete-context|delete-user}}
{{cluster|context|user}}
```

- Permanently add custom kubeconfig files:

```
export KUBECONFIG="{{path/to/kubeconfig1.yaml}}:{{path/to/
kubeconfig2.yaml}}"
```

kubectl cordon

Mark a node as unschedulable, preventing new pods from being assigned to it.

See also: **`kubectl uncordon`**.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_cordon/.

- Mark a node as unschedulable:

```
kubectl cordon {{node_name}}
```

- Mark multiple nodes as unschedulable:

```
kubectl cordon {{node_name1 node_name2 ...}}
```

- Mark a node as unschedulable in a specific context:

```
kubectl cordon {{node_name}} --context {{context_name}}
```

- Mark nodes matching a label selector as unschedulable:

```
kubectl cordon {{[-l|--selector]}} {{label_key}}
={{label_value}}
```

- Preview the changes without actually cordoning the nodes (dry run):

```
kubectl cordon {{node_name}} --dry-run={{none|server|client}}
```

kubectl cp

Copy files and directories between a local filesystem and a container in a pod.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_cp/.

- Copy a local file or directory to a pod:

```
kubectl cp {{path/to/local_file}} {{pod_name}}:/{{path/to/file_in_pod}}
```

- Copy a local file or directory to a pod in a specific namespace:

```
kubectl cp {{path/to/local_file}} {{namespace}}/{{pod_name}}:/{{path/to/file_in_pod}}
```

- Copy a file or directory from a pod to the local machine:

```
kubectl cp {{namespace}}/{{pod_name}}:/{{path/to/file_in_pod}} {{path/to/local_file}}
```

- Copy a file or directory to a specific container in a pod:

```
kubectl cp {{path/to/local_file}} {{pod_name}}:/{{path/to/file_in_pod}} {{[-c|--container]}} {{container_name}}
```

- Copy a file or directory to a pod without preserving ownership and permissions:

```
kubectl cp {{path/to/local_file}} {{namespace}}/{{pod_name}}:/{{path/to/file_in_pod}} --no-preserve
```

- Copy a local file or directory to a pod with retries on failure:

```
kubectl cp {{path/to/local_file}} {{pod_name}}:/{{path/to/file_in_pod}} --retries {{3}}
```

kubectl create

Create a resource from a file or from **`stdin`**.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_create/.

- Create a resource using the resource definition file:

```
kubectl create {{[-f|--filename]}} {{path/to/file.yml}}
```

- Create a resource from `stdin`:

```
kubectl create {{[-f|--filename]}} -
```

- Create a deployment:

```
kubectl create {{[deploy|deployment]}} {{deployment_name}} --image {{image}}
```

- Create a deployment with replicas:

```
kubectl create {{[deploy|deployment]}} {{deployment_name}} --image {{image}} --replicas {{number_of_replicas}}
```

- Create a service:

```
kubectl create {{[svc|service]}} {{service_type}} {{service_name}} --tcp {{port}}:{{target_port}}
```

- Create a namespace:

```
kubectl create {{[ns|namespace]}} {{namespace_name}}
```

kubectl debug

Debug cluster resources using interactive debugging containers.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_debug/.

- Create an interactive debugging session in a pod and immediately attach to it:

```
kubectl debug {{pod_name}} {{[-it|--stdin --tty]}} --image busybox
```

- Create a debug container with a custom image and name:

```
kubectl debug --image {{image}} {{[-c|--container]}} {{container_name}} {{pod_name}}
```

- Create an interactive debugging session on a node and immediately attach to it (the container will run in the host namespaces and the host's filesystem will be mounted at `/host`):

```
kubectl debug node/{{node_name}} {{[-it|--stdin --tty]}} --image busybox
```

- Create a copy of a pod and add a debug container to it:

```
kubectl debug {{pod_name}} {{[-it|--stdin --tty]}} --image {{image}} --copy-to {{pod_copy_name}}
```

- Create a copy of a pod and change the command of a specific container:

```
kubectl debug {{pod_name}} {{[-it|--stdin --tty]}} --copy-to {{pod_copy_name}} --container {{container_name}} -- {{command}}
```

- Create a copy of a pod and change the image of a specific container:

```
kubectl debug {{pod_name}} --copy-to {{pod_copy_name}} --set-image {{container_name}}={{image}}
```

- Create a copy of a pod and change all container images:

```
kubectl debug {{pod_name}} --copy-to {{pod_copy_name}} --set-image '*={{image}}'
```

- Create an ephemeral debug container and target a specific container (useful for debugging distroless containers):

```
kubectl debug {{pod_name}} {{[-it|--stdin --tty]}} --image
{{image}} --target {{target_container_name}}
```

kubectl delete

Delete Kubernetes resources.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_delete/.

- Delete a specific pod:

```
kubectl delete {{[po|pods]}} {{pod_name}}
```

- Delete a specific deployment:

```
kubectl delete {{[deploy|deployments]}} {{deployment_name}}
```

- Delete a specific node:

```
kubectl delete {{[no|nodes]}} {{node_name}}
```

- Delete all pods in a specified namespace:

```
kubectl delete {{[po|pods]}} --all {{[-n|--namespace]}} {{namespace}}
```

- Delete all deployments and services in a specified namespace:

```
kubectl delete {{[deploy|deployments]}},{{[svc|services]}} --all {{[-n|--namespace]}} {{namespace}}
```

- Delete all nodes:

```
kubectl delete {{[no|nodes]}} --all
```

- Delete resources defined in a YAML manifest:

```
kubectl delete {{[-f|--filename]}} {{path/to/manifest.yaml}}
```

kubectl describe

Show details of Kubernetes resources.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_describe/.

- Show details of pods in a namespace:

```
kubectl describe {{[po|pods]}} {{[-n|--namespace]}} {{namespace}}
```

- Show details of nodes in a namespace:

```
kubectl describe {{[no|nodes]}} {{[-n|--namespace]}} {{namespace}}
```

- Show the details of a specific pod in a namespace:

```
kubectl describe {{[po|pods]}} {{pod_name}} {{[-n|--namespace]}} {{namespace}}
```

- Show the details of a specific node in a namespace:

```
kubectl describe {{[no|nodes]}} {{node_name}} {{[-n|--namespace]}} {{namespace}}
```

- Show details of Kubernetes objects defined in a YAML manifest file:

```
kubectl describe {{[-f|--filename]}} {{path/to/manifest.yaml}}
```

kubectl diff

Check differences between live resources and files.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_diff/.

- View differences between the live resource and file definition:

```
kubectl diff {{[-f|--filename]}} {{path/to/filename}}
```

kubectl drain

Drain a node in preparation for maintenance by marking it unschedulable and evicting all pods.

See also: **`kubectl cordon`**, **`kubectl uncordon`**.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_drain/.

- Drain a node:

```
kubectl drain {{node_name}}
```

- Drain a node, ignoring DaemonSet-managed pods:

```
kubectl drain {{node_name}} --ignore-daemonsets
```

- Drain a node and delete pods using emptyDir volumes (local data will be lost):

```
kubectl drain {{node_name}} --ignore-daemonsets --delete-emptydir-data
```

- Drain a node, forcing eviction of pods not managed by a controller:

```
kubectl drain {{node_name}} --force
```

- Drain a node with a custom grace period for pod termination:

```
kubectl drain {{node_name}} --grace-period {{seconds}}
```

- Drain a node, evicting only pods that match a label selector:

```
kubectl drain {{node_name}} --pod-selector {{label_key}}={{label_value}}
```

- Drain a node with a timeout:

```
kubectl drain {{node_name}} --timeout {{duration}}
```

- Preview the drain operation without actually evicting pods (dry run):

```
kubectl drain {{node_name}} --dry-run={{none|server|client}}
```

kubectl edit

Edit Kubernetes resources.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_edit/.

- Edit a pod in the default namespace:

```
kubectl edit {{[po|pods]}}/{{pod_name}}
```

- Edit a deployment in the default namespace:

```
kubectl edit {{[deploy|deployment]}}/{{deployment_name}}
```

- Edit a service in the default namespace:

```
kubectl edit {{[svc|service]}}/{{service_name}}
```

- Edit all entries of a given resource in a given namespace:

```
kubectl edit {{resource}} {{[-n|--namespace]}} {{namespace}}
```

- Edit a resource using a specific editor:

```
KUBE_EDITOR={{nano}} kubectl edit {{resource}}/
{{resource_name}}
```

- Edit a resource in JSON format:

```
kubectl edit {{resource}}/{{resource_name}} {{[-o|--output]}}
json
```

kubectl events

Display resource events.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_events/.

- Show events in the default namespace:

```
kubectl events
```

- Show events in all namespaces:

```
kubectl events {{[-A|--all-namespaces]}}
```

- Watch events in a specific namespace:

```
kubectl events {{[-w|--watch]}} {{[-n|--namespace]}} {{namespace}}
```

- Show events for a pod in a specific namespace:

```
kubectl events --for {{pod}}/{{pod_name}} {{[-n|--namespace]}} {{namespace}}
```

- Show events for a resource in a specific namespace:

```
kubectl events --for {{resource}}/{{resource_name}} {{[-n|--namespace]}} {{namespace}}
```

- Show events for type `Warning` or `Normal`:

```
kubectl events --types Warning,Normal
```

- Output events in YAML format:

```
kubectl events {{[-o|--output]}} yaml
```

kubectl exec

Execute a command in a container.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_exec/.

- Open Bash in a pod, using the first container by default:

```
kubectl exec {{pod_name}} {{[-it|--stdin --tty]}} -- bash
```

kubectl explain

Display the documentation of a Kubernetes API resource, including available fields and descriptions.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_explain/.

- Show documentation for a resource:

```
kubectl explain {{pods|nodes|deployments|...}}
```

- Show documentation for a sub-resource or field of an object:

```
kubectl explain {{pod.spec.containers}}
```

- Show documentation for a specific versioned resource:

```
kubectl explain {{ingress.v1.networking.k8s.io}}
```

- Show all fields recursively for a resource:

```
kubectl explain {{[po|pods]}} --recursive
```

- Display help:

```
kubectl explain --help
```

kubectl expose

Expose a resource as a new Kubernetes service.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_expose/.

- Create a service for a resource, which will be served from container port to node port:

```
kubectl expose {{resource_type}} {{resource_name}} --port {{node_port}} --target-port {{container_port}}
```

- Create a service for a resource identified by a file:

```
kubectl expose {{[-f|--filename]}} {{path/to/file.yml}} --port {{node_port}} --target-port {{container_port}}
```

- Create a service with a name, to serve to a node port which will be same for container port:

```
kubectl expose {{resource_type}} {{resource_name}} --port {{node_port}} --name {{service_name}}
```

kubectl get

Get Kubernetes objects and resources.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_get/.

- Get all namespaces in the current cluster:

```
kubectl get {{[ns|namespaces]}}
```

- Get nodes in a specified namespace:

```
kubectl get {{[no|nodes]}} {{[-n|--namespace]}} {{namespace}}
```

- Get pods in a specified namespace:

```
kubectl get {{[po|pods]}} {{[-n|--namespace]}} {{namespace}}
```

- Get deployments in a specified namespace:

```
kubectl get {{[deploy|deployments]}} {{[-n|--namespace]}} {{namespace}}
```

- Get services in a specified namespace:

```
kubectl get {{[svc|services]}} {{[-n|--namespace]}} {{namespace}}
```

- Get other resources:

```
kubectl get {{persistentvolumeclaims|secret|...}}
```

- Get all resources in all namespaces:

```
kubectl get all {{[-A|--all-namespaces]}}
```

- Get Kubernetes objects defined in a YAML manifest file:

```
kubectl get {{[-f|--filename]}} {{path/to/manifest.yaml}}
```

kubectl kustomize

Build a set of Kubernetes resources using a **`kustomization.yaml`** file.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_kustomize/.

- Build resources from the current directory:

```
kubectl kustomize
```

- Build resources from a specific directory:

```
kubectl kustomize {{path/to/directory}}
```

- Build resources from a remote URL:

```
kubectl kustomize {{https://github.com/user/repo/path}}
```

- Build resources and save to a file:

```
kubectl kustomize {{path/to/directory}} > {{output.yaml}}
```

- Build resources with load restrictor disabled:

```
kubectl kustomize --load-restrictor {{LoadRestrictionsNone}} {{path/to/directory}}
```

kubectl label

Label Kubernetes resources.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_label/.

- Label a pod:

```
kubectl label {{[po|pods]}} {{pod_name}} {{key}}={{value}}
```

- Update a pod label by overwriting the existing value:

```
kubectl label {{[po|pods]}} {{pod_name}} {{key}}={{value}} --overwrite
```

- Label all pods in the namespace:

```
kubectl label {{[po|pods]}} {{key}}={{value}} --all
```

- Label a pod identified by the pod definition file:

```
kubectl label {{[-f|--filename]}} {{pod_definition_file}} {{key}}={{value}}
```

- Remove the label from a pod:

```
kubectl label {{[po|pods]}} {{pod_name}} {{key}}-
```

kubectl logs

Show logs for containers in a pod.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_logs/.

- Show logs for a single-container pod:

```
kubectl logs {{pod_name}}
```

- Show logs for a specified container in a pod:

```
kubectl logs {{[-c|--container]}} {{container_name}} {{pod_name}}
```

- Show logs for all containers in a pod:

```
kubectl logs --all-containers={{true}} {{pod_name}}
```

- Stream pod logs:

```
kubectl logs {{[-f|--follow]}} {{pod_name}}
```

- Show pod logs newer than a relative time like `10s`, `5m`, or `1h`:

```
kubectl logs --since {{relative_time}} {{pod_name}}
```

- Show the 10 most recent logs in a pod:

```
kubectl logs --tail {{10}} {{pod_name}}
```

- Show all pod logs for a given deployment:

```
kubectl logs {{[deploy|deployment]}}/{{deployment_name}}
```

kubectl patch

Patch Kubernetes resources with new values.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_patch/.

- Partially patch a secret using a strategic merge JSON patch to remove the finalizer:

```
kubectl patch secrets {{secret_name}} {{[-p|--patch]}} '{"metadata":{"finalizers": []\}\}' --type merge
```

- Partially patch a secret using a strategic merge YAML patch to remove the finalizer:

```
kubectl patch secrets {{secret_name}} {{[-p|--patch]}} $'metadata:\n finalizers: []' --type merge
```

- Partially patch a pod's container using a JSON patch with positional arrays:

```
kubectl patch {{[po|pods]}} {{pod_name}} --type 'json' {{[-p|--patch]}} '[{"op": "replace", "path": "/spec/containers/0/image", "value":"{{new_image_value}}"}]'
```

- Update a deployment's replicas through the scale subresource using a strategic merge JSON patch:

```
kubectl patch {{[deploy|deployments]}} {{deployment_name}} --subresource 'scale' --type 'merge' {{[-p|--patch]}} '{"spec":{"replicas":{{number_of_replicas}}\}\}'
```

kubectl plugin

Manage kubectl plugins that extend the functionality of the command.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_plugin/.

- List all available plugins on the system `$PATH`:

  ```
  kubectl plugin list
  ```

- List only the executable names of available plugins without full paths:

  ```
  kubectl plugin list --name-only
  ```

- Display help:

  ```
  kubectl plugin {{[-h|--help]}}
  ```

kubectl port-forward

Forward one or more local ports to a pod.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_port-forward/.

- Forward local ports 5000 and 6000 to the pod ports 5000 and 6000:

```
kubectl port-forward {{[po|pods]}}/{{pod_name}} 5000 6000
```

- Forward a random local port to the pod port 5000:

```
kubectl port-forward {{[po|pods]}}/{{pod_name}} :5000
```

- Forward local ports 5000 and 6000 to the deployment ports 5000 and 6000:

```
kubectl port-forward {{[deploy|deployment]}}/
{{deployment_name}} 5000 6000
```

- Forward local port 8443 to the service port named https:

```
kubectl port-forward {{[svc|service]}}/{{service_name}}
8443:https
```

- Forward port 8888 on all addresses to the pod port 5000:

```
kubectl port-forward {{[po|pods]}}/{{pod_name}} 8888:5000 --
address 0.0.0.0
```

- Forward port 8888 on localhost and selected IP to the pod port 5000:

```
kubectl port-forward {{[po|pods]}}/{{pod_name}} 8888:5000 --
address localhost,{{10.19.21.23}}
```

kubectl proxy

Create a proxy server or application-level gateway between localhost and the Kubernetes API server.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_proxy/.

- Run a proxy using the default settings on port 8001 and listen on localhost:

```
kubectl proxy
```

- Proxy part of the Kubernetes API while serving static files from a local directory:

```
kubectl proxy {{[-w|--www]}} {{path/to/static_dir}} {{[-P|--www-prefix]}} {{/static_prefix/}} --api-prefix {{/api_subset/}}
```

- Proxy the entire Kubernetes API under a custom prefix:

```
kubectl proxy --api-prefix {{/custom_prefix/}}
```

- Serve the Kubernetes API on a specific port while also serving static content:

```
kubectl proxy {{[-p|--port]}} {{port}} {{[-w|--www]}} {{path/to/static_dir}}
```

- Run a proxy on a random local port, printing the chosen port to `stdout`:

```
kubectl proxy {{[-p|--port]}} 0
```

- Run the proxy on a Unix domain socket instead of a TCP port:

```
kubectl proxy {{[-u|--unix-socket]}} {{path/to/socket}}
```

- Accept connections from remote hosts by listening on all interfaces (use caution when exposing the proxy publicly):

```
kubectl proxy --address 0.0.0.0 --accept-hosts '.*'
```

- Allow only selected API paths while rejecting sensitive endpoints:

```
kubectl proxy --accept-paths '^/api/v1/namespaces/default/.*' --reject-paths '^/api/.*/pods/.*/exec'
```

kubectl replace

Replace a resource by file or **`stdin`**.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_replace/.

- Replace the resource using the resource definition file:

```
kubectl replace {{[-f|--filename]}} {{path/to/file.yml}}
```

- Replace the resource using the input passed into `stdin`:

```
kubectl replace {{[-f|--filename]}} -
```

- Force replace, delete and then re-create the resource:

```
kubectl replace {{[-f|--filename]}} {{path/to/file.yml}} --force
```

kubectl rollout

Manage the rollout of a Kubernetes resource (deployments, daemonsets, and statefulsets).

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_rollout/.

- Start a rolling restart of a resource:

```
kubectl rollout restart {{resource_type}}/{{resource_name}}
```

- Watch the rolling update status of a resource:

```
kubectl rollout status {{resource_type}}/{{resource_name}}
```

- Roll back a resource to the previous revision:

```
kubectl rollout undo {{resource_type}}/{{resource_name}}
```

- View the rollout history of a resource:

```
kubectl rollout history {{resource_type}}/{{resource_name}}
```

kubectl run

Run pods in Kubernetes.

Specifies pod generator to avoid deprecation error in some K8S versions.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_run/.

- Run an nginx pod and expose port 80:

```
kubectl run {{nginx-dev}} --image nginx --port 80
```

- Run an nginx pod, setting the `$TEST_VAR` environment variable:

```
kubectl run {{nginx-dev}} --image nginx --env "{{TEST_VAR}}
={{testing}}"
```

- Show API calls that would be made to create an nginx container:

```
kubectl run {{nginx-dev}} --image nginx --dry-run={{none|
server|client}}
```

- Run an Ubuntu pod interactively, never restart it, and remove it when it exits:

```
kubectl run {{temp-ubuntu}} --image ubuntu:22.04 --restart
Never --rm -- /bin/bash
```

- Run an Ubuntu pod, overriding the default command with echo, and specifying custom arguments:

```
kubectl run {{temp-ubuntu}} --image ubuntu:22.04 --command --
echo {{argument1 argument2 ...}}
```

kubectl scale

Set a new size for a deployment, replica set, replication controller, or stateful set.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_scale/.

- Scale a replica set:

```
kubectl scale --replicas {{replicas_count}} rs/{{replica_name}}
```

- Scale a resource identified by a file:

```
kubectl scale --replicas {{replicas_count}} {{[-f|--filename]}} {{path/to/file.yml}}
```

- Scale a deployment based on current number of replicas:

```
kubectl scale --replicas {{replicas_count}} --current-replicas {{current_replicas}} {{[deploy|deployment]}}/{{deployment_name}}
```

kubectl set

Update fields of existing application resources.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_set/.

- Update the image of a container in a deployment:

```
kubectl set image {{[deploy|deployment]}}/{{deployment_name}}
{{container_name}}={{image}}
```

- Update the image of all containers in a deployment:

```
kubectl set image {{[deploy|deployment]}}/{{deployment_name}}
*={{image}}
```

- Set resource limits (CPU and memory) on a deployment:

```
kubectl set resources {{[deploy|deployment]}}/
{{deployment_name}} --limits
cpu={{cpu_limit}},memory={{memory_limit}}
```

- Set an environment variable on a deployment:

```
kubectl set env {{[deploy|deployment]}}/{{deployment_name}}
{{variable_name}}={{value}}
```

- Remove an environment variable from a deployment:

```
kubectl set env {{[deploy|deployment]}}/{{deployment_name}}
{{variable_name}}-
```

- Import environment variables from a secret or ConfigMap:

```
kubectl set env --from {{secret|configmap}}/{{resource_name}}
{{[deploy|deployment]}}/{{deployment_name}}
```

- Update the service account of a deployment:

```
kubectl set {{[sa|serviceaccount]}} {{[deploy|deployment]}}/
{{deployment_name}} {{service_account_name}}
```

kubectl taint

Update the taints on nodes.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_taint/.

- Apply taint to a node:

```
kubectl taint {{[no|nodes]}} {{node_name}} {{label_key}}
={{label_value}}:{{effect}}
```

- Remove taint from a node:

```
kubectl taint {{[no|nodes]}} {{node_name}} {{label_key}}:
{{effect}}-
```

- Remove all taints from a node:

```
kubectl taint {{[no|nodes]}} {{node_name}} {{label_key}}-
```

kubectl top

See the resource consumption for nodes or pods.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_top/.

- Get the resource consumption of all nodes:

```
kubectl top {{[no|nodes]}}
```

- Get resource consumption of a specific node:

```
kubectl top {{[no|nodes]}} {{node_name}}
```

- Get resource consumption of all pods:

```
kubectl top {{[po|pods]}}
```

- Get resource consumption of a specific pod:

```
kubectl top {{[po|pods]}} {{pod_name}}
```

- Get resource consumption of all pods in a namespace:

```
kubectl top {{[po|pods]}} {{[-n|--namespace]}} {{namespace_name}}
```

- Get resource consumption of all containers in a pod:

```
kubectl top {{[po|pods]}} --containers
```

- Get resource consumption of all pods with the specified label:

```
kubectl top {{[po|pods]}} {{[-l|--selector]}} {{key=value}}
```

kubectl uncordon

Mark a node as schedulable, allowing new pods to be assigned to it.

See also: **`kubectl cordon`**.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_uncordon/.

- Mark a node as schedulable:

```
kubectl uncordon {{node_name}}
```

- Mark multiple nodes as schedulable:

```
kubectl uncordon {{node_name1 node_name2 ...}}
```

- Mark a node as schedulable in a specific context:

```
kubectl uncordon {{node_name}} --context {{context_name}}
```

- Mark nodes matching a label selector as schedulable:

```
kubectl uncordon {{[-l|--selector]}} {{label_key}}
={{label_value}}
```

- Preview the changes without actually uncordoning the nodes (dry run):

```
kubectl uncordon {{node_name}} --dry-run={{none|server|
client}}
```

kubectl version

Print the client and server version information for the current context.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_version/.

- Print the client and server version information for the current context:

```
kubectl version
```

- Print the client version only for the current context:

```
kubectl version --client
```

- Output the client and server version information for the current context in JSON:

```
kubectl version {{[-o|--output]}} json
```

- Output the client and server version information for the current context in YAML:

```
kubectl version {{[-o|--output]}} yaml
```

kubectl wait

Wait for resource(s) to reach a certain state.

More information: https://kubernetes.io/docs/reference/kubectl/generated/kubectl_wait/.

- Wait for a deployment to become available:

```
kubectl wait --for condition=available deployment/{{deployment_name}}
```

- Wait for all pods with a certain [l]abel to be ready:

```
kubectl wait --for condition=ready pod {{[-l|--selector]}} {{label_key}}={{label_value}}
```

- Wait for a pod to be deleted:

```
kubectl wait --for delete pod {{pod_name}}
```

- Wait for a job to complete, within 120 seconds (if the condition isn't met on time, the exit status will be unsuccessful):

```
kubectl wait --for condition=complete job/{{job_name}} --timeout 120s
```

kubectl

Run commands against Kubernetes clusters.

Some subcommands such as **`run`** have their own usage documentation.

More information: https://kubernetes.io/docs/reference/kubectl/.

- List information about a resource with more details:

```
kubectl get {{pod|service|deployment|ingress|...}} {{[-o|--output]}} wide
```

- Update specified pod with the label `unhealthy` and the value `true`:

```
kubectl label pods {{name}} unhealthy=true
```

- List all resources with different types:

```
kubectl get all
```

- Display resource (CPU/Memory/Storage) usage of nodes or pods:

```
kubectl top {{pods|node}}
```

- Print the address of the master and cluster services:

```
kubectl cluster-info
```

- Display an explanation of a specific field:

```
kubectl explain {{pods.spec.containers}}
```

- Print the logs for a container in a pod or specified resource:

```
kubectl logs {{pod_name}}
```

- Run command in an existing pod:

```
kubectl exec {{pod_name}} -- {{ls /}}
```

kubectx

Utility to manage and switch between **`kubectl`** contexts.

More information: https://manned.org/kubectx.

- List the contexts:

  ```
  kubectx
  ```

- Switch to a named context:

  ```
  kubectx {{name}}
  ```

- Switch to the previous context:

  ```
  kubectx -
  ```

- Rename a named context:

  ```
  kubectx {{alias}}={{name}}
  ```

- Show the current named context:

  ```
  kubectx {{[-c|--current]}}
  ```

- Delete a named context:

  ```
  kubectx -d {{name}}
  ```

kubens

Utility to switch between Kubernetes namespaces.

More information: https://manned.org/kubens.

- List the namespaces:

```
kubens
```

- Change the active namespace:

```
kubens {{name}}
```

- Switch to the previous namespace:

```
kubens -
```

kubeseal

Client-side utility for encrypting Kubernetes secrets using the Bitnami Sealed Secrets controller.

Creates SealedSecret resources that can be safely stored in version control.

Requires a controller running in the cluster (e.g., installed via **`kubectl apply --filename controller.yaml`**).

More information: https://github.com/bitnami-labs/sealed-secrets.

- Encrypt a Kubernetes secret from a YAML file into a SealedSecret (default JSON output):

```
kubeseal < {{secret.yaml}} > {{sealedsecret.json}}
```

- Encrypt a secret, outputting it in YAML or JSON format, using a bearer token for API authentication:

```
kubeseal < {{secret.yaml}} {{[-o|--format]}} {{yaml|json}} --token {{my-bearer-token}} > {{sealedsecret.yaml}}
```

- Seal a secret using a specific controller namespace of sealed-secrets controller and name:

```
kubeseal < {{secret.yaml}} --controller-namespace {{controller-namespace}} --controller-name {{controller-name}} > {{sealedsecret.yaml}}
```

- Encrypt a raw secret value from a file with a specified name and scope:

```
kubeseal --raw --from-file {{path/to/secret.txt}} --name {{my-secret}} --scope {{strict|namespace-wide|cluster-wide}} > {{sealedsecret.yaml}}
```

- Fetch the controller's public certificate for offline sealing with basic auth:

```
kubeseal --fetch-cert --username {{username}} --password {{password}} > {{cert.pem}}
```

- Seal a secret offline using a fetched certificate:

```
kubeseal < {{secret.yaml}} --cert {{cert.pem}} > {{sealedsecret.yaml}}
```

- Merge a secret into an existing SealedSecret file in-place:

```
kubeseal < {{secret.yaml}} --merge-into {{sealedsecret.yaml}}
```

- Validate a SealedSecret without applying it:

```
kubeseal < {{sealedsecret.yaml}} --validate
```

kubetail

Utility to tail multiple Kubernetes pod logs at the same time.

More information: https://github.com/johanhaleby/kubetail.

- Tail the logs of multiple pods (whose name starts with `app_name`) in one go:

```
kubetail {{app_name}}
```

- Tail only a specific container from multiple pods:

```
kubetail {{app_name}} {{[-c|--container]}} {{container_name}}
```

- Tail multiple containers from multiple pods:

```
kubetail {{app_name}} {{[-c|--container]}}
{{container_name_1}} {{[-c|--container]}}
{{container_name_2}}
```

- Tail multiple applications at the same time separate them by comma:

```
kubetail {{app_name_1,app_name_2,...}}
```

kubie

Utility to switch between **`kubectl`** contexts and namespaces.

More information: https://github.com/sbstp/kubie#usage.

- Display a selectable menu of contexts:

```
kubie ctx
```

- Switch current shell to the given context:

```
kubie ctx {{context}}
```

- Switch current shell to the given namespace:

```
kubie ns {{namespace}}
```

- Switch current shell to the given context and namespace:

```
kubie ctx {{context}} {{[-n|--namespace]}} {{namespace}}
```

- Execute a command in the given context and namespace, without spawning a shell:

```
kubie exec {{context}} {{namespace}} {{command}}
```

- Check the Kubernetes configuration files for issues:

```
kubie lint
```

kustomize

Easily deploy resources for Kubernetes.

More information: https://github.com/kubernetes-sigs/kustomize/blob/master/site/content/en/docs/Reference/CLI/_index.md.

- Create a kustomization file with resources and namespace:

```
kustomize create --resources {{deployment.yaml,service.yaml}} --namespace {{staging}}
```

- Build a kustomization file and deploy it with `kubectl`:

```
kustomize build . | kubectl apply {{[-f|--filename]}} -
```

- Set an image in the kustomization file:

```
kustomize edit set image {{busybox=alpine:3.6}}
```

- Search for Kubernetes resources in the current directory to be added to the kustomization file:

```
kustomize create --autodetect
```

l2ping

Send an L2CAP echo request and receive an answer.

More information: https://manned.org/l2ping.

- Ping a Bluetooth device:

```
sudo l2ping {{mac_address}}
```

- Reverse ping a Bluetooth device:

```
sudo l2ping -r {{mac_address}}
```

- Ping a Bluetooth device from a specified interface:

```
sudo l2ping -i {{hci0}} {{mac_address}}
```

- Ping Bluetooth device with a specified sized data package:

```
sudo l2ping -s {{byte_count}} {{mac_address}}
```

- Ping flood a Bluetooth device:

```
sudo l2ping -f {{mac_address}}
```

- Ping a Bluetooth device a specified amount of times:

```
sudo l2ping -c {{amount}} {{mac_address}}
```

- Ping a Bluetooth device with a specified delay between requests:

```
sudo l2ping -d {{seconds}} {{mac_address}}
```

lambo new

A super-powered **`laravel new`** for Laravel and Valet.

More information: https://github.com/tighten/lambo#lambo-commands.

- Create a new Laravel application:

```
lambo new {{app_name}}
```

- Install the application in a specific path:

```
lambo new {{[-p|--path]}} {{path/to/directory}} {{app_name}}
```

- Include authentication scaffolding:

```
lambo new --auth {{app_name}}
```

- Include a specific frontend:

```
lambo new --{{vue|bootstrap|react}} {{app_name}}
```

- Install `npm` dependencies after the project has been created:

```
lambo new --node {{app_name}}
```

- Create a Valet site after the project has been created:

```
lambo new {{[-l|--link]}} {{app_name}}
```

- Create a new MySQL database with the same name as the project:

```
lambo new --create-db --dbuser={{user}} --
dbpassword={{password}} {{app_name}}
```

- Open a specific editor after the project has been created:

```
lambo new {{[-e|--editor]}} "{{editor}}" {{app_name}}
```

lambo

A super-powered **`laravel new`** for Laravel and Valet.

See also: **`lambo new`** for additional command flags.

More information: https://github.com/tighten/lambo#usage.

- Create a new Laravel application:

  ```
  lambo new {{app_name}}
  ```

- Open the configuration in your default editor:

  ```
  lambo edit-config
  ```

- Open the configuration in a specific editor:

  ```
  lambo edit-config {{[-e|--editor]}} "{{path/to/editor}}"
  ```

- Open the configuration file that is run after new applications have been scaffolded:

  ```
  lambo edit-after
  ```

lame

Encode WAV to MP3 files.

More information: https://svn.code.sf.net/p/lame/svn/trunk/lame/USAGE.

- Encode an audio file to MP3 using CBR 320 kbit/second:

```
lame -b 320 {{path/to/file}}.wav {{path/to/output}}.mp3
```

- Encode an audio file to MP3 using the V0 preset:

```
lame -V 0 {{path/to/file}}.wav {{path/to/output}}.mp3
```

- Encode an audio file to AAC:

```
lame {{path/to/file}}.wav {{path/to/output}}.aac
```

lando

Local development environment and DevOps tool built on Docker.

More information: https://docs.lando.dev/cli/.

- Initialize code for use with `lando`:

  ```
  lando init
  ```

- Print information about your app:

  ```
  lando info
  ```

- Start your app:

  ```
  lando start
  ```

- Stop your app:

  ```
  lando stop
  ```

- Restart your app:

  ```
  lando restart
  ```

- Rebuild your app from scratch, preserving data:

  ```
  lando rebuild
  ```

- Display logs for your app:

  ```
  lando logs
  ```

- Destroy your app:

  ```
  lando destroy
  ```

laravel-zero

An installer for the Laravel Zero framework.

More information: https://laravel-zero.com/.

- Create a new Laravel Zero application:

  ```
  laravel-zero new {{name}}
  ```

- Update the installer to the latest version:

  ```
  laravel-zero self-update
  ```

- List the available installer commands:

  ```
  laravel-zero list
  ```

laravel

Installer for the Laravel framework.

More information: https://laravel.com/docs/installation.

- Create a new Laravel application:

```
laravel new {{name}}
```

- Use the latest development release:

```
laravel new {{name}} --dev
```

- Overwrite if the directory already exists:

```
laravel new {{name}} --force
```

- Install the Laravel Jetstream scaffolding:

```
laravel new {{name}} --jet
```

- Install the Laravel Jetstream scaffolding with a specific stack:

```
laravel new {{name}} --jet --stack {{livewire|inertia}}
```

- Install the Laravel Jetstream scaffolding with support for teams:

```
laravel new {{name}} --jet --teams
```

- List the available installer commands:

```
laravel list
```

lastcomm

Show last commands executed.

More information: https://manned.org/lastcomm.

- Print information about all the commands in the acct (record file):

```
lastcomm
```

- Display commands executed by a given user:

```
lastcomm --user {{user}}
```

- Display information about a given command executed on the system:

```
lastcomm --command {{command}}
```

- Display information about commands executed on a given terminal:

```
lastcomm --tty {{terminal_name}}
```

latex

Compile a DVI document from LaTeX source files.

More information: https://texdoc.org/serve/tex.man1.pdf/0.

- Compile a DVI document:

```
latex {{source.tex}}
```

- Compile a DVI document, specifying an output directory:

```
latex -output-directory={{path/to/directory}} {{source.tex}}
```

- Compile a DVI document, exiting on each error:

```
latex -halt-on-error {{source.tex}}
```

latexdiff

Determine differences between two LaTeX files.

More information: https://ctan.org/pkg/latexdiff.

- Determine changes between different versions of a LaTeX file (the resulting LaTeX file can be compiled to show differences underlined):

```
latexdiff {{old.tex}} {{new.tex}} > {{diff.tex}}
```

- Determine changes between different versions of a LaTeX file by highlighting differences in boldface:

```
latexdiff --type=BOLD {{old.tex}} {{new.tex}} > {{diff.tex}}
```

- Determine changes between different versions of a LaTeX file, and display minor changes in equations with both added and deleted graphics:

```
latexdiff --math-markup=fine --graphics-markup=both
{{old.tex}} {{new.tex}} > {{diff.tex}}
```

latexmk

Compile LaTeX source files into finished documents.

Automatically does multiple runs when needed.

More information: https://mg.readthedocs.io/latexmk.html.

- Compile a DVI (Device Independent file) document from every source:

```
latexmk
```

- Compile a DVI document from a specific source file:

```
latexmk {{path/to/source.tex}}
```

- Compile a PDF document:

```
latexmk -pdf {{path/to/source.tex}}
```

- Open the document in a viewer and continuously update it whenever source files change:

```
latexmk -pvc {{path/to/source.tex}}
```

- Force the generation of a document even if there are errors:

```
latexmk -f {{path/to/source.tex}}
```

- Clean up temporary TEX files created for a specific TEX file:

```
latexmk -c {{path/to/source.tex}}
```

- Clean up all temporary TEX files in the current directory:

```
latexmk -c
```

latexpand

Simplify LaTeX source files by removing comments and resolving **`\include`**s, **`\input`**s, etc.

More information: https://www.ctan.org/pkg/latexpand.

- Simplify the specified source file and save the result to the specified output file:

```
latexpand {{[-o|--output]}} {{path/to/output.tex}} {{path/to/file.tex}}
```

- Do not remove comments:

```
latexpand --keep-comments {{[-o|--output]}} {{path/to/output.tex}} {{path/to/file.tex}}
```

- Do not expand `\includes`, `\inputs` etc.:

```
latexpand --keep-includes {{[-o|--output]}} {{path/to/output.tex}} {{path/to/file.tex}}
```

- Expand `\usepackages` as far as the corresponding STY files can be found:

```
latexpand --expand-usepackage {{[-o|--output]}} {{path/to/output.tex}} {{path/to/file.tex}}
```

- Inline the specified BBL file:

```
latexpand --expand-bbl {{path/to/bibliography.bbl}} {{[-o|--output]}} {{path/to/output.tex}} {{path/to/file.tex}}
```

laydown

Prepare for Daily Standup.

More information: https://github.com/badjr13/laydown.

- Add an item to DID section:

  ```
  laydown did {{item}}
  ```

- Add an item to DOING section:

  ```
  laydown doing {{item}}
  ```

- Clear all items:

  ```
  laydown clear
  ```

- Use an editor to edit current data:

  ```
  laydown edit
  ```

- Archive and clear current data:

  ```
  laydown archive
  ```

lazydocker

A terminal UI for managing Docker containers, images, volumes, and more.

More information: https://github.com/jesseduffield/lazydocker.

- Open Lazydocker:

```
lazydocker
```

- Display the current default configuration:

```
lazydocker --config
```

- Run Lazydocker in debug mode:

```
lazydocker --debug
```

- Specify an alternate Docker Compose file:

```
lazydocker --file {{path/to/docker-compose.yml}}
```

- Display help:

```
lazydocker --help
```

- Display version:

```
lazydocker --version
```

lazygit

A simple terminal UI for Git commands, providing an intuitive interface for managing repositories.

More information: https://manned.org/lazygit.

- Open Lazygit in the current repository:

```
lazygit
```

- Open Lazygit for a specific Git repository:

```
lazygit {{[-p|--path]}} {{path/to/repository}}
```

- Start Lazygit with focus on a specific panel:

```
lazygit {{status|branch|log|stash|...}}
```

- Print the default Lazygit configuration:

```
lazygit {{[-c|--config]}}
```

- Tail the Lazygit logs (useful with debug mode in another terminal):

```
lazygit {{[-l|--logs]}}
```

- Run Lazygit in debug mode:

```
lazygit {{[-d|--debug]}}
```

- Print the configuration directory:

```
lazygit {{[-cd|--print-config-dir]}}
```

lb

Manage a blog contained in the current directory.

Drafts and posts to operate on are selected interactively when running the commands.

More information: https://github.com/LukeSmithxyz/lb#usage.

- Make a new draft:

```
lb {{[n|new]}}
```

- Edit a draft:

```
lb {{[e|edit]}}
```

- Delete a draft:

```
lb {{[t|trash]}}
```

- Publish a draft:

```
lb {{[p|publish]}}
```

- Delete a published post:

```
lb {{[d|delete]}}
```

- Unpublish a published post to edit it as a draft again:

```
lb {{[r|revise]}}
```

lckdo

This command is deprecated and has been superseded by **`flock`**.

More information: https://manned.org/lckdo.

- View documentation for the recommended replacement:

```
tldr flock
```

ld

Link object files together.

More information: https://sourceware.org/binutils/docs/ld.html.

- Link a specific object file with no dependencies into an executable:

```
ld {{path/to/file.o}} {{[-o|--output]}} {{path/to/output_executable}}
```

- Link two object files together:

```
ld {{path/to/file1.o}} {{path/to/file2.o}} {{[-o|--output]}} {{path/to/output_executable}}
```

- Dynamically link an x86_64 program to glibc (file paths change depending on the system):

```
ld {{[-o|--output]}} {{path/to/output_executable}} {{[-I|--dynamic-linker]}} /lib/ld-linux-x86-64.so.2 /lib/crt1.o /lib/crti.o -lc {{path/to/file.o}} /lib/crtn.o
```

ldapsearch

Query an LDAP directory.

More information: https://docs.ldap.com/ldap-sdk/docs/tool-usages/ldapsearch.html.

- Query an LDAP server for all items that are a member of the given group and return the object's displayName value:

```
ldapsearch {{[-D|--bindDN]}} '{{admin_DN}}' {{[-w|--
bindPassword]}} '{{password}}' {{[-h|--hostname]}}
{{ldap_host}} {{[-b|--baseDN]}} {{base_ou}}
'{{memberOf=group1}}' displayName
```

- Query an LDAP server with a no-newline password file for all items that are a member of the given group and return the object's displayName value:

```
ldapsearch {{[-D|--bindDN]}} '{{admin_DN}}' {{[-u|--
keyStorePasswordFile]}} '{{password_file}}' {{[-h|--
hostname]}} {{ldap_host}} {{[-b|--baseDN]}} {{base_ou}}
'{{memberOf=group1}}' displayName
```

- Return 5 items that match the given filter:

```
ldapsearch {{[-D|--bindDN]}} '{{admin_DN}}' {{[-w|--
bindPassword]}} '{{password}}' {{[-h|--hostname]}}
{{ldap_host}} {{[-b|--baseDN]}} {{base_ou}}
'{{memberOf=group1}}' {{[-z|--sizeLimit]}} 5 displayName
```

- Wait up to 7 seconds for a response:

```
ldapsearch {{[-D|--bindDN]}} '{{admin_DN}}' {{[-w|--
bindPassword]}} '{{password}}' {{[-h|--hostname]}}
{{ldap_host}} {{[-b|--baseDN]}} {{base_ou}}
'{{memberOf=group1}}' {{[-l|--timeLimitSeconds]}} 7
displayName
```

- Invert the filter:

```
ldapsearch {{[-D|--bindDN]}} '{{admin_DN}}' {{[-w|--
bindPassword]}} '{{password}}' {{[-h|--hostname]}}
{{ldap_host}} {{[-b|--baseDN]}} {{base_ou}} '(!
(memberOf={{group1}}))' displayName
```

- Return all items that are part of multiple groups, returning the display name for each item:

```
ldapsearch {{[-D|--bindDN]}} '{{admin_DN}}' {{[-w|--
bindPassword]}} '{{password}}' {{[-h|--hostname]}}
{{ldap_host}} '(&({{memberOf=group1}})({{memberOf=group2}})
({{memberOf=group3}}))' "displayName"
```

- Return all items that are members of at least 1 of the specified groups:

```
ldapsearch {{[-D|--bindDN]}} '{{admin_DN}}' {{[-w|--
bindPassword]}} '{{password}}' {{[-h|--hostname]}}
{{ldap_host}} '(|({{memberOf=group1}})({{memberOf=group1}})
({{memberOf=group3}}))' displayName
```

- Combine multiple boolean logic filters:

```
ldapsearch {{[-D|--bindDN]}} '{{admin_DN}}' {{[-w|--
bindPassword]}} '{{password}}' {{[-h|--hostname]}}
{{ldap_host}} '(&({{memberOf=group1}})({{memberOf=group2}})(!
({{memberOf=group3}})))' displayName
```

ldc

D compiler using LLVM as a backend.

More information: https://wiki.dlang.org/Using_LDC.

- Compile a source code file into an executable binary:

```
ldc2 {{path/to/source.d}} -of={{path/to/output_executable}}
```

- Compile the source code file without linking:

```
ldc2 -c {{path/to/source.d}}
```

- Select the target architecture and OS:

```
ldc -mtriple={{architecture_OS}} -c {{path/to/source.d}}
```

- Display help:

```
ldc2 -h
```

- Display complete help:

```
ldc2 -help-hidden
```

leaftoppm

Convert an Interleaf image to a PPM image.

More information: https://netpbm.sourceforge.net/doc/leaftoppm.html.

- Generate a PPM image file as output for an Interleaf image file as input:

```
leaftoppm {{path/to/file.pl}}
```

- Display version:

```
leaftoppm {{[-v|-version]}}
```

leave

Set a reminder for when it's time to leave.

To remove reminders use **`kill $(pidof leave)`**.

More information: https://man.freebsd.org/cgi/man.cgi?leave.

- Set a reminder at a given time:

```
leave {{time_to_leave}}
```

- Set a reminder to leave at noon:

```
leave {{1200}}
```

- Set a reminder in a specific amount of time:

```
leave +{{amount_of_time}}
```

- Set a reminder to leave in 4 hours and 4 minutes:

```
leave +{{0404}}
```

lebab

A JavaScript modernizer for transpiling code to ES6/ES7.

Transformations must be provided for all examples.

More information: https://github.com/lebab/lebab.

- Transpile using one or more comma-separated transformations:

```
lebab --transform {{transformation1,transformation2,...}}
```

- Transpile a file to `stdout`:

```
lebab {{path/to/input_file}}
```

- Transpile a file to the specified output file:

```
lebab {{path/to/input_file}} --out-file {{path/to/
output_file}}
```

- Replace all `.js` files in-place in the specified directory, glob, or file:

```
lebab --replace {{directory|glob|file}}
```

- Display help:

```
lebab --help
```

ledger

A powerful, double-entry accounting system.

More information: https://ledger-cli.org/doc/ledger.1.html.

- Print a balance report showing totals:

```
ledger balance --file {{path/to/ledger.journal}}
```

- List all postings in Expenses ordered by amount:

```
ledger register {{expenses}} {{[-S|--sort]}} {{amount}}
```

- Print total Expenses other than Drinks and Food:

```
ledger balance {{Expenses}} and not ({{Drinks}} or {{Food}})
```

- Print a budget report:

```
ledger budget
```

- Print summary information about all the postings:

```
ledger stats
```

lein

Manage Clojure projects with declarative configuration.

More information: https://manned.org/lein.

- Generate scaffolding for a new project based on a template:

  ```
  lein new {{template_name}} {{project_name}}
  ```

- Start a REPL session either with the project or standalone:

  ```
  lein repl
  ```

- Run the project's `-main` function with optional args:

  ```
  lein run {{args}}
  ```

- Run the project's tests:

  ```
  lein test
  ```

- Package up the project files and all its dependencies into a jar file:

  ```
  lein uberjar
  ```

lerna

Manage JavaScript projects with multiple packages.

More information: https://lerna.js.org/docs/api-reference/commands.

- Initialize project files (`lerna.json`, `package.json`, `.git`, etc.):

```
lerna init
```

- Install all external dependencies of each package and symlink together local dependencies:

```
lerna bootstrap
```

- Run a specific script for every package that contains it in its `package.json`:

```
lerna run {{script}}
```

- Execute an arbitrary shell command in every package:

```
lerna exec -- {{ls}}
```

- Publish all packages that have changed since the last release:

```
lerna publish
```

<>

Open a file descriptor for read and write.

More information: https://www.gnu.org/software/bash/manual/bash.html#Opening-File-Descriptors-for-Reading-and-Writing.

- Open a file in a file descriptor for read an write:

```
exec {{3}}<>{{path/to/file}}
```

- Open a file descriptor to a remote connection:

```
exec {{3}}<>/dev/{{tcp}}/{{remote_host}}/{{port_number}}
```

- Close a file descriptor:

```
exec {{3}}<>-
```

<

Redirect data to **`stdin`**.

More information: https://gnu.org/software/bash/manual/bash.html#Redirecting-Input.

- Redirect a file to `stdin` (achieves the same effect as `cat file.txt |`):

```
{{command}} < {{path/to/file.txt}}
```

- Create a here document and pass that into `stdin` (requires a multiline command):

```
{{command}} << {{EOF}} <Enter> {{multiline_text}} <Enter>
{{EOF}}
```

- Create a here string and pass that into `stdin` (achieves the same effect as `echo string |`):

```
{{command}} <<< {{string}}
```

- Process data from a file and write the output to another file:

```
{{command}} < {{path/to/file.txt}} > {{path/to/file2.txt}}
```

- Write a here document into a file:

```
cat << {{EOF}} > {{path/to/file.txt}} <Enter>
{{multiline_data}} <Enter> {{EOF}}
```

- Disregard leading tabs (good for scripts with indentation but does not work for spaces):

```
cat <<- {{EOF}} > {{path/to/file.txt}} <Enter>
{{multiline_data}} <Enter> {{EOF}}
```

- Pass command output to a program as a file descriptor (Note: unlike the rest of these, this replaces the argument in-place with a file path like `/dev/fd/63`):

```
diff <({{command1}}) <({{command2}})
```

- Open a persistent file descriptor:

```
exec {{3}}<{{path/to/file}}
```

less

Open a file for interactive reading, allowing scrolling and search.

More information: https://greenwoodsoftware.com/less/.

- Open a file:

```
less {{source_file}}
```

- Page down/up:

```
{{<Space>|<b>}}
```

- Go to end/start of file:

```
{{<G>|<g>}}
```

- Forward search for a string (press <n>/<N> to go to next/previous match):

```
</>{{something}}
```

- Backward search for a string (press <n>/<N> to go to next/previous match):

```
<?>{{something}}
```

- Follow the output of the currently opened file:

```
<F>
```

- Open the current file in an editor:

```
<v>
```

- Exit:

```
<q>
```

let

Evaluate arithmetic expressions in shell.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-let.

- Evaluate a simple arithmetic expression:

```
let "{{result = a + b}}"
```

- Use post-increment and assignment in an expression:

```
let "{{x++}}"
```

- Use conditional operator in an expression:

```
let "{{result = (x > 10) ? x : 0}}"
```

- Display help:

```
let --help
```

lex

Lexical analyzer generator.

Given the specification for a lexical analyzer, generates C code implementing it.

Note: On most major OSes, this command is an alias for **`flex`**.

More information: https://manned.org/lex.

- Generate an analyzer from a Lex file, storing it to the file `lex.yy.c`:

```
lex {{analyzer.l}}
```

- Specify the output file:

```
lex -t {{analyzer.l}} > {{analyzer.c}}
```

- Compile a C file generated by Lex:

```
c99 {{path/to/lex.yy.c}} -o {{executable}}
```

libreoffice

This command is an alias of **`soffice`**.

- View documentation for the original command:

  ```
  tldr soffice
  ```

librewolf

This command is an alias of **`firefox`**.

More information: https://librewolf.net/.

- View documentation for the original command:

```
tldr firefox
```

license

Create license files for open-source projects.

More information: https://nishanths.github.io/license/.

- Print a license to `stdout`, using the defaults (auto-detected author name, and current year):

```
license {{license_name}}
```

- Generate a license and save it to a file:

```
license -o {{path/to/file}} {{license_name}}
```

- List all available licenses:

```
license ls
```

- Generate a license with custom author name and year:

```
license --name {{author}} --year {{release_year}}
{{license_name}}
```

licensor

Write licenses to **`stdout`**.

More information: https://github.com/raftario/licensor.

- Write the MIT license to a file named `LICENSE`:

```
licensor {{MIT}} > {{LICENSE}}
```

- Write the MIT license with a placeholder copyright notice to a file named `LICENSE`:

```
licensor {{[-p|--keep-placeholder]}} {{MIT}} > {{LICENSE}}
```

- Specify a copyright holder named Bobby Tables:

```
licensor {{MIT}} "{{Bobby Tables}}" > {{LICENSE}}
```

- Specify license exceptions with a WITH expression:

```
licensor "{{Apache-2.0 WITH LLVM-exception}}" > {{LICENSE}}
```

- List all available licenses:

```
licensor {{[-l|--licenses]}}
```

- List all available exceptions:

```
licensor {{[-e|--exceptions]}}
```

light-arionum-cli

The PHP light wallet for the Arionum cryptocurrency.

More information: https://github.com/arionum/lightWalletCLI#usage.

- Generate a new public/private key pair:

```
light-arionum-cli
```

- Display the balance of the current address:

```
light-arionum-cli balance
```

- Display the balance of the specified address:

```
light-arionum-cli balance {{address}}
```

- Send a transaction with an optional message:

```
light-arionum-cli send {{address}} {{value}}
{{optional_message}}
```

- Export the current wallet information:

```
light-arionum-cli export
```

- Display information about the current block:

```
light-arionum-cli block
```

- Display information about the current address' transactions:

```
light-arionum-cli transactions
```

- Display information about a specific transaction:

```
light-arionum-cli transaction {{transaction_id}}
```

lighthouse

Analyzes web applications and web pages, collecting modern performance metrics and insights on developer best practices.

More information: https://github.com/GoogleChrome/lighthouse#cli-options.

- Generate an HTML report for a specific website and save it to a file in the current directory:

```
lighthouse {{https://example.com}}
```

- Generate a JSON report and print it:

```
lighthouse --output {{json}} {{https://example.com}}
```

- Generate a JSON report and save it to a specific file:

```
lighthouse --output {{json}} --output-path {{path/to/
file.json}} {{https://example.com}}
```

- Generate a report using the browser in headless mode without logging to `stdout`:

```
lighthouse --quiet --chrome-flags="{{--headless}}" {{https://
example.com}}
```

- Generate a report, using the HTTP header key/value pairs in the specified JSON file for all requests:

```
lighthouse --extra-headers={{path/to/file.json}} {{https://
example.com}}
```

- Generate a report for specific categories only:

```
lighthouse --only-
categories={{performance,accessibility,best-
practices,seo,pwa}} {{https://example.com}}
```

- Generate a report with device emulation and all throttling disabled:

```
lighthouse --screenEmulation.disabled --throttling-
method={{provided}} --no-emulatedUserAgent {{https://
example.com}}
```

- Display help:

```
lighthouse --help
```

lilypond

Typeset music and/or produce MIDI from file.

See also: **musescore**.

More information: https://lilypond.org/doc/v2.24/Documentation/usage/command_002dline-usage.

- Compile a lilypond file into a PDF:

```
lilypond {{path/to/file}}
```

- Compile into the specified format:

```
lilypond {{[-f|--format]}} {{format_dump}} {{path/to/file}}
```

- Compile the specified file, suppressing progress updates:

```
lilypond {{[-s|--silent]}} {{path/to/file}}
```

- Compile the specified file, and also specify the output filename:

```
lilypond {{[-o|--output]}} {{path/to/output_file}} {{path/to/input_file}}
```

- Display version:

```
lilypond {{[-v|--version]}}
```

lima

This command is an alias of **`limactl shell`** for the default VM instance.

You can also set the **`$LIMA_INSTANCE`** environment variable to work on a different instance.

- View documentation for the original command:

```
tldr limactl
```

limactl

Virtual machine manager for Linux guests, with multiple VM templates available.

Can be used to run containers on macOS, but also for generic virtual machine use cases on macOS and Linux hosts.

More information: https://github.com/lima-vm/lima.

- List VMs:

```
limactl list
```

- Create a VM using the default settings and optionally provide a name and/or a template (see `limactl create --list-templates` for available templates):

```
limactl create --name {{vm_name}} template://{{debian|fedora|ubuntu|...}}
```

- Start a VM (this might install some dependencies in it and take a few minutes):

```
limactl start {{vm_name}}
```

- Open a remote shell inside a VM:

```
limactl shell {{vm_name}}
```

- Run a command inside a VM:

```
limactl shell {{vm_name}} {{command}}
```

- Stop/shutdown a VM:

```
limactl stop {{vm_name}}
```

- Delete a VM:

```
limactl remove {{vm_name}}
```

link

Create a hard link to an existing file.

For more options, see the **`ln`** command.

More information: https://www.gnu.org/software/coreutils/manual/html_node/link-invocation.html.

- Create a hard link from a new file to an existing file:

```
link {{path/to/existing_file}} {{path/to/new_file}}
```

linkchecker

Client to check HTML documents and websites for broken links.

More information: https://linkchecker.github.io/linkchecker/man/linkchecker.html.

- Find broken links on https://example.com/:

```
linkchecker {{https://example.com/}}
```

- Also check URLs that point to external domains:

```
linkchecker --check-extern {{https://example.com/}}
```

- Ignore URLs that match a specific `regex`:

```
linkchecker --ignore-url {{regex}} {{https://example.com/}}
```

- Output results to a CSV file:

```
linkchecker --file-output {{csv}}/{{path/to/file}} {{https://example.com/}}
```

linode-cli account

Manage Linode accounts.

See also: **`linode-cli`**.

More information: https://techdocs.akamai.com/cloud-computing/docs/cli-commands-for-account-management.

- View account:

```
linode-cli account view
```

- View account settings:

```
linode-cli account settings
```

- Make a payment:

```
linode-cli account payment-create --cvv {{cvv}} --usd {{amount_in_dollars}}
```

- View account notifications:

```
linode-cli account notifications-list
```

linode-cli domains

Manage Linode Domains and DNS configuration.

See also: **`linode-cli`**.

More information: https://techdocs.akamai.com/cloud-computing/docs/cli-commands-for-the-dns-manager.

- List all managed domains:

```
linode-cli domains list
```

- Create a new managed domain:

```
linode-cli domains create --domain {{domain_name}} --type
{{master|slave}} --soa-email {{email}}
```

- View details of a specific domain:

```
linode-cli domains view {{domain_id}}
```

- Delete a managed domain:

```
linode-cli domains delete {{domain_id}}
```

- List records for a specific domain:

```
linode-cli domains records-list {{domain_id}}
```

- Add a DNS record to a domain:

```
linode-cli domains records-create {{domain_id}} --type {{A|
AAAA|CNAME|MX|...}} --name {{subdomain}} --target
{{target_value}}
```

- Update a DNS record for a domain:

```
linode-cli domains records-update {{domain_id}} {{record_id}}
--target {{new_target_value}}
```

- Delete a DNS record from a domain:

```
linode-cli domains records-delete {{domain_id}} {{record_id}}
```

linode-cli events

Manage Linode events.

See also: **`linode-cli`**.

More information: https://techdocs.akamai.com/cloud-computing/docs/cli-commands-for-viewing-events.

- List the events on your account:

```
linode-cli events list
```

- View details about a specific event:

```
linode-cli events view {{event_id}}
```

- Mark an event as read:

```
linode-cli events mark-read {{event_id}}
```

linode-cli linodes

Manage Linode instances.

See also: **`linode-cli`**.

More information: https://techdocs.akamai.com/cloud-computing/docs/cli-commands-for-compute-instances.

- List all Linodes:

```
linode-cli linodes list
```

- Create a new Linode:

```
linode-cli linodes create --type {{linode_type}} --region {{region}} --image {{image_id}}
```

- View details of a specific Linode:

```
linode-cli linodes view {{linode_id}}
```

- Update settings for a Linode:

```
linode-cli linodes update {{linode_id}} --label {{new_label}}
```

- Delete a Linode:

```
linode-cli linodes delete {{linode_id}}
```

- Perform a power management operation on a Linode:

```
linode-cli linodes {{boot|reboot|shutdown}} {{linode_id}}
```

- List available backups for a Linode:

```
linode-cli linodes backups-list {{linode_id}}
```

- Restore a backup to a Linode:

```
linode-cli linodes backups-restore {{linode_id}} --backup-id {{backup_id}}
```

linode-cli lke

Manage Linode Kubernetes Engine (LKE) clusters.

See also: **`linode-cli`**.

More information: https://techdocs.akamai.com/cloud-computing/docs/cli-commands-for-lke.

- List all LKE clusters:

```
linode-cli lke clusters list
```

- Create a new LKE cluster:

```
linode-cli lke clusters create --region {{region}} --type {{type}} --node-type {{node_type}} --nodes-count {{count}}
```

- View details of a specific LKE cluster:

```
linode-cli lke clusters view {{cluster_id}}
```

- Update an existing LKE cluster:

```
linode-cli lke clusters update {{cluster_id}} --node-type {{new_node_type}}
```

- Delete an LKE cluster:

```
linode-cli lke clusters delete {{cluster_id}}
```

linode-cli nodebalancers

Manage Linode NodeBalancers.

See also: **`linode-cli`**.

More information: https://techdocs.akamai.com/cloud-computing/docs/cli-commands-for-nodebalancers.

- List all NodeBalancers:

```
linode-cli nodebalancers list
```

- Create a new NodeBalancer:

```
linode-cli nodebalancers create --region {{region}}
```

- View details of a specific NodeBalancer:

```
linode-cli nodebalancers view {{nodebalancer_id}}
```

- Update an existing NodeBalancer:

```
linode-cli nodebalancers update {{nodebalancer_id}} --label {{new_label}}
```

- Delete a NodeBalancer:

```
linode-cli nodebalancers delete {{nodebalancer_id}}
```

- List configurations for a NodeBalancer:

```
linode-cli nodebalancers configs list {{nodebalancer_id}}
```

- Add a new configuration to a NodeBalancer:

```
linode-cli nodebalancers configs create {{nodebalancer_id}} --port {{port}} --protocol {{protocol}}
```

linode-cli object-storage

Manage Linode Object Storage.

See also: **`linode-cli`**.

More information: https://techdocs.akamai.com/cloud-computing/docs/cli-commands-for-object-storage.

- List all Object Storage buckets:

```
linode-cli object-storage buckets list
```

- Create a new Object Storage bucket:

```
linode-cli object-storage buckets create --cluster
{{cluster_id}} --label {{bucket_label}}
```

- Delete an Object Storage bucket:

```
linode-cli object-storage buckets delete {{cluster_id}}
{{bucket_label}}
```

- List Object Storage cluster regions:

```
linode-cli object-storage clusters list
```

- List access keys for Object Storage:

```
linode-cli object-storage keys list
```

- Create a new access key for Object Storage:

```
linode-cli object-storage keys create --label {{label}}
```

- Revoke an access key for Object Storage:

```
linode-cli object-storage keys revoke {{access_key_id}}
```

linode-cli tickets

Manage Linode Support Tickets.

See also: **`linode-cli`**.

More information: https://techdocs.akamai.com/cloud-computing/docs/cli-commands-for-account-management.

- List your Support Tickets:

```
linode-cli tickets list
```

- Open a new Ticket:

```
linode-cli tickets create --summary "{{Summary or quick title for the Ticket}}" --description "{{Detailed description of the issue}}"
```

- List replies to a Ticket:

```
linode-cli tickets replies {{ticket_id}}
```

- Reply to a specific Ticket:

```
linode-cli tickets reply {{ticket_id}} --description "{{The content of your reply}}"
```

linode-cli volumes

Manage Linode Volumes.

See also: **`linode-cli`**.

More information: https://techdocs.akamai.com/cloud-computing/docs/cli-commands-for-block-storage-volumes.

- List current Volumes:

```
linode-cli volumes list
```

- Create a new Volume and attach it to a specific Linode:

```
linode-cli volumes create --label {{volume_label}} --size {{size_in_GB}} --linode-id {{linode_id}}
```

- Attach a Volume to a specific Linode:

```
linode-cli volumes attach {{volume_id}} --linode-id {{linode_id}}
```

- Detach a Volume from a Linode:

```
linode-cli volumes detach {{volume_id}}
```

- Resize a Volume (Note: Size can only be increased):

```
linode-cli volumes resize {{volume_id}} --size {{new_size_in_GB}}
```

- Delete a Volume:

```
linode-cli volumes delete {{volume_id}}
```

linode-cli

Manage Linode cloud services.

Some subcommands such as **`events`** have their own usage documentation.

More information: https://techdocs.akamai.com/cloud-computing/docs/getting-started-with-the-linode-cli.

- List all Linodes:

```
linode-cli linodes list
```

- View documentation for managing Linode accounts:

```
tldr linode-cli account
```

- View documentation for managing Linodes:

```
tldr linode-cli linodes
```

- View documentation for managing Linode Kubernetes Engine (LKE) clusters:

```
tldr linode-cli lke
```

- View documentation for managing NodeBalancers:

```
tldr linode-cli nodebalancers
```

- View documentation for managing Object Storage:

```
tldr linode-cli object-storage
```

- View documentation for managing domains and DNS configuration:

```
tldr linode-cli domains
```

- View documentation for managing Linode Volumes:

```
tldr linode-cli volumes
```

liquidctl

Control liquid coolers.

More information: https://github.com/liquidctl/liquidctl.

- List available devices:

```
liquidctl list
```

- Initialize all supported devices:

```
sudo liquidctl initialize all
```

- Print the status of available liquid coolers:

```
liquidctl status
```

- Match a string in product name to pick a device and set its fan speed to 0% at 20°C, 50% at 50°C, and 100% at 70°C:

```
liquidctl {{[-m|--match]}} {{string}} set fan speed {{20 0 50 50 70 100}}
```

lispmtopgm

Convert a Lisp Machine bitmap into a PGM image.

See also: **pgmtolispm**.

More information: https://netpbm.sourceforge.net/doc/lispmtopgm.html.

- Convert the specified Lisp Machine bitmap file into a PGM image:

```
lispmtopgm {{path/to/input.lispm}} > {{path/to/output.pgm}}
```

lit

LLVM integrated tester for executing LLVM and Clang style test suites, summarizing results.

Part of LLVM.

More information: https://www.llvm.org/docs/CommandGuide/lit.html.

- Run a specified test case:

```
lit {{path/to/test_file.test}}
```

- Run all test cases in a specified directory:

```
lit {{path/to/test_suite}}
```

- Run all test cases and check the wall time for each cases, then report to summary output:

```
lit {{path/to/test_suite}} --time-tests
```

- Run individual tests with Valgrind (memory check and memory leak test):

```
lit {{path/to/test_file.test}} --vg --vg-leak --vg-args={{args_to_valgrind}}
```

live-server

A simple development HTTP server with live reload capability.

More information: https://github.com/tapio/live-server.

- Serve an `index.html` file and reload on changes:

  `live-server`

- Specify a port (default is 8080) from which to serve a file:

  `live-server --port={{8081}}`

- Specify a given file to serve:

  `live-server --open={{about.html}}`

- Proxy all requests for ROUTE to URL:

  `live-server --proxy={{/}}:{{http:localhost:3000}}`

llc

Compiles LLVM Intermediate Representation or bitcode to target-specific assembly language.

More information: https://www.llvm.org/docs/CommandGuide/llc.html.

- Compile a bitcode or IR file to an assembly file with the same base name:

```
llc {{path/to/file.ll}}
```

- Enable all optimizations:

```
llc -O3 {{path/to/input.ll}}
```

- Output assembly to a specific file:

```
llc --output {{path/to/output.s}}
```

- Emit fully relocatable, position independent code:

```
llc -relocation-model=pic {{path/to/input.ll}}
```

lldb

The LLVM Low-Level Debugger.

More information: https://lldb.llvm.org/.

- Debug an executable:

```
lldb {{executable}}
```

- Attach `lldb` to a running process with a given PID:

```
lldb -p {{pid}}
```

- Wait for a new process to launch with a given name, and attach to it:

```
lldb -w -n {{process_name}}
```

lli

Directly execute programs from LLVM bitcode.

More information: https://www.llvm.org/docs/CommandGuide/lli.html.

- Execute a bitcode or IR file:

```
lli {{path/to/file.ll}}
```

- Execute with command-line arguments:

```
lli {{path/to/file.ll}} {{argument1 argument2 ...}}
```

- Enable all optimizations:

```
lli -O3 {{path/to/file.ll}}
```

- Load a dynamic library before linking:

```
lli --dlopen={{path/to/library.dll}} {{path/to/file.ll}}
```

llm

Interact with Large Language Models (LLMs) via remote APIs and models that can be installed and run on your machine.

More information: https://llm.datasette.io/en/stable/help.html.

- Set up an OpenAI API Key:

```
llm keys set openai
```

- Run a prompt:

```
llm "{{Ten fun names for a pet pelican}}"
```

- Run a system prompt against a file:

```
cat {{path/to/file.py}} | llm {{[-s|--system]}} "{{Explain
this code}}"
```

- Install packages from PyPI into the same environment as LLM:

```
llm install {{package1 package2 ...}}
```

- Download and run a prompt against a model:

```
llm {{[-m|--model]}} {{orca-mini-3b-gguf2-q4_0}} "{{What is
the capital of France?}}"
```

- Create a system prompt and save it with a template name:

```
llm {{[-s|--system]}} '{{You are a sentient cheesecake}}' --
save {{sentient_cheesecake}}
```

- Have an interactive chat with a specific model using a specific template:

```
llm chat {{[-m|--model]}} {{chatgpt}} {{[-t|--template]}}
{{sentient_cheesecake}}
```

llvd

Linkedin Learning Video Downloader.

More information: https://github.com/knowbee/llvd.

- Download a course using cookie-based authentication:

```
llvd {{[-c|--course]}} {{course-slug}} --cookies
```

- Download a course at a specific resolution:

```
llvd {{[-c|--course]}} {{course-slug}} {{[-r|--resolution]}}
720
```

- Download a course with captions (subtitles):

```
llvd {{[-c|--course]}} {{course-slug}} {{[-ca|--caption]}}
```

- Download a course path with throttling between 10 to 30 seconds:

```
llvd {{[-p|--path]}} {{path-slug}} {{[-t|--throttle]}}
{{10,30}} --cookies
```

llvm-ar

This command is an alias of **ar**.

- View documentation for the original command:

```
tldr ar
```

llvm-as

LLVM Intermediate Representation (`.ll`) to Bitcode (`.bc`) assembler.

More information: https://llvm.org/docs/CommandGuide/llvm-as.html.

- Assemble an IR file:

```
llvm-as -o {{path/to/out.bc}} {{path/to/source.ll}}
```

- Assemble an IR file and include a module hash in the produced Bitcode file:

```
llvm-as --module-hash -o {{path/to/out.bc}} {{path/to/
source.ll}}
```

- Read an IR file from `stdin` and assemble it:

```
cat {{path/to/source.ll}} | llvm-as -o {{path/to/out.bc}}
```

llvm-bcanalyzer

LLVM Bitcode (`.bc`) analyzer.

More information: https://llvm.org/docs/CommandGuide/llvm-bcanalyzer.html.

- Print statistics about a Bitcode file:

```
llvm-bcanalyzer {{path/to/file.bc}}
```

- Print an SGML representation and statistics about a Bitcode file:

```
llvm-bcanalyzer -dump {{path/to/file.bc}}
```

- Read a Bitcode file from `stdin` and analyze it:

```
cat {{path/to/file.bc}} | llvm-bcanalyzer
```

llvm-cat

Concatenate LLVM Bitcode (**`.bc`**) files.

More information: https://github.com/llvm/llvm-project/blob/main/llvm/tools/llvm-cat/llvm-cat.cpp.

- Concatenate Bitcode files:

```
llvm-cat {{path/to/file1.bc}} {{path/to/file2.bc}} -o {{path/to/out.bc}}
```

llvm-config

Get various configuration information needed to compile programs which use LLVM.

Typically called from build systems, like in Makefiles or configure scripts.

More information: https://llvm.org/docs/CommandGuide/llvm-config.html.

- Compile and link an LLVM based program:

```
clang++ $(llvm-config --cxxflags --ldflags --libs) --output
{{path/to/output_executable}} {{path/to/source.cc}}
```

- Print the PREFIX of your LLVM installation:

```
llvm-config --prefix
```

- Print all targets supported by your LLVM build:

```
llvm-config --targets-built
```

llvm-dis

Convert LLVM bitcode files into human-readable LLVM Intermediate Representation (IR).

More information: https://www.llvm.org/docs/CommandGuide/llvm-dis.html.

- Convert a bitcode file as LLVM IR and write the result to `stdout`:

```
llvm-dis {{path/to/input.bc}} -o -
```

- Convert a bitcode file to an LLVM IR file with the same filename:

```
llvm-dis {{path/to/file.bc}}
```

- Convert a bitcode file to LLVM IR, writing the result to the specified file:

```
llvm-dis {{path/to/input.bc}} -o {{path/to/output.ll}}
```

llvm-g++

This command is an alias of **clang++**.

- View documentation for the original command:

```
tldr clang++
```

llvm-gcc

This command is an alias of **clang**.

- View documentation for the original command:

```
tldr clang
```

llvm-mc

LLVM Machine Code Playground. It provides a set of tools for working with LLVM machine code.

Part of LLVM.

More information: https://llvm.org/docs/CommandGuide/llvm-mc.html.

- Assemble assembly code file into object file with machine code:

```
llvm-mc --filetype=obj -o {{path/to/output.o}} {{path/to/input.s}}
```

- Disassemble object file with machine code into assembly code file:

```
llvm-mc --disassemble -o {{path/to/output.s}} {{path/to/input.o}}
```

- Compile LLVM bit code file into assembly code:

```
llvm-mc -o {{path/to/output.s}} {{path/to/input.bc}}
```

- Assemble assembly code from `stdin` and show encoding to `stdout`:

```
echo "{{addl %eax, %ebx}}" | llvm-mc -show-encoding -show-inst
```

- Disassemble machine code from `stdin` for specified triple:

```
echo "{{0xCD 0x21}}" | llvm-mc --disassemble -triple={{target_name}}
```

llvm-nm

This command is an alias of **nm**.

- View documentation for the original command:

```
tldr nm
```

llvm-objdump

This command is an alias of **objdump**.

- View documentation for the original command:

```
tldr objdump
```

llvm-strings

This command is an alias of **`strings`**.

- View documentation for the original command:

```
tldr strings
```

lmms

Free, open source, cross-platform digital audio workstation.

Render a **`.mmp`** or **`.mmpz`** project file, dump a **`.mmpz`** as XML, or start the GUI.

See also: **`mixxx`**.

More information: https://manned.org/lmms.

- Start the GUI:

```
lmms
```

- Start the GUI and load external config:

```
lmms {{[-c|--config]}} {{path/to/config.xml}}
```

- Start the GUI and import MIDI or Hydrogen file:

```
lmms --import {{path/to/midi_or_hydrogen_file}}
```

- Start the GUI with a specified window size:

```
lmms --geometry {{x_size}}x{{y_size}}+{{x_offset}}+
{{y_offset}}
```

- Dump a `.mmpz` file:

```
lmms dump {{path/to/mmpz_file.mmpz}}
```

- Render a project file:

```
lmms render {{path/to/mmpz_or_mmp_file}}
```

- Render the individual tracks of a project file:

```
lmms rendertracks {{path/to/mmpz_or_mmp_file}} {{path/to/
dump_directory}}
```

- Render with custom samplerate, format, and as a loop:

```
lmms render {{[-s|--samplerate]}} {{88200}} {{[-f|--format]}}
{{ogg}} {{[-l|--loop]}} {{[-o|--output]}} {{path/to/
output_file.ogg}}
```

ln

Create links to files and directories.

More information: https://www.gnu.org/software/coreutils/manual/html_node/ln-invocation.html.

- Create a symbolic link to a file or directory:

```
ln {{[-s|--symbolic]}} /{{path/to/file_or_directory}} {{path/to/symlink}}
```

- Create a symbolic link relative to where the link is located:

```
ln {{[-s|--symbolic]}} {{path/to/file_or_directory}} {{path/to/symlink}}
```

- Overwrite an existing symbolic link to point to a different file:

```
ln {{[-sf|--symbolic --force]}} /{{path/to/new_file}} {{path/to/symlink}}
```

- Create a hard link to a file:

```
ln /{{path/to/file}} {{path/to/hardlink}}
```

loadtest

Run a load test on the selected HTTP or WebSockets URL.

More information: https://github.com/alexfernandez/loadtest#usage.

- Run with concurrent users and a specified amount of requests per second:

```
loadtest {{[-c|--concurrency]}} {{10}} {{[--rps|--
requestsPerSecond]}} {{200}} {{https://example.com}}
```

- Run with a custom HTTP header:

```
loadtest --headers "{{accept:text/plain;text-
html}}" {{https://example.com}}
```

- Run with a specific HTTP method:

```
loadtest {{[-m|--method]}} {{GET}} {{https://example.com}}
```

loc

Count lines of code. Written in Rust.

More information: https://github.com/cgag/loc.

- Print lines of code in the current directory:

```
loc
```

- Print lines of code in the target directory:

```
loc {{path/to/directory}}
```

- Print lines of code with stats for individual files:

```
loc --files
```

- Print lines of code without `.gitignore` (etc.) files (e.g. two `-u` flags will additionally count hidden files and dirs):

```
loc {{[-u|--unrestricted]}}
```

local

Declare local variables and give them attributes.

See also: **`declare`**, **`export`**.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-local.

- Declare a string variable with the specified value:

```
local {{variable}}="{{value}}"
```

- Declare an integer variable with the specified value:

```
local -i {{variable}}="{{value}}"
```

- Declare an array variable with the specified value:

```
local {{variable}}=({{item_a item_b item_c}})
```

- Declare an associative array variable with the specified value:

```
local -A {{variable}}=({{[key_a]=item_a [key_b]=item_b [key_c]=item_c}})
```

- Declare a readonly variable with the specified value:

```
local -r {{variable}}="{{value}}"
```

- Display help:

```
local --help
```

locust

Load-testing tool to determine number of concurrent users a system can handle.

More information: https://docs.locust.io/en/stable/configuration.html#configuration.

- Load-test "example.com" with web interface using locustfile.py:

```
locust {{[-H|--host]}} {{http://example.com}}
```

- Use a different test file:

```
locust {{[-H|--host]}} {{http://example.com}} {{[-f|--locustfile]}} {{test_file.py}}
```

- Run test without web interface, spawning 1 user a second until there are 100 users:

```
locust {{[-H|--host]}} {{http://example.com}} --headless {{[-u|--users]}} 100 {{[-r|--spawn-rate]}} 1
```

- Start Locust in master mode:

```
locust {{[-H|--host]}} {{http://example.com}} --master
```

- Connect Locust worker to master:

```
locust {{[-H|--host]}} {{http://example.com}} --worker
```

- Connect Locust worker to master on a different machine:

```
locust {{[-H|--host]}} {{http://example.com}} --worker --master-host {{master_hostname}}
```

loft

Install and manage multi-tenant Kubernetes environments using virtual clusters.

More information: https://loft.sh/docs/cli/loft/.

- Install or upgrade Loft in the current Kubernetes cluster:

```
loft start
```

- Authenticate to a remote Loft instance:

```
loft login {{https://loft.example.com}}
```

- Create a virtual cluster with a specific space and cluster:

```
loft create vcluster {{vcluster_name}} {{[-s|--space]}}
{{space_name}} {{[-c|--cluster]}} {{cluster_name}}
```

- List all virtual clusters:

```
loft list vclusters
```

- Switch context to a specific virtual cluster:

```
loft use vcluster {{vcluster_name}}
```

- Delete a virtual cluster:

```
loft delete vcluster {{vcluster_name}}
```

- Show the current Loft username:

```
loft vars username
```

- Uninstall Loft from the cluster:

```
loft uninstall
```

logger

Add messages to syslog.

More information: https://manned.org/logger.1p.

- Log a message to syslog:

```
logger {{message}}
```

logname

Show the user's login name.

See also: **id**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/logname-invocation.html.

- Display the currently logged in user's name:

```
logname
```

logout

Exit a login shell.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-logout.

- Exit a login shell:

```
logout
```

- Exit a login shell and specify a return value:

```
logout {{exit_code}}
```

logstash

An Elasticsearch ETL (extract, transform, and load) tool.

Commonly used to load data from various sources (such as databases and log files) into Elasticsearch.

More information: https://www.elastic.co/logstash.

- Check validity of a Logstash configuration:

```
logstash --configtest --config {{logstash_config.conf}}
```

- Run Logstash using configuration:

```
sudo logstash --config {{logstash_config.conf}}
```

- Run Logstash with the most basic inline configuration string:

```
sudo logstash -e 'input {} filter {} output {}'
```

lolcat

Put a rainbow in everything you **`cat`** to the console.

More information: https://manned.org/lolcat.

- Print a file to the console in rainbow colors:

```
lolcat {{path/to/file}}
```

- Print the result of a text-producing command in rainbow colors:

```
{{fortune}} | lolcat
```

- Use a seed to generate consistent colors (default: `0` as in random):

```
lolcat {{[-S|--seed]}} {{number}} {{path/to/file}}
```

- Control rainbow frequency (default: `0.1`):

```
lolcat {{[-F|--frequency]}} {{number}} {{path/to/file}}
```

- Control rainbow smoothing (default: `3`):

```
lolcat {{[-p|--spread]}} {{number}} {{path/to/file}}
```

- Print a file to the console with animated rainbow colors:

```
lolcat {{[-a|--animate]}} {{path/to/file}}
```

- Print a file to the console with 24-bit (truecolor) rainbow colors:

```
lolcat {{[-t|--truecolor]}} {{path/to/file}}
```

look

Display lines beginning with a prefix in a sorted file.

Note: The lines in the file must be sorted.

See also: **`grep`**, **`sort`**.

More information: https://man.openbsd.org/look.

- Search for lines beginning with a specific prefix in a specific file:

```
look {{prefix}} {{path/to/file}}
```

- Case-insensitively search only on alphanumeric characters:

```
look {{[-f|--ignore-case]}} {{[-d|--alphanum]}} {{prefix}} {{path/to/file}}
```

- Specify a string termination character (space by default):

```
look {{[-t|--terminate]}} {{,}}
```

- Search in `/usr/share/dict/words` (`--alphanum` and `--ignore-case` are assumed):

```
look {{prefix}}
```

lorem

Create some random Latin looking placeholder text.

More information: https://manned.org/lorem.

- Print the specified number of words:

```
lorem -n {{20}}
```

- Print 10 lines of Goethe's Faust:

```
lorem -l {{10}} --faust
```

- Print 5 sentences of Poe's Raven:

```
lorem -s {{5}} --raven
```

- Print 40 random characters from Boccaccio's Decameron:

```
lorem --randomize -c {{40}} --decamerone
```

lp

Print files.

More information: https://manned.org/lp.

- Print the output of a command to the default printer (see `lpstat` command):

```
echo "test" | lp
```

- Print a file to the default printer:

```
lp {{path/to/file}}
```

- Print a file to a named printer (see `lpstat` command):

```
lp -d {{printer_name}} {{path/to/file}}
```

- Print `n` copies of a file to the default printer:

```
lp -n {{n}} {{path/to/file}}
```

- Print only certain pages to the default printer (print pages 1, 3-5, and 16):

```
lp -P 1,3-5,16 {{path/to/file}}
```

- Resume printing a job:

```
lp -i {{job_id}} -H resume
```

lpadmin

Configure CUPS printers and classes.

See also: **`lpoptions`**.

More information: https://openprinting.github.io/cups/doc/man-lpadmin.html.

- Set the default printer:

```
lpadmin -d {{printer}}
```

- Delete a specific printer or class:

```
lpadmin -x {{printer|class}}
```

- Add a printer to a class:

```
lpadmin -p {{printer}} -c {{class}}
```

- Remove a printer from a class:

```
lpadmin -p {{printer}} -r {{class}}
```

lpass

Interface for the LastPass password manager.

More information: https://lastpass.github.io/lastpass-cli/lpass.1.html.

- Log in to your LastPass account, by entering your master password when prompted:

```
lpass login {{username}}
```

- Show login status:

```
lpass status
```

- List all sites grouped by category:

```
lpass ls
```

- Generate a new password for gmail.com with the identifier `myinbox` and add to LastPass:

```
lpass generate --username {{username}} --url {{gmail.com}} {{myinbox}} {{password_length}}
```

- Show password for a specified entry:

```
lpass show {{myinbox}} --password
```

lpinfo

List connected printers and installed drivers for the CUPS print server.

More information: https://openprinting.github.io/cups/doc/man-lpinfo.html.

- List all the currently connected printers:

```
lpinfo -v
```

- List all the currently installed printer drivers:

```
lpinfo -m
```

- Search installed printer drivers by make and model:

```
lpinfo --make-and-model "{{printer_model}}" -m
```

lpmove

Move a job or all jobs to another printer.

See also: **`cancel`**, **`lp`**, **`lpr`**, **`lprm`**.

More information: https://openprinting.github.io/cups/doc/man-lpmove.html.

- Move a specific job to `new_printer`:

```
lpmove {{job_id}} {{new_printer}}
```

- Move a job from `old_printer` to `new_printer`:

```
lpmove {{old_printer}}-{{job_id}} {{new_printer}}
```

- Move all jobs from `old_printer` to `new_printer`:

```
lpmove {{old_printer}} {{new_printer}}
```

- Move a specific job to `new_printer` on a specific server:

```
lpmove -h {{server}} {{job_id}} {{new_printer}}
```

lpoptions

Display or set printer options and defaults.

See also: **`lpadmin`**.

More information: https://openprinting.github.io/cups/doc/man-lpoptions.html.

- Set the default printer:

```
lpoptions -d {{printer}}/{{instance}}
```

- List printer-specific options of a specific printer:

```
lpoptions -d {{printer}} -l
```

- Set a new option on a specific printer:

```
lpoptions -d {{printer}} -o {{option}}
```

- Remove the options of a specific printer:

```
lpoptions -d {{printer}} -x
```

lpq

Show printer queue status.

More information: https://openprinting.github.io/cups/doc/man-lpq.html.

- Show the queued jobs of the default destination:

```
lpq
```

- Show the queued jobs of all printers enforcing encryption:

```
lpq -a -E
```

- Show the queued jobs in a long format:

```
lpq -l
```

- Show the queued jobs of a specific printer or class:

```
lpq -P {{destination}}/{{instance}}
```

- Show the queued jobs once every n seconds until the queue is empty:

```
lpq +{{interval}}
```

lpr

Print files.

See also: **`lpstat`**, **`lpadmin`**.

More information: https://openprinting.github.io/cups/doc/man-lpr.html.

- Print a file to the default printer:

```
lpr {{path/to/file}}
```

- Print 2 copies:

```
lpr -# {{2}} {{path/to/file}}
```

- Print to a named printer:

```
lpr -P {{printer}} {{path/to/file}}
```

- Print either a single page (e.g. 2) or a range of pages (e.g. 2-16):

```
lpr -o page-ranges={{2|2-16}} {{path/to/file}}
```

- Print double-sided either in portrait (long) or in landscape (short):

```
lpr -o sides={{two-sided-long-edge|two-sided-short-edge}}
{{path/to/file}}
```

- Set page size (more options may be available depending on setup):

```
lpr -o media={{a4|letter|legal}} {{path/to/file}}
```

- Print multiple pages per sheet:

```
lpr -o number-up={{2|4|6|9|16}} {{path/to/file}}
```

lprm

Cancel queued print jobs of a server.

See also: **`lpq`**.

More information: https://openprinting.github.io/cups/doc/man-lprm.html.

- Cancel current job on the default printer:

```
lprm
```

- Cancel a job of a specific server:

```
lprm -h {{server}} {{job_id}}
```

- Cancel a job of a specific server in a specific port:

```
lprm -h {{server}}:{{port}} {{job_id}}
```

- Cancel multiple jobs with a encrypted connection to the server:

```
lprm -E {{job_id1 job_id2 ...}}
```

- Cancel all jobs:

```
lprm -
```

- Cancel the current job of a specific printer or class:

```
lprm -P {{destination}}/{{instance}}
```

lpstat

Show status information about printers.

More information: https://manned.org/lpstat.

- List printers present on the machine and whether they are enabled for printing:

```
lpstat -p
```

- Show the default printer:

```
lpstat -d
```

- Display all available status information:

```
lpstat -t
```

- List print jobs queued by a specific user:

```
lpstat -u {{user}}
```

ls

List directory contents.

More information: https://www.gnu.org/software/coreutils/manual/html_node/ls-invocation.html.

- List files one per line:

```
ls -1
```

- List all files, including hidden files:

```
ls {{[-a|--all]}}
```

- List files with a trailing symbol to indicate file type (directory/, symbolic_link@, executable*, ...):

```
ls {{[-F|--classify]}}
```

- List all files in [l]ong format (permissions, ownership, size, and modification date):

```
ls {{[-la|-l --all]}}
```

- List files in [l]ong format with size displayed using human-readable units (KiB, MiB, GiB):

```
ls {{[-lh|-l --human-readable]}}
```

- List files in [l]ong format, sorted by [S]ize (descending) recursively:

```
ls {{[-lSR|-lS --recursive]}}
```

- List files in [l]ong format, sorted by [t]ime the file was modified and in reverse order (oldest first):

```
ls {{[-ltr|-lt --reverse]}}
```

- Only list directories:

```
ls {{[-d|--directory]}} */
```

lsar

List an archive file's contents.

See also: **`unar`**, **`ar`**.

More information: https://manned.org/lsar.

- List an archive file's contents:

```
lsar {{path/to/archive}}
```

- List a password protected archive file's contents:

```
lsar {{path/to/archive}} {{[-p|--password]}} {{password}}
```

- Print all available information about each file in the archive (it's very long):

```
lsar {{[-L|--verylong]}} {{path/to/archive}}
```

- Test the integrity of the files in the archive (if possible):

```
lsar {{[-t|--test]}} {{path/to/archive}}
```

- List the archive file's contents in JSON format:

```
lsar {{[-j|--json]}} {{path/to/archive}}
```

- Display help:

```
lsar {{[-h|--help]}}
```

lsd

List directory contents.

The next generation **`ls`** command, written in Rust.

More information: https://github.com/lsd-rs/lsd/blob/main/doc/lsd.md.

- List files and directories, one per line:

```
lsd {{[-1|--oneline]}}
```

- List all files and directories, including hidden ones, in the current directory:

```
lsd {{[-a|--all]}}
```

- List files and directories with trailing `/` added to directory names:

```
lsd {{[-F|--classify]}}
```

- List all files and directories in long format (permissions, ownership, size in human-readable format, and modification date):

```
lsd {{[-lha|--long --human-readable --all]}}
```

- List files and directories in long format, sorted by size (descending):

```
lsd {{[-lS|--long --sizesort]}}
```

- List files and directories in long format, sorted by modification date (oldest first):

```
lsd {{[-ltr|--long --timesort --reverse]}}
```

- Only list directories:

```
lsd {{[-d|--directory-only]}} {{*/}}
```

- Recursively list all directories in a tree format:

```
lsd --tree {{[-d|--directory-only]}}
```

lsix

List and display images in sixel format on the terminal.

See also: **`img2sixel`**.

More information: https://github.com/hackerb9/lsix.

- List images in the current directory:

```
lsix
```

- List images in a specific directory:

```
lsix {{path/to/directory}}
```

- Display an image on the terminal:

```
lsix {{path/to/image}}
```

lsof

List open files and the corresponding processes.

Note: Root privileges are required to list files opened by others.

More information: https://manned.org/lsof.

- Find the processes that have a given file open:

```
lsof {{path/to/file}}
```

- Find the process that opened a local internet port:

```
lsof -i :{{port}}
```

- Only output the process ID (PID):

```
lsof -t {{path/to/file}}
```

- List files opened by the given user:

```
lsof -u {{username}}
```

- List files opened by the given command or process:

```
lsof -c {{process_or_command_name}}
```

- List files opened by a specific process, given its PID:

```
lsof -p {{PID}}
```

- List open files in a directory:

```
lsof +D {{path/to/directory}}
```

- Find the process that is listening on a local IPv6 TCP port and don't convert network or port numbers:

```
lsof -i6TCP:{{port}} -sTCP:LISTEN -n -P
```

lspath

List the contents of the **`$PATH`** environment variable, with optional paging.

More information: https://github.com/clementi/lspath.

- Print the contents of the system `$PATH` variable, with one element per line:

  ```
  lspath
  ```

- Print the current contents of the system `$PATH` variable, with one element per line, with the output paged:

  ```
  lspath --page
  ```

lstopo

Show the hardware topology of the system.

More information: https://manned.org/lstopo.

- Show the summarized system topology in a graphical window (or print to console if no graphical display is available):

```
lstopo
```

- Show the full system topology without summarizations:

```
lstopo --no-factorize
```

- Show the summarized system topology with only physical indices (i.e. as seen by the OS):

```
lstopo {{[-p|--physical]}}
```

- Write the full system topology to a file in the specified format:

```
lstopo --no-factorize {{[--of|--output-format]}} {{console|ascii|tex|fig|svg|pdf|ps|png|xml}} {{path/to/file}}
```

- Output in monochrome or greyscale:

```
lstopo --palette {{none|grey}}
```

lsyncd

Watch files and directories and run **`rsync`** when they change.

It is often used to keep two directories on separate systems in sync, ensuring that changes made in one directory are immediately mirrored to the other.

More information: https://github.com/lsyncd/lsyncd/blob/master/docs/manpage/lsyncd.1.txt.

- Watch the source for changes and run `rsync` to synchronize files to the destination on every change:

```
lsyncd -rsync {{path/to/source}} {{host::share_name}}
```

- Use SSH instead of `rsyncd` shares:

```
lsyncd -rsyncssh {{path/to/source}} {{host}} {{path/to/destination}}
```

lt

Localtunnel exposes your localhost to the world for easy testing and sharing.

More information: https://github.com/localtunnel/localtunnel.

- Start tunnel from a specific port:

```
lt {{[-p|--port]}} {{8000}}
```

- Specify the upstream server doing the forwarding:

```
lt {{[-p|--port]}} {{8000}} {{[-h|--host]}} {{host}}
```

- Request a specific subdomain:

```
lt {{[-p|--port]}} {{8000}} {{[-s|--subdomain]}} {{subdomain}}
```

- Print basic request info:

```
lt {{[-p|--port]}} {{8000}} --print-requests
```

- Open the tunnel URL in the default web browser:

```
lt {{[-p|--port]}} {{8000}} {{[-o|--open]}}
```

lua

A powerful, light-weight embeddable programming language.

More information: https://www.lua.org/manual/5.4/lua.html.

- Start an interactive Lua shell:

```
lua
```

- Execute a Lua script:

```
lua {{path/to/script.lua}} {{--optional-argument}}
```

- Execute a Lua expression:

```
lua -e '{{print("Hello World")}}'
```

luac

Lua bytecode compiler.

More information: https://www.lua.org/manual/5.4/luac.html.

- Compile a Lua source file to Lua bytecode:

```
luac -o {{byte_code.luac}} {{source.lua}}
```

- Do not include debug symbols in the output:

```
luac -s -o {{byte_code.luac}} {{source.lua}}
```

luajit

A just-in-time compiler (JIT) for the Lua programming language.

See also: **`lua`**.

More information: https://luajit.org/luajit.html.

- Start an interactive Lua shell:

```
luajit
```

- Execute a Lua script:

```
luajit {{path/to/script.lua}} {{--optional-argument}}
```

- Execute a Lua expression:

```
luajit -e '{{print("Hello World")}}'
```

lualatex

An extended version of TeX using Lua to compile.

More information: https://texdoc.org/serve/tex.man1.pdf/0.

- Start `texlua` to act as a Lua interpreter:

```
lualatex
```

- Compile a Tex file to PDF:

```
lualatex {{path/to/file.tex}}
```

- Compile a Tex file without error interruption:

```
lualatex -interaction nonstopmode {{path/to/file.tex}}
```

- Compile a Tex file with a specific output file name:

```
lualatex -jobname={{filename}} {{path/to/file.tex}}
```

luanti

Infinite-world block sandbox game.

More information: https://manned.org/luanti.

- Start Luanti in client mode:

```
luanti
```

- List downloaded gamemodes:

```
luanti --gameid list
```

- Start Luanti in server mode by hosting a specific gamemode:

```
luanti --server --gameid {{game_id}}
```

- Start a server with the default world once it has been created:

```
luanti --server
```

- Start a server with a specific world:

```
luanti --server --world {{world_name}}
```

- Start a server on a specific port:

```
luanti --server --port {{port}}
```

- Write logs to a specific file:

```
luanti --logfile {{path/to/file}}
```

- Only write errors to the console:

```
luanti --quiet
```

luantiserver

This command is an alias of **`luanti --server`**.

- View documentation for the original command:

  `tldr luanti`

ludusavi

Backup video game save data.

More information: https://github.com/mtkennerly/ludusavi/blob/master/docs/cli.md.

- Backup games:

```
ludusavi backup --path {{path/to/backup}}
```

- Restore games:

```
ludusavi restore --path {{path/to/backup}} {{"game1" "game2" ...}}
```

- List backups:

```
ludusavi backups --path {{path/to/backup}}
```

- Wrap launcher game:

```
ludusavi wrap --gui --infer {{heroic|lutris|steam}} -- {{game_launch_commands}}
```

- Wrap standalone game:

```
ludusavi wrap --gui --name {{name}} -- {{game_launch_commands}}
```

lumen

An installer for the Lumen micro-framework.

More information: https://lumen.laravel.com.

- Create a new Lumen application:

  ```
  lumen new {{application_name}}
  ```

- List the available installer commands:

  ```
  lumen list
  ```

lwp-request

Simple HTTP client.

Built with libwww-perl.

More information: https://metacpan.org/pod/lwp-request.

- Make a simple GET request:

```
lwp-request -m GET {{http://example.com/some/path}}
```

- Upload a file with a POST request:

```
lwp-request < {{path/to/file}} -m POST {{http://example.com/some/path}}
```

- Make a request with a custom user agent:

```
lwp-request -H 'User-Agent: {{user_agent}} -m {{METHOD}} {{http://example.com/some/path}}
```

- Make a request with HTTP authentication:

```
lwp-request -C {{username}}:{{password}} -m {{METHOD}} {{http://example.com/some/path}}
```

- Make a request and print request headers:

```
lwp-request -U -m {{METHOD}} {{http://example.com/some/path}}
```

- Make a request and print response headers and status chain:

```
lwp-request -E -m {{METHOD}} {{http://example.com/some/path}}
```

lychee

Find broken URLs.

More information: https://github.com/lycheeverse/lychee/blob/master/README.md#commandline-usage.

- Scan a website for broken links:

```
lychee {{https://example.com}}
```

- Display a breakdown of error types:

```
lychee --format detailed {{https://example.com}}
```

- Limit the amount of connections to prevent DDOS protection:

```
lychee --max-concurrency {{5}} {{links.txt}}
```

- Check files in a directory structure for any broken URLs:

```
grep {{[-r|--recursive]}} "{{pattern}}" | lychee -
```

- Display help:

```
lychee --help
```

lynx

Command-line web browser.

More information: https://manned.org/lynx.

- Visit a website:

```
lynx {{example.com}}
```

- Apply restrictions for anonymous account:

```
lynx -anonymous {{example.com}}
```

- Turn on mouse support, if available:

```
lynx -use_mouse {{example.com}}
```

- Force color mode on, if available:

```
lynx -color {{example.com}}
```

- Open a link, using a specific file to read and write cookies:

```
lynx -cookie_file={{path/to/file}} {{example.com}}
```

- Navigate forwards and backwards through the links on a page:

```
{{<ArrowUp>|<ArrowDown>}}
```

- Go back to the previously displayed page:

```
{{<ArrowLeft>|<u>}}
```

- Exit:

```
<q><y>
```

lz4

Compress or decompress .lz4 files.

More information: https://github.com/lz4/lz4.

- Compress a file:

```
lz4 {{path/to/file}}
```

- Decompress a file:

```
lz4 {{[-d|--decompress]}} {{file.lz4}}
```

- Decompress a file and write to `stdout`:

```
lz4 {{[-dc|--decompress --stdout]}} {{file.lz4}}
```

- Package and compress a directory and its contents:

```
tar cvf - {{path/to/directory}} | lz4 - {{dir.tar.lz4}}
```

- Decompress and unpack a directory and its contents:

```
lz4 {{[-dc|--decompress --stdout]}} {{dir.tar.lz4}} | tar -xv
```

- Compress a file using the best compression:

```
lz4 {{[-12|--best]}} {{path/to/file}}
```

lzcat

This command is an alias of **`xz --format lzma --decompress --stdout`**.

- View documentation for the original command:

  ```
  tldr xz
  ```

lzcmp

This command is an alias of **xzcmp**.

- View documentation for the original command:

  ```
  tldr xzcmp
  ```

lzdiff

This command is an alias of **`xzdiff`**.

- View documentation for the original command:

```
tldr xzdiff
```

lzegrep

This command is an alias of **`xzgrep --extended-regexp`**.

- View documentation for the original command:

```
tldr xzgrep
```

lzfgrep

This command is an alias of **`xzgrep --fixed-strings`**.

- View documentation for the original command:

  `tldr xzgrep`

lzgrep

This command is an alias of **`xzgrep`**.

- View documentation for the original command:

```
tldr xzgrep
```

lzip

A lossless data compressor with a user interface similar to **gzip** or **bzip2**.

Lzip uses a simplified form of the "Lempel-Ziv-Markovchain-Algorithm" (LZMA) stream format and provides 3-factor integrity checking to maximize interoperability and optimize safety.

More information: https://www.nongnu.org/lzip/manual/lzip_manual.html#Invoking-lzip.

- Archive a file, replacing it with with a compressed version:

```
lzip {{path/to/file}}
```

- Archive a file, keeping the input file:

```
lzip {{[-k|--keep]}} {{path/to/file}}
```

- Archive a file with the best compression (level=9):

```
lzip {{[-k|--keep]}} {{path/to/file}} --best
```

- Archive a file at the fastest speed (level=0):

```
lzip {{[-k|--keep]}} {{path/to/file}} --fast
```

- Test the integrity of compressed file:

```
lzip {{[-t|--test]}} {{path/to/archive.lz}}
```

- Decompress a file, replacing it with the original uncompressed version:

```
lzip {{[-d|--decompress]}} {{path/to/archive.lz}}
```

- Decompress a file, keeping the archive:

```
lzip {{[-d|--decompress]}} {{[-k|--keep]}} {{path/to/archive.lz}}
```

- List files which are in an archive and show compression stats:

```
lzip {{[-l|--list]}} {{path/to/archive.lz}}
```

lzless

This command is an alias of **`xzless`**.

- View documentation for the original command:

  ```
  tldr xzless
  ```

lzma

This command is an alias of **`xz --format lzma`**.

- View documentation for the original command:

```
tldr xz
```

lzmore

This command is an alias of **xzmore**.

- View documentation for the original command:

```
tldr xzmore
```

lzop

Compress or decompress files with LZO compression.

More information: https://www.lzop.org/lzop_man.php.

- Compress a file into a new file with the `.lzo` suffix:

```
lzop {{path/to/file}}
```

- Decompress a file:

```
lzop {{[-d|--decompress]}} {{path/to/file.lzo}}
```

- Compress a file, while specifying the compression level. 0 = Worst, 9 = Best (Default level is 3):

```
lzop -{{level}} {{path/to/file}}
```

- Compress a file with the best compression level:

```
lzop {{[-9|--best]}} {{path/to/file}}
```

- Compress a file with the fastest compression level:

```
lzop {{[-1|--fast]}} {{path/to/file}}
```

m4

Macro processor.

More information: https://www.gnu.org/software/m4/manual/m4.html#Invoking-m4.

- Process macros in a file:

```
m4 {{path/to/file}}
```

- Define a macro before processing files:

```
m4 {{[-D|--define]}} {{macro_name}}={{macro_value}} {{path/to/file}}
```

m4b-tool

Merge, split, and manipulate audiobook files with chapters.

More information: https://github.com/sandreas/m4b-tool.

- Create an audiobook with the audio files in the input directory:

```
m4b-tool merge {{path/to/input_directory}} --output-file={{path/to/merged.m4b}}
```

- Make chapters using the input files' names:

```
m4b-tool merge {{path/to/input_directory}} --output-file={{path/to/merged.m4b}} --use-filenames-as-chapters
```

macchina

Display information about your computer.

More information: https://github.com/Macchina-CLI/macchina.

- List out system information, with either default settings or those specified in your configuration file:

```
macchina
```

- Specify a custom configuration file path:

```
macchina --config {{path/to/configuration_file}}
```

- List system information, but lengthen uptime, shell, and kernel output:

```
macchina --long-uptime --long-shell --long-kernel
```

- Check for any errors/system failures encountered when trying to fetch system information:

```
macchina --doctor
```

- List original artists of all the ASCII art:

```
macchina --ascii-artists
```

macptopbm

Read a MacPaint file as input and produce a PBM image as output.

See also: **pbmtomacp**.

More information: https://netpbm.sourceforge.net/doc/macptopbm.html.

- Convert a MacPaint file into a PGM image:

```
macptopbm {{path/to/file.macp}} > {{path/to/output.pbm}}
```

- Skip over n bytes when reading the file:

```
macptopbm {{[-e|-extraskip]}} {{n}} > {{path/to/output.pbm}}
```

- Suppress all informational messages:

```
macptopbm {{[-q|-quiet]}} > {{path/to/output.pbm}}
```

- Display version:

```
macptopbm {{[-v|-version]}}
```

maestral

A lightweight Dropbox client for macOS and Linux.

More information: https://maestral.app/cli.

- Start the GUI:

```
maestral gui
```

- Print current status of Maestral:

```
maestral status
```

- Pause syncing:

```
maestral pause
```

- Resume syncing:

```
maestral resume
```

- Print sync status of a specific file or folder:

```
maestral filestatus {{path/to/file_or_directory}}
```

magento

Manage the Magento PHP framework.

More information: https://experienceleague.adobe.com/en/docs/commerce-operations/tools/cli-reference/commerce-on-premises.

- Enable one or more modules:

```
magento module:enable {{module1 module2 ...}}
```

- Disable one or more modules:

```
magento module:disable {{module1 module2 ...}}
```

- Update the database after enabling modules:

```
magento setup:upgrade
```

- Update code and dependency injection configuration:

```
magento setup:di:compile
```

- Deploy static assets:

```
magento setup:static-content:deploy
```

- Enable maintenance mode:

```
magento maintenance:enable
```

- Disable maintenance mode:

```
magento maintenance:disable
```

- List all available commands:

```
magento list
```

magick compare

Create a comparison image to visually annotate the difference between two images.

See also: **magick**.

More information: https://imagemagick.org/script/compare.php.

- Compare two images:

```
magick compare {{path/to/image1.png}} {{path/to/image2.png}} {{path/to/diff.png}}
```

- Compare two images using the specified metric:

```
magick compare -verbose -metric {{PSNR}} {{path/to/image1.png}} {{path/to/image2.png}} {{path/to/diff.png}}
```

magick convert

Convert between image formats, scale, join, and create images, and much more.

Note: This tool (previously **`convert`**) has been replaced by **`magick`** in ImageMagick 7+.

More information: https://imagemagick.org/script/convert.php.

- Convert an image from JPEG to PNG:

```
magick convert {{path/to/input_image.jpg}} {{path/to/
output_image.png}}
```

- Scale an image to 50% of its original size:

```
magick convert {{path/to/input_image.png}} -resize 50%
{{path/to/output_image.png}}
```

- Scale an image keeping the original aspect ratio to a maximum dimension of 640x480:

```
magick convert {{path/to/input_image.png}} -resize 640x480
{{path/to/output_image.png}}
```

- Scale an image to have a specified file size:

```
magick convert {{path/to/input_image.png}} -define
jpeg:extent={{512kb}} {{path/to/output_image.jpg}}
```

- Vertically/horizontally append images and have the empty space be transparent:

```
magick convert -background none {{path/to/image1.png path/to/
image2.png ...}} {{-append|+append}} {{path/to/
output_image.png}}
```

- Create a GIF from a series of images with 100ms delay between them:

```
magick convert {{path/to/image1.png path/to/image2.png ...}}
-delay {{10}} {{path/to/animation.gif}}
```

- Create an image with nothing but a solid red background:

```
magick convert -size {{800x600}} "xc:{{#ff0000}}" {{path/to/
image.png}}
```

- Create a favicon from several images of different sizes:

```
magick convert {{path/to/image1.png path/to/image2.png ...}}
{{path/to/favicon.ico}}
```

magick identify

Describe the format and characteristics of image files.

See also: **magick**.

More information: https://imagemagick.org/script/identify.php.

- Describe the format and basic characteristics of an image:

```
magick identify {{path/to/image}}
```

- Describe the format and verbose characteristics of an image:

```
magick identify -verbose {{path/to/image}}
```

- Collect dimensions of all JPEG files in the current directory and save them into a CSV file:

```
magick identify -format "{{%f,%w,%h\n}}" {{*.jpg}} > {{path/to/filelist.csv}}
```

magick import

Capture some or all of an X server screen and save the image to a file.

See also: **`magick`**.

More information: https://imagemagick.org/script/import.php.

- Capture the entire X server screen into a PostScript file:

```
magick import -window root {{path/to/output.ps}}
```

- Capture contents of a remote X server screen into a PNG image:

```
magick import -window root -display {{remote_host}}:
{{screen}}.{{display}} {{path/to/output.png}}
```

- Capture a specific window given its ID as displayed by `xwininfo` into a JPEG image:

```
magick import -window {{window_id}} {{path/to/output.jpg}}
```

magick mogrify

Perform operations on multiple images, such as resizing, cropping, flipping, and adding effects.

Changes are applied directly to the original file.

See also: **magick**.

More information: https://imagemagick.org/script/mogrify.php.

- Resize all JPEG images in the directory to 50% of their initial size:

```
magick mogrify -resize {{50%}} {{*.jpg}}
```

- Resize all images starting with DSC to 800x600:

```
magick mogrify -resize {{800x600}} {{DSC*}}
```

- Convert all PNGs in the directory to JPEG:

```
magick mogrify -format {{jpg}} {{*.png}}
```

- Halve the saturation of all image files in the current directory:

```
magick mogrify -modulate {{100,50}} {{*}}
```

- Double the brightness of all image files in the current directory:

```
magick mogrify -modulate {{200}} {{*}}
```

- Reduce file sizes of all GIF images in the current directory by reducing quality:

```
magick mogrify -layers 'optimize' -fuzz {{7%}} {{*.gif}}
```

- Display help:

```
magick mogrify -help
```

magick montage

Tile images into a customizable grid.

See also: **magick**.

More information: https://imagemagick.org/script/montage.php.

- Tile images into a grid, automatically resizing images larger than the grid cell size:

```
magick montage {{path/to/image1.jpg path/to/image2.jpg ...}} {{path/to/montage.jpg}}
```

- Tile images into a grid, automatically calculating the grid cell size from the largest image:

```
magick montage {{path/to/image1.jpg path/to/image2.jpg ...}} -geometry {{+0+0}} {{path/to/montage.jpg}}
```

- Specify the grid cell size and resize images to fit it before tiling:

```
magick montage {{path/to/image1.jpg path/to/image2.jpg ...}} -geometry {{640x480+0+0}} {{path/to/montage.jpg}}
```

- Limit the number of rows and columns in the grid, causing input images to overflow into multiple output montages:

```
magick montage {{path/to/image1.jpg path/to/image2.jpg ...}} -geometry {{+0+0}} -tile {{2x3}} {{montage_%d.jpg}}
```

- Resize and crop images to fill their grid cells before tiling:

```
magick montage {{path/to/image1.jpg path/to/image2.jpg ...}} -geometry {{+0+0}} -resize {{640x480^}} -gravity {{center}} -crop {{640x480+0+0}} {{path/to/montage.jpg}}
```

magick

Create, edit, compose, or convert between image formats.

This tool replaces **`convert`** in ImageMagick 7+. See **`magick convert`** to use the old tool in versions 7+.

Some subcommands, such as **`mogrify`** have their own usage documentation.

More information: https://imagemagick.org/script/magick.php.

- Convert between image formats:

```
magick {{path/to/input_image.png}} {{path/to/
output_image.jpg}}
```

- Resize an image, making a new copy:

```
magick {{path/to/input_image.jpg}} -resize {{100x100}}
{{path/to/output_image.jpg}}
```

- Resize an image by a percentage:

```
magick {{path/to/input_image.png}} -resize {{50}}% {{path/to/
output_image.png}}
```

- Scale an image to have a specified file size:

```
magick {{path/to/input_image.png}} -define
jpeg:extent={{512kb}} {{path/to/output_image.jpg}}
```

- Create a GIF out of all JPEG images in the current directory:

```
magick {{*.jpg}} {{path/to/images.gif}}
```

- Create a checkerboard pattern:

```
magick -size {{640x480}} pattern:checkerboard {{path/to/
checkerboard.png}}
```

- Create a PDF file out of all JPEG images in the current directory:

```
magick {{*.jpg}} -adjoin {{path/to/file.pdf}}
```

mail

Operate on the user's mailbox.

To send an email the message body is built from **`stdin`**.

More information: https://manned.org/mail.

- Open an interactive prompt to check personal mail:

```
mail
```

- Send a typed email message with optional CC. The command-line below continues after pressing `<Enter>`. Input message text (can be multiline). Press `<Ctrl d>` to complete the message text:

```
mail --subject "{{subject line}}" {{to_user@example.com}} --
cc "{{cc_email_address}}"
```

- Send an email that contains file content:

```
mail < {{path/to/file.txt}} --subject "{{$HOSTNAME
filename.txt}}" {{to_user@example.com}}
```

- Send a `.tar.gz` file as an attachment:

```
tar cvzf - {{path/to/directory1 path/to/directory2}} |
uuencode {{data.tar.gz}} | mail --subject
"{{subject_line}}" {{to_user@example.com}}
```

- Display help:

```
mail {{[-h|--help]}}
```

mailsy

Quickly generate a disposable email using **`mail.tm`** API.

More information: https://github.com/BalliAsghar/Mailsy#usage.

- Create an email address:

  `mailsy g`

- Fetch emails (press `<Enter>` to open email in browser):

  `mailsy m`

- Show details about the account:

  `mailsy me`

- Dispose the email address:

  `mailsy d`

mailx

Send and receive mail.

More information: https://manned.org/mailx.

- Send mail (the content should be typed after the command, and ended with <Ctrl d>):

```
mailx {{[-s|--subject]}} "{{subject}}" {{to_addr}}
```

- Send mail with content passed from another command:

```
echo "{{content}}" | mailx {{[-s|--subject]}}
"{{subject}}" {{to_addr}}
```

- Send mail with content read from a file:

```
mailx < {{content.txt}} {{[-s|--subject]}}
"{{subject}}" {{to_addr}}
```

- Send mail to a recipient and CC to another address:

```
mailx {{[-s|--subject]}} "{{subject}}" {{[-c|--cc]}}
{{cc_addr}} {{to_addr}}
```

- Send mail specifying the sender address:

```
mailx {{[-s|--subject]}} "{{subject}}" {{[-r|--from-
address]}} {{from_addr}} {{to_addr}}
```

- Send mail with an attachment:

```
mailx {{[-a|--attach]}} {{path/to/file}} {{[-s|--subject]}}
"{{subject}}" {{to_addr}}
```

make

Task runner for targets described in Makefile.

Mostly used to control the compilation of an executable from source code.

More information: https://www.gnu.org/software/make/manual/make.html.

- Call the first target specified in the Makefile (usually named "all"):

```
make
```

- Call a specific target:

```
make {{target}}
```

- Call a specific target, executing 4 jobs at a time in parallel:

```
make {{[-j|--jobs]}} 4 {{target}}
```

- Use a specific Makefile:

```
make {{[-f|--file]}} {{path/to/file}}
```

- Execute make from another directory:

```
make {{[-C|--directory]}} {{path/to/directory}}
```

- Force making of a target, even if source files are unchanged:

```
make {{[-B|--always-make]}} {{target}}
```

- Override a variable defined in the Makefile:

```
make {{target}} {{variable}}={{new_value}}
```

- Override variables defined in the Makefile by the environment:

```
make {{[-e|--environment-overrides]}} {{target}}
```

makebuildserver

Create an F-Droid build server virtual machine.

More information: https://f-droid.org/en/docs/Build_Server_Setup/.

- Create a new virtual machine or update an existing one (if available):

```
makebuildserver
```

- Force creating a fresh virtual machine:

```
makebuildserver {{[-c|--clean]}}
```

makensis

Cross-platform compiler for NSIS installers.

It compiles a NSIS script into a Windows installer executable.

More information: https://nsis.sourceforge.io/Docs/Chapter3.html.

- Compile a NSIS script:

```
makensis {{path/to/file.nsi}}
```

- Compile a NSIS script in strict mode (treat warnings as errors):

```
makensis -WX {{path/to/file.nsi}}
```

- Display help for a specific command:

```
makensis -CMDHELP {{command}}
```

makepasswd

Generate and encrypt passwords.

More information: https://manned.org/makepasswd.

- Generate a random password (8 to 10 characters long, containing letters and numbers):

```
makepasswd
```

- Generate a 10 characters long password:

```
makepasswd --chars {{10}}
```

- Generate a 5 to 10 characters long password:

```
makepasswd --minchars {{5}} --maxchars {{10}}
```

- Generate a password containing only the characters "b", "a", or "r":

```
makepasswd --string {{bar}}
```

mamba repoquery

Efficiently query conda and mamba package repositories and package dependencies.

More information: https://mamba.readthedocs.io/en/latest/user_guide/mamba.html#repoquery.

- Search for all available versions of a particular package:

  ```
  mamba repoquery search {{package}}
  ```

- Search for all packages satisfying specific constraints:

  ```
  mamba repoquery search "{{sphinx<5}}"
  ```

- List the dependencies of a package installed in the currently activated environment, in a tree format:

  ```
  mamba repoquery depends {{[-t|--tree]}} {{scipy}}
  ```

- Print packages in the current environment that require a particular package to be installed (i.e. inverse of `depends`):

  ```
  mamba repoquery whoneeds {{ipython}}
  ```

mamba

Fast, cross-platform package manager, intended as a drop-in replacement for conda.

Some subcommands such as **`repoquery`** have their own usage documentation.

More information: https://mamba.readthedocs.io/en/latest/user_guide/mamba.html.

- Create a new environment, installing the specified packages into it:

```
mamba create {{[-n|--name]}} {{environment_name}} {{python=3.10 matplotlib}}
```

- Install packages into the current environment, specifying the package channel:

```
mamba install {{[-c|--channel]}} {{conda-forge}} {{python=3.6 numpy}}
```

- Update all packages in the current environment:

```
mamba update {{[-a|--all]}}
```

- Search for a specific package across repositories:

```
mamba repoquery search {{numpy}}
```

- List all environments:

```
mamba info {{[-e|--envs]}}
```

- Remove unused packages and tarballs from the cache:

```
mamba clean {{[-pt|--packages --tarballs]}}
```

- Activate an environment:

```
mamba activate {{environment_name}}
```

- List all installed packages in the currently activated environment:

```
mamba list
```

man

Format and display manual pages.

See also: **`whatis`**, **`apropos`**.

More information: https://manned.org/man.

- Display the man page for a command:

```
man {{command}}
```

- Open the man page for a command in a browser (`=browser_name` can be omitted if `$BROWSER` is set):

```
man {{[-H|--html=]}}{{browser_name}} {{command}}
```

- Display the man page for a command from section 7:

```
man 7 {{command}}
```

- List all available sections for a command:

```
man {{[-f|--whatis]}} {{command}}
```

- Display the path searched for manpages:

```
man {{[-w|--path]}}
```

- Display the location of a manpage rather than the manpage itself:

```
man {{[-w|--where]}} {{command}}
```

- Display the man page using a specific locale:

```
man {{[-L|--locale]}} {{locale}} {{command}}
```

- Search for manpages containing a search string:

```
man {{[-k|--apropos]}} "{{search_string}}"
```

manim

Animation engine for explanatory math videos.

More information: https://docs.manim.community/en/stable/tutorials/quickstart.html.

- Render a scene from a Python script using the default settings:

```
manim {{path/to/file.py}} {{SceneName}}
```

- Render with live preview (auto-opens the video file after rendering):

```
manim {{[-pql|--preview --quality low]}} {{path/to/file.py}} {{SceneName}}
```

- Render at high quality (1080p 60fps):

```
manim {{[-pqh|--preview --quality high]}} {{path/to/file.py}} {{SceneName}}
```

- Specify a custom output file name:

```
manim {{[-o|--output_file]}} {{output_file_name}} {{path/to/file.py}} {{SceneName}}
```

- Render using a specific resolution and frame rate:

```
manim {{[-r|--resolution]}} {{1920,1080}} {{[-f|--fps]}} {{60}} {{path/to/file.py}} {{SceneName}}
```

- List available scenes in a file without rendering:

```
manim --list_scenes {{path/to/file.py}}
```

- Display help:

```
manim --help
```

mapfile

This command is an alias of **`readarray`**.

- View documentation for the original command:

```
tldr readarray
```

mariadb-install-db

Initialize a MariaDB database.

More information: https://manned.org/mariadb-install-db.

- Initialize a database:

```
sudo mariadb-install-db --user {{user}} --basedir {{/usr}} --datadir {{/var/lib/mysql}}
```

- Display help:

```
mariadb-install-db --help
```

mariadb

The mariadb client tool.

More information: https://mariadb.com/docs/server/clients-and-utilities/mariadb-client/mariadb-command-line-client.

- Connect to a specific MariaDB database:

```
mariadb {{db_name}}
```

- Connect to a specific MariaDB database using username and password:

```
mariadb {{[-u|--user]}} {{user_name}} {{[-p|--password]}} {{your_password}} {{db_name}}
```

- Show warnings after every statement in interactive and batch mode:

```
mariadb --show-warning
```

- Display less verbose outputs (can be used multiple times to produce less output):

```
mariadb {{-s|-ss|-sss|--silent}}
```

- Execute SQL statements from a script file:

```
mariadb < {{path/to/script.sql}} {{db_name}} > {{path/to/output.tab}}
```

- Check memory and open file usage at exit:

```
mariadb --debug-check
```

- Connect using a socket file for local connections:

```
mariadb {{[-S|--socket]}} {{path/to/socket_name}}
```

- Display help:

```
mariadb {{[-?|--help]}}
```

marimo

A reactive Python notebook environment.

Combines features of Jupyter, Streamlit, and other notebook tools with reactive execution.

More information: https://docs.marimo.io/cli/.

- Create or edit notebooks by starting a marimo server:

  ```
  marimo edit
  ```

- Start a marimo server on a specific port without launching a browser:

  ```
  marimo edit {{[-p|--port]}} {{port_number}} --headless
  ```

- Edit a specific notebook:

  ```
  marimo edit {{path/to/notebook.py}}
  ```

- Run a marimo notebook as an app in read-only mode:

  ```
  marimo run {{path/to/notebook.py}}
  ```

- Start an interactive tutorial to learn marimo:

  ```
  marimo tutorial {{intro|components|dataflow|io}}
  ```

- View command-specific help:

  ```
  marimo {{edit|run|tutorial|config|new|...}} --help
  ```

markdown2pdf

Convert markdown to PDF.

More information: https://github.com/theiskaa/markdown2pdf.

- Convert a Markdown file to a PDF:

```
markdown2pdf {{[-p|--path]}} {{path/to/input_file.md}}
```

- Convert a Markdown file to a PDF with a specific path:

```
markdown2pdf {{[-p|--path]}} {{path/to/input_file.md}} {{[-o|--output]}} {{path/to/output_file.pdf}}
```

- Convert Markdown content provided as a string:

```
markdown2pdf {{[-s|--string]}} {{markdown_text}} {{[-o|--output]}} {{path/to/output_file.pdf}}
```

- Convert from URL (this will convert a Markdown file at that URL to a local PDF file):

```
markdown2pdf {{[-u|--url]}} {{URL}} {{[-o|--output]}} {{path/to/output_file.pdf}}
```

masscan

A very fast network scanner.

Works best with elevated privileges. For help with Nmap compatibility, run **`masscan --nmap`**.

More information: https://manned.org/masscan.

- Scan an IP or network subnet for port 80:

```
masscan {{ip_address|network_prefix}} {{[-p|--ports]}} {{80}}
```

- Scan a class B subnet for the top 100 ports at 100,000 packets per second:

```
masscan {{10.0.0.0/16}} --top-ports {{100}} --rate {{100000}}
```

- Scan a class B subnet avoiding ranges from a specific exclude file:

```
masscan {{10.0.0.0/16}} --top-ports {{100}} --excludefile
{{path/to/file}}
```

- Scan a class B subnet with Nmap-like version detection (banner grabbing):

```
masscan {{10.0.0.0/16}} {{[-p|--ports]}} {{22,80}} --banners
--rate {{100000}}
```

- Scan the Internet for web servers running on port 80 and 443:

```
masscan {{0.0.0.0/0}} {{[-p|--ports]}} {{80,443}} --rate
{{10000000}}
```

- Scan the Internet for DNS servers running on UDP port 53:

```
masscan {{0.0.0.0/0}} {{[-p|--ports]}} {{U:53}} --rate
{{10000000}}
```

- Scan the Internet for a specific port range and export to a file:

```
masscan {{0.0.0.0/0}} {{[-p|--ports]}} {{0-65535}} --output-
format {{binary|grepable|json|list|xml}} --output-filename
{{path/to/file}}
```

- Read binary scan results from a file and output to `stdout`:

```
masscan --readscan {{path/to/file}}
```

mat2

Anonymise various file formats by removing metadata.

More information: https://0xacab.org/jvoisin/mat2.

- List supported file formats:

```
mat2 --list
```

- Remove metadata from a file:

```
mat2 {{path/to/file}}
```

- Remove metadata from a file and print detailed output to the console:

```
mat2 --verbose {{path/to/file}}
```

- Show metadata in a file without removing it:

```
mat2 --show {{path/to/file}}
```

- Partially remove metadata from a file:

```
mat2 --lightweight {{path/to/file}}
```

- Remove metadata from a file in place, without creating a backup:

```
mat2 --inplace {{path/to/file}}
```

mate-dictionary

Look up words on dictionaries.

More information: https://manned.org/mate-dictionary.

- Print a specific word definition:

```
mate-dictionary --no-window --look-up '{{word}}'
```

- Show similar words for a specific one in a new window:

```
mate-dictionary --match '{{word}}'
```

matlab

Numerical computation environment by MathWorks.

More information: https://www.mathworks.com/help/matlab/matlab_env/startup-options/.

- Run without splash screen during startup:

```
matlab -nosplash
```

- Execute a MATLAB statement:

```
matlab -r "{{matlab_statement}}"
```

- Run a MATLAB script:

```
matlab -r "run({{path/to/script.m}})"
```

maza

Local ad blocker. Like Pi-hole but local and using the operating system.

More information: https://github.com/tanrax/maza-ad-blocking.

- Update the Maza database:

```
maza update
```

- Start Maza:

```
sudo maza start
```

- Stop Maza:

```
sudo maza stop
```

- Show the status of Maza:

```
maza status
```

mc

MinIO Client for object storage and filesystems.

May be named **`mc`** or **`mcli`** on some systems.

More information: https://minio.github.io/mc/.

- Add connection to a S3 server:

```
mc alias set {{local}} {{http://localhost:9000}}
{{access_key}} {{secret_key}}
```

- Create a bucket:

```
mc mb {{local/bucket_name}}
```

- List buckets and their content recursively:

```
mc ls {{local}} --recursive
```

mc

Midnight Commander, a TUI file manager.

Navigate the directory structure using the **<ArrowKeys>**, the mouse or by typing the commands into the terminal.

See also: **ranger**, **clifm**, **vifm**, **nautilus**.

More information: https://source.midnight-commander.org/man/mc.html.

- Start Midnight Commander:

```
mc
```

- Start Midnight Commander in black and white:

```
mc {{[-b|--nocolor]}}
```

mc

mc can refer to multiple commands with the same name.

- View documentation for MinIO client:

  ```
  tldr mc.cli
  ```

- View documentation for Midnight Commander:

  ```
  tldr mc.fm
  ```

mcat

Parse, convert, and preview files (including Markdown), directories, images, and videos.

More information: https://github.com/Skardyy/mcat#example-usage.

- Display the contents of a file:

```
mcat {{path/to/file}}
```

- Display a Markdown file with a specific theme:

```
mcat {{[-t|--theme]}} {{theme_name}} {{path/to/file.md}}
```

- Display an image or video inline:

```
mcat {{[-i|--output inline]}} {{path/to/file}}
```

- Convert a file to a specific format (e.g. `html`, `md`, `image`):

```
mcat {{[-o|--output]}} {{format}} {{path/to/file}}
```

- List the contents of a directory:

```
mcat {{path/to/directory}}
```

- List the contents of a directory, including hidden files:

```
mcat {{[-a|--hidden]}} {{path/to/directory}}
```

- Display content without paging:

```
mcat {{[-P|--paging never]}} {{path/to/file}}
```

mcfly

A smart command history search and management tool.

Replaces your default shell history search (**<Ctrl r>**) with an intelligent search engine providing context and relevance to the commands.

More information: https://github.com/cantino/mcfly.

- Print the mcfly integration code for the specified shell:

```
mcfly init {{bash|fish|zsh}}
```

- Search the history for a command, with 20 results:

```
mcfly search --results {{20}} "{{search_terms}}"
```

- Add a new command to the history:

```
mcfly add "{{command}}"
```

- Record that a directory has moved and transfer the historical records from the old path to the new one:

```
mcfly move "{{path/to/old_directory}}" "{{path/to/
new_directory}}"
```

- Train the suggestion engine (developer tool):

```
mcfly train
```

- Display help for a specific subcommand:

```
mcfly help {{subcommand}}
```

mcli

This command is an alias of **`mc`** (MinIO client).

- View documentation for the original command:

```
tldr mc.cli
```

mcs

Mono C# Compiler.

More information: https://manned.org/mcs.

- Compile the specified files:

```
mcs {{path/to/input_file1.cs path/to/input_file2.cs ...}}
```

- Specify the output program name:

```
mcs -out:{{path/to/file.exe}} {{path/to/input_file1.cs path/to/input_file2.cs ...}}
```

- Specify the output program type:

```
mcs -target:{{exe|winexe|library|module}} {{path/to/input_file1.cs path/to/input_file2.cs ...}}
```

md-to-clip

Convert tldr-pages to Command Line Interface Pages.

See also: **`clip-view`**.

More information: https://github.com/command-line-interface-pages/v2-tooling/tree/main/md-to-clip.

- Convert tldr-pages files and save into the same directories:

```
md-to-clip {{path/to/page1.md path/to/page2.md ...}}
```

- Convert tldr-pages files and save into a specific directory:

```
md-to-clip --output-directory {{path/to/directory}} {{path/to/page1.md path/to/page2.md ...}}
```

- Convert a tldr-page file to `stdout`:

```
md-to-clip --no-file-save <(echo '{{page-content}}')
```

- Convert tldr-pages files while recognizing additional placeholders from a specific config:

```
md-to-clip --special-placeholder-config {{path/to/config.yaml}} {{path/to/page1.md path/to/page2.md ...}}
```

- Display help:

```
md-to-clip --help
```

- Display version:

```
md-to-clip --version
```

md5sum

Calculate MD5 cryptographic checksums.

More information: https://www.gnu.org/software/coreutils/manual/html_node/md5sum-invocation.html.

- Calculate the MD5 checksum for one or more files:

```
md5sum {{path/to/file1 path/to/file2 ...}}
```

- Calculate and save the list of MD5 checksums to a file:

```
md5sum {{path/to/file1 path/to/file2 ...}} > {{path/to/file.md5}}
```

- Calculate an MD5 checksum from `stdin`:

```
{{command}} | md5sum
```

- Read a file of MD5 checksums and filenames and verify all files have matching checksums:

```
md5sum {{[-c|--check]}} {{path/to/file.md5}}
```

- Only show a message for missing files or when verification fails:

```
md5sum {{[-c|--check]}} --quiet {{path/to/file.md5}}
```

- Only show a message when verification fails, ignoring missing files:

```
md5sum --ignore-missing {{[-c|--check]}} --quiet {{path/to/file.md5}}
```

- Check a known MD5 checksum of a file:

```
echo {{known_md5_checksum_of_the_file}} {{path/to/file}} | md5sum {{[-c|--check]}}
```

mdatopbm

Convert a Microdesign MDA file to a PBM image.

See also: **pbmtomda**.

More information: https://netpbm.sourceforge.net/doc/mdatopbm.html.

- Convert a MDA file to a PBM image:

```
mdatopbm {{path/to/image.mda}} > {{path/to/output.pbm}}
```

- Invert the colors in the input image:

```
mdatopbm -i {{path/to/image.mda}} > {{path/to/output.pbm}}
```

- Double the input image's height:

```
mdatopbm -d {{path/to/image.mda}} > {{path/to/output.pbm}}
```

mdk4

A proof-of-concept tool to exploit common IEEE 802.11 protocol weaknesses.

Note: Exercise extreme caution as this tool can disrupt Wi-Fi networks and disconnect nearby users.

See also: **`airodump-ng`**, **`airmon-ng`**.

More information: https://github.com/aircrack-ng/mdk4.

- Flood access points with beacon frames to create fake networks (set interface to monitor mode with `sudo airmon-ng start wifi_interface` if needed):

```
sudo mdk4 {{wifi_interface}} b -f {{path/to/beacons.txt}}
```

- Perform deauthentication attack against all clients on all BSSIDs:

```
sudo mdk4 {{wifi_interface}} d
```

- Perform deauthentication attack on a specific BSSID (list BSSIDs using `sudo airodump-ng wifi_interface`):

```
sudo mdk4 {{wifi_interface}} d -B {{BSSID}}
```

mdp

Make presentations from Markdown files.

More information: https://manned.org/mdp.

- Launch a presentation in the terminal from a Markdown file:

```
mdp {{presentation.md}}
```

- Disable fading transitions:

```
mdp {{[-f|--nofade]}} {{presentation.md}}
```

- Invert font colors to use in terminals with light background:

```
mdp {{[-i|--invert]}} {{presentation.md}}
```

- Disable transparency in transparent terminals:

```
mdp {{[-t|--notrans]}} {{presentation.md}}
```

mediainfo

Display metadata from video and audio files.

More information: https://mediaarea.net/MediaInfo.

- Display metadata for a given file in the console:

```
mediainfo {{file}}
```

- Store the output to a given file along with displaying in the console:

```
mediainfo --Logfile={{out.txt}} {{file}}
```

- List metadata attributes that can be extracted:

```
mediainfo --Info-Parameters
```

medusa

A modular and parallel login brute-forcer for a variety of protocols.

More information: https://manned.org/medusa.

- List all installed modules:

```
medusa -d
```

- Show usage example of a specific module (use `medusa -d` for listing all installed modules):

```
medusa -M {{ssh|http|web-form|postgres|ftp|mysql|...}} -q
```

- Execute brute force against an FTP server using a file containing usernames and a file containing passwords:

```
medusa -M ftp -h host -U {{path/to/username_file}} -P {{path/to/password_file}}
```

- Execute a login attempt against an HTTP server using the username, password, and user-agent specified:

```
medusa -M HTTP -h host -u {{username}} -p {{password}} -m USER-AGENT:"{{Agent}}"
```

- Execute a brute force against a MySQL server using a file containing usernames and a hash:

```
medusa -M mysql -h host -U {{path/to/username_file}} -p {{hash}} -m PASS:HASH
```

- Execute a brute force against a list of SMB servers using a username and a pwdump file:

```
medusa -M smbnt -H {{path/to/hosts_file}} -C {{path/to/pwdump_file}} -u {{username}} -m PASS:HASH
```

meld

Graphical diffing and merging tool.

More information: https://manned.org/meld.

- Start `meld`:

```
meld
```

- Compare 2 files:

```
meld {{path/to/file_1}} {{path/to/file_2}}
```

- Compare 2 directories:

```
meld {{path/to/directory_1}} {{path/to/directory_2}}
```

- Compare 3 files:

```
meld {{path/to/file_1}} {{path/to/file_2}} {{path/to/file_3}}
```

- Open a comparison as a new tab in a pre-existing meld instance:

```
meld --newtab {{path/to/file_1}} {{path/to/file_2}}
```

- Compare multiple sets of files:

```
meld --diff {{path/to/file_1}} {{path/to/file_2}} --diff
{{path/to/file_3}} {{path/to/file_4}}
```

melt

Backup and restore Ed25519 SSH keys using memorizable seed phrases.

More information: https://github.com/charmbracelet/melt#usage.

- Generate a seed phrase from an existing Ed25519 private key:

```
melt {{~/.ssh/id_ed25519}}
```

- Generate a seed phrase from `stdin`:

```
{{cat ~/.ssh/id_ed25519}} | melt
```

- Restore an SSH key from a seed phrase:

```
melt restore {{path/to/key}} --seed "{{seed_phrase}}"
```

- Restore an SSH key from a seed phrase via `stdin`:

```
{{cat path/to/file}} | melt restore -
```

mesg

Check or set a terminal's ability to receive messages from other users, usually from the **`write`** command.

See also: **`write`**, **`talk`**.

More information: https://manned.org/mesg.1p.

- Check terminal's openness to write messages:

```
mesg
```

- Disallow receiving messages from the write command:

```
mesg n
```

- Allow receiving messages from the write command:

```
mesg y
```

meshlabserver

Interface for the MeshLab 3D mesh processing software.

More information: https://manned.org/meshlabserver.

- Convert an STL file to an OBJ file:

```
meshlabserver -i {{input.stl}} -o {{output.obj}}
```

- Convert a WRL file to a OFF file, including the vertex and face normals in the output mesh:

```
meshlabserver -i {{input.wrl}} -o {{output.off}} -om vn fn
```

- Dump a list of all the available processing filters into a file:

```
meshlabserver -d {{path/to/file}}
```

- Process a 3D file using a filter script created in the MeshLab GUI (Filters > Show current filter script > Save Script):

```
meshlabserver -i {{input.ply}} -o {{output.ply}} -s
{{filter_script.mlx}}
```

- Process a 3D file using a filter script, writing the output of the filters into a log file:

```
meshlabserver -i {{input.x3d}} -o {{output.x3d}} -s
{{filter_script.mlx}} -l {{logfile}}
```

meshnamed

Distributed naming system for IPv6 mesh networks.

More information: https://github.com/zhoreeq/meshname.

- Start a local meshname DNS server:

  ```
  meshnamed
  ```

- Convert an IPv6 address into a meshname:

  ```
  meshnamed -getname {{200:6fc8:9220:f400:5cc2:305a:4ac6:967e}}
  ```

- Convert a meshname to an IPv6 address:

  ```
  meshnamed -getip {{aiag7sesed2aaxgcgbnevruwpy}}
  ```

meson

SCons-like build system that uses Python as a front-end language and Ninja as a building backend.

More information: https://mesonbuild.com/Commands.html.

- Generate a C project with a given name and version:

```
meson init {{[-l|--language]}} c {{[-n|--name]}} {{myproject}} --version {{0.1}}
```

- Configure the `builddir` with default values:

```
meson setup {{build_directory}}
```

- Build the project:

```
meson compile -C {{path/to/build_directory}}
```

- Run all tests in the project:

```
meson test
```

- Display help:

```
meson {{[-h|--help]}}
```

- Display version:

```
meson {{[-v|--version]}}
```

meteor

Full-stack JavaScript platform for building web applications.

More information: https://docs.meteor.com/cli/.

- Run a meteor project from its root directory in development mode:

```
meteor
```

- Create a project under the given directory:

```
meteor create {{path/to/directory}}
```

- Display the list of packages the project is currently using:

```
meteor list
```

- Add a package to the project:

```
meteor add {{package}}
```

- Remove a package from the project:

```
meteor remove {{package}}
```

- Create a production build of the project as a tarball under the given directory:

```
meteor build {{path/to/directory}}
```

mg

A small, fast, and portable text editor based on **emacs**.

More information: https://manned.org/mg.

- Open a file for editing:

```
mg {{path/to/file}}
```

- Open a file at a specified line number:

```
mg +{{line_number}} {{path/to/file}}
```

- Open files in a read-only mode:

```
mg -R {{path/to/file1 path/to/file2 ...}}
```

- Disable ~ backup files while editing:

```
mg -n {{path/to/file}}
```

mgrtopbm

Convert a MGR bitmap into a PBM file.

See also: **pbmtomgr**.

More information: https://netpbm.sourceforge.net/doc/mgrtopbm.html.

- Convert a MGR bitmap into a PBM file:

```
mgrtopbm {{path/to/image.mgr}} > {{path/to/output.pbm}}
```

mh_copyright

Adjust copyright headers for MATLAB or Octave code.

More information: https://florianschanda.github.io/miss_hit/copyright.html.

- Update the year (range) to include the current year for the specified files:

```
mh_copyright --primary-entity="{{entity}}" --update-year
{{path/to/file_or_directory1.m path/to/
file_or_director2.m ...}}
```

- Update the year (range) to include the current year for all files:

```
mh_copyright --primary-entity="{{entity}}" --update-year
```

mh_lint

Attempt to find bugs in MATLAB or Octave code.

Please note that this tool is neither sound nor complete.

More information: https://florianschanda.github.io/miss_hit/cli.html.

- Check the current directory:

```
mh_lint
```

- Check a specific directory recursively:

```
mh_lint {{path/to/directory}}
```

- Check a MATLAB file:

```
mh_lint {{path/to/file.m}}
```

- Check an Octave file:

```
mh_lint --octave {{path/to/file.m}}
```

mh_metric

Calculate and enforce code metrics for MATLAB or Octave code.

More information: https://florianschanda.github.io/miss_hit/metrics.html.

- Print the code metrics for the specified files:

```
mh_metric {{path/to/file1.m path/to/file2.m ...}}
```

- Print the code metrics for the specified Octave files:

```
mh_metric --octave {{path/to/file1.m path/to/file2.m ...}}
```

- Print the code metrics for the specified directory recursively:

```
mh_metric {{path/to/directory}}
```

- Print the code metrics for the current directory:

```
mh_metric
```

- Print the code metrics report in HTML or JSON format:

```
mh_metric --{{html|json}} {{path/to/output_file}}
```

micro

A modern and intuitive terminal-based text editor.

You can use your keyboard, but also your mouse to navigate and/or select text.

More information: https://github.com/zyedidia/micro#usage.

- Open a file:

```
micro {{path/to/file}}
```

- Save a file:

```
<Ctrl s>
```

- Cut the entire line:

```
<Ctrl k>
```

- Search for a pattern in the file (press `<Ctrl n>`/`<Ctrl p>` to go to next/previous match):

```
<Ctrl f>{{pattern}}<Enter>
```

- Execute a command:

```
<Ctrl e>{{command}}<Enter>
```

- Perform a substitution in the whole file:

```
<Ctrl e>replaceall "{{pattern}}" "{{replacement}}"<Enter>
```

- Quit:

```
<Ctrl q>
```

micromamba

A fast, minimal, standalone package and environment manager for **conda** packages.

Drop-in replacement for **conda**, ideal for CI, Docker, and lightweight setups.

More information: https://manned.org/micromamba.

- Create a new environment at a specific path, installing named packages into it:

```
micromamba create {{[-p|--prefix]}} /{{path/to/env}} {{python=3.11 numpy}}
```

- Activate an environment by name or path:

```
micromamba activate {{[-p|--prefix]}} /{{path/to/env}}
```

- Run a command inside an environment without activating it in the shell:

```
micromamba run {{[-p|--prefix]}} /{{path/to/env}} {{pytest tests/}}
```

- Install packages into the currently active environment:

```
micromamba install {{scipy pandas}}
```

- List all installed packages in the current environment:

```
micromamba list
```

- Search for packages in channels or current environment:

```
micromamba search {{package_name}}
```

- Query tree-like dependencies of a package:

```
micromamba repoquery depends {{[-t|--tree]}} {{package_name}}
```

- Show information about the current `micromamba` setup:

```
micromamba info
```

microsoft-edge

Modern web browser developed by Microsoft based on the Chromium web browser developed by Google.

This command is available instead as **`msedge`** for Windows.

Note: Additional command arguments from **`chromium`** may also be usable to control Microsoft Edge.

More information: https://microsoft.com/edge.

- Open a specific URL or file:

```
microsoft-edge {{https://example.com|path/to/file.html}}
```

- Open in InPrivate mode:

```
microsoft-edge --inprivate {{example.com}}
```

- Open in a new window:

```
microsoft-edge --new-window {{example.com}}
```

- Open in application mode (without toolbars, URL bar, buttons, etc.):

```
microsoft-edge --app={{https://example.com}}
```

- Use a proxy server:

```
microsoft-edge --proxy-server="{{socks5://hostname:
66}}" {{example.com}}
```

- Open with a custom profile directory:

```
microsoft-edge --user-data-dir={{path/to/directory}}
```

- Open without CORS validation (useful to test an API):

```
microsoft-edge --user-data-dir={{path/to/directory}} --
disable-web-security
```

- Open with a DevTools window for each tab opened:

```
microsoft-edge --auto-open-devtools-for-tabs
```

mid3v2

Edit audio tags.

See also: **id3v2**.

More information: https://mutagen.readthedocs.io/en/latest/man/mid3v2.html.

- List all supported ID3v2.3 or ID3v2.4 frames and their meanings:

```
mid3v2 --list-frames {{path/to/file1.mp3 path/to/
file2.mp3 ...}}
```

- List all supported ID3v1 numeric genres:

```
mid3v2 --list-genres {{path/to/file1.mp3 path/to/
file2.mp3 ...}}
```

- List all tags in specific files:

```
mid3v2 --list {{path/to/file1.mp3 path/to/file2.mp3 ...}}
```

- Set specific artist, album, or song information:

```
mid3v2 {{--artist|--album|--song}}={{string}} {{path/to/
file1.mp3 path/to/file2.mp3 ...}}
```

- Set specific picture information:

```
mid3v2 --
picture={{filename:description:image_type:mime_type}} {{path/
to/file1.mp3 path/to/file2.mp3 ...}}
```

- Set specific year information:

```
mid3v2 --year={{YYYY}} {{path/to/file1.mp3 path/to/
file2.mp3 ...}}
```

- Set specific date information:

```
mid3v2 --date={{YYYY-MM-DD}} {{path/to/file1.mp3 path/to/
file2.mp3 ...}}
```

middleman

Static site generator written in Ruby.

More information: https://middlemanapp.com/basics/install/.

- Create a new Middleman project:

```
middleman init "{{project_name}}"
```

- Start local server for current project on port 4567:

```
middleman server
```

- Start local server for current project on a specified port:

```
middleman server -p "{{port}}"
```

- Build the project in the current directory to prepare for deployment:

```
bundle exec middleman build
```

- Deploy the Middleman project in the current directory:

```
middleman deploy
```

Minecraft

Run a headless Minecraft server.

More information: https://minecraft.wiki/w/Tutorial:Setting_up_a_Java_Edition_server.

- Start a Minecraft server and generate a world if it doesn't exist:

```
java -jar {{path/to/server.jar}} --nogui
```

- Set the minimum and maximum amount of memory a server is allowed to have (Note: Setting them the same prevents lag caused by heap scaling):

```
java -Xms{{1024M}} -Xmx{{2048M}} -jar {{path/to/server.jar}} --nogui
```

- Start a server with a GUI:

```
java -jar {{path/to/server.jar}}
```

- [Interactive] Shut the server down:

```
stop
```

minetest

This command is an alias of **`luanti`**.

- View documentation for the original command:

```
tldr luanti
```

minetestserver

This command is an alias of **`luanti --server`**.

- View documentation for the original command:

  `tldr luanti`

mingle

Bundle the edges of a graph layout.

Graphviz filters: **`acyclic`**, **`bcomps`**, **`comps`**, **`edgepaint`**, **`gvcolor`**, **`gvpack`**, **`mingle`**, **`nop`**, **`sccmap`**, **`tred`**, & **`unflatten`**.

More information: https://www.graphviz.org/pdf/mingle.1.pdf.

- Bundle the edges of one or more graph layouts (that already have layout information):

```
mingle {{path/to/layout1.gv path/to/layout2.gv ...}} > {{path/to/output.gv}}
```

- Perform layout, bundling, and output to a picture with one command:

```
dot {{path/to/input.gv}} | mingle | dot -T {{png}} > {{path/to/output.png}}
```

- Display help:

```
mingle -?
```

minidlna

ReadyMedia (formerly MiniDLNA) is a lightweight media server compatible with DLNA/UPnP-AV clients.

Used to stream media to smart TVs, consoles, and other DLNA-compatible devices.

Configuration is typically done via the **`minidlna.conf`** file.

More information: https://manned.org/minidlna.

- Start the MiniDLNA daemon using the default configuration at `/etc/minidlna.conf`:

```
minidlna
```

- Start MiniDLNA with a specific configuration file:

```
minidlna -f {{path/to/minidlna.conf}}
```

- Force a database rescan on startup:

```
minidlna -R
```

- Run MiniDLNA in the foreground (useful for debugging):

```
minidlna -d
```

- Enable verbose debug output:

```
minidlna -d -v
```

- Specify a custom media directory (overrides config):

```
minidlna -m {{path/to/media}}
```

- Specify a custom database directory:

```
minidlna -P {{path/to/pidfile}}
```

- Specify a custom log file path:

```
minidlna -l {{path/to/logfil.log}}
```

minifab

Automate the setup and deployment of Hyperledger Fabric networks.

More information: https://github.com/hyperledger-labs/minifabric.

- Bring up the default Hyperledger Fabric network:

```
minifab up {{[-i|--fabric-release]}} {{minifab_version}}
```

- Bring down the Hyperledger Fabric network:

```
minifab down
```

- Install chaincode onto a specified channel:

```
minifab install {{[-n|--chaincode-name]}} {{chaincode_name}}
```

- Install a specific chaincode version onto a channel:

```
minifab install {{[-n|--chaincode-name]}} {{chaincode_name}}
{{[-v|--chaincode-version]}} {{chaincode_version}}
```

- Initialize the chaincode after installation/upgrade:

```
minifab approve,commit,initialize,discover
```

- Invoke a chaincode method with the specified arguments:

```
minifab invoke {{[-n|--chaincode-name]}} {{chaincode_name}}
{{[-p|--chaincode-parameters]}} '"{{method_name}}",
{{"argument1", "argument2", ...}}'
```

- Make a query on the ledger:

```
minifab blockquery {{block_number}}
```

- Quickly run an application:

```
minifab apprun {{[-l|--chaincode-language]}}
{{app_programming_language}}
```

minikube start

Start **`minikube`** with different configurations.

More information: https://minikube.sigs.k8s.io/docs/commands/start/.

- Start `minikube` with a specific Kubernetes version:

  ```
  minikube start --kubernetes-version {{v1.24.0}}
  ```

- Start `minikube` with specific resource allocations (e.g., memory and CPU):

  ```
  minikube start --memory {{2048}} --cpus {{2}}
  ```

- Start `minikube` with a specific driver (e.g., VirtualBox):

  ```
  minikube start --driver {{virtualbox}}
  ```

- Start `minikube` in the background (headless mode):

  ```
  minikube start --background
  ```

- Start `minikube` with custom add-ons (e.g., the metrics server):

  ```
  minikube start --addons {{metrics-server}}
  ```

minikube

Run Kubernetes locally.

More information: https://minikube.sigs.k8s.io/docs/.

- Start the cluster:

  ```
  minikube start
  ```

- Get the IP address of the cluster:

  ```
  minikube ip
  ```

- Access a service named `my_service` exposed via a node port and get the URL:

  ```
  minikube service {{my_service}} --url
  ```

- Open the Kubernetes dashboard in a browser:

  ```
  minikube dashboard
  ```

- Stop the running cluster:

  ```
  minikube stop
  ```

- Delete the cluster:

  ```
  minikube delete
  ```

- Connect to LoadBalancer services:

  ```
  minikube tunnel
  ```

minio-client

This command is an alias of **`mc`** (MinIO client).

- View documentation for the original command:

```
tldr mc.cli
```

minio server

MinIO server command for starting the MinIO S3 compatible storage engine.

More information: https://docs.min.io/enterprise/aistor-object-store/reference/aistor-server/.

- Start a server using the default configuration:

```
minio server {{path/to/data_directory}}
```

- Start a server binding to a different port for the API and web console:

```
minio server --address ":{{port}}" --console-address ":
{{port}}" {{path/to/data_directory}}
```

- Start a server as part of a cluster of 2 nodes:

```
minio server {{node1_hostname}} {{path/to/data_directory}}
{{node2_hostname}} {{path/to/data_directory}}
```

minipro

Control Xgecu chip programmers (TL866A/CS, TL866II+, T48, T56).

Supports various chips including AVRs, PICs, microcontrollers, and memory chips.

More information: https://manned.org/minipro.

- List all supported devices:

```
minipro {{[-l|--list]}}
```

- Search for a specific device:

```
minipro {{[-L|--search]}} {{device_name}}
```

- Read chip ID:

```
minipro {{[-p|--device]}} {{chip_name}} {{[-D|--read_id]}}
```

- Read chip contents to a file:

```
minipro {{[-p|--device]}} {{chip_name}} {{[-r|--read]}}
{{path/to/output_file.bin}}
```

- Write a file to chip:

```
minipro {{[-p|--device]}} {{chip_name}} {{[-w|--write]}}
{{path/to/input_file.bin}}
```

- Verify chip contents against a file:

```
minipro {{[-p|--device]}} {{chip_name}} {{[-m|--verify]}}
{{path/to/file.bin}}
```

- Erase a chip:

```
minipro {{[-p|--device]}} {{chip_name}} {{[-E|--erase]}}
```

- Display help:

```
minipro {{[-h|--help]}}
```

miniserve

Simple HTTP file server.

More information: https://github.com/svenstaro/miniserve#usage.

- Serve a directory:

```
miniserve {{path/to/directory}}
```

- Serve a single file:

```
miniserve {{path/to/file}}
```

- Serve a directory using HTTP basic authentication:

```
miniserve {{[-a|--auth]}} {{username}}:{{password}} {{path/to/directory}}
```

minisign

A dead simple tool to sign files and verify signatures.

More information: https://jedisct1.github.io/minisign/.

- Generate a new keypair at the default location:

```
minisign -G
```

- Sign a file:

```
minisign -Sm {{path/to/file}}
```

- Sign a file, adding a trusted (signed) and an untrusted (unsigned) comment in the signature:

```
minisign -Sm {{path/to/file}} -c "{{Untrusted comment}}" -t "{{Trusted comment}}"
```

- Verify a file and the trusted comments in its signature using the specified public key file:

```
minisign -Vm {{path/to/file}} -p {{path/to/publickey.pub}}
```

- Verify a file and the trusted comments in its signature, specifying a public key as a Base64 encoded literal:

```
minisign -Vm {{path/to/file}} -P "{{public_key_base64}}"
```

mise

Manage language runtimes like Node.js, Python, Ruby, Go, Java, etc and various tools.

More information: https://mise.jdx.dev/cli/.

- List all available plugins:

```
mise plugins list-all
```

- Install a plugin:

```
mise plugins add {{name}}
```

- List runtime versions available for install:

```
mise ls-remote {{name}}
```

- Install a specific version of a package:

```
mise install {{name}}@{{version}}
```

- Set global version for a package:

```
mise use {{[-g|--global]}} {{name}}@{{version}}
```

- Set local version for a package:

```
mise use {{name}}@{{version}}
```

- Set environment variable in configuration:

```
mise set {{variable}}={{value}}
```

- Pass plugin options:

```
mise use {{name}}\[{{option1}}={{option1_value}},{{option2}}
={{option2_value}}\]@{{version}}
```

mispipe

Pipe two commands and return the exit status of the first command.

More information: https://manned.org/mispipe.

- Pipe two commands and return the exit status of the first command:

```
mispipe {{command1}} {{command2}}
```

mitmdump

View, record, and programmatically transform HTTP traffic.

The command-line counterpart to mitmproxy.

More information: https://docs.mitmproxy.org/stable/#mitmdump.

- Start a proxy and save all output to a file:

```
mitmdump {{[-w|--wfile]}} {{path/to/file}}
```

- Filter a saved traffic file to just POST requests:

```
mitmdump {{[-nr|--no-server --read-flows]}}
{{input_filename}} {{[-w|--wfile]}} {{output_filename}} "{{~m
post}}"
```

- Replay a saved traffic file:

```
mitmdump {{[-nc|--no-server --client-replay]}} {{path/to/
file}}
```

- Intercept DNS traffic (starts an intercepting DNS server on 127.0.0.1:53):

```
sudo mitmdump {{[-m|--mode]}} dns
```

mitmproxy

An interactive man-in-the-middle HTTP proxy.

See also: **`mitmweb`**, **`mitmdump`**.

More information: https://docs.mitmproxy.org/stable/.

- Start `mitmproxy` with default settings (will listen on port `8080`):

```
mitmproxy
```

- Start `mitmproxy` bound to a custom address and port:

```
mitmproxy --listen-host {{ip_address}} {{[-p|--listen-port]}} {{port}}
```

- Start `mitmproxy` using a script to process traffic:

```
mitmproxy {{[-s|--scripts]}} {{path/to/script.py}}
```

- Export the logs with SSL/TLS master keys to external programs (wireshark, etc.):

```
SSLKEYLOGFILE="{{path/to/file}}" mitmproxy
```

- Specify mode of operation of the proxy server (`regular` is the default):

```
mitmproxy {{[-m|--mode]}} {{regular|transparent|socks5|...}}
```

- Set the console layout:

```
mitmproxy --console-layout {{horizontal|single|vertical}}
```

- Save all proxied traffic to a file for later analysis:

```
mitmproxy {{[-w|--save-stream-file]}} {{path/to/dump.mitm}}
```

- Replay a previously saved HTTP flow file:

```
mitmproxy {{[-nr|--no-server --rfile]}} {{path/to/dump.mitm}}
```

mitmweb

A web-based interactive man-in-the-middle HTTP proxy.

See also: **`mitmproxy`**.

More information: https://docs.mitmproxy.org/stable/concepts-options/.

- Start `mitmweb` with default settings:

```
mitmweb
```

- Start `mitmweb` bound to a custom address and port:

```
mitmweb --listen-host {{ip_address}} --listen-port {{port}}
```

- Start `mitmweb` using a script to process traffic:

```
mitmweb --scripts {{path/to/script.py}}
```

mix

Build tool that provides tasks for creating, compiling, and testing Elixir projects, managing its dependencies, and more.

More information: https://hexdocs.pm/mix/index.html.

- Execute a particular file:

  ```
  mix run {{my_script.exs}}
  ```

- Create a new project:

  ```
  mix new {{project_name}}
  ```

- Compile project:

  ```
  mix compile
  ```

- Run project tests:

  ```
  mix test
  ```

- Display help:

  ```
  mix help
  ```

mixxx

Free and open source cross-platform DJ software.

See also: **`lmms`**.

More information: https://mixxx.org/manual/latest/chapters/appendix.html#command-line-options.

- Start the Mixxx GUI in fullscreen:

```
mixxx --fullScreen
```

- Start in safe developer mode to debug a crash:

```
mixxx --developer --safeMode
```

- Debug a malfunction:

```
mixxx --debugAssertBreak --developer --loglevel trace
```

- Start Mixxx using the specified settings file:

```
mixxx --resourcePath {{mixxx/res/controllers}} --settingsPath {{path/to/settings-file}}
```

- Debug a custom controller mapping:

```
mixxx --controllerDebug --resourcePath {{path/to/mapping-directory}}
```

- Display help:

```
mixxx --help
```

mk

Task runner for targets described in Mkfile.

Mostly used to control the compilation of an executable from source code.

More information: https://doc.cat-v.org/plan_9/4th_edition/papers/mk.

- Call the first target specified in the Mkfile (usually named "all"):

```
mk
```

- Call a specific target:

```
mk {{target}}
```

- Call a specific target, executing 4 jobs at a time in parallel:

```
NPROC=4 mk {{target}}
```

- Force mking of a target, even if source files are unchanged:

```
mk -w{{target}} {{target}}
```

- Assume all targets to be out of date. Thus, update `target` and all of its dependencies:

```
mk -a {{target}}
```

- Keep going as far as possible on error:

```
mk -k
```

mkcert

Make locally-trusted development certificates.

More information: https://manned.org/mkcert.

- Install the local CA in the system trust store:

```
mkcert -install
```

- Generate certificate and private key for a given domain:

```
mkcert {{example.org}}
```

- Generate certificate and private key for multiple domains:

```
mkcert {{example.org}} {{myapp.dev}} {{127.0.0.1}}
```

- Generate wildcard certificate and private key for a given domain and its subdomains:

```
mkcert "{{*.example.it}}"
```

- Uninstall the local CA:

```
mkcert -uninstall
```

mkdir

Create directories and set their permissions.

More information: https://www.gnu.org/software/coreutils/manual/html_node/mkdir-invocation.html.

- Create specific directories:

```
mkdir {{path/to/directory1 path/to/directory2 ...}}
```

- Create specific directories and their parents if needed:

```
mkdir {{[-p|--parents]}} {{path/to/directory1 path/to/directory2 ...}}
```

- Create directories with specific permissions:

```
mkdir {{[-m|--mode]}} {{rwxrw-r--}} {{path/to/directory1 path/to/directory2 ...}}
```

- Create multiple nested directories recursively:

```
mkdir {{[-p|--parents]}} {{path/to/{a,b}/{x,y,z}/{h,i,j}}}
```

mkdocs

Project documentation with Markdown.

More information: https://www.mkdocs.org/user-guide/cli/.

- Create a new mkdocs project:

  ```
  mkdocs new {{project_name}}
  ```

- Serve the project in the current directory using the mkdocs dev-server:

  ```
  mkdocs serve
  ```

- Build the documentation in the current directory:

  ```
  mkdocs build
  ```

- Deploy the documentation in the current directory to GitHub pages:

  ```
  mkdocs gh-deploy
  ```

mkfifo

Make named pipes, also known as First In First Out (FIFO).

More information: https://www.gnu.org/software/coreutils/manual/html_node/mkfifo-invocation.html.

- Create a named pipe at a given path:

```
mkfifo {{path/to/pipe}}
```

- Send data through a named pipe and send the command to the background:

```
echo "{{Hello World}}" > {{path/to/pipe}} &
```

- Receive data through a named pipe:

```
cat {{path/to/pipe}}
```

- Share your terminal session in real-time:

```
mkfifo {{path/to/pipe}}; script {{[-f|--flush]}} {{path/to/pipe}}
```

mkfile

Create empty files of any size.

More information: https://manned.org/mkfile.

- Create an empty file of 15 kilobytes:

```
mkfile -n {{15k}} {{path/to/file}}
```

- Create a file of a given size and unit (bytes, KB, MB, GB):

```
mkfile -n {{size}}{{b|k|m|g}} {{path/to/file}}
```

- Create two files of 4 megabytes each:

```
mkfile -n {{4m}} {{first_filename}} {{second_filename}}
```

mktemp

Create a temporary file or directory.

More information: https://man.openbsd.org/mktemp.1.

- Create an empty temporary file and print its absolute path:

```
mktemp
```

- Use a custom directory if `$TMPDIR` is not set (the default is platform-dependent, but usually `/tmp`):

```
mktemp -p /{{path/to/temporary_directory}}
```

- Use a custom path template (`X`s are replaced with random alphanumeric characters):

```
mktemp {{/tmp/example.XXXXXXXX}}
```

- Use a custom file name template:

```
mktemp -t {{example.XXXXXXXX}}
```

- Create an empty temporary directory and print its absolute path:

```
mktemp -d
```

mktorrent

Create BitTorrent metainfo files.

More information: https://manned.org/mktorrent.

- Create a torrent with 2^21 KB as the piece size:

```
mktorrent {{[-a|--announce]}} {{tracker_announce_url}} {{[-l|--piece-length]}} {{21}} {{[-o|--output]}} {{path/to/example.torrent}} {{path/to/file_or_directory}}
```

- Create a private torrent with a 2^21 KB piece size:

```
mktorrent {{[-p|--private]}} {{[-a|--announce]}} {{tracker_announce_url}} {{[-l|--piece-length]}} {{21}} {{[-o|--output]}} {{path/to/example.torrent}} {{path/to/file_or_directory}}
```

- Create a torrent with a comment:

```
mktorrent {{[-c|--comment]}} "{{comment}}" {{[-a|--announce]}} {{tracker_announce_url}} {{[-l|--piece-length]}} {{21}} {{[-o|--output]}} {{path/to/example.torrent}} {{path/to/file_or_directory}}
```

- Create a torrent with multiple trackers:

```
mktorrent {{[-a|--announce]}} {{tracker_announce_url,tracker_announce_url_2}} {{[-l|--piece-length]}} {{21}} {{[-o|--output]}} {{path/to/example.torrent}} {{path/to/file_or_directory}}
```

- Create a torrent with web seed URLs:

```
mktorrent {{[-a|--announce]}} {{tracker_announce_url}} -w {{web_seed_url}} {{[-l|--piece-length]}} {{21}} {{[-o|--output]}} {{path/to/example.torrent}} {{path/to/file_or_directory}}
```

mkvmerge

Merge and extract multimedia streams.

More information: https://mkvtoolnix.download/doc/mkvmerge.html.

- Display information about a Matroska file:

```
mkvmerge --identify {{path/to/file.mkv}}
```

- Extract the audio from track 1 of a specific file:

```
mkvextract tracks {{path/to/file.mkv}} {{1}}:{{path/to/
output.webm}}
```

- Extract the subtitle from track 3 of a specific file:

```
mkvextract tracks {{path/to/file.mkv}} {{3}}:{{path/to/
subs.srt}}
```

- Add a subtitle track to a file:

```
mkvmerge --output {{path/to/output.mkv}} {{path/to/file.mkv}}
{{path/to/subs.srt}}
```

mlr

Miller is like **awk**, **sed**, **cut**, **join**, and **sort** for name-indexed data such as CSV, TSV, and tabular JSON.

More information: https://miller.readthedocs.io/en/latest/manpage/.

- Pretty-print a CSV file in a tabular format:

```
mlr --icsv --opprint cat {{example.csv}}
```

- Receive JSON data and pretty print the output:

```
{{echo '{"key":"value"}'}} | mlr --ijson --opprint cat
```

- Sort alphabetically on a field:

```
mlr --icsv --opprint sort -f {{field}} {{example.csv}}
```

- Sort in descending numerical order on a field:

```
mlr --icsv --opprint sort -nr {{field}} {{example.csv}}
```

- Convert CSV to JSON, performing calculations, and display those calculations:

```
mlr --icsv --ojson put '${{newField1}} = ${{oldFieldA}}/$
{{oldFieldB}}' {{example.csv}}
```

- Receive JSON and format the output as vertical JSON:

```
{{echo '{"key1":"value1", "key2":"value2"}'}} | mlr --ijson
--ojson --jvstack cat
```

- Filter lines of a compressed CSV file treating numbers as [S]trings:

```
mlr --prepipe 'gunzip' {{[-c|--csv]}} filter {{[-S|--infer-
none]}} '${{fieldName}} =~ "{{regex}}"' {{example.csv.gz}}
```

mm2gv

Convert a graph from Matrix Market **mm** format to **gv** format.

Converters: **gml2gv**, **gv2gml**, **gv2gxl**, **gxl2gv**, **graphml2gv** & **mm2gv**.

More information: https://graphviz.org/pdf/mm2gv.1.pdf.

- Convert a graph from `mm` to `gv` format:

```
mm2gv -o {{output.gv}} {{input.mm}}
```

- Convert a graph using `stdin` and `stdout`:

```
cat {{input.mm}} | mm2gv > {{output.gv}}
```

- Display help:

```
mm2gv -?
```

mmdc

CLI for mermaid, a diagram generation tool with a domain-specific language.

A mermaid definition file is taken as input and a SVG, PNG, or PDF file is generated as output.

More information: http://mermaid.js.org/.

- Convert a file to the specified format (automatically determined from the file extension):

```
mmdc {{[-i|--input]}} {{input.mmd}} {{[-o|--output]}} {{output.svg}}
```

- Specify the theme of the chart:

```
mmdc {{[-i|--input]}} {{input.mmd}} {{[-o|--output]}} {{output.svg}} {{[-t|--theme]}} {{forest|dark|neutral|default}}
```

- Specify the background color of the chart (e.g. `lime`, `"#D8064F"`, or `transparent`):

```
mmdc {{[-i|--input]}} {{input.mmd}} {{[-o|--output]}} {{output.svg}} {{[-b|--backgroundColor]}} {{color}}
```

mmls

Display the partition layout of a volume system.

More information: https://wiki.sleuthkit.org/index.php?title=Mmls.

- Display the partition table stored in an image file:

```
mmls {{path/to/image_file}}
```

- Display the partition table with an additional column for the partition size:

```
mmls -B -i {{path/to/image_file}}
```

- Display the partition table in a split EWF image:

```
mmls -i ewf {{image.e01}} {{image.e02}}
```

- Display nested partition tables:

```
mmls -t {{nested_table_type}} -o {{offset}} {{path/to/
image_file}}
```

mmv

Move and rename files in bulk.

More information: https://manned.org/mmv.1.

- Rename all files with a certain extension to a different extension:

```
mmv "*{{.old_extension}}" "#1{{.new_extension}}"
```

- Copy `report6part4.txt` to `./french/rapport6partie4.txt` along with all similarly named files:

```
mmv {{[-c|--copy]}} "{{report*part*.txt}}" "{{./french/
rapport#1partie#2.txt}}"
```

- Append all `.txt` files into one file:

```
mmv {{[-a|--append]}} "{{*.txt}}" "{{all.txt}}"
```

- Convert dates in filenames from "M-D-Y" format to "D-M-Y" format:

```
mmv "{{[0-1][0-9]-[0-3][0-9]-[0-9][0-9][0-9][0-9].txt}}"
"{{#3#4-#1#2-#5#6#7#8.txt}}"
```

mocha

A feature-rich JavaScript test framework.

More information: https://mochajs.org/#command-line-usage.

- Run tests with default configuration or as configured in `mocha.opts`:

  ```
  mocha
  ```

- Run tests contained at a specific location:

  ```
  mocha {{path/to/test_directory}}
  ```

- Run tests that match a specific `grep` pattern:

  ```
  mocha {{[-g|--grep]}} {{regex}}
  ```

- Run tests on changes to JavaScript files in the current directory and once initially:

  ```
  mocha {{[-w|--watch]}}
  ```

- Run tests with a specific reporter:

  ```
  mocha {{[-R|--reporter]}} {{reporter}}
  ```

mods

AI for the command-line, built for pipelines.

More information: https://github.com/charmbracelet/mods#usage.

- Ask a generic question:

```
mods "{{write me a poem about platypuses}}"
```

- Open settings in your $EDITOR:

```
mods --settings
```

- Ask for comments on your code, in markdown format:

```
mods < {{path/to/file}} {{[-f|--format]}} "{{what are your
thoughts on improving this code?}}"
```

- Ask for help with your documentation, in markdown format:

```
mods < {{README.md}} {{[-f|--format]}} "{{write a new section
to this readme for a feature that sends you a free rabbit if
you hit r}}"
```

- Organize your videos, in markdown format:

```
ls {{path/to/videos}} | mods {{[-f|--format]}} "{{organize
these by decade and summarize}}"
```

- Read through raw HTML and summarize the contents, in markdown format:

```
curl "{{https://api.open-meteo.com/v1/forecast?
latitude=29.00&longitude=-90.00&current_weather=true&hourly=temperatur
| mods {{[-f|--format]}} "{{summarize this weather data for a
human}}"
```

- Display help:

```
mods --help
```

modutil

Manage PKCS #11 module information within the NSS security module database.

More information: https://manned.org/modutil.

- Add a PKCS #11 module to a NSS database (e.g. a Firefox profile: `$HOME/.mozilla/firefox/default-release`):

```
modutil -dbdir sql:{{path/to/nss_database_directory}} -add
"{{module_label}}" -libfile {{path/to/pkcs11_mod.so}}
```

- List PKCS #11 modules in a NSS database:

```
modutil -dbdir sql:{{path/to/nss_database_directory}} -list
```

moe

A WYSIWYG text editor for ISO-8859-15 encoded text.

More information: https://www.gnu.org/software/moe/moe.html.

- Open moe and create a backup file (file~) when saving edits:

```
moe {{path/to/file}}
```

- Open a file as read-only:

```
moe {{[-o|--read-only]}} {{path/to/file}}
```

- Edit a file without creating backups:

```
moe {{[-B|--no-backup]}} {{path/to/file}}
```

- Edit a file ignoring case in searches:

```
moe {{[-i|--ignore-case]}} {{path/to/file}}
```

- Save and Quit:

```
<Ctrl x>
```

mogrify

This command is an alias of **`magick mogrify`**.

- View documentation for the original command:

```
tldr magick mogrify
```

molecule

Molecule helps testing Ansible roles.

More information: https://docs.ansible.com/projects/molecule/usage/.

- Create a new Ansible role:

  ```
  molecule init role --role-name {{role_name}}
  ```

- Run tests:

  ```
  molecule test
  ```

- Start the instance:

  ```
  molecule create
  ```

- Configure the instance:

  ```
  molecule converge
  ```

- List scenarios of the instance:

  ```
  molecule matrix converge
  ```

- Log in into the instance:

  ```
  molecule login
  ```

mongo

The legacy MongoDB shell. See **`mongosh`** for the new shell.

Note: All connection options can be replaced with one string: **`mongodb://user@host:port/db_name?authSource=authdb_name`**.

More information: https://www.mongodb.com/docs/mongodb-shell/.

- Connect to a local database on the default port (`mongodb://localhost:27017`):

```
mongo
```

- Connect to a database:

```
mongo --host {{host}} --port {{port}} {{db_name}}
```

- Authenticate using the specified username on the specified database (you will be prompted for a password):

```
mongo --host {{host}} --port {{port}} --username {{username}} --authenticationDatabase {{authdb_name}} {{db_name}}
```

- Evaluate a JavaScript expression on a database:

```
mongo --eval '{{JSON.stringify(db.foo.findOne())}}' {{db_name}}
```

mongod

The MongoDB database server.

More information: https://www.mongodb.com/docs/manual/reference/program/mongod/.

- Specify the storage directory (default: `/data/db` on Linux and macOS, `C:\data\db` on Windows):

```
mongod --dbpath {{path/to/directory}}
```

- Specify a configuration file:

```
mongod --config {{path/to/file}}
```

- Specify the port to listen on (default: 27017):

```
mongod --port {{port}}
```

- Specify the database profiling level. 0 is off, 1 is only slow operations, 2 is all (default: 0):

```
mongod --profile {{0|1|2}}
```

mongodump

Utility to export the contents of a MongoDB instance.

More information: https://www.mongodb.com/docs/database-tools/mongodump/.

- Create a dump of all databases (this will place the files inside a directory called "dump"):

```
mongodump
```

- Specify an output location for the dump:

```
mongodump {{[-o|--out]}} {{path/to/directory}}
```

- Create a dump of a given database:

```
mongodump {{[-d|--db]}} {{database_name}}
```

- Create a dump of a given collection within a given database:

```
mongodump {{[-c|--collection]}} {{collection_name}} {{[-d|--db]}} {{database_name}}
```

- Connect to a given host running on a given port and create a dump:

```
mongodump {{[-h|--host]}} {{host}} --port {{port}}
```

- Create a dump of a given database with a given username; user will be prompted for password:

```
mongodump {{[-u|--username]}} {{username}} {{database}} {{[-p|--password]}}
```

- Create a dump from a specific instance; host, user, password, and database will be defined in the connection string:

```
mongodump --uri {{connection_string}}
```

mongoexport

Produce exports of data stored in a MongoDB instance formatted as JSON or CSV.

More information: https://www.mongodb.com/docs/database-tools/mongoexport/.

- Export a collection to `stdout`, formatted as JSON:

```
mongoexport --uri={{connection_string}} --
collection={{collection_name}}
```

- Export the documents in the specified collection that match a query to a JSON file:

```
mongoexport --db={{database_name}} --
collection={{collection_name}} --query="{{query_object}}" --
out={{path/to/file.json}}
```

- Export documents as a JSON array instead of one object per line:

```
mongoexport --collection={{collection_name}} --jsonArray
```

- Export documents to a CSV file:

```
mongoexport --collection={{collection_name}} --type={{csv}}
--fields="{{field1,field2,...}}" --out={{path/to/file.csv}}
```

- Export documents that match the query in the specified file to a CSV file, omitting the list of field names on the first line:

```
mongoexport --collection={{collection_name}} --type={{csv}}
--fields="{{field1,field2,...}}" --queryFile={{path/to/file}}
--noHeaderLine --out={{path/to/file.csv}}
```

- Export documents to `stdout`, formatted as human-readable JSON:

```
mongoexport --uri={{mongodb_uri}} --
collection={{collection_name}} --pretty
```

- Display help:

```
mongoexport --help
```

mongoimport

Imports content from a JSON, CSV, or TSV file into a MongoDB database.

More information: https://www.mongodb.com/docs/database-tools/mongoimport/.

- Import a JSON file into a specific collection:

```
mongoimport --file {{path/to/file.json}} --uri
{{mongodb_uri}} {{[-c|--collection]}} {{collection_name}}
```

- Import a CSV file, using the first line of the file to determine field names:

```
mongoimport --type {{csv}} --file {{path/to/file.csv}} {{[-
d|--db]}} {{database_name}} {{[-c|--collection]}}
{{collection_name}}
```

- Import a JSON array, using each element as a separate document:

```
mongoimport --jsonArray --file {{path/to/file.json}}
```

- Import a JSON file using a specific mode and a query to match existing documents:

```
mongoimport --file {{path/to/file.json}} --mode {{delete|
merge|upsert}} --upsertFields "{{field1,field2,...}}"
```

- Import a CSV file, reading field names from a separate CSV file and ignoring fields with empty values:

```
mongoimport --type {{csv}} --file {{path/to/file.csv}} --
fieldFile {{path/to/field_file.csv}} --ignoreBlanks
```

- Display help:

```
mongoimport --help
```

mongorestore

Utility to import a collection or database from a binary dump into a MongoDB instance.

More information: https://www.mongodb.com/docs/database-tools/mongorestore/.

- Import a BSON data dump from a directory to a MongoDB database:

```
mongorestore --db {{database_name}} {{path/to/directory}}
```

- Import a BSON data dump from a directory to a given database in a MongoDB server host, running at a given port, with user authentication (user will be prompted for password):

```
mongorestore --host {{database_host:port}} --db {{database_name}} --username {{username}} {{path/to/directory}} --password
```

- Import a collection from a BSON file to a MongoDB database:

```
mongorestore --db {{database_name}} {{path/to/file}}
```

- Import a collection from a BSON file to a given database in a MongoDB server host, running at a given port, with user authentication (user will be prompted for password):

```
mongorestore --host {{database_host:port}} --db {{database_name}} --username {{username}} {{path/to/file}} --password
```

mongosh

A new shell for MongoDB, replacement for **`mongo`**.

Note: All connection options can be replaced with one string: **`mongodb://user@host:port/db_name?authSource=authdb_name`**.

More information: https://www.mongodb.com/docs/mongodb-shell/.

- Connect to a local database on the default port (`mongodb://localhost:27017`):

  ```
  mongosh
  ```

- Connect to a database:

  ```
  mongosh --host {{host}} --port {{port}} {{db_name}}
  ```

- Authenticate using the specified username on the specified database (you will be prompted for a password):

  ```
  mongosh --host {{host}} --port {{port}} --username {{username}} --authenticationDatabase {{authdb_name}} {{db_name}}
  ```

- Evaluate a JavaScript expression on a database:

  ```
  mongosh --eval '{{JSON.stringify(db.foo.findOne())}}' {{db_name}}
  ```

monodevelop

Cross platform IDE for C#, F#, and more.

More information: https://www.monodevelop.com/documentation/.

- Start MonoDevelop:

```
monodevelop
```

- Open a specific file:

```
monodevelop {{path/to/file}}
```

- Open a specific file with the caret at a specific position:

```
monodevelop {{path/to/file}};{{line_number}};
{{column_number}}
```

- Force opening a new window instead of switching to an existing one:

```
monodevelop --new-window
```

- Disable redirection of `stdout` and `stderr` to a log file:

```
monodevelop --no-redirect
```

- Enable performance monitoring:

```
monodevelop --perf-log
```

monodis

The Mono Common Intermediate Language (CIL) disassembler.

More information: https://www.mono-project.com/docs/tools+libraries/tools/monodis/.

- Disassemble an assembly to textual CIL:

```
monodis {{path/to/assembly.exe}}
```

- Save the output to a file:

```
monodis --output={{path/to/output.il}} {{path/to/assembly.exe}}
```

- Show information about an assembly:

```
monodis --assembly {{path/to/assembly.dll}}
```

- List the references of an assembly:

```
monodis --assemblyref {{path/to/assembly.exe}}
```

- List all the methods in an assembly:

```
monodis --method {{path/to/assembly.exe}}
```

- List resources embedded within an assembly:

```
monodis --manifest {{path/to/assembly.dll}}
```

- Extract all the embedded resources to the current directory:

```
monodis --mresources {{path/to/assembly.dll}}
```

monolith

Save a web page as a single HTML file.

More information: https://github.com/Y2Z/monolith.

- Save a webpage as a single HTML file:

```
monolith {{url}}
```

- Save a webpage as a single HTML file, excluding audio:

```
monolith {{url}} {{[-a|--no-audio]}}
```

- Save a webpage as a single HTML file, excluding CSS:

```
monolith {{url}} {{[-c|--no-css]}}
```

- Save a webpage as a single HTML file, excluding images:

```
monolith {{url}} {{[-i|--no-images]}}
```

- Save a webpage as a single HTML file, excluding videos:

```
monolith {{url}} {{[-v|--no-video]}}
```

- Save a webpage as a single HTML file, excluding JavaScript:

```
monolith {{url}} {{[-j|--no-js]}}
```

- Save a webpage as a single HTML file, accepting invalid TLS certificates:

```
monolith {{url}} {{[-k|--insecure]}}
```

- Save a webpage as a single HTML file, specifying a specific output file:

```
monolith {{url}} {{[-o|--output]}} {{path/to/file.html}}
```

monop

Finds and displays signatures of Types and methods inside .NET assemblies.

More information: https://manned.org/monop.

- Show the structure of a Type built-in of the .NET Framework:

```
monop {{System.String}}
```

- List the types in an assembly:

```
monop -r:{{path/to/assembly.exe}}
```

- Show the structure of a Type in a specific assembly:

```
monop -r:{{path/to/assembly.dll}} {{Namespace.Path.To.Type}}
```

- Only show members defined in the specified Type:

```
monop -r:{{path/to/assembly.dll}} {{[-d|--declared-only]}}
{{Namespace.Path.To.Type}}
```

- Show private members:

```
monop -r:{{path/to/assembly.dll}} {{[-p|--private]}}
{{Namespace.Path.To.Type}}
```

- Hide obsolete members:

```
monop -r:{{path/to/assembly.dll}} {{[-f|--filter-obsolete]}}
{{Namespace.Path.To.Type}}
```

- List the other assemblies that a specified assembly references:

```
monop -r:{{path/to/assembly.dll}} --refs
```

montage

This command is an alias of **`magick montage`**.

- View documentation for the original command:

```
tldr magick montage
```

more

Interactively display a file, allowing scrolling and searching.

See also: **`less`**.

More information: https://manned.org/more.1p.

- Open a file:

```
more {{path/to/file}}
```

- Display a specific line:

```
more +{{line_number}} {{path/to/file}}
```

- Go to the next page:

```
<Space>
```

- Search for a string (press <n> to go to the next match):

```
</>{{something}}<Enter>
```

- Exit:

```
<q>
```

- Display help about interactive commands:

```
<h>
```

moro

Track work time.

More information: https://github.com/getmoro/moro/blob/master/DOCUMENTATION.md.

- Invoke `moro` without parameters, to set the current time as the start of the working day:

```
moro
```

- Specify a custom time for the start of the working day:

```
moro hi {{09:30}}
```

- Invoke `moro` without parameters a second time, to set the current time at the end of the working day:

```
moro
```

- Specify a custom time for the end of the working day:

```
moro bye {{17:30}}
```

- Add a note on the current working day:

```
moro note {{3 hours on project Foo}}
```

- Show a report of time logs and notes for the current working day:

```
moro report
```

- Show a report of time logs and notes for all working days on record:

```
moro report --all
```

mosh

Mobile Shell (**mosh**) is a robust and responsive replacement for SSH.

mosh persists connections to remote servers while roaming between networks.

More information: https://manned.org/mosh.

- Connect to a remote server:

```
mosh {{username}}@{{remote_host}}
```

- Connect to a remote server with a specific identity (private key):

```
mosh --ssh="ssh -i {{path/to/key_file}}" {{username}}
@{{remote_host}}
```

- Connect to a remote server using a specific port:

```
mosh --ssh="ssh -p {{2222}}" {{username}}@{{remote_host}}
```

- Run a command on a remote server:

```
mosh {{remote_host}} -- {{command -with -flags}}
```

- Select Mosh UDP port (useful when `remote_host` is behind a NAT):

```
mosh -p {{124}} {{username}}@{{remote_host}}
```

- Usage when `mosh-server` binary is outside standard path:

```
mosh --server={{path/to/mosh-server}} {{remote_host}}
```

mosquitto

An MQTT broker.

More information: https://mosquitto.org/man/mosquitto-8.html.

- Start Mosquitto:

```
mosquitto
```

- Specify a configuration file to use:

```
mosquitto {{[-c|--config-file]}} {{path/to/file.conf}}
```

- Listen on a specific port:

```
mosquitto {{[-p|--port]}} {{8883}}
```

- Daemonize by forking into the background:

```
mosquitto {{[-d|--daemon]}}
```

mosquitto_passwd

Manage password files for mosquitto.

See also: **`mosquitto`**, the MQTT server that this manages.

More information: https://mosquitto.org/man/mosquitto_passwd-1.html.

- Add a new user to a password file (will prompt to enter the password):

```
mosquitto_passwd {{path/to/password_file}} {{username}}
```

- Create the password file if it doesn't already exist:

```
mosquitto_passwd -c {{path/to/password_file}} {{username}}
```

- Delete the specified username instead:

```
mosquitto_passwd -D {{path/to/password_file}} {{username}}
```

- Upgrade an old plain-text password file to a hashed password file:

```
mosquitto_passwd -U {{path/to/password_file}}
```

mosquitto_pub

A simple MQTT version 3.1.1 client that will publish a single message on a topic and exit.

More information: https://mosquitto.org/man/mosquitto_pub-1.html.

- Publish a temperature value of 32 on the topic `sensors/temperature` to 192.168.1.1 (defaults to `localhost`) with Quality of Service (`QoS`) set to 1:

```
mosquitto_pub {{[-h|--host]}} {{192.168.1.1}} {{[-t|--
topic]}} {{sensors/temperature}} {{[-m|--message]}} {{32}}
{{[-q|--qos]}} {{1}}
```

- Publish timestamp and temperature data on the topic `sensors/temperature` to a remote host on a non-standard port:

```
mosquitto_pub {{[-h|--host]}} {{192.168.1.1}} {{[-p|--port]}}
{{1885}} {{[-t|--topic]}} {{sensors/temperature}} {{[-m|--
message]}} "{{1266193804 32}}"
```

- Publish light switch status and retain the message on the topic `switches/kitchen_lights/status` to a remote host because there may be a long period of time between light switch events:

```
mosquitto_pub {{[-r|--retain]}} {{[-h|--host]}}
"{{iot.eclipse.org}}" {{[-t|--topic]}} {{switches/
kitchen_lights/status}} {{[-m|--message]}} "{{on}}"
```

- Send the contents of a file (`data.txt`) as a message and publish it to `sensors/temperature` topic:

```
mosquitto_pub {{[-t|--topic]}} {{sensors/temperature}} {{[-
f|--file]}} {{data.txt}}
```

- Send the contents of a file (`data.txt`), by reading from `stdin` and send the entire input as a message and publish it to `sensors/temperature` topic:

```
mosquitto_pub < {{data.txt}} {{[-t|--topic]}} {{sensors/
temperature}} {{[-s|--stdin-file]}}
```

- Read newline delimited data from `stdin` as a message and publish it to `sensors/temperature` topic:

```
{{echo data.txt}} | mosquitto_pub {{[-t|--topic]}} {{sensors/
temperature}} {{[-l|--stdin-line]}}
```

mosquitto_sub

A simple MQTT version 3.1.1 client that will subscribe to topics and print the messages that it receives.

More information: https://mosquitto.org/man/mosquitto_sub-1.html.

- Subscribe to the topic `sensors/temperature` information with Quality of Service (`QoS`) set to 1. (The default hostname is `localhost` and port 1883):

```
mosquitto_sub {{[-t|--topic]}} {{sensors/temperature}} {{[-q|--qos]}} {{1}}
```

- Subscribe to all broker status messages publishing on `iot.eclipse.org` port 1885 and print published messages verbosely:

```
mosquitto_sub {{[-v|--verbose]}} {{[-h|--host]}} "iot.eclipse.org" {{[-p|--port]}} 1885 {{[-t|--topic]}} {{\$SYS/#}}
```

- Subscribe to multiple topics matching a given pattern. (+ takes any metric name):

```
mosquitto_sub {{[-t|--topic]}} {{sensors/machines/+/temperature/+}}
```

most

Open one or several files for interactive reading, allowing scrolling and search.

More information: https://manned.org/most.

- Open a file:

```
most {{path/to/file}}
```

- Open several files:

```
most {{path/to/file1 path/to/file2 ...}}
```

- Open a file at the first occurrence of "string":

```
most {{path/to/file}} +/{{string}}
```

- Move through opened files:

```
<:><n>{{<ArrowUp>|<ArrowDown>}}
```

- Jump to the 100th line:

```
<j>{{100}}<Enter>
```

- Edit current file:

```
<e>
```

- Split the current window in half:

```
<CTRL x><o>
```

- Exit:

```
<q>
```

mozillavpn

A Virtual Private Network from the makers of Firefox.

See also: **`fastd`**, **`ivpn`**, **`mullvad`**, **`warp-cli`**.

More information: https://github.com/mozilla-mobile/mozilla-vpn-client/wiki/Command-line-interface.

- Log in with an interactive prompt:

```
mozillavpn login
```

- Connect to Mozilla VPN:

```
mozillavpn activate
```

- Display the connection status:

```
mozillavpn status
```

- List available servers:

```
mozillavpn servers
```

- Select a specific server:

```
mozillavpn select {{server_name}}
```

- Disconnect from Mozilla VPN:

```
mozillavpn deactivate
```

- Log out:

```
mozillavpn logout
```

- Display help for a subcommand:

```
mozillavpn {{subcommand}} --help
```

mp3info

Viewer/editor for ID3v1 (but not ID3v2) tags of MP3 files.

More information: https://www.ibiblio.org/mp3info/mp3info.html.

- Show all ID3v1 tags of a specific MP3 file:

```
mp3info {{path/to/file.mp3}}
```

- Edit ID3v1 tags [i]nteractively:

```
mp3info -i {{path/to/file.mp3}}
```

- Set values for ID3v1 tags in a specific MP3 file ([a]rtist, [t]itle, a[l]bum, [y]ear, and [c]omment):

```
mp3info -a "{{artist_name}}" -t "{{song_title}}" -l
"{{album_title}}" -y {{year}} -c "{{comment_text}}" {{path/
to/file.mp3}}
```

- Set the [n]umber of the track in the album for a specific MP3 file:

```
mp3info -n {{track_number}} {{path/to/file.mp3}}
```

- [G]et a list of valid genres and their numeric codes:

```
mp3info -G
```

- Set the music [g]enre for a specific MP3 file:

```
mp3info -g {{genre_number}} {{path/to/file.mp3}}
```

mp4box

MPEG-4 Systems Toolbox: muxe streams into MP4 container.

More information: https://github.com/gpac/gpac/wiki/Fragmentation,-segmentation,-splitting-and-interleaving.

- Display information about an existing MP4 file:

```
mp4box -info {{path/to/file}}
```

- Add an SRT subtitle file into an MP4 file:

```
mp4box -add {{input_subs.srt}}:lang=eng -add {{input.mp4}} {{output.mp4}}
```

- Combine audio from one file and video from another:

```
mp4box -add {{input1.mp4}}#audio -add {{input2.mp4}}#video {{output.mp4}}
```

mpc

Music Player Client: control the Music Player Daemon (MPD).

See also: **`mpd`**, **`ncmpcpp`**, **`cmus`**.

More information: https://www.musicpd.org/doc/mpc/html/.

- Toggle play/pause:

```
mpc toggle
```

- Stop playing:

```
mpc stop
```

- Show information about the currently playing song:

```
mpc status
```

- Play the next song:

```
mpc next
```

- Play the previous song:

```
mpc prev
```

- Seek `n` seconds forward (`+`) or backward (`-`):

```
mpc {{+n|-n}}
```

mpd

Music Player Daemon.

See also: **`mpc`**, **`ncmpcpp`**.

More information: https://mpd.readthedocs.io/en/stable/mpd.1.html.

- Start MPD:

```
mpd
```

- Start MPD but don't read from the configuration file:

```
mpd --no-config
```

- Start MPD and don't detach it from the console:

```
mpd --no-daemon
```

- Kill the currently running MPD session:

```
mpd --kill
```

mpg321

High Performance MPEG 1.0/2.0/2.5 Audio Player for Layer 1, 2, and 3.

Mpg321 was written (sometime in 1999) to be a drop-in replacement for the (previously) non-free mpg123 player.

More information: https://manned.org/mpg321.

- Play an audio source exactly `n` times (0 means forever):

```
mpg321 {{[-l|--loop]}} {{n}} {{path/to/file1|URL1 path/to/file2|URL2 ...}}
```

- Play a directory recursively:

```
mpg321 -B {{path/to/directory}}
```

- Enable Basic Keys (`*` or `/` - Increase or decrease volume, `n` - Skip song, `m` - Mute/unmute.) while playing:

```
mpg321 -K {{path/to/file1|URL1 path/to/file2|URL2 ...}}
```

- Play files randomly until interrupted:

```
mpg321 {{[-Z|--random]}} {{path/to/file1|URL1 path/to/file2|URL2 ...}}
```

- Shuffle the files before playing them once:

```
mpg321 {{[-z|--shuffle]}} {{path/to/file1|URL1 path/to/file2|URL2 ...}}
```

- Play all files in the current directory and subdirectories, randomly (until interrupted), with Basic Keys enabled:

```
mpg321 -B {{[-Z|--random]}} -K .
```

mpic++

Open MPI wrapper compiler for C++.

See also: **`mpirun`**.

More information: https://manned.org/mpicxx.

- Compile an Open MPI program:

```
mpic++ {{path/to/source_file}}
```

- Show all the wrapper-supplied flags:

```
mpic++ --showme
```

mpicc

Open MPI C wrapper compiler.

More information: https://www.mpich.org/static/docs/latest/www1/mpicc.html.

- Compile a source code file into an object file:

```
mpicc -c {{path/to/file.c}}
```

- Link an object file and make an executable:

```
mpicc -o {{executable}} {{path/to/object_file.o}}
```

- Compile and link source code in a single command:

```
mpicc -o {{executable}} {{path/to/file.c}}
```

mpicxx

This command is an alias of **`mpic++`**.

- View documentation for the original command:

```
tldr mpic++
```

mpiexec

This command is an alias of **`mpirun`**.

- View documentation for the original command:

  ```
  tldr mpirun
  ```

mpijavac

Open MPI compiler wrapper for Java.

See also: **`mpirun`**.

More information: https://docs.open-mpi.org/en/main/features/java.html#building-java-mpi-applications.

- Compile a Java source file:

```
mpijavac {{path/to/source_file.java}}
```

- Pass application-specific classpaths to compiler:

```
mpijavac -cp {{path/to/app.jar}} {{path/to/source_file.java}}
```

- Show the flags necessary to build MPI Java applications:

```
mpijavac --showme
```

- Show the flags necessary to compile MPI Java applications:

```
mpijavac --showme:compile
```

- Show full invoked Java compiler command line:

```
mpijavac {{path/to/source_file.java}} --showme
```

mpirun

Execute serial and parallel jobs in Open MPI.

See also: **`mpic++`**.

More information: https://docs.open-mpi.org/en/main/man-openmpi/man1/mpirun.1.html.

- Execute an Open MPI program:

```
mpirun {{path/to/executable}}
```

- Execute an Open MPI program with `n` parallel processes:

```
mpirun -n {{n}} {{path/to/executable}}
```

- Allow more processes than available physical cores:

```
mpirun -oversubscribe {{path/to/executable}}
```

mplayer

Cross-platform multimedia player.

More information: https://mplayerhq.hu/DOCS/HTML/en/commandline.html.

- Play the specified file or URL:

```
mplayer {{path/to/file|url}}
```

- Play multiple files:

```
mplayer {{path/to/file1 path/to/file2 ...}}
```

- Play a specific file repeatedly:

```
mplayer -loop {{0}} {{path/to/file}}
```

- Pause playback:

```
<Space>
```

- Quit mplayer:

```
<Esc>
```

- Seek backward or forward 10 seconds:

```
{{<ArrowLeft>|<ArrowRight>}}
```

mpremote

Remotely control MicroPython devices.

More information: https://docs.micropython.org/en/latest/reference/mpremote.html.

- List all connected MicroPython devices:

  ```
  mpremote connect list
  ```

- Open an interactive REPL session with a connected device:

  ```
  mpremote connect {{device}}
  ```

- Run a local script on a connected device:

  ```
  mpremote run {{path/to/script.py}}
  ```

- Mount a local directory to the device:

  ```
  mpremote mount {{path/to/directory}}
  ```

- Install a mip package on the device:

  ```
  mpremote mip install {{package}}
  ```

mpv

A audio/video player based on MPlayer.

See also: **`mplayer`**, **`vlc`**.

More information: https://mpv.io/manual/stable/.

- Play a video or audio from a URL or file:

```
mpv {{url|path/to/file}}
```

- Jump backward/forward 5 seconds:

```
{{<ArrowLeft>|<ArrowRight>}}
```

- Jump backward/forward 1 minute:

```
{{<ArrowDown>|<ArrowUp>}}
```

- Decrease or increase playback speed by 10%:

```
{{<[>|<]>}}
```

- Add subtitles from a file:

```
mpv --sub-file={{path/to/file}}
```

- Take a screenshot of the current frame (saved to `mpv-shotNNNN.jpg` by default):

```
<s>
```

- Play a file at a specified speed (1 by default):

```
mpv --speed {{0.01..100}} {{path/to/file}}
```

- Play a file using a profile defined in the `mpv.conf` file:

```
mpv --profile {{profile_name}} {{path/to/file}}
```

mqtt_check.py

Simple utility for testing and validating MQTT login credentials.

Part of the Impacket suite.

More information: https://github.com/fortra/impacket.

- Check MQTT login credentials for a target (MQTT broker's hostname):

```
mqtt_check.py {{domain}}/{{username}}:{{password}}
@{{targetName}}
```

- Specify a custom client ID for authentication:

```
mqtt_check.py -client-id {{client_id}} {{domain}}/
{{username}}:{{password}}@{{targetName}}
```

- Enable SSL for the connection:

```
mqtt_check.py -ssl {{domain}}/{{username}}:{{password}}
@{{targetName}}
```

- Connect to a specific port (default is 1883):

```
mqtt_check.py -port {{port}} {{domain}}/{{username}}:
{{password}}@{{targetName}}
```

- Enable debug output:

```
mqtt_check.py -debug {{domain}}/{{username}}:{{password}}
@{{targetName}}
```

- Display help:

```
mqtt_check.py --help
```

mr

Manage all of your version control repositories at once.

More information: https://manned.org/mr.

- Register a repository:

```
mr register
```

- Update repositories in 5 concurrent jobs:

```
mr {{[-j|--jobs]}} {{5}} update
```

- Print the status of all repositories:

```
mr status
```

- Checkout all repositories to the latest version:

```
mr checkout
```

msbuild

The Microsoft build tool for Visual Studio project solutions.

More information: https://learn.microsoft.com/visualstudio/msbuild.

- Build the first project file in the current directory:

```
msbuild
```

- Build a specific project file:

```
msbuild {{path/to/project_file}}
```

- Specify one or more semicolon-separated targets to build:

```
msbuild {{path/to/project_file}} /target:{{targets}}
```

- Specify one or more semicolon-separated properties:

```
msbuild {{path/to/project_file}} /property:{{name=value}}
```

- Specify the build tools version to use:

```
msbuild {{path/to/project_file}} /toolsversion:{{version}}
```

- Display detailed information at the end of the log about how the project was configured:

```
msbuild {{path/to/project_file}} /detailedsummary
```

- Display help:

```
msbuild /help
```

mscore

This command is an alias of **musescore**.

- View documentation for the original command:

```
tldr musescore
```

msedge

The Microsoft Edge command-line utility is available as **`msedge`** on Windows and **`microsoft-edge`** for other platforms.

More information: https://microsoft.com/edge.

- View the documentation for Microsoft Edge for Windows:

```
tldr {{[-p|--platform]}} windows msedge
```

- View the documentation for Microsoft Edge for other platforms:

```
tldr {{[-p|--platform]}} common microsoft-edge
```

msfconsole

Console for the Metasploit Framework.

More information: https://docs.rapid7.com/metasploit/msf-overview/.

- Launch the console:

```
msfconsole
```

- Launch the console quietly without any banner:

```
msfconsole {{[-q|--quiet]}}
```

- Do not enable database support:

```
msfconsole {{[-n|--no-database]}}
```

- Execute console commands (Note: Use `;` for passing multiple commands):

```
msfconsole {{[-x|--execute-command]}} "{{use auxiliary/
server/capture/ftp; set SRVHOST 0.0.0.0; set SRVPORT 21;
run}}"
```

- Display help:

```
msfconsole {{[-h|--help]}}
```

- Display version:

```
msfconsole {{[-v|--version]}}
```

msfvenom

Manually generate payloads for metasploit.

More information: https://docs.metasploit.com/docs/using-metasploit/basics/how-to-use-msfvenom.html.

- List payloads:

```
msfvenom {{[-l|--list]}} payloads
```

- List formats:

```
msfvenom {{[-l|--list]}} formats
```

- Show payload options:

```
msfvenom {{[-p|--payload]}} {{payload}} --list-options
```

- Create an ELF binary with a reverse TCP handler:

```
msfvenom {{[-p|--payload]}} linux/x64/meterpreter/reverse_tcp
LHOST={{local_ip}} LPORT={{local_port}} {{[-f|--format]}} elf
{{[-o|--out]}} {{path/to/binary}}
```

- Create an EXE binary with a reverse TCP handler:

```
msfvenom {{[-p|--payload]}} windows/x64/meterpreter/
reverse_tcp LHOST={{local_ip}} LPORT={{local_port}} {{[-f|--
format]}} exe {{[-o|--out]}} {{path/to/binary.exe}}
```

- Create a raw Bash with a reverse TCP handler:

```
msfvenom {{[-p|--payload]}} cmd/unix/reverse_bash
LHOST={{local_ip}} LPORT={{local_port}} {{[-f|--format]}} raw
```

msgattrib

Filter and manipulate message attributes in **`.po`** translation files.

More information: https://www.gnu.org/software/gettext/manual/gettext.html#msgattrib-Invocation.

- Keep only translated messages:

```
msgattrib --translated {{input.po}} > {{translated.po}}
```

- Keep only untranslated messages:

```
msgattrib --untranslated {{input.po}} > {{untranslated.po}}
```

- Remove fuzzy messages:

```
msgattrib --no-fuzzy {{input.po}} > {{clean.po}}
```

- Keep only fuzzy messages:

```
msgattrib --only-fuzzy {{input.po}} > {{fuzzy.po}}
```

- Mark all messages as fuzzy:

```
msgattrib --set-fuzzy {{input.po}} > {{fuzzy.po}}
```

- Clear fuzzy marks:

```
msgattrib --clear-fuzzy {{input.po}} > {{clean.po}}
```

- Sort output by file location:

```
msgattrib {{[-F|--sort-by-file]}} {{input.po}} >
{{sorted.po}}
```

- Display help:

```
msgattrib {{[-h|--help]}}
```

msgcat

Concatenate and merge multiple `.po` translation files.

Useful in software localization pipelines to combine message catalogs with filtering options.

More information: https://www.gnu.org/software/gettext/manual/gettext.html#msgcat-Invocation.

- Combine multiple `.po` files into one:

```
msgcat {{file1.po file2.po ...}} {{[-o|--output-file]}} {{combined.po}}
```

- Combine input files listed in a text file:

```
msgcat {{[-f|--files-from]}} {{path/to/file_list.txt}} {{[-o|--output-file]}} {{combined.po}}
```

- Set the output encoding (e.g. UTF-8):

```
msgcat {{[-t|--to-code]}} {{UTF-8}} {{input.po}} {{[-o|--output-file]}} {{output.po}}
```

- Output only unique messages (appearing in one file only):

```
msgcat {{[-u|--unique]}} {{file1.po file2.po ...}} {{[-o|--output-file]}} {{unique.po}}
```

- Use the first available translation for duplicate entries:

```
msgcat --use-first {{file1.po file2.po ...}} {{[-o|--output-file]}} {{output.po}}
```

- Display help:

```
msgcat {{[-h|--help]}}
```

msgfmt

Compile message catalog to binary format.

More information: https://www.gnu.org/software/gettext/manual/gettext.html#msgfmt-Invocation.

- Compile a file to `messages.mo`:

```
msgfmt {{file.po}}
```

- Convert a `.po` file to a `.mo` file:

```
msgfmt {{path/to/file.po}} {{[-o|--output-file]}} {{path/to/file.mo}}
```

- Display help:

```
msgfmt {{[-h|--help]}}
```

msginit

Generate language specific translation files based on Portable Object Templates.

More information: https://www.gnu.org/software/gettext/manual/gettext.html#msginit-Invocation.

- Generate Portable Object files in system locale from `messages.pot`:

```
msginit
```

- Define locale to generate from a specific template:

```
msginit {{[-l|--locale]}} {{locale}} {{[-i|--input]}} {{path/to/messages.pot}}
```

- Display help:

```
msginit {{[-h|--help]}}
```

msgmerge

Update an existing translation file from a new template.

More information: https://www.gnu.org/software/gettext/manual/gettext.html#msgmerge-Invocation.

- Update a translation file:

```
msgmerge {{[-U|--update]}} {{path/to/file.po}} {{path/to/messages.pot}}
```

- Display help:

```
msgmerge {{[-h|--help]}}
```

msgunfmt

Decompile message catalog from the binary format.

More information: https://www.gnu.org/software/gettext/manual/gettext.html#msgunfmt-Invocation.

- Output conversion:

```
msgunfmt {{path/to/file.mo}}
```

- Convert a `.mo` file to a `.po` file:

```
msgunfmt {{path/to/file.mo}} > {{path/to/file.po}}
```

msmtp

An SMTP client.

It reads text from **`stdin`** and sends it to an SMTP server.

More information: https://marlam.de/msmtp/.

- Send an email using the default account configured in `~/.msmtprc`:

```
echo "{{Hello world}}" | msmtp {{to@example.org}}
```

- Send an email using a specific account configured in `~/.msmtprc`:

```
echo "{{Hello world}}" | msmtp --account={{account_name}}
{{to@example.org}}
```

- Send an email without a configured account. The password should be specified in the `~/.msmtprc` file:

```
echo "{{Hello world}}" | msmtp --host={{localhost}} --
port={{999}} --from={{from@example.org}} {{to@example.org}}
```

mssqlclient.py

Connect to Microsoft SQL Server instances and execute queries.

Part of the Impacket suite.

More information: https://github.com/fortra/impacket.

- Connect to an MSSQL server using Windows authentication:

```
mssqlclient.py -windows-auth {{domain}}/{{username}}:{{password}}@{{target}}
```

- Connect using SQL server authentication:

```
mssqlclient.py {{username}}:{{password}}@{{target}}
```

- Connect using pass-the-hash authentication:

```
mssqlclient.py {{domain}}/{{username}}@{{target}} -hashes {{LM_Hash}}:{{NT_Hash}}
```

- Connect using Kerberos authentication (requires valid tickets):

```
mssqlclient.py -k {{domain}}/{{username}}@{{target}}
```

- Execute a specific SQL command upon connection:

```
mssqlclient.py {{username}}:{{password}}@{{target}} -query "{{SELECT user_name();}}"
```

- Execute multiple SQL commands from a file:

```
mssqlclient.py {{username}}:{{password}}@{{target}} -file {{path/to/sql_file.sql}}
```

- Connect to a specific database instance (default is `None`):

```
mssqlclient.py {{username}}:{{password}}@{{target}} -db {{database_name}}
```

- Display SQL queries before execution:

```
mssqlclient.py {{username}}:{{password}}@{{target}} -show
```

mtm

Minimal terminal multiplexer.

See also: **`tmux`**, **`screen`**.

More information: https://manned.org/mtm.

- Start the program with default command chord (`<Ctrl g>`):

  `mtm`

- Use `<Ctrl q>` as the command chord:

  `mtm -c {{q}}`

- Split and stack horizontally:

  `<Ctrl g><h>`

- Split and stack vertically:

  `<Ctrl g><v>`

- View scrollback buffer:

  `<Ctrl g><PageUp>`

- Switch terminals:

  `<Ctrl g><ArrowKeys>`

- Close current terminal:

  `<Ctrl g><w>`

mtr

Matt's Traceroute: combined traceroute and ping tool.

More information: https://manned.org/mtr.

- Traceroute to a host and continuously ping all intermediary hops:

```
mtr {{example.com}}
```

- Disable IP address and host name mapping:

```
mtr {{[-n|--no-dns]}} {{example.com}}
```

- Generate output after pinging each hop 10 times:

```
mtr {{[-w|--report-wide]}} {{example.com}}
```

- Force IP IPv4 or IPV6:

```
mtr -4 {{example.com}}
```

- Wait for a given time (in seconds) before sending another packet to the same hop:

```
mtr {{[-i|--interval]}} {{10}} {{example.com}}
```

- Display the Autonomous System Number (ASN) for each hop:

```
mtr {{[-z|--aslookup]}} {{example.com}}
```

- Display both IP address and reverse DNS name:

```
mtr {{[-b|--show-ips]}} {{example.com}}
```

mtvtoppm

Convert an MTV or PRT ray tracer file to a PPM image.

More information: https://netpbm.sourceforge.net/doc/mtvtoppm.html.

- Convert an MTV or PRT ray tracer file to a PPM image:

```
mtvtoppm {{path/to/file.mtv}} > {{path/to/output.ppm}}
```

mu

Index and search emails from a local Maildir.

More information: https://man.cx/mu.

- Initialize the email database, optionally specifying the Maildir directory and email addresses:

```
mu init --maildir={{path/to/directory}} --my-address={{name@example.com}}
```

- Index new emails:

```
mu index
```

- Find messages using a specific keyword (in message body, subject, sender, ...):

```
mu find {{keyword}}
```

- Find messages to Alice with subject `jellyfish` containing the words `apples` or `oranges`:

```
mu find to:{{alice}} subject:{{jellyfish}} {{apples}} OR {{oranges}}
```

- Find unread messages about words starting with `soc` (the `*` only works at the end of the search term) in the Sent Items folder:

```
mu find 'subject:{{soc}}*' flag:{{unread}} maildir:'/{{Sent Items}}'
```

- Find messages from Sam with attached images, between 2 KiB and 2 MiB, written in 2021:

```
mu find 'mime:{{image/*}} size:{{2k..2m}} date:{{20210101..20211231}} from:{{sam}}
```

- List contacts with `Bob` in either name or email address:

```
mu cfind {{Bob}}
```

mullvad

CLI client for Mullvad VPN.

See also: **`fastd`**, **`ivpn`**, **`mozillavpn`**, **`warp-cli`**.

More information: https://mullvad.net/en/help/how-use-mullvad-cli.

- Link your Mullvad account with the specified account number:

```
mullvad account set {{account_number}}
```

- Enable LAN access while VPN is on:

```
mullvad lan set allow
```

- Select a server in a specific city:

```
mullvad relay set location {{se}} {{mma}}
```

- Select a specific server:

```
mullvad relay set location {{se-mma-wg-001}}
```

- Establish the VPN tunnel:

```
mullvad connect
```

- Check status of VPN tunnel:

```
mullvad status
```

- Check the account expiration date and obtain the device name:

```
mullvad account get
```

multipass

Manage Ubuntu virtual machines using native hypervisors.

More information: https://documentation.ubuntu.com/multipass/latest/reference/command-line-interface/.

- List the aliases that can be used to launch an instance:

```
multipass find
```

- Launch a new instance, set its name and use a cloud-init configuration file:

```
multipass launch {{[-n|--name]}} {{instance_name}} --cloud-init {{configuration_file}}
```

- List all the created instances and some of their properties:

```
multipass list
```

- Start a specific instance by name:

```
multipass start {{instance_name}}
```

- Show the properties of an instance:

```
multipass info {{instance_name}}
```

- Open a shell prompt on a specific instance by name:

```
multipass shell {{instance_name}}
```

- Delete an instance by name:

```
multipass delete {{instance_name}}
```

- Mount a directory into a specific instance:

```
multipass mount {{path/to/local_directory}} {{instance_name}}:{{path/to/target_directory}}
```

multitail

Extension of tail.

More information: https://manned.org/multitail.

- Tail all files matching a pattern in a single stream:

```
multitail -Q 1 '{{pattern}}'
```

- Tail all files in a directory in a single stream:

```
multitail -Q 1 '{{path/to/directory}}/*'
```

- Automatically add new files to a window:

```
multitail -Q {{pattern}}
```

- Show 5 logfiles while merging 2 and put them in 2 columns with only one in the left column:

```
multitail -s 2 -sn 1,3 {{path/to/mergefile}} -I {{path/to/file1}} {{path/to/file2}} {{path/to/file3}} {{path/to/file4}}
```

mumble

Low-latency, high quality voice chat software.

More information: https://manned.org/mumble.

- Open Mumble:

```
mumble
```

- Open Mumble and immediately connect to a server:

```
mumble mumble://{{username}}@{{example.com}}
```

- Open Mumble and immediately connect to a password protected server:

```
mumble mumble://{{username}}:{{password}}@{{example.com}}
```

- Mute/unmute the microphone in a running Mumble instance:

```
mumble rpc {{mute|unmute}}
```

- Mute/unmute the microphone and the audio output of Mumble:

```
mumble rpc {{deaf|undeaf}}
```

mupdf

A lightweight PDF, XPS, and E-book viewer.

More information: https://mupdf.readthedocs.io/en/latest/tools/mupdf-gl.html.

- Open a PDF on the first page:

```
mupdf {{path/to/file}}
```

- Open a PDF on page 3:

```
mupdf {{path/to/file}} {{3}}
```

- Open a password secured PDF:

```
mupdf -p {{password}} {{path/to/file}}
```

- Open a PDF with an initial zoom level, specified as DPI, of 72:

```
mupdf -r {{72}} {{path/to/file}}
```

- Open a PDF with inverted color:

```
mupdf -I {{path/to/file}}
```

- Open a PDF tinted red #FF0000 (hexadecimal color syntax RRGGBB):

```
mupdf -C {{FF0000}}
```

- Open a PDF without anti-aliasing (0 = off, 8 = best):

```
mupdf -A {{0}}
```

musescore

MuseScore sheet music editor.

See also: **`lilypond`**.

More information: https://handbook.musescore.org/appendix/command-line-usage.

- Set the MP3 output bitrate in kbit/s:

```
musescore {{[-b|--bitrate]}} {{bitrate}}
```

- Start MuseScore in debug mode:

```
musescore {{[-d|--debug]}}
```

- Enable experimental features, such as layers:

```
musescore {{[-e|--experimental]}}
```

- Export the given file to the specified output file. The file type depends on the given extension:

```
musescore {{[-o|--export-to]}} {{output_file}} {{input_file}}
```

- Print a diff between the given scores:

```
musescore --diff {{path/to/file1}} {{path/to/file2}}
```

- Specify a MIDI import operations file:

```
musescore {{[-M|--midi-operations]}} {{path/to/file}}
```

musl-gcc

A wrapper around **gcc** that automatically sets options for linking against musl libc.

All options specified are passed directly to **gcc**.

More information: https://manned.org/musl-gcc.

- View documentation for `gcc`:

```
tldr gcc
```

mutagen

Real-time file synchronization and network forwarding tool.

More information: https://mutagen.io/documentation/introduction/.

- Start a synchronization session between a local directory and a remote host:

```
mutagen sync create --name={{session_name}} /{{path/to/
local_directory}}/ {{user}}@{{host}}:/{{path/to/
remote_directory}}/
```

- Start a synchronization session between a local directory and a Docker container:

```
mutagen sync create --name={{session_name}} /{{path/to/
local_directory}}/ docker://{{user}}@{{container_name}}/
{{path/to/remote_directory}}/
```

- Stop a running session:

```
mutagen sync terminate {{session_name}}
```

- Start a project:

```
mutagen project start
```

- Stop a project:

```
mutagen project terminate
```

- List running sessions for the current project:

```
mutagen project list
```

mutool

Convert, query information, and extract data from PDF files.

More information: https://mupdf.readthedocs.io/en/latest/tools/mutool.html.

- Convert a range of pages to PNGs (Note: `%nd` in the output placeholder must be replaced with a print modifier like `%d` or `%2d`):

```
mutool convert -o {{path/to/output%nd.png}} {{path/to/input.pdf}} {{1-10}}
```

- Convert one or more pages of a PDF into text in `stdout`:

```
mutool draw -F txt {{path/to/input.pdf}} {{2,3,5,...}}
```

- Concatenate multiple PDF files:

```
mutool merge -o {{path/to/output.pdf}} {{path/to/input1.pdf path/to/input2.pdf ...}}
```

- Query information about all content embedded in a PDF:

```
mutool info {{path/to/input.pdf}}
```

- Extract all images, fonts, and resources embedded in a PDF to the current directory:

```
mutool extract {{path/to/input.pdf}}
```

- Show the outline (table of contents) of a PDF:

```
mutool show {{path/to/input.pdf}} outline
```

mutt

Command-line email client.

More information: http://mutt.org/doc/mutt.1.txt.

- Open the specified mailbox:

```
mutt -f {{mailbox}}
```

- Send an email and specify a subject and a cc recipient:

```
mutt -s {{subject}} -c {{cc@example.com}}
{{recipient@example.com}}
```

- Send an email with files attached:

```
mutt -a {{file1 file2 ...}} -- {{recipient@example.com}}
```

- Specify a file to include as the message body:

```
mutt -i {{path/to/file}} {{recipient@example.com}}
```

- Specify a draft file containing the header and the body of the message, in RFC 5322 format:

```
mutt -H {{path/to/file}} {{recipient@example.com}}
```

mv

Move or rename files and directories.

More information: https://www.gnu.org/software/coreutils/manual/html_node/mv-invocation.html.

- Rename a file or directory when the target is not an existing directory:

```
mv {{path/to/source}} {{path/to/target}}
```

- Move a file or directory into an existing directory:

```
mv {{path/to/source}} {{path/to/existing_directory}}
```

- Move multiple files into an existing directory, keeping the filenames unchanged:

```
mv {{path/to/source1 path/to/source2 ...}} {{path/to/existing_directory}}
```

- Do not prompt for confirmation before overwriting existing files:

```
mv {{[-f|--force]}} {{path/to/source}} {{path/to/target}}
```

- Prompt for confirmation interactively before overwriting existing files, regardless of file permissions:

```
mv {{[-i|--interactive]}} {{path/to/source}} {{path/to/target}}
```

- Do not overwrite existing files at the target:

```
mv {{[-n|--no-clobber]}} {{path/to/source}} {{path/to/target}}
```

- Move files in verbose mode, showing files after they are moved:

```
mv {{[-v|--verbose]}} {{path/to/source}} {{path/to/target}}
```

- Specify target directory so that you can use external tools to gather movable files:

```
{{find /var/log -type f -name '*.log' -print0}} | {{xargs -0}} mv {{[-t|--target-directory]}} {{path/to/target_directory}}
```

mvn archetype

Generate a new Maven project from a predefined template (archetype).

More information: https://maven.apache.org/archetype/maven-archetype-plugin/usage.html.

- Generate a new project interactively:

```
mvn archetype:generate
```

- Generate a project non-interactively with specific archetype and project parameters:

```
mvn archetype:generate --define archetypeGroupId={{group_id}}
--define archetypeArtifactId={{artifact_id}} --define
archetypeVersion={{version}} --define
groupId={{project_group_id}} --define
artifactId={{project_name}} --define interactiveMode=false
```

mvn compile

Compile a Maven project's source code.

More information: https://manned.org/mvn.

- Compile the project's source code:

```
mvn compile
```

- Clean compiled files and recompile:

```
mvn clean compile
```

- Compile a specific module in a multi-module project:

```
mvn compile {{[-pl|--projects]}} {{module_name}}
```

- Skip tests while compiling:

```
mvn compile {{[-D|--define]}} skipTests
```

mvn dependency

Manage and analyze Maven project dependencies.

Provides goals for viewing, resolving, and copying project dependencies.

More information: https://maven.apache.org/plugins/maven-dependency-plugin/usage.html.

- Display the full dependency tree, including direct and transitive dependencies:

  `mvn dependency:tree`

- Analyze the dependencies and highlight unused or undeclared ones:

  `mvn dependency:analyze`

- Copy all project dependencies (by default, to `target/dependency/`):

  `mvn dependency:copy-dependencies`

- Resolve and download all project dependencies to the local Maven repository:

  `mvn dependency:resolve`

- Force Maven to update all dependencies from remote repositories:

  `mvn dependency:resolve {{[-U|--update-snapshots]}}`

mvn deploy

Add an artifact to a remote repository.

More information: https://manned.org/mvn.

- Copy the final artifact into the remote repository configured in the `settings.xml` file:

```
mvn deploy
```

- Copy an artifact, that is not built using Maven to the remote repository:

```
mvn deploy:deploy-file {{[-D|--define]}}
url={{URLOfTheRemoteRepository}} {{[-D|--define]}}
repositoryId={{ServerIdFromSettingsXML}} {{[-D|--define]}}
file={{FileToBeDeployed}}
```

mvn generate-sources

Generate source code for a Maven project before the main compilation phase.

This phase runs after **`initialize`** and before **`process-sources`**.

More information: https://manned.org/mvn.

- Run all lifecycle phases up to `generate-sources`:

  ```
  mvn generate-sources
  ```

- Run the next phase to generate resources:

  ```
  mvn generate-resources
  ```

- Clean and regenerate sources:

  ```
  mvn clean generate-sources
  ```

mvn idea

Generate IntelliJ IDEA project files (**`.ipr`**, **`.iml`**, and **`.iws`**) for a Maven project.

Note: This plugin is retired. It is no longer maintained.

More information: https://maven.apache.org/plugins/maven-idea-plugin/usage.html.

- Generate all IntelliJ IDEA project files:

  ```
  mvn idea:idea
  ```

- Generate only the project (`.ipr`) file:

  ```
  mvn idea:project
  ```

- Generate only the workspace (`.iws`) file:

  ```
  mvn idea:workspace
  ```

- Generate only module (`.iml`) files:

  ```
  mvn idea:module
  ```

- Delete all generated project files:

  ```
  mvn idea:clean
  ```

mvn install

Install third-party Maven dependencies and build the project.

More information: https://manned.org/mvn.

- Compile, test, package, and install the project into the local repository:

```
mvn install
```

- Skip tests during installation:

```
mvn install {{[-D|--define]}} skipTests
```

- Force update of dependencies before installing:

```
mvn install {{[-U|--update-snapshots]}}
```

- Skip test compilation and execution:

```
mvn install {{[-D|--define]}} maven.test.skip=true
```

mvn package

Package the compiled code of a Maven project into its distributable format (such as a **`.jar`** or **`.war`**).

More information: https://manned.org/mvn.

- Package a project:

  ```
  mvn package
  ```

- Package a project while skipping test execution:

  ```
  mvn package {{[-D|--define]}} skipTests
  ```

- Package a project and force Maven to update all dependencies:

  ```
  mvn package {{[-U|--update-snapshots]}}
  ```

mvn site

Generate a project website based on the information in the **`pom.xml`** file.

More information: https://maven.apache.org/plugins/maven-site-plugin/usage.html.

- Generate a project site using the site plugin:

  ```
  mvn site
  ```

- Generate a site for a specific Maven project (multi-module build):

  ```
  mvn site {{[-pl|--projects]}} {{module_name}}
  ```

- Clean previous site output before generating a new one:

  ```
  mvn clean site
  ```

- Skip tests while generating the site:

  ```
  mvn site {{[-D|--define]}} skipTests
  ```

- Generate and deploy the site to the remote server:

  ```
  mvn site-deploy
  ```

mvn

Apache Maven: build and manage Java-based projects.

More information: https://manned.org/mvn.

- Compile a project:

```
mvn compile
```

- Compile and package the compiled code in its distributable format, such as a `jar`:

```
mvn package
```

- Compile and package, skipping unit tests:

```
mvn package {{[-D|--define]}} skipTests
```

- Install the built package in local maven repository. (This will invoke the compile and package commands too):

```
mvn install
```

- Delete build artifacts from the target directory:

```
mvn clean
```

- Do a clean and then invoke the package phase:

```
mvn clean package
```

- Clean and then package the code with a given build profile:

```
mvn clean {{[-P|--activate-profiles]}} {{profile}} package
```

- Run a class with a main method:

```
mvn exec:java {{[-D|--define]}}
exec.mainClass="{{com.example.Main}}" {{[-D|--define]}}
exec.args="{{argument1 argument2 ...}}"
```

mycli

A CLI for MySQL, MariaDB, and Percona that can do auto-completion and syntax highlighting.

More information: https://manned.org/mycli.

- Connect to a local database on port 3306, using the current user's username:

```
mycli {{database_name}}
```

- Connect to a database (user will be prompted for a password):

```
mycli {{[-u|--user]}} {{username}} {{database_name}}
```

- Connect to a database on another host:

```
mycli {{[-h|--host]}} {{database_host}} {{[-P|--port]}} {{port}} {{[-u|--user]}} {{username}} {{database_name}}
```

mypy

Type check Python code.

More information: https://mypy.readthedocs.io/en/stable/running_mypy.html.

- Type check a specific file:

```
mypy {{path/to/file.py}}
```

- Type check a specific module:

```
mypy {{[-m|--module]}} {{module_name}}
```

- Type check a specific package:

```
mypy {{[-p|--package]}} {{package_name}}
```

- Type check a string of code:

```
mypy {{[-c|--command]}} "{{code}}"
```

- Ignore missing imports:

```
mypy --ignore-missing-imports {{path/to/file_or_directory}}
```

- Show detailed error messages:

```
mypy {{[--tb|--show-traceback]}} {{path/to/
file_or_directory}}
```

- Specify a custom configuration file:

```
mypy --config-file {{path/to/config_file}}
```

- Display help:

```
mypy {{[-h|--help]}}
```

mysql

The MySQL tool.

More information: https://manned.org/mysql.

- Connect to a database:

```
mysql {{database_name}}
```

- Connect to a database, user will be prompted for a password:

```
mysql {{[-u|--user]}} {{user}} {{[-p|--password]}} {{database_name}}
```

- Connect to a database on another host:

```
mysql {{[-h|--host]}} {{database_host}} {{database_name}}
```

- Connect to a database through a Unix socket:

```
mysql {{[-S|--socket]}} {{path/to/socket.sock}}
```

- Execute SQL statements in a script file (batch file):

```
mysql {{[-e|--execute]}} "source {{filename.sql}}" {{database_name}}
```

- Restore a database from a backup created with `mysqldump` (user will be prompted for a password):

```
mysql < {{path/to/backup.sql}} {{[-u|--user]}} {{user}} {{[-p|--password]}} {{database_name}}
```

- Restore all databases from a backup (user will be prompted for a password):

```
mysql < {{path/to/backup.sql}} {{[-u|--user]}} {{user}} {{[-p|--password]}}
```

mysql_secure_installation

Set up MySQL to have better security.

More information: https://dev.mysql.com/doc/refman/en/mysql-secure-installation.html.

- Start an interactive setup:

```
mysql_secure_installation
```

- Use specific host and port:

```
mysql_secure_installation --host {{host}} --port {{port}}
```

- Display help:

```
mysql_secure_installation --help
```

mysqlbinlog

Utility for processing MySQL binary log files.

More information: https://dev.mysql.com/doc/refman/en/mysqlbinlog.html.

- Show events from a specific binary log file:

```
mysqlbinlog {{path/to/binlog}}
```

- Show entries from a binary log for a specific database:

```
mysqlbinlog --database {{database_name}} {{path/to/binlog}}
```

- Show events from a binary log between specific dates:

```
mysqlbinlog --start-datetime='{{2022-01-01 01:00:00}}' --
stop-datetime='{{2022-02-01 01:00:00}}' {{path/to/binlog}}
```

- Show events from a binary log between specific positions:

```
mysqlbinlog --start-position={{100}} --stop-position={{200}}
{{path/to/binlog}}
```

- Show binary log from a MySQL server on the given host:

```
mysqlbinlog --host={{hostname}} {{path/to/binlog}}
```

mysqlcheck

Check and repair MySQL tables.

More information: https://dev.mysql.com/doc/refman/en/mysqlcheck.html.

- Check a table:

```
mysqlcheck --check {{table}}
```

- Check a table and provide credentials to access it:

```
mysqlcheck --check {{table}} --user {{username}} --password {{password}}
```

- Repair a table:

```
mysqlcheck --repair {{table}}
```

- Optimize a table:

```
mysqlcheck --optimize {{table}}
```

mysqld

Start the MySQL database server.

More information: https://dev.mysql.com/doc/refman/en/mysqld.html.

- Start the MySQL database server:

```
mysqld
```

- Start the server, printing error messages to the console:

```
mysqld --console
```

- Start the server, saving logging output to a custom log file:

```
mysqld --log={{path/to/file.log}}
```

- Print the default arguments and their values and exit:

```
mysqld --print-defaults
```

- Start the server, reading arguments and values from a file:

```
mysqld --defaults-file={{path/to/file}}
```

- Start the server and listen on a custom port:

```
mysqld --port={{port}}
```

- Display help:

```
mysqld --verbose --help
```

mysqldump

Backups MySQL databases.

See also: **`mysql`** for restoring databases.

More information: https://dev.mysql.com/doc/refman/en/mysqldump.html.

- Create a backup (user will be prompted for a password):

```
mysqldump --user {{user}} --password {{database_name}} --
result-file={{path/to/file.sql}}
```

- Backup a specific table redirecting the output to a file (user will be prompted for a password):

```
mysqldump --user {{user}} --password {{database_name}}
{{table_name}} > {{path/to/file.sql}}
```

- Backup all databases redirecting the output to a file (user will be prompted for a password):

```
mysqldump --user {{user}} --password --all-databases >
{{path/to/file.sql}}
```

- Backup all databases from a remote host, redirecting the output to a file (user will be prompted for a password):

```
mysqldump --host={{ip_or_hostname}} --user {{user}} --
password --all-databases > {{path/to/file.sql}}
```

mysqlsh

Advanced client for MySQL, supporting SQL, JavaScript, and Python.

It offers features for managing InnoDB clusters and document store collections.

More information: https://manned.org/mysqlsh.

- Start MySQL Shell in interactive mode:

```
mysqlsh
```

- Connect to a MySQL server:

```
mysqlsh --user {{username}} --host {{hostname}} --port {{port}}
```

- Execute an SQL statement on the server and exit:

```
mysqlsh --user {{username}} --execute '{{sql_statement}}'
```

- Start MySQL Shell in JavaScript mode:

```
mysqlsh --js
```

- Start MySQL Shell in Python mode:

```
mysqlsh --py
```

- Import JSON documents into a MySQL collection:

```
mysqlsh --import {{path/to/file.json}} --schema {{schema_name}} --collection {{collection_name}}
```

- Enable verbose output:

```
mysqlsh --verbose
```

mytop

Display MySQL server performance info like **`top`**.

More information: https://jeremy.zawodny.com/mysql/mytop/mytop.html.

- Start `mytop`:

```
mytop
```

- Connect with a specified username and password:

```
mytop {{[-u|-user]}} {{user}} {{[-p|-password]}} {{password}}
```

- Connect with a specified username (the user will be prompted for a password):

```
mytop {{[-u|-user]}} {{user}} -prompt
```

- Do not show any idle (sleeping) threads:

```
mytop {{[-u|-user]}} {{user}} {{[-p|-password]}} {{password}} --noidle
```

n

Manage multiple node versions.

More information: https://github.com/tj/n.

- Install a given version of node. If the version is already installed, it will be activated:

```
n {{version}}
```

- Display installed versions and interactively activate one of them:

```
n
```

- Remove a version:

```
n rm {{version}}
```

- Execute a file with a given version:

```
n use {{version}} {{file.js}}
```

- Output binary path for a version:

```
n bin {{version}}
```

naabu

A fast port scanner written in Go with a focus on reliability and simplicity.

Note: Some features are only activated when **naabu** is run with root privileges such as SYN scan.

More information: https://docs.projectdiscovery.io/opensource/naabu/running.

- Run a SYN scan against default (top 100) ports of remote host:

```
sudo naabu -host {{host}}
```

- Display available network interfaces and public IP address of the local host:

```
naabu {{[-il|-interface-list]}}
```

- Scan all ports of the remote host (CONNECT scan without `sudo`):

```
naabu {{[-p|-port]}} - -host {{host}}
```

- Scan the top 1000 ports of the remote host:

```
naabu {{[-tp|-top-ports]}} 1000 -host {{host}}
```

- Scan TCP ports 80, 443, and UDP port 53 of the remote host:

```
naabu {{[-p|-port]}} 80,443,u:53 -host {{host}}
```

- Show CDN type the remote host is using, if any:

```
naabu {{[-p|-port]}} 80,443 -cdn -host {{host}}
```

- Run `nmap` from `naabu` for additional functionalities (`nmap` must be installed):

```
sudo naabu {{[-v|-verbose]}} -host {{host}} -nmap-cli 'nmap
{{-v -T5 -sC}}'
```

nagios

Legacy host/service/networking monitoring program.

Largely deprecated by **`nagios4`**.

See also: **`nagios2`**, **`nagios3`**, **`nagios4`**.

More information: https://manned.org/nagios.

- Start `nagios`:

```
nagios /etc/nagios/nagios.cfg
```

- Start `nagios` in daemon mode:

```
nagios -d
```

- Start `nagios`, print service check scheduling information to `stdout`, then shutdown:

```
nagios -s
```

- Verify configuration file:

```
nagios -v
```

nagios2

Legacy host/service/networking monitoring program.

Largely deprecated by **`nagios4`**.

See also: **`nagios`**, **`nagios3`**, **`nagios4`**.

More information: https://manned.org/nagios.

- Start `nagios2`:

```
nagios2 /etc/nagios2/nagios.cfg
```

- Start `nagios2` in daemon mode:

```
nagios2 -d
```

- Start `nagios2`, print service check scheduling information to `stdout`, then shutdown:

```
nagios2 -s
```

- Verify configuration file:

```
nagios2 -v
```

nagios3

Legacy host/service/networking monitoring program.

Largely deprecated by **`nagios4`**.

See also: **`nagios`**, **`nagios2`**, **`nagios4`**.

More information: https://manned.org/nagios.

- Start `nagios3`:

  ```
  nagios3 /etc/nagios3/nagios.cfg
  ```

- Start `nagios3` in daemon mode:

  ```
  nagios3 -d
  ```

- Start `nagios3`, print service check scheduling information to `stdout`, then shutdown:

  ```
  nagios3 -s
  ```

- Verify configuration file:

  ```
  nagios3 -v
  ```

nagios4

Legacy host/service/networking monitoring program.

See also: **`nagios`**, **`nagios2`**, **`nagios3`**.

More information: https://manned.org/nagios.

- Start `nagios4`:

```
nagios4 /etc/nagios4/nagios.cfg
```

- Start `nagios4` in daemon mode:

```
nagios4 -d
```

- Start `nagios4`, print service check scheduling information to `stdout`, then shutdown:

```
nagios4 -s
```

- Verify configuration file:

```
nagios4 -v
```

nano

Text editor. An enhanced **`pico`** clone.

See also: **`pico`**, **`rnano`**.

More information: https://nano-editor.org/dist/latest/nano.html.

- Open specific files, moving to the next file after closing the previous one:

```
nano {{path/to/file1 path/to/file2 ...}}
```

- Start the editor without using configuration files:

```
nano {{[-I|--ignorercfiles]}}
```

- Open a file and position the cursor at a specific line and column:

```
nano +{{line}},{{column}} {{path/to/file}}
```

- Open a file and enable soft wrapping:

```
nano {{[-S|--softwrap]}} {{path/to/file}}
```

- Open a file and indent new lines to the previous line's indentation:

```
nano {{[-i|--autoindent]}} {{path/to/file}}
```

- Open a file and create a backup file (`path/to/file~`) on save:

```
nano {{[-B|--backup]}} {{path/to/file}}
```

- Open a file in restricted mode (i.e. don't read/write to files not specified on the command-line):

```
nano {{[-R|--restricted]}} {{path/to/file}}
```

- Exit nano:

```
<Ctrl x>
```

nasm

The Netwide Assembler, a portable 80x86 assembler.

More information: https://www.nasm.us/xdoc/3.01/html/nasm02.html.

- Assemble `source.asm` into a binary file `source`, in the (default) raw binary format:

```
nasm {{source.asm}}
```

- Assemble `source.asm` into a binary file `output_file`, in the specified format:

```
nasm -f {{format}} {{source.asm}} -o {{output_file}}
```

- List valid output formats (along with basic nasm help):

```
nasm -hf
```

- Assemble and generate an assembly listing file:

```
nasm -l {{list_file}} {{source.asm}}
```

- Add a directory (must be written with trailing slash) to the include file search path before assembling:

```
nasm -i {{path/to/include_directory}}/ {{source.asm}}
```

nativefier

Create a desktop app for any web site with minimal configuration.

More information: https://github.com/nativefier/nativefier.

- Make a desktop app for a website:

```
nativefier {{url}}
```

- Create a desktop app with a custom name:

```
nativefier --name {{name}} {{url}}
```

- Use a custom icon, should be a PNG:

```
nativefier --icon {{path/to/icon.png}} {{url}}
```

nb

Note-taking, bookmarking, and archiving tool.

Supports encryption, tagging, wiki-style links, Git syncing, Pandoc conversion, and more.

More information: https://github.com/xwmx/nb#-help.

- Create a new note in your `$EDITOR`:

```
nb {{[a|add]}} "{{note_title}}"
```

- Edit a note in your `$EDITOR`:

```
nb {{[e|edit]}} {{note_id}}
```

- List all notes in the current notebook:

```
nb list
```

- Add a todo:

```
nb {{[to|todos]}} {{[a|add]}} {{title}}
```

- Import a file:

```
nb import ({{path/to/file|url}})
```

- Search for notes containing a keyword:

```
nb {{[q|search]}} "{{keyword}}"
```

- Sync notes via Git:

```
nb sync
```

- Display help:

```
nb help
```

nbtscan

Scan networks for NetBIOS name information.

More information: https://github.com/resurrecting-open-source-projects/nbtscan.

- Scan a network for NetBIOS names:

```
nbtscan {{192.168.0.1/24}}
```

- Scan a single IP address:

```
nbtscan {{192.168.0.1}}
```

- Display verbose output:

```
nbtscan -v {{192.168.0.1/24}}
```

- Display output in `/etc/hosts` format:

```
nbtscan -e {{192.168.0.1/24}}
```

- Read IP addresses/networks to scan from a file:

```
nbtscan -f {{path/to/file.txt}}
```

nc

Redirect I/O into a network stream through this versatile tool.

More information: https://manned.org/nc.

- Start a [l]istener on the specified TCP [p]ort and send a file into it:

```
nc < {{filename}} -l -p {{port}}
```

- Connect to a target listener on the specified port and receive a file from it:

```
nc {{host}} {{port}} > {{received_filename}}
```

- Scan the open TCP ports of a specified host:

```
nc -v -z -w {{timeout_in_seconds}} {{host}} {{start_port}}-{{end_port}}
```

- Start a [l]istener on the specified TCP [p]ort and provide your local shell access to the connected party (this is dangerous and can be abused):

```
nc -l -p {{port}} -e {{shell_executable}}
```

- Connect to a target listener and provide your local shell access to the remote party (this is dangerous and can be abused):

```
nc {{host}} {{port}} -e {{shell_executable}}
```

- Act as a proxy and forward data from a local TCP port to the given remote host:

```
nc -l -p {{local_port}} | nc {{host}} {{remote_port}}
```

- Send an HTTP GET request:

```
echo -e "GET / HTTP/1.1\nHost: {{host}}\n\n" | nc {{host}} 80
```

ncc

Compile a Node.js application into a single file.

Supports TypeScript, binary addons, and dynamic requires.

More information: https://github.com/vercel/ncc#usage.

- Bundle a Node.js application:

```
ncc build {{path/to/file.js}}
```

- Bundle and minify a Node.js application:

```
ncc build {{[-m|--minify]}} {{path/to/file.js}}
```

- Bundle and minify a Node.js application and generate source maps:

```
ncc build {{[-s|--source-map]}} {{path/to/file.js}}
```

- Automatically recompile on changes to source files:

```
ncc build {{[-w|--watch]}} {{path/to/file.js}}
```

- Bundle a Node.js application into a temporary directory and run it for testing:

```
ncc run {{path/to/file.js}}
```

- Clean the `ncc` cache:

```
ncc clean cache
```

ncdu

Disk usage analyzer with an ncurses interface.

More information: https://dev.yorhel.nl/ncdu/man.

- Analyze the current working directory:

```
ncdu
```

- Colorize output:

```
ncdu --color {{dark|off}}
```

- Analyze a given directory:

```
ncdu {{path/to/directory}}
```

- Save results to a file:

```
ncdu -o {{path/to/file}}
```

- Exclude files that match a pattern, argument can be given multiple times to add more patterns:

```
ncdu --exclude '{{*.txt}}'
```

ncmpcpp

A music player client for the Music Player Daemon.

See also: **`mpd`**, **`mpc`**, **`qmmp`**, **`termusic`**.

More information: https://rybczak.net:443/ncmpcpp/.

- Connect to a music player daemon on a given host and port:

```
ncmpcpp --host {{ip_address}} --port {{port}}
```

- Display metadata of the current song to console:

```
ncmpcpp --current-song
```

- Use a specified configuration file:

```
ncmpcpp --config {{file}}
```

- Use a different set of key bindings from a file:

```
ncmpcpp --bindings {{file}}
```

ncspot

Cross-platform TUI Spotify client.

More information: https://github.com/hrkfdn/ncspot/blob/main/doc/users.md.

- Start `ncspot`:

  ```
  ncspot
  ```

- Enable logging to the specified file:

  ```
  ncspot {{[-d|--debug]}} {{path/to/file}}
  ```

- Display paths to the configuration and cache:

  ```
  ncspot info
  ```

- Use a different configuration file (in the directory reported by `ncspot info`; default: `config.toml`):

  ```
  ncspot {{[-c|--config]}} {{file_name}}
  ```

- Display a list of keybindings:

  ```
  <?>
  ```

ncu

Find newer versions of package dependencies and check outdated npm packages locally or globally.

`ncu` only updates dependency versions in **`package.json`**. To install the new versions, run **`npm install`** afterwards.

More information: https://github.com/raineorshine/npm-check-updates.

- List outdated dependencies in the current directory:

```
ncu
```

- List outdated global `npm` packages:

```
ncu --global
```

- Upgrade all dependencies in the current directory:

```
ncu --upgrade
```

- Interactively upgrade dependencies in the current directory:

```
ncu --interactive
```

- List outdated dependencies up to the highest minor version:

```
ncu --target {{minor}}
```

- List outdated dependencies that match a keyword or `regex`:

```
ncu --filter {{keyword|/regex/}}
```

- List only a specific section of outdated dependencies:

```
ncu --dep {{dev|optional|peer|prod|packageManager}}
```

- Display help:

```
ncu --help
```

ndc

Name daemon control service for name servers.

If a command isn't provided, NDC will prompt for one until EOF.

More information: https://manned.org/ndc.

- Set the [c]ontrol channel rendezvous point:

```
ndc -c {{channel}} {{command}}
```

- Bind the client side to a specific [l]ocalsock address:

```
ndc -l {{localsock}} {{command}}
```

- Set path to [p]idfile for UNIX signal control:

```
ndc -p {{path/to/pidfile}} {{command}}
```

- Enable [d]ebugging:

```
ndc -d {{command}}
```

- Enable [q]uiet mode:

```
ndc -q {{command}}
```

- Enable nonfatal error [s]uppression:

```
ndc -s {{command}}
```

- Enable [t]racing for protocol and system debugging:

```
ndc -t {{command}}
```

- List built-in commands:

```
ndc /help
```

neato

Render an image of a **`linear undirected`** network graph from a **`graphviz`** file.

Layouts: **`dot`**, **`neato`**, **`twopi`**, **`circo`**, **`fdp`**, **`sfdp`**, **`osage`** & **`patchwork`**.

More information: https://graphviz.org/doc/info/command.html.

- Render a PNG image with a filename based on the input filename and output format (uppercase -O):

```
neato -T {{png}} -O {{path/to/input.gv}}
```

- Render a SVG image with the specified output filename (lowercase -o):

```
neato -T {{svg}} -o {{path/to/image.svg}} {{path/to/input.gv}}
```

- Render the output in PS, PDF, SVG, Fig, PNG, GIF, JPEG, JSON, or DOT format:

```
neato -T {{format}} -O {{path/to/input.gv}}
```

- Render a GIF image using `stdin` and `stdout`:

```
echo "{{graph {this -- that} }}" | neato -T {{gif}} > {{path/to/image.gif}}
```

- Display help:

```
neato -?
```

ned

Like **grep** but with powerful replace capabilities.

Unlike **sed**, as it isn't restricted to line oriented editing.

More information: https://github.com/nevdelap/ned#ned-usage.

- Recursively search starting in the current directory, ignoring case:

```
ned {{[-i|--ignore-case]}} {{[-R|--recursive]}}
'{{^[dl]og}}' {{.}}
```

- Search always showing colored output:

```
ned --colors '{{^[dl]og}}' {{.}}
```

- Search never showing colored output:

```
ned --colors never '{{^[dl]og}}' {{.}}
```

- Search ignoring certain files:

```
ned {{[-R|--recursive]}} --exclude '{{*.htm}}'
'{{^[dl]og}}' {{.}}
```

- Simple replace:

```
ned '{{dog}}' {{[-r|--replace]}} '{{cat}}' {{.}}
```

- Replace using numbered group references:

```
ned '{{the ([a-z]+) dog and the ([a-z]+) dog}}' {{[-r|--
replace]}} '{{the $2 dog and the $1 dog}}' {{.}}
```

- Replace changing case:

```
ned '{{([a-z]+) dog}}' --case-replacements {{[-r|--replace]}}
'{{\U$1\E! dog}}' --stdout {{.}}
```

- Preview results of a find and replace without updating the target files:

```
ned '{{^[sb]ad}}' {{[-r|--replace]}} '{{happy}}' --stdout
{{.}}
```

neo4j-admin

Manage and administer a Neo4j DBMS (Database Management System).

See also: **`cypher-shell`**, **`mysqld`**.

More information: https://neo4j.com/docs/operations-manual/current/neo4j-admin-neo4j-cli/.

- Start the DBMS:

```
neo4j-admin server start
```

- Stop the DBMS:

```
neo4j-admin server stop
```

- Set the initial password of the default `neo4j` user (prerequisite for the first start of the DBMS):

```
neo4j-admin dbms set-initial-password {{database_name}}
```

- Create an archive (dump) of an offline database to a file named `database_name.dump`:

```
neo4j-admin database dump --to-path={{path/to/directory}}
{{database_name}}
```

- Load a database from an archive named `database_name.dump`:

```
neo4j-admin database load --from-path={{path/to/directory}}
{{database_name}} --overwrite-destination=true
```

- Load a database from a specified archive file through `stdin`:

```
neo4j-admin < {{path/to/file.dump}} database load --from-
stdin {{database_name}} --overwrite-destination=true
```

- Display help:

```
neo4j-admin --help
```

neofetch

Display information about the operating system, software, and hardware.

Note: **`neofetch`** is no longer maintained.

See also: **`fastfetch`**.

More information: https://manned.org/neofetch.

- Return the default config, and create it if it's the first time the program runs:

```
neofetch
```

- Trigger an info line from appearing in the output, where `infoname` is the function name in the configuration file, e.g. memory:

```
neofetch --{{enable|disable}} {{infoname}}
```

- Hide/Show OS architecture:

```
neofetch --os_arch {{on|off}}
```

- Enable/Disable CPU brand in output:

```
neofetch --cpu_brand {{on|off}}
```

neomutt

NeoMutt email client.

More information: https://neomutt.org/guide/reference.html.

- Open the specified mailbox:

```
neomutt -f {{path/to/mailbox}}
```

- Start writing an email and specify a subject and a `cc` recipient:

```
neomutt -s "{{subject}}" -c {{cc@example.com}}
{{recipient@example.com}}
```

- Send an email with files attached:

```
neomutt -a {{path/to/file1 path/to/file2 ...}} --
{{recipient@example.com}}
```

- Specify a file to include as the message body:

```
neomutt -i {{path/to/file}} {{recipient@example.com}}
```

- Specify a draft file containing the header and the body of the message, in RFC 5322 format:

```
neomutt -H {{path/to/file}} {{recipient@example.com}}
```

neotoppm

Convert an Atari Neochrome NEO file into a PPM image.

More information: https://netpbm.sourceforge.net/doc/neotoppm.html.

- Generate the PPM image as output for an Atari Neochrome NEO file as input:

```
neotoppm {{path/to/file.neo}}
```

- Display version:

```
neotoppm {{[-v|-version]}}
```

nest

Initialize, develop, and maintain Nest applications.

More information: https://docs.nestjs.com/cli/overview.

- Display information about installed nest version:

  ```
  nest {{[i|info]}}
  ```

- Create a new NestJS project interactively:

  ```
  nest {{[n|new]}}
  ```

- Create a new NestJS project without prompting:

  ```
  nest {{[n|new]}} {{project_name}} {{[-p|--package-manager]}}
  {{npm|yarn|pnpm}}
  ```

- Build the NestJS project in the current working directory:

  ```
  nest build
  ```

- Run the NestJS project in the current working directory:

  ```
  nest start
  ```

- Import a library into the current NestJS project:

  ```
  nest add {{library_name}}
  ```

- Generate a new component:

  ```
  nest {{[g|generate]}} {{module|controller|service|...}}
  {{component_name}}
  ```

- Display help:

  ```
  nest
  ```

netcat

This command is an alias of **nc**.

- View documentation for the original command:

  ```
  tldr nc
  ```

netdiscover

Network scanner used to find live hosts on a network.

More information: https://github.com/netdiscover-scanner/netdiscover.

- Scan the IP range on the network interface for active hosts:

```
netdiscover -r {{172.16.6.0/23}} -i {{ens244}}
```

netexec

This command is an alias of **`nxc`**.

- View documentation for the original command:

```
tldr nxc
```

netlify

Deploy sites and configure continuous deployment to the Netlify platform.

More information: https://cli.netlify.com/.

- Log in to the Netlify account:

  ```
  netlify login
  ```

- Deploy the contents of a directory to Netlify:

  ```
  netlify deploy
  ```

- Configure continuous deployment for a new or an existing site:

  ```
  netlify init
  ```

- Start a local dev server:

  ```
  netlify dev
  ```

netperf

Client-side command for **`netperf`**, the benchmarking application that measures network throughput. Similar to **`iperf`**.

See also: **`netserver`** for the server-side command.

More information: https://hewlettpackard.github.io/netperf/doc/netperf.html#Global-Command_002dline-Options.

- Connect to server on a specific IP address via default port (12865):

```
netperf {{address}}
```

- Specify [p]ort:

```
netperf {{address}} -p {{port}}
```

- Specify the sampling [l]ength in seconds (default is 10):

```
netperf {{address}} -l {{seconds}}
```

- Force IPv[4] or IPv[6]:

```
netperf {{address}} -{{4|6}}
```

netserver

Server-side command for **`netperf`**, the benchmarking application that measures network throughput.

See also: **`netperf`** for the client-side command.

More information: https://manned.org/netserver.

- Start a server on the default port (12865) and fork to background:

```
netserver
```

- Start server in foreground and do not fork:

```
netserver -D
```

- Specify [p]ort:

```
netserver -p {{port}}
```

- Force IPv[4] or IPv[6]:

```
netserver -{{4|6}}
```

netstat

Display network-related information such as open connections, open socket ports, etc.

See also: **ss**.

More information: https://manned.org/netstat.

- List all ports:

```
netstat {{[-a|--all]}}
```

- List all listening ports:

```
netstat {{[-l|--listening]}}
```

- List listening TCP ports:

```
netstat {{[-t|--tcp]}}
```

- Display PID and program names:

```
netstat {{[-p|--program]}}
```

- List information continuously:

```
netstat {{[-c|--continuous]}}
```

- List routes and do not resolve IP addresses to hostnames:

```
netstat {{[-rn|--route --numeric]}}
```

- List listening TCP and UDP ports (+ user and process if you're root):

```
netstat {{[-tulpne|--tcp --udp --listening --program --
numeric --extend]}}
```

nettacker

Automate information gathering, vulnerability scanning and eventually generate a report.

More information: https://nettacker.readthedocs.io/en/latest/Home/.

- List all available modules:

```
nettacker --show-all-modules
```

- Run a port scan on targets:

```
nettacker {{[-m|--modules]}} port_scan {{[-i|--targets]}}
{{192.168.0.1/24,owasp.org,scanme.org,...}}
```

- Run a port scan on specific ports and targets listed in a file (newline separated):

```
nettacker {{[-m|--modules]}} port_scan {{[-g|--ports]}}
{{22,80,443,...}} {{[-l|--targets-list]}} {{path/to/
targets.txt}}
```

- Run ping test before scan and then run multiple scan types on target:

```
nettacker --ping-before-scan {{[-m|--modules]}}
{{port_scan,subdomain_scan,waf_scan,...}} {{[-g|--ports]}}
{{80,443}} {{[-i|--targets]}} {{owasp.org}}
```

newman

Collection runner for Postman.

More information: https://github.com/postmanlabs/newman#command-line-options.

- Run a collection (from a file):

```
newman run {{path/to/collection.json}}
```

- Run a collection (from a URL):

```
newman run {{https://www.getpostman.com/collections/631643-f695cab7-6878-eb55-7943-ad88e1ccfd65-JsLv}}
```

newsboat

An RSS/Atom feed reader for text terminals.

More information: https://newsboat.org/releases/2.40/docs/newsboat.html#_first_steps.

- First import feed URLs from an OPML file:

```
newsboat {{[-i|--import-from-opml]}} {{my-feeds.xml}}
```

- Alternatively, add feeds manually:

```
echo {{http://example.com/path/to/feed}} >> "${HOME}/.newsboat/urls"
```

- Start Newsboat and refresh all feeds on startup:

```
newsboat {{[-r|--refresh-on-start]}}
```

- Execute one or more commands in non-interactive mode:

```
newsboat {{[-x|--execute]}} {{reload|print-unread|...}}
```

- See keyboard shortcuts (the most relevant are visible in the status line):

```
<?>
```

next

React framework that uses server-side rendering for building optimized web applications.

More information: https://nextjs.org/docs/app/api-reference/cli/next.

- Start the current application in development mode:

  ```
  next dev
  ```

- Start the current application and listen on a specific port:

  ```
  next dev {{[-p|--port]}} {{port}}
  ```

- Build the current application optimized for production:

  ```
  next build
  ```

- Start the compiled application in production mode:

  ```
  next start
  ```

- Start the compiled application and listen on a specific port:

  ```
  next start {{[-p|--port]}} {{port}}
  ```

- Export the current application to static HTML pages:

  ```
  next export
  ```

- Display the Next.js telemetry status:

  ```
  next telemetry
  ```

- Display help for a subcommand:

  ```
  next {{build|dev|export|start|telemetry}} {{[-h|--help]}}
  ```

nextclade

Bioinformatics tool for virus genome alignment, clade assignment and qc checks.

More information: https://docs.nextstrain.org/projects/nextclade/en/stable/user/nextclade-cli/reference.html.

- Align sequences to user provided reference, outputting the alignment to a file:

```
nextclade run {{path/to/sequences.fa}} {{[-r|--input-ref]}} {{path/to/reference.fa}} {{[-o|--output-fasta]}} {{path/to/alignment.fa}}
```

- Create a TSV report, auto-downloading the latest dataset:

```
nextclade run {{path/to/fasta}} {{[-d|--dataset-name]}} {{dataset_name}} {{[-t|--output-tsv]}} {{path/to/report.tsv}}
```

- List all available datasets:

```
nextclade dataset list
```

- Download the latest SARS-CoV-2 dataset:

```
nextclade dataset get {{[-n|--name]}} sars-cov-2 {{[-o|--output-dir]}} {{path/to/directory}}
```

- Use a downloaded dataset, producing all outputs:

```
nextclade run {{[-D|--input-dataset]}} {{path/to/dataset_directory}} {{[-O|--output-all]}} {{path/to/output_directory}} {{path/to/sequences.fasta}}
```

- Run on multiple files:

```
nextclade run {{[-d|--dataset-name]}} {{dataset_name}} {{[-t|--output-tsv]}} {{path/to/output_tsv}} -- {{path/to/input_fasta_1 path/to/input_fasta_2 ...}}
```

- Try reverse complement if sequence does not align:

```
nextclade run --retry-reverse-complement {{[-d|--dataset-name]}} {{dataset_name}} {{[-t|--output-tsv]}} {{path/to/output_tsv}} {{path/to/input_fasta}}
```

nextflow

Run computational pipelines. Mostly used for bioinformatics workflows.

More information: https://www.nextflow.io/docs/latest/cli.html.

- Run a pipeline, use cached results from previous runs:

```
nextflow run {{main.nf}} -resume
```

- Run a specific release of a remote workflow from GitHub:

```
nextflow run {{user/repo}} -revision {{release_tag}}
```

- Run with a given work directory for intermediate files, save execution report:

```
nextflow run {{workflow}} -work-dir {{path/to/directory}} -with-report {{report.html}}
```

- Show details of previous runs in current directory:

```
nextflow log
```

- Remove cache and intermediate files for a specific run:

```
nextflow clean -force {{run_name}}
```

- List all downloaded projects:

```
nextflow list
```

- Pull the latest version of a remote workflow from Bitbucket:

```
nextflow pull {{user/repo}} -hub bitbucket
```

- Update Nextflow:

```
nextflow self-update
```

nf-core

The nf-core framework tools to create, check, and develop best-practice guidelines for Nextflow.

More information: https://nf-co.re/docs/nf-core-tools.

- List existing pipelines on nf-core:

  ```
  nf-core list
  ```

- Create a new pipeline skeleton:

  ```
  nf-core create
  ```

- Lint the pipeline code:

  ```
  nf-core lint {{path/to/directory}}
  ```

- Bump software versions in pipeline recipe:

  ```
  nf-core bump-version {{path/to/directory}} {{new_version}}
  ```

- Launch an nf-core pipeline:

  ```
  nf-core launch {{pipeline_name}}
  ```

- Download an nf-core pipeline for offline use:

  ```
  nf-core download {{pipeline_name}}
  ```

ng add

Add and configure packages for the current workspace project.

More information: https://angular.dev/cli/add.

- Add a package to the current project:

  ```
  ng add {{package}}
  ```

- Add multiple packages:

  ```
  ng add {{package1 package2 ...}}
  ```

- Add a specific version of a package:

  ```
  ng add {{package}}@{{version}}
  ```

- Skip the confirmation prompt:

  ```
  ng add {{package}} --skip-confirmation
  ```

- Disable interactive prompts:

  ```
  ng add {{package}} --interactive false
  ```

- Display verbose output about internal operations:

  ```
  ng add {{package}} --verbose
  ```

- Perform a dry run without making any changes:

  ```
  ng add {{package}} {{[-d|--dry-run]}}
  ```

ng analytics

Manage Angular CLI analytics settings.

More information: https://angular.dev/cli/analytics.

- Enable analytics for the current project:

  ```
  ng analytics {{[on|enable]}}
  ```

- Enable analytics globally:

  ```
  ng analytics {{[on|enable]}} {{[-g|--global]}}
  ```

- Disable analytics for the current project:

  ```
  ng analytics {{[off|disable]}}
  ```

- Disable analytics globally:

  ```
  ng analytics {{[off|disable]}} {{[-g|--global]}}
  ```

- Display the current analytics configuration and status:

  ```
  ng analytics info
  ```

- Prompt interactively to configure analytics settings:

  ```
  ng analytics prompt
  ```

ng update

Update an Angular workspace and its dependencies.

More information: https://angular.dev/cli/update.

- Update all dependencies in the workspace:

  ```
  ng update
  ```

- Update a specific package:

  ```
  ng update {{package}}
  ```

- Update multiple packages:

  ```
  ng update {{package1 package2 ...}}
  ```

- Ignore peer dependency version mismatches:

  ```
  ng update {{package}} --force
  ```

- Allow updating when the repository contains modified or untracked files:

  ```
  ng update {{package}} --allow-dirty
  ```

- Update to prerelease versions, including beta and release candidates:

  ```
  ng update {{package}} --next
  ```

- Display additional details about internal operations:

  ```
  ng update {{package}} --verbose
  ```

ng version

Display Angular CLI version.

More information: https://angular.dev/cli/version.

- Display version:

  ```
  ng {{[v|version]}}
  ```

- Display the CLI, framework, system, and project dependency versions in JSON format:

  ```
  ng {{[v|version]}} --json
  ```

ng

Create and manage Angular applications.

More information: https://angular.io/cli.

- Create a new Angular application inside a directory:

  ```
  ng new {{project_name}}
  ```

- Add a new component to one's application:

  ```
  ng generate component {{component_name}}
  ```

- Add a new class to one's application:

  ```
  ng generate class {{class_name}}
  ```

- Add a new directive to one's application:

  ```
  ng generate directive {{directive_name}}
  ```

- Run the application with the following command in its root directory:

  ```
  ng serve
  ```

- Build the application:

  ```
  ng build
  ```

- Run unit tests:

  ```
  ng test
  ```

- Display version:

  ```
  ng version
  ```

nginx

Nginx web server.

More information: https://nginx.org/docs/switches.html.

- Start the server with the default configuration file:

```
nginx
```

- Start the server with a custom configuration file:

```
nginx -c {{configuration_file}}
```

- Start the server with a prefix for all relative paths in the configuration file:

```
nginx -c {{configuration_file}} -p {{path/to/prefix}}
```

- Test the configuration without affecting the running server:

```
nginx -t
```

- Reload the configuration by sending a signal with no downtime:

```
nginx -s reload
```

ngrep

Filter network traffic packets using **regex**.

More information: https://github.com/jpr5/ngrep/blob/master/EXAMPLES.md.

- Capture traffic of all interfaces:

```
ngrep -d any
```

- Capture traffic of a specific interface:

```
ngrep -d {{eth0}}
```

- Capture traffic crossing port 22 of interface eth0:

```
ngrep -d {{eth0}} port {{22}}
```

- Capture traffic from or to a host:

```
ngrep host {{www.example.com}}
```

- Filter keyword 'User-Agent:' of interface eth0:

```
ngrep -d {{eth0}} '{{User-Agent:}}'
```

ngrok

Reverse proxy that creates a secure tunnel from a public endpoint to a locally running web service.

More information: https://ngrok.com/docs/agent/cli.

- Expose a local HTTP service on a given port:

```
ngrok http {{80}}
```

- Expose a local HTTP service on a specific host:

```
ngrok http {{example.com}}:{{80}}
```

- Expose a local HTTPS server:

```
ngrok http https://localhost
```

- Expose TCP traffic on a given port:

```
ngrok tcp {{22}}
```

- Expose TLS traffic for a specific host and port:

```
ngrok tls -hostname={{example.com}} {{443}}
```

ngs

Scripting language created specifically for Ops.

More information: https://github.com/ngs-lang/ngs.

- Execute a code snippet:

```
ngs -e "{{echo('ngs is executed')}}"
```

- Execute a script:

```
ngs {{path/to/script.ngs}}
```

- Display version:

```
ngs --version
```

nh

Modern helper utility tool for the Nix/Nixos ecosystem.

More information: https://github.com/nix-community/nh#usage.

- Search for a package in Nixpkgs, limiting results:

```
nh search {{[-l|--limit]}} {{number}} {{name}}
```

- Collect all garbage and gcroots from the Nix store:

```
nh clean all {{[-a|--ask]}}
```

- Build a specified Nixos flake configuration and create a symlink of the result from the Nix store:

```
nh os build-vm {{path/to/flake}} {{[-H|--hostname]}} {{host}}
```

- Build and test a specified Nixos flake configuration:

```
nh os test {{path/to/flake}} {{[-H|--hostname]}} {{nixos}}
```

- Build and switch to a specified Home manager flake configuration:

```
nh home switch {{path/to/flake}} {{[-c|--configuration]}}
{{home}}
```

- Build and switch to a nix-darwin flake configuration:

```
nh darwin switch {{path/to/flake}} {{[-H|--hostname]}}
{{host}}
```

- Generate shell completions for a specified shell:

```
nh completions {{shell}}
```

nhentai

Download doujinshis from nhentai.

More information: https://github.com/RicterZ/nhentai#usage.

- Set cookies:

```
nhentai --cookie "csrftoken={{TOKEN}}; sessionid={{ID}}"
```

- Download a specific doujin:

```
nhentai --id {{number}}
```

- Download the first page of your favorites:

```
nhentai {{[-F|--favorites]}} {{[-D|--download]}} {{[-d|--
delay]}} 1
```

- Download specific pages of your favorites:

```
nhentai {{[-F|--favorites]}} --pages {{start_page}}-
{{end_page}} {{[-D|--download]}} {{[-d|--delay]}} 1
```

nice

Execute a program with a custom scheduling priority (niceness).

Niceness values range from -20 (the highest priority) to 19 (the lowest).

Note: Some modern schedulers ignore niceness or limit its effects inside autogroups.

More information: https://www.gnu.org/software/coreutils/manual/html_node/nice-invocation.html.

- Print the current niceness value:

```
nice
```

- Increment the current niceness value by 10:

```
nice nice
```

- Launch a program with lowered priority:

```
nice -{{niceness_value}} {{command}}
```

- Launch a program with heightened priority:

```
sudo nice --{{niceness_value}} {{command}}
```

- Define the priority with an explicit option:

```
nice {{[-n|--adjustment]}} {{niceness_value}} {{command}}
```

nicotine

Graphical client for the Soulseek peer-to-peer network.

More information: https://manned.org/nicotine.

- Start Nicotine+:

```
nicotine
```

- Start Nicotine+ in headless ([n]) mode:

```
nicotine {{[-n|--headless]}}
```

- Rescan shared files:

```
nicotine {{[-r|--rescan]}}
```

- Display help:

```
nicotine {{[-h|--help]}}
```

nikto

Web server scanner which performs tests against web servers for multiple items.

More information: http://cirt.net/nikto/.

- Perform a basic Nikto scan against a target host:

```
perl nikto.pl {{[-h|-host]}} {{192.168.0.1}}
```

- Specify the port number when performing a basic scan:

```
perl nikto.pl {{[-h|-host]}} {{192.168.0.1}} {{[-p|-port]}} {{443}}
```

- Scan ports and protocols with full URL syntax:

```
perl nikto.pl {{[-h|-host]}} {{https://192.168.0.1:443/}}
```

- Scan multiple ports in the same scanning session:

```
perl nikto.pl {{[-h|-host]}} {{192.168.0.1}} {{[-p|-port]}} {{80,88,443}}
```

- Update to the latest plugins and databases:

```
perl nikto.pl {{[-u|-update]}}
```

nim

The Nim compiler.

Process, compile, and link Nim language source files.

More information: https://nim-lang.org/docs/nimc.html.

- Compile a source file:

```
nim {{[c|compile]}} {{path/to/file.nim}}
```

- Compile and run a source file:

```
nim {{[c|compile]}} {{[-r|--run]}} {{path/to/file.nim}}
```

- Compile a source file with release optimizations enabled:

```
nim {{[c|compile]}} {{[-d|--define]}}:release {{path/to/
file.nim}}
```

- Build a release binary optimized for low file size:

```
nim {{[c|compile]}} {{[-d|--define]}}:release --opt:size
{{path/to/file.nim}}
```

- Generate HTML documentation for a module (output will be placed in the current directory):

```
nim doc {{path/to/file.nim}}
```

- Check a file for syntax and semantics:

```
nim check {{path/to/file.nim}}
```

nimble

Package manager for the Nim programming language.

Manage Nim projects and their dependencies.

More information: https://github.com/nim-lang/nimble.

- Search for packages:

```
nimble search {{search_string}}
```

- Install a package:

```
nimble install {{package}}
```

- List installed packages:

```
nimble list {{[-i|--installed]}}
```

- Create a new Nimble package in the current directory:

```
nimble init
```

- Build a Nimble package:

```
nimble build
```

- Install a Nimble package:

```
nimble install
```

ninja

A Build system designed to be fast.

More information: https://ninja-build.org/manual.html.

- Build in the current directory:

```
ninja
```

- Build in the current directory, executing 4 jobs at a time in parallel:

```
ninja -j {{4}}
```

- Build a program in a given directory:

```
ninja -C {{path/to/directory}}
```

- Show targets (e.g. `install` and `uninstall`):

```
ninja -t targets
```

- Display help:

```
ninja -h
```

nix-build

Build a Nix expression.

See also: **`nix build.3`**.

More information: https://nix.dev/manual/nix/stable/command-ref/nix-build.html.

- Build a Nix expression:

```
nix-build '<nixpkgs>' {{[-A|--attr]}} {{firefox}}
```

- Build a sandboxed Nix expression (on non-NixOS):

```
nix-build '<nixpkgs>' {{[-A|--attr]}} {{firefox}} --option
sandbox true
```

nix build

Build a Nix expression (downloading from the cache when possible).

See also: **`nix-build`** for information about traditional Nix builds from expressions, **`nix flake`** for information about flakes.

More information: https://nix.dev/manual/nix/stable/command-ref/new-cli/nix3-build.html.

- Build a package from nixpkgs, symlinking the result to `./result`:

  ```
  nix build {{nixpkgs#pkg}}
  ```

- Build a package from a flake in the current directory, showing the build logs in the process:

  ```
  nix build {{[-L|--print-build-logs]}} {{.#pkg}}
  ```

- Build the default package from a flake in some directory:

  ```
  nix build {{path/to/directory}}
  ```

- Build a package without making the `result` symlink, instead printing the store path to the `stdout`:

  ```
  nix build --no-link --print-out-paths
  ```

nix-build

nix-build can refer to multiple commands with the same name.

- View documentation for the traditional builder before version 2.4 of Nix:

  ```
  tldr nix-build.2
  ```

- View documentation for nix3 builder:

  ```
  tldr nix build.3
  ```

nix-channel

Manage **`nix`** update channels.

More information: https://nixos.wiki/wiki/Nix_channels.

- List current channels:

```
nix-channel --list
```

- Add a channel:

```
nix-channel --add {{https://nixos.org/channels/nixpkgs-unstable}}
```

- Update package list of all channels:

```
nix-channel --update
```

nix classic

A classic, stable interface to a powerful package manager that makes package management reliable, reproducible, and declarative.

Some Nix commands such as **`nix-build`**, **`nix-shell`**, **`nix-env`**, and **`nix-store`** have their own pages.

See also: **`nix`**.

More information: https://nixos.org/.

- Search for a package in nixpkgs via its name:

```
nix-env {{[-qaP|--query --available --attr-path]}} {{search_term_regex}}
```

- Start a shell with the specified packages available:

```
nix-shell {{[-p|--packages]}} {{pkg1 pkg2 pkg3 ...}}
```

- Install some packages permanently:

```
nix-env {{[-iA|--install --attr]}} {{nixpkgs.pkg1 nixpkgs.pkg2 ...}}
```

- Show all dependencies of a store path (package), in a tree format:

```
nix-store {{[-q|--query]}} --tree /nix/store/{{checksum-package-version.ext}}
```

- Update the channels (repositories):

```
nix-channel --update
```

- Remove unused paths from Nix store:

```
nix-collect-garbage
```

nix-collect-garbage

Delete unused and unreachable nix store paths.

Generations can be listed using **`nix-env --list-generations`**.

More information: https://nix.dev/manual/nix/stable/command-ref/nix-collect-garbage.html.

- Delete all user related store paths unused by current generations of each profile:

  ```
  nix-collect-garbage {{[-d|--delete-old]}}
  ```

- Simulate the deletion of old store paths:

  ```
  nix-collect-garbage {{[-d|--delete-old]}} --dry-run
  ```

- Delete all store paths older than 30 days:

  ```
  nix-collect-garbage --delete-older-than 30d
  ```

- Delete all store paths unused by the current generation of each profile system-wide:

  ```
  sudo nix-collect-garbage {{[-d|--delete-old]}}
  ```

nix develop

Run a Bash shell that provides the build environment of a derivation.

More information: https://nix.dev/manual/nix/stable/command-ref/new-cli/nix3-develop.html.

- Start a shell with all dependencies of a package from nixpkgs available:

```
nix develop {{nixpkgs#pkg}}
```

- Start a development shell for the default package in a flake in the current directory:

```
nix develop
```

- In that shell, configure and build the sources:

```
configurePhase; buildPhase
```

nix edit

Open the Nix expression of a Nix package in **`$EDITOR`**.

More information: https://nix.dev/manual/nix/stable/command-ref/new-cli/nix3-edit.html.

- Open the source of the Nix expression of a package from nixpkgs in your `$EDITOR`:

```
nix edit {{nixpkgs#pkg}}
```

- Dump the source of a package to `stdout`:

```
EDITOR=cat nix edit {{nixpkgs#pkg}}
```

nix-env

Manipulate or query Nix user environments.

More information: https://nix.dev/manual/nix/stable/command-ref/nix-env.html.

- List all installed packages:

```
nix-env {{[-q|--query]}}
```

- Query installed packages (`regex` is supported):

```
nix-env {{[-q|--query]}} {{search_pattern}}
```

- Query available packages from the Nixpkgs registry:

```
nix-env {{[-qa|--query --available]}} {{search_pattern}}
```

- Install a package from the Nixpkgs registry:

```
nix-env {{[-iA|--install --attr]}} nixpkgs.{{pkg_name}}
```

- Install a package from a custom URL:

```
nix-env {{[-i|--install]}} {{pkg_name}} {{[-f|--file]}}
{{example.com}}
```

- Uninstall a package:

```
nix-env {{[-e|--uninstall]}} {{pkg_name}}
```

- Upgrade a package:

```
nix-env {{[-u|--upgrade]}} {{pkg_name}}
```

- Get usage help for a specific operation (`--install`, `--upgrade`, etc.):

```
nix-env --help --{{option_name}}
```

nix eval

Evaluate a Nix expression and print the result to **`stdout`**.

More information: https://nix.dev/manual/nix/stable/command-ref/new-cli/nix3-eval.html.

- Evaluate Nix flake attributes in the current directory:

```
nix eval .#{{attributes}}
```

- Evaluate a given Nix expression:

```
nix eval --expr '{{your_expression}}'
```

- Evaluate a Nix expression from a specified file:

```
nix eval --file {{path/to/file}}
```

- Print the store path of the specified package from nixpkgs:

```
nix eval {{nixpkgs#pkg}} --raw
```

- Evaluate attributes from a flake directly from GitHub:

```
nix eval {{github:owner/repo#attributes}}
```

- Evaluate a given lambda function passing the specified package as argument:

```
nix eval {{nixpkgs#pkg}} --apply '{{lambda_function}}'
```

nix flake info

Show flake metadata.

More information: https://nix.dev/manual/nix/stable/command-ref/new-cli/nix3-flake-info.

- Show flake metadata of the flake in the current directory:

```
nix flake info
```

- Show flake metadata from GitHub as a json on a single line:

```
nix flake info {{github:owner/repo}} --json --no-pretty
```

- Show flake metadata from Github as a multi-line indented json:

```
nix flake info {{github:owner/repo}} --json --pretty
```

nix flake init

Create a flake in the current directory from a template.

More information: https://nix.dev/manual/nix/stable/command-ref/new-cli/nix3-flake-init.html.

- Create a new flake from the default template, in the current directory:

```
nix flake init
```

- Create a new flake with a specified template (see `nix flake show` for information about templates):

```
nix flake init {{[-t|--template]}}
templates#{{your_template}}
```

nix flake show

Show outputs provided by a flake.

More information: https://nix.dev/manual/nix/stable/command-ref/new-cli/nix3-flake-show.html.

- Show all the outputs of the flake in the current directory:

```
nix flake show
```

- Show all the outputs of a flake on GitHub and print the output as a json on a single line:

```
nix flake show {{github:owner/repo}} --json --no-pretty
```

- Show all the `legacyPackages` outputs of a flake on GitHub and print the output as a multi-line indented json:

```
nix flake show {{github:owner/repo}} --json --pretty --legacy
```

- List all available flake templates for `nix flake init`:

```
nix flake show templates
```

nix flake

Manage Nix flakes.

Some subcommands such as **`init`**, **`show`**, **`info`** have their own usage documentation.

More information: https://nix.dev/manual/nix/stable/command-ref/new-cli/nix3-flake.html.

- Update all inputs (dependencies) of the flake in the current directory:

```
nix flake update
```

- Update a specific input (dependency) of the flake in the current directory:

```
nix flake update {{input}}
```

- Clone a GitHub repository containing a flake:

```
nix flake clone {{github:owner/repo#attributes}}
```

- Create missing lock file entries for a flake in a specified directory:

```
nix flake lock {{path/to/flake}}
```

- Display help:

```
nix flake --help
```

nix profile

Install, update, and remove packages from Nix profiles.

More information: https://nix.dev/manual/nix/stable/command-ref/new-cli/nix3-profile.html.

- Install some packages from nixpkgs into the default profile:

```
nix profile install {{nixpkgs#pkg1 nixpkgs#pkg2 ...}}
```

- Install a package from a flake on GitHub into a custom profile:

```
nix profile install {{github:owner/repo/pkg}} --profile {{path/to/directory}}
```

- List packages currently installed in the default profile:

```
nix profile list
```

- Remove a package installed from nixpkgs from the default profile, by name:

```
nix profile remove {{legacyPackages.x86_64-linux.pkg}}
```

- Upgrade packages in the default to the latest available versions:

```
nix profile upgrade
```

- Rollback (cancel) the latest action on the default profile:

```
nix profile rollback
```

nix registry

Manage a Nix flake registry.

See also: **`nix flake`** for information about flakes.

More information: https://nix.dev/manual/nix/stable/command-ref/new-cli/nix3-registry.html.

- Pin the `nixpkgs` revision to the current version of the upstream repository:

  ```
  nix registry pin {{nixpkgs}}
  ```

- Pin an entry to the latest version of the branch, or a particular reivision of a GitHub repository:

  ```
  nix registry pin {{entry}} {{github:owner/repo/branch_or_revision}}
  ```

- Add a new entry that always points to the latest version of a GitHub repository, updating automatically:

  ```
  nix registry add {{entry}} {{github:owner/repo}}
  ```

- Remove a registry entry:

  ```
  nix registry remove {{entry}}
  ```

- See documentation about what Nix flake registries are:

  ```
  nix registry --help
  ```

nix repl

Start an interactive environment for evaluating Nix expressions.

See https://nixos.org/manual/nix/stable/language/index.html for a description of the Nix expression language.

More information: https://nix.dev/manual/nix/stable/command-ref/new-cli/nix3-repl.html.

- Start an interactive environment for evaluating Nix expressions:

  ```
  nix repl
  ```

- Load all packages from a flake (e.g. `nixpkgs`) into scope:

  ```
  :lf {{nixpkgs}}
  ```

- Build a package from an expression:

  ```
  :b {{expression}}
  ```

- Start a shell with package from the expression available:

  ```
  :u {{expression}}
  ```

- Start a shell with dependencies of the package from the expression available:

  ```
  :s {{expression}}
  ```

nix run

Run an application from a Nix flake.

See also: **`nix flake`** for information about flakes.

More information: https://nix.dev/manual/nix/stable/command-ref/new-cli/nix3-run.html.

- Run the default application in the flake in the current directory:

```
nix run
```

- Run a command whose name matches the package name from nixpkgs (if you want a different command from that package, see `tldr nix shell`):

```
nix run nixpkgs#{{pkg}}
```

- Run a command with provided arguments:

```
nix run nixpkgs#{{vim}} -- {{path/to/file}}
```

- Run from a remote repository:

```
nix run {{remote_name}}:{{owner}}/{{repository}}
```

- Run from a remote repository using a specific tag, revision, or branch:

```
nix run {{remote_name}}:{{owner}}/{{repository}}/
{{reference}}
```

- Run from a remote repository specifying a subdirectory and a program:

```
nix run "{{remote_name}}:{{owner}}/{{repository}}?
dir={{dir_name}}#{{app}}"
```

- Run the flake of a GitHub pull request:

```
nix run github:{{owner}}/{{repository}}/pull/{{number}}/head
```

nix search

Search for packages in a Nix flake.

See also: **`nix flake`** for information about flakes.

More information: https://nix.dev/manual/nix/stable/command-ref/new-cli/nix3-search.html.

- Search `nixpkgs` for a package based on its name or description:

```
nix search {{nixpkgs}} {{search_term}}
```

- Show description of a package from nixpkgs:

```
nix search {{nixpkgs#pkg}}
```

- Show all packages available from a flake on github:

```
nix search {{github:owner/repo}}
```

nix-shell

Start an interactive shell based on a Nix expression.

See also: **`nix shell.3`**.

More information: https://nix.dev/manual/nix/stable/command-ref/nix-shell.html.

- Start with nix expression in `shell.nix` or `default.nix` in the current directory:

```
nix-shell
```

- Run shell command in non-interactive shell and exit:

```
nix-shell --run "{{command}} {{argument1 argument2 ...}}"
```

- Start with expression in `default.nix` in the current directory:

```
nix-shell {{default.nix}}
```

- Start with packages loaded from nixpkgs:

```
nix-shell {{[-p|--packages]}} {{package1 package2 ...}}
```

- Start with packages loaded from specific nixpkgs revision:

```
nix-shell {{[-p|--packages]}} {{package1 package2 ...}} {{[-I|--include]}} nixpkgs={{https://github.com/NixOS/nixpkgs/archive/nixpkgs_revision.tar.gz}}
```

- Evaluate rest of file in specific interpreter, for use in `#!-scripts` (see https://nixos.org/manual/nix/stable/#use-as-a-interpreter):

```
nix-shell -i {{interpreter}} {{[-p|--packages]}} {{package1 package2 ...}}
```

nix shell

Start a shell in which the specified packages are available.

See also: **`nix-shell`** for setting up development environments, **`nix flake`** for information about flakes.

More information: https://manned.org/nix3-shell.

- Start an interactive shell with some packages from `nixpkgs`:

  ```
  nix shell {{nixpkgs#pkg1 nixpkgs#packageSet.pkg2 ...}}
  ```

- Start a shell providing a package from an older version of `nixpkgs` (21.05):

  ```
  nix shell {{nixpkgs/nixos-21.05#pkg}}
  ```

- Start a shell with the "default package" from a flake in the current directory, printing build logs if any builds happen:

  ```
  nix shell -L
  ```

- Start a shell with a package from a flake on GitHub:

  ```
  nix shell {{github:owner/repo#pkg}}
  ```

- Run a command in a shell with a package:

  ```
  nix shell {{nixpkgs#pkg}} -c {{some-cmd --someflag 'Some other arguments'}}
  ```

nix-shell

`nix-shell` can refer to multiple commands with the same name.

- View documentation for the traditional shell before version 2.4 of Nix:

  ```
  tldr nix-shell.2
  ```

- View documentation for nix3 shell:

  ```
  tldr nix shell.3
  ```

nix-store

Manipulate or query the Nix store.

See also: **`nix store.3`**.

More information: https://nix.dev/manual/nix/stable/command-ref/nix-store.html.

- Collect garbage, such as removing unused paths:

```
nix-store --gc
```

- Hard-link identical files together to reduce space usage:

```
nix-store --optimise
```

- Delete a specific store path (must be unused):

```
nix-store --delete /nix/store/{{checksum-package-version.ext}}
```

- Show all dependencies of a store path (package), in a tree format:

```
nix-store {{[-q|--query]}} --tree /nix/store/{{checksum-package-version.ext}}
```

- Calculate the total size of a certain store path with all the dependencies:

```
du {{[-cLsh|--total --dereference --summarize --human-readable]}} $(nix-store {{[-q|--query]}} --references /nix/store/{{checksum-package-version.ext}})
```

- Show all dependents of a particular store path:

```
nix-store {{[-q|--query]}} --referrers /nix/store/{{checksum-package-version.ext}}
```

nix store

Manipulate the Nix store.

See also: **`nix-store`**.

More information: https://nix.dev/manual/nix/stable/command-ref/new-cli/nix3-store.html.

- Collect garbage, i.e. remove unused paths to reduce space usage:

```
nix store gc
```

- Hard-link identical files together to reduce space usage:

```
nix store optimise
```

- Delete a specific store path (must be unused):

```
nix store delete /nix/store/{{checksum-package-version.ext}}
```

- List a contents of the store path, on a remote store:

```
nix store --store {{https://cache.nixos.org}} ls /nix/store/{{checksum-package-version.ext}}
```

- Show the differences in versions between two store paths, with their respective dependencies:

```
nix store diff-closures /nix/store/{{checksum-package-version.ext}} /nix/store/{{checksum-package-version.ext}}
```

nix-store

nix-store can refer to multiple commands with the same name.

- View documentation for the traditional store before version 2.4 of Nix:

  `tldr nix-store.2`

- View documentation for nix3 store:

  `tldr nix store.3`

nix why-depends

Show why a package depends on another package.

More information: https://nix.dev/manual/nix/stable/command-ref/new-cli/nix3-why-depends.html.

- Show why the currently running NixOS system requires a certain store path:

```
nix why-depends {{/run/current-system}} /nix/store/
{{checksum-package-version.ext}}
```

- Show why a package from nixpkgs requires another package as a build-time dependency:

```
nix why-depends --derivation {{nixpkgs#dependent}}
{{nixpkgs#dependency}}
```

nix

A powerful package manager that makes package management reliable, reproducible, and declarative.

`nix` is experimental and requires enabling experimental features.

See also: **`nix classic`** for a classic, stable interface.

Some subcommands such as **`build`**, **`develop`**, **`flake`**, **`registry`**, **`profile`**, **`search`**, **`repl`**, **`store`**, **`edit`**, **`why-depends`**, etc. have their own usage documentation.

More information: https://nix.dev/manual/nix/stable/command-ref/new-cli/nix.

- Enable the `nix` command:

```
mkdir {{[-p|--parents]}} ~/.config/nix; echo 'experimental-features = nix-command flakes' > ~/.config/nix/nix.conf
```

- Search for a package in nixpkgs via its name or description:

```
nix search nixpkgs {{search_term}}
```

- Start a shell with the specified packages from nixpkgs available:

```
nix shell {{nixpkgs#pkg1 nixpkgs#pkg2 nixpkgs#pkg3 ...}}
```

- Install some packages from nixpkgs permanently:

```
nix profile install {{nixpkgs#pkg1 nixpkgs#pkg2 nixpkgs#pkg3 ...}}
```

- Remove unused paths from Nix store to free up space:

```
nix store gc
```

- Start an interactive environment for evaluating Nix expressions:

```
nix repl
```

- Display help for a specific subcommand:

```
nix help {{subcommand}}
```

nixpkgs-review

Review pull requests in the NixOS packages repository (nixpkgs).

After a successful build, a **`nix-shell`** with all built packages is started.

More information: https://github.com/Mic92/nixpkgs-review#usage.

- Build changed packages in the specified pull request:

  ```
  nixpkgs-review pr {{pr_number|pr_url}}
  ```

- Build changed packages and post a comment with a report (requires setting up a token in `hub`, `gh`, or the `$GITHUB_TOKEN` environment variable):

  ```
  nixpkgs-review pr --post-result {{pr_number|pr_url}}
  ```

- Build changed packages and print a report:

  ```
  nixpkgs-review pr --print-result {{pr_number|pr_url}}
  ```

- Build changed packages in a local commit:

  ```
  nixpkgs-review rev {{HEAD}}
  ```

- Build changed packages that haven't been committed yet:

  ```
  nixpkgs-review wip
  ```

- Build changed packages that have been staged:

  ```
  nixpkgs-review wip --staged
  ```

nkf

Network kanji filter: convert kanji code from one encoding to another.

More information: https://manned.org/nkf.

- Convert to UTF-8 encoding:

```
nkf -w {{path/to/file.txt}}
```

- Convert to SHIFT_JIS encoding:

```
nkf -s {{path/to/file.txt}}
```

- Convert to UTF-8 encoding and overwrite the file:

```
nkf -w --overwrite {{path/to/file.txt}}
```

- Use LF as the new line code and overwrite (UNIX type):

```
nkf -d --overwrite {{path/to/file.txt}}
```

- Use CRLF as the new line code and overwrite (windows type):

```
nkf -c --overwrite {{path/to/file.txt}}
```

- Decrypt mime file and overwrite:

```
nkf -m --overwrite {{path/to/file.txt}}
```

nl

Number lines from a file or from **`stdin`**.

More information: https://manned.org/nl.1p.

- Number non-blank lines in a file:

```
nl {{path/to/file}}
```

- Read from `stdin`:

```
{{command}} | nl -
```

- Number [a]ll [b]ody lines including blank lines or do [n]ot number [b]ody lines:

```
nl -b {{a|n}} {{path/to/file}}
```

- Number only the [b]ody lines that match a basic `regex` (BRE) [p]attern:

```
nl -b p'FooBar[0-9]' {{path/to/file}}
```

- Use a specific [i]ncrement for line numbering:

```
nl -i {{increment}} {{path/to/file}}
```

- Specify the line numbering format to [r]ight or [l]eft justified, keeping leading [z]eros or [n]ot:

```
nl -n {{rz|ln|rn}}
```

- Specify the line numbering's [w]idth (6 by default):

```
nl -w {{col_width}} {{path/to/file}}
```

- Use a specific string to [s]eparate the line numbers from the lines (`TAB` by default):

```
nl -s {{separator}} {{path/to/file}}
```

nload

Visualize network usage in the terminal.

More information: https://manned.org/nload.

- View all network traffic (use the `<ArrowKeys>` to switch interfaces):

```
nload
```

- View network traffic on specific interfaces (use the `<ArrowKeys>` to switch interfaces):

```
nload devices {{interface1 interface2 ...}}
```

nm-classic

This command is an alias of **nm**.

- View documentation for the original command:

```
tldr nm
```

nm

List symbol names in object files.

More information: https://manned.org/nm.

- List global (extern) functions in a file (prefixed with T):

```
nm {{[-g|--extern-only]}} {{path/to/file.o}}
```

- List only undefined symbols in a file:

```
nm {{[-u|--undefined-only]}} {{path/to/file.o}}
```

- List all symbols, even debugging symbols:

```
nm {{[-a|--debug-syms]}} {{path/to/file.o}}
```

- Demangle C++ symbols (make them readable):

```
nm {{[-C|--demangle]}} {{path/to/file.o}}
```

nmap

Network exploration tool and security/port scanner.

Some features (e.g. SYN scan) activate only when **`nmap`** is run with root privileges.

More information: https://nmap.org/book/man.html.

- Scan the top 1000 ports of a remote host with various [v]erbosity levels:

```
nmap -v{{1|2|3}} {{ip_or_hostname}}
```

- Run a ping sweep over an entire [s]ub[n]et or individual hosts very aggressively:

```
nmap -T5 -sn {{192.168.0.0/24|
ip_or_hostname1,ip_or_hostname2,...}}
```

- Enable OS detection, version detection, script scanning, and traceroute of hosts from a file:

```
sudo nmap -A -iL {{path/to/file.txt}}
```

- Scan a specific list of [p]orts (use `-p-` for all ports from 1 to 65535):

```
nmap -p {{port1,port2,...}} {{ip_or_host1,ip_or_host2,...}}
```

- Perform service and version detection of the top 1000 ports using default NSE scripts, writing results (`-oA`) to output files:

```
nmap -sC -sV -oA {{top-1000-ports}}
{{ip_or_host1,ip_or_host2,...}}
```

- Scan target(s) carefully using `default and safe` NSE scripts:

```
nmap --script "default and
safe" {{ip_or_host1,ip_or_host2,...}}
```

- Scan for web servers running on standard [p]orts 80 and 443 using all available `http-*` NSE scripts:

```
nmap --script "http-*" {{ip_or_host1,ip_or_host2,...}} -p
80,443
```

- Attempt evading IDS/IPS detection by using an extremely slow scan (`-T0`), [D]ecoy source addresses, [f]ragmented packets, random data and other methods:

```
sudo nmap -T0 -D {{decoy_ip1,decoy_ip2,...}} --source-port
{{53}} -f --data-length {{16}} -Pn {{ip_or_host}}
```

nmblookup

Discover SMB shares.

More information: https://www.samba.org/samba/docs/current/man-html/nmblookup.1.html.

- Find hosts in the local network with SMB shares:

```
nmblookup {{[-S|--status]}} '*'
```

- Find hosts in the local network with SMB shares run by SAMBA:

```
nmblookup {{[-S|--status]}} __SAMBA__
```

nms

Tool that recreates the famous data decryption effect seen in the 1992 movie Sneakers from **`stdin`**.

More information: https://github.com/bartobri/no-more-secrets.

- Decrypt text after a keystroke:

```
echo "{{Hello, World!}}" | nms
```

- Decrypt output immediately, without waiting for a keystroke:

```
{{ls -la}} | nms -a
```

- Decrypt the content of a file, with a custom output color:

```
cat {{path/to/file}} | nms -a -f {{blue|white|yellow|black|magenta|green|red}}
```

- Clear the screen before decrypting:

```
{{command}} | nms -a -c
```

nnn

Interactive terminal file manager and disk usage analyzer.

More information: https://github.com/jarun/nnn/wiki/Usage#program-options.

- Open the current directory (or specify one as the first argument):

```
nnn
```

- Start in [d]etailed mode:

```
nnn -d
```

- Show [H]idden files:

```
nnn -H
```

- Open an existing [b]ookmark (defined in the `$NNN_BMS` environment variable):

```
nnn -b {{bookmark_name}}
```

- Sort files on [a]pparent disk usage / [d]isk usage / [e]xtension / [r]everse / [s]ize / [t]ime / [v]ersion:

```
nnn -T {{a|d|e|r|s|t|v}}
```

- Open a file you have selected. Select the file then press `<o>`, and type a program to open the file in:

```
nnn -o
```

node

Server-side JavaScript platform (Node.js).

More information: https://nodejs.org/docs/latest/api/cli.html#options.

- Run a JavaScript file:

```
node {{path/to/file}}
```

- Start a REPL (interactive shell):

```
node
```

- Execute the specified file restarting the process when an imported file is changed (requires Node.js version 18.11+):

```
node --watch {{path/to/file}}
```

- Evaluate JavaScript code by passing it as an argument:

```
node {{[-e|--eval]}} "{{code}}"
```

- Evaluate and print the result, useful to print node's dependencies versions:

```
node {{[-p|--print]}} "process.versions"
```

- Activate inspector, pausing execution until a debugger is connected once source code is fully parsed:

```
node --no-lazy --inspect-brk {{path/to/file}}
```

nodemon

Watch files and automatically restart a node application when changes are detected.

More information: https://github.com/remy/nodemon/tree/main/doc/cli.

- Execute the specified file and watch a specific file for changes:

```
nodemon {{path/to/file.js}}
```

- Manually restart nodemon (note nodemon must already be active for this to work):

```
rs
```

- Ignore specific files:

```
nodemon {{[-i|--ignore]}} {{path/to/file_or_directory}}
```

- Pass arguments to the node application:

```
nodemon {{path/to/file.js}} {{arguments}}
```

- Pass arguments to node itself if they're not nodemon arguments already (e.g. `--inspect`):

```
nodemon {{arguments}} {{path/to/file.js}}
```

- Run an arbitrary non-node script:

```
nodemon {{[-x|--exec]}} "{{command_to_run_script}} {{options}}" {{path/to/script}}
```

- Run a Python script:

```
nodemon {{[-x|--exec]}} "python {{options}}" {{path/to/file.py}}
```

nodenv

Manage Node.js versions.

More information: https://github.com/nodenv/nodenv.

- Install a specific version of Node.js:

```
nodenv install {{version}}
```

- Display a list of available versions:

```
nodenv install --list
```

- Use a specific version of Node.js across the whole system:

```
nodenv global {{version}}
```

- Use a specific version of Node.js with a directory:

```
nodenv local {{version}}
```

- Display the Node.js version for the current directory:

```
nodenv version
```

- Display the location of a Node.js installed command (e.g. `npm`):

```
nodenv which {{command}}
```

nohup

Allows for a process to live when the terminal gets killed.

More information: https://www.gnu.org/software/coreutils/manual/html_node/nohup-invocation.html.

- Run a process that can live beyond the terminal:

```
nohup {{command}} {{argument1 argument2 ...}}
```

- Launch `nohup` in background mode:

```
nohup {{command}} {{argument1 argument2 ...}} &
```

- Run a shell script that can live beyond the terminal:

```
nohup {{path/to/script.sh}} &
```

- Run a process and write the output to a specific file:

```
nohup {{command}} {{argument1 argument2 ...}} > {{path/to/output_file}} &
```

nokogiri

An HTML, XML, SAX, and Reader parser.

More information: https://manned.org/nokogiri.

- Parse the contents of a URL or file:

```
nokogiri {{url|path/to/file}}
```

- Parse as a specific type:

```
nokogiri {{url|path/to/file}} --type {{xml|html}}
```

- Load a specific initialization file before parsing:

```
nokogiri {{url|path/to/file}} -C {{path/to/config_file}}
```

- Parse using a specific encoding:

```
nokogiri {{url|path/to/file}} {{[-E|--encoding]}}
{{encoding}}
```

- Validate using a RELAX NG file:

```
nokogiri {{url|path/to/file}} --rng {{url|path/to/file}}
```

nomad

Distributed, highly available, datacenter-aware scheduler.

More information: https://developer.hashicorp.com/nomad/commands.

- Show the status of nodes in the cluster:

```
nomad node status
```

- Validate a job file:

```
nomad job validate {{path/to/file.nomad}}
```

- Plan a job for execution on the cluster:

```
nomad job plan {{path/to/file.nomad}}
```

- Run a job on the cluster:

```
nomad job run {{path/to/file.nomad}}
```

- Show the status of jobs currently running on the cluster:

```
nomad job status
```

- Show the detailed status information about a specific job:

```
nomad job status {{job_name}}
```

- Follow the logs of a specific allocation:

```
nomad alloc logs {{alloc_id}}
```

- Show the status of storage volumes:

```
nomad volume status
```

nop

Check validity and pretty-print graphs in canonical format.

Graphviz filters: **`acyclic`**, **`bcomps`**, **`comps`**, **`edgepaint`**, **`gvcolor`**, **`gvpack`**, **`mingle`**, **`nop`**, **`sccmap`**, **`tred`**, & **`unflatten`**.

More information: https://www.graphviz.org/pdf/nop.1.pdf.

- Pretty-print one or more graphs in canonical format:

```
nop {{path/to/input1.gv path/to/input2.gv ...}} > {{path/to/output.gv}}
```

- Check one or more graphs for validity, producing no output graph:

```
nop -p {{path/to/input1.gv path/to/input2.gv ...}}
```

- Display help:

```
nop -?
```

noti

Monitor a process and trigger a banner notification.

More information: https://github.com/variadico/noti/blob/main/docs/noti.md.

- Display a notification when tar finishes compressing files:

```
noti {{tar -cjf example.tar.bz2 example/}}
```

- Display a notification even when you put it after the command to watch:

```
{{command_to_watch}}; noti
```

- Monitor a process by PID and trigger a notification when the PID disappears:

```
noti {{[-w|--pwatch]}} {{process_id}}
```

notify-send

Use the current desktop environment's notification system to create a notification.

More information: https://manned.org/notify-send.

- Show a notification with the title "Test" and the content "This is a test":

```
notify-send "{{Test}}" "{{This is a test}}"
```

- Show a notification with a custom icon:

```
notify-send {{[-i|--icon]}} {{icon.png}} "{{Test}}" "{{This is a test}}"
```

- Show a notification for 5 seconds:

```
notify-send {{[-t|--expire-time]}} 5000 "{{Test}}" "{{This is a test}}"
```

- Show a notification with the specified urgency level (default: normal):

```
notify-send {{[-u|--urgency]}} {{low|normal|critical}} "{{Test}}" "{{This is a test}}"
```

- Show a notification with an app's icon and name:

```
notify-send "{{Test}}" {{[-i|--icon]}} {{google-chrome}} {{[-a|--app-name]}} "{{Google Chrome}}"
```

notmuch

Index, search, read, and tag large collections of email messages.

More information: https://notmuchmail.org/manpages/.

- Configure for first use:

```
notmuch setup
```

- Add a tag for all messages matching a search term:

```
notmuch tag +{{custom_tag}} "{{search_term}}"
```

- Remove a tag for all messages matching a search term:

```
notmuch tag -{{custom_tag}} "{{search_term}}"
```

- Count messages matching the given search term:

```
notmuch count --output={{messages|threads}} "{{search_term}}"
```

- Search for messages matching the given search term:

```
notmuch search --format={{json|text}} --output={{summary|
threads|messages|files|tags}} "{{search_term}}"
```

- Limit the number of search results to X:

```
notmuch search --format={{json|text}} --output={{summary|
threads|messages|files|tags}} --limit={{X}} "{{search_term}}"
```

- Create a reply template for a set of messages:

```
notmuch reply --format={{default|headers-only}} --reply-
to={{sender|all}} "{{search_term}}"
```

now

Cloud platform for serverless deployment.

This command is deprecated. See **`vercel`**, the updated version of this tool.

More information: https://vercel.com/home.

- Deploy the current directory:

  ```
  now
  ```

- Display a list of deployments:

  ```
  now list
  ```

- Display information related to a deployment:

  ```
  now inspect {{deployment_url}}
  ```

- Remove a deployment:

  ```
  now remove {{deployment_id}}
  ```

- Log in into an account or create a new one:

  ```
  now login
  ```

- Initialize an example project (a new directory will be created):

  ```
  now init
  ```

nping

Network packet generation tool/ping utility.

More information: https://nmap.org/nping/.

- Ping a specified host using ICMP if the user is allowed to, otherwise using TCP:

```
nping {{example.com}}
```

- Ping a specified host using ICMP assuming that the user is allowed to do so:

```
nping --icmp --privileged {{example.com}}
```

- Ping a specified host using UDP:

```
nping --udp {{example.com}}
```

- Ping a specified host on a given port using TCP:

```
nping --tcp --dest-port {{443}} {{example.com}}
```

- Ping a certain number of times:

```
nping --count {{10}} {{example.com}}
```

- Wait a certain amount of time between each ping:

```
nping --delay {{5s}} {{example.com}}
```

- Send the request over a specified interface:

```
nping --interface {{eth0}} {{example.com}}
```

- Ping an IP range:

```
nping {{10.0.0.1-10}}
```

npm access

Set access level on published packages.

More information: https://docs.npmjs.com/cli/npm-access/.

- List packages for a user or scope:

```
npm access list packages {{user|scope|scope:team}}
{{package_name}}
```

- List collaborators on a package:

```
npm access list collaborators {{package_name}} {{username}}
```

- Get status of a package:

```
npm access get status {{package_name}}
```

- Set package status (public or private):

```
npm access set status {{public|private}} {{package_name}}
```

- Grant access to a package:

```
npm access grant {{read-only|read-write}} {{scope:team}}
{{package_name}}
```

- Revoke access to a package:

```
npm access revoke {{scope:team}} {{package_name}}
```

- Configure two-factor authentication requirement:

```
npm access set mfa {{none|publish|automation}}
{{package_name}}
```

npm adduser

Add a registry user account.

More information: https://docs.npmjs.com/cli/npm-adduser/.

- Create a new user in the specified registry and save credentials to `.npmrc`:

```
npm adduser --registry {{registry_url}}
```

- Log in to a private registry with a specific scope:

```
npm login --scope {{@organization}} --registry {{https://registry.example.com}}
```

- Log out from a specific scope and remove the auth token:

```
npm logout --scope {{@organization}}
```

- Create a scoped package during initialization:

```
npm init --scope {{@organization}} {{[-y|--yes]}}
```

npm audit

Scan project dependencies for known security vulnerabilities.

More information: https://docs.npmjs.com/cli/npm-audit/.

- Scan the project's dependencies for known vulnerabilities:

```
npm audit
```

- Automatically fix vulnerabilities in the project's dependencies:

```
npm audit fix
```

- Force an automatic fix to dependencies with vulnerabilities:

```
npm audit fix {{[-f|--force]}}
```

- Update the lock file without modifying the `node_modules` directory:

```
npm audit fix --package-lock-only
```

- Perform a dry run. Simulate the fix process without making any changes:

```
npm audit fix --dry-run
```

- Output audit results in JSON format:

```
npm audit --json
```

- Configure the audit to only fail on vulnerabilities above a specified severity:

```
npm audit --audit-level {{info|low|moderate|high|critical}}
```

npm author

This command is an alias of **`npm owner`**.

- View documentation for the original command:

  ```
  tldr npm owner
  ```

npm bugs

Report bugs for a package in a web browser.

Attempts to open the package's bug tracker URL or support email.

More information: https://docs.npmjs.com/cli/npm-bugs/.

- Report bugs for a specific package by opening the bug tracker for the specified package:

  ```
  npm bugs {{package_name}}
  ```

- Open the bug tracker for the current package by searching for a `package.json` file and using its name:

  ```
  npm bugs
  ```

- Configure the browser used to open URLs by setting your preferred browser for `npm` commands:

  ```
  npm {{[c|config]}} set browser {{browser_name}}
  ```

- Control URL opening: set `browser` to `true` for the system URL opener, or `false` to print URLs in the terminal:

  ```
  npm {{[c|config]}} set browser {{true|false}}
  ```

npm cache

Manage the npm package cache.

More information: https://docs.npmjs.com/cli/npm-cache/.

- Add a specific package to the cache:

```
npm cache add {{package_name}}
```

- Clear a specific cached item by key:

```
npm cache clean {{key}}
```

- Clear the entire npm cache:

```
npm cache clean {{[-f|--force]}}
```

- List cached packages:

```
npm cache ls
```

- List cached packages matching a specific name and version:

```
npm cache ls {{name}}@{{version}}
```

- Verify the integrity of the npm cache:

```
npm cache verify
```

- List all entries in the npx cache:

```
npm cache npx ls
```

npm-check

Check for outdated, incorrect, and unused npm package dependencies.

More information: https://github.com/dylang/npm-check.

- Display a report of outdated, incorrect, and unused dependencies:

```
npm-check
```

- Interactively update out-of-date packages:

```
npm-check {{[-u|--update]}}
```

- Update everything without prompting:

```
npm-check {{[-y|--update-all]}}
```

- Don't check for unused packages:

```
npm-check {{[-s|--skip-unused]}}
```

npm ci

Clean install of **`npm`** project dependencies for automated environments.

Installs packages based on **`package-lock.json`** or **`npm-shrinkwrap.json`**.

More information: https://docs.npmjs.com/cli/npm-ci/.

- Install project dependencies from `package-lock.json` or `npm-shrinkwrap.json`:

  ```
  npm ci
  ```

- Install project dependencies but skip the specified dependency type:

  ```
  npm ci --omit {{dev|optional|peer}}
  ```

- Install project dependencies without running any pre-/post-scripts defined in `package.json`:

  ```
  npm ci --ignore-scripts
  ```

npm completion

Enable or set up tab-completion for npm commands.

More information: https://docs.npmjs.com/cli/npm-completion/.

- Enable tab-completion for the current shell session:

```
npm completion
```

- Add completion to your shell profile (Bash):

```
npm completion >> ~/.bashrc
```

- Add completion to your shell profile (Zsh):

```
npm completion >> ~/.zshrc
```

- Write completions script to a specific file:

```
npm completion > {{path/to/file}}
```

npm config

Manage the **npm** configuration settings.

More information: https://docs.npmjs.com/cli/npm-config/.

- Show all configuration settings:

```
npm {{[c|config]}} list
```

- List all configuration settings as JSON:

```
npm {{[c|config]}} list --json
```

- Get the value of a specific configuration key:

```
npm {{[c|config]}} get {{key}}
```

- Set a configuration key to a specific value:

```
npm {{[c|config]}} set {{key}} {{value}}
```

- Delete a configuration key:

```
npm {{[c|config]}} delete {{key}}
```

- Edit the global npm configuration file in the default editor:

```
npm {{[c|config]}} edit
```

- Attempt to repair invalid configuration items:

```
npm {{[c|config]}} fix
```

npm dedupe

Reduce duplication in the **`node_modules`** directory.

More information: https://docs.npmjs.com/cli/npm-dedupe/.

- Deduplicate packages in `node_modules`:

  ```
  npm {{[ddp|dedupe]}}
  ```

- Follow `package-lock.json` or `npm-shrinkwrap.json` during deduplication:

  ```
  npm {{[ddp|dedupe]}} --lock
  ```

- Run deduplication in strict mode:

  ```
  npm {{[ddp|dedupe]}} --strict
  ```

- Skip optional/peer dependencies during deduplication:

  ```
  npm {{[ddp|dedupe]}} --omit {{optional|peer}}
  ```

- Enable detailed logging for troubleshooting:

  ```
  npm {{[ddp|dedupe]}} --loglevel verbose
  ```

- Limit deduplication to a specific package:

  ```
  npm {{[ddp|dedupe]}} {{package_name}}
  ```

npm deprecate

Mark a version or range of versions of an **npm** package as deprecated.

More information: https://docs.npmjs.com/cli/npm-deprecate/.

- Deprecate a specific version of a package:

```
npm deprecate {{package_name}}@{{version}}
"{{deprecation_message}}"
```

- Deprecate a range of versions of a package:

```
npm deprecate {{package_name}}@"<{{version_range}}"
"{{deprecation_message}}"
```

- Un-deprecate a specific version of a package:

```
npm deprecate {{package_name}}@{{version}} ""
```

npm diff

Compare package versions from the **npm** registry and show differences.

Similar to **git diff**.

More information: https://docs.npmjs.com/cli/npm-diff/.

- Compare two specific package versions:

```
npm diff --diff {{package_name}}@{{version1}} --diff
{{package_name}}@{{version2}}
```

- Compare current local packages with latest published version:

```
npm diff
```

- Compare current local package with a specific version:

```
npm diff --diff {{package_name}}@{{version}}
```

- Compare a package in the current directory with the registry version:

```
npm diff --diff {{package_name}}
```

- Show only filenames that differ:

```
npm diff --diff-name-only --diff {{package_name}}
@{{version1}} --diff {{package_name}}@{{version2}}
```

- Compare specific files or directories only:

```
npm diff {{path/to/file_or_directory}} --diff
{{package_name}}@{{version1}} --diff {{package_name}}
@{{version2}}
```

- Ignore whitespace when comparing:

```
npm diff --diff-ignore-all-space --diff {{package_name}}
@{{version1}} --diff {{package_name}}@{{version2}}
```

npm dist-tag

Manage distribution tags on packages.

More information: https://docs.npmjs.com/cli/npm-dist-tag/.

- List all distribution tags for a package:

```
npm dist-tag ls {{package_name}}
```

- List all distribution tags for the current package:

```
npm dist-tag ls
```

- Add a distribution tag to a specific package version:

```
npm dist-tag add {{package_name}}@{{version}} {{tag}}
```

- Remove a distribution tag from a package:

```
npm dist-tag rm {{package_name}} {{tag}}
```

- Add a tag using the configured tag from npm config:

```
npm dist-tag add {{package_name}}@{{version}}
```

- Add a tag with two-factor authentication:

```
npm dist-tag add {{package_name}}@{{version}} {{tag}} --otp
{{one_time_password}}
```

npm docs

Open the documentation for one or more packages in the default web browser.

More information: https://docs.npmjs.com/cli/npm-docs/.

- Open a specific package's documentation page:

```
npm docs {{package}}
```

- Open documentation for multiple packages at once:

```
npm docs {{package1 package2 ...}}
```

npm doctor

Check the health of the npm environment.

More information: https://docs.npmjs.com/cli/npm-doctor/.

- Run all default health checks for `npm`:

```
npm doctor
```

- Check the connection to the `npm` registry:

```
npm doctor connection
```

- Check the versions of Node.js and `npm` in use:

```
npm doctor versions
```

- Check for permissions issues with `npm` directories and cache:

```
npm doctor permissions
```

- Validate the cached package files and checksums:

```
npm doctor cache
```

npm edit

Select a dependency in the current project and open the package folder in the default editor (**`$EDITOR`**).

After editing, the package is rebuilt to pick up any changes in compiled packages.

More information: https://docs.npmjs.com/cli/npm-edit/.

- Edit a locally installed package in the default editor:

```
npm edit {{package_name}}
```

npm exec

Execute binaries from **`npm`** packages.

More information: https://docs.npmjs.com/cli/npm-exec/.

- Execute the command from a local or remote `npm` package:

```
npm {{[x|exec]}} {{command}} {{argument1 argument2 ...}}
```

- Specify the package explicitly (useful if multiple commands with the same name exist):

```
npm {{[x|exec]}} --package {{package}} {{command}}
```

- Run a command if it exists in the current path or in `node_modules/.bin`:

```
npm {{[x|exec]}} --no-install {{command}} {{argument1
argument2 ...}}
```

- Execute a specific command, suppressing any output from `npm` itself:

```
npm {{[x|exec]}} --quiet {{command}} {{argument1
argument2 ...}}
```

- Display help:

```
npm {{[x|exec]}} --help
```

npm explain

Explain how a package is installed, detailing its dependencies and reasons for inclusion.

More information: https://docs.npmjs.com/cli/explain/.

- Explain why a specific package is installed:

```
npm {{[why|explain]}} {{package_name}}
```

- Show explanation in JSON format:

```
npm {{[why|explain]}} {{package_name}} --json
```

- Include peer dependencies in the explanation:

```
npm {{[why|explain]}} {{package_name}} --include peer
```

- Limit explanation depth to 2 levels deep:

```
npm {{[why|explain]}} {{package_name}} --depth 2
```

npm explore

Browse an installed npm package.

More information: https://docs.npmjs.com/cli/npm-explore/.

- Browse an installed package:

```
npm explore {{package_name}}
```

- Browse a package and run a command inside it:

```
npm explore {{package_name}} -- {{command}}
```

npm find-dupes

Identify duplicate dependencies in **`node_modules`**.

More information: https://docs.npmjs.com/cli/npm-find-dupes/.

- List all duplicate packages within `node_modules`:

  `npm find-dupes`

- Include `devDependencies` in duplicate detection:

  `npm find-dupes --include dev`

- List all duplicate instances of a specific package in `node-modules`:

  `npm find-dupes {{package_name}}`

- Exclude optional dependencies from duplicate detection:

  `npm find-dupes --omit optional`

- Set the logging level for output:

  `npm find-dupes --loglevel {{silent|error|warn|info|verbose}}`

- Output duplicate information in JSON format:

  `npm find-dupes --json`

- Limit duplicate search to specific scopes:

  `npm find-dupes --scope {{@scope1,@scope2}}`

- Exclude specific scopes from duplicate detection:

  `npm find-dupes --omit-scope {{@scope1,@scope2}}`

npm fund

Retrieve funding information from packages.

More information: https://docs.npmjs.com/cli/npm-fund/.

- List dependencies with funding URL for the project in the current directory:

```
npm fund
```

- Open the funding URL for a specific package in the default web browser:

```
npm fund {{package}}
```

- List dependencies with a funding URL for a specific workspace for the project in the current directory:

```
npm fund {{[-w|--workspace]}} {{workspace}}
```

npm help-search

Search npm help documentation using a keyword.

More information: https://docs.npmjs.com/cli/npm-help-search/.

- Search for commands or topics related to a keyword:

```
npm help-search {{keyword}}
```

- Search with multiple words:

```
npm help-search {{keyword1 keyword2 ...}}
```

npm help

Display an overview of **npm** syntax, frequently used commands, and a short description of each command.

More information: https://docs.npmjs.com/cli/npm-help/.

- Display the documentation for a specific command:

```
npm help {{command}}
```

npm-home

Open the **npm** page, Yarn page, or GitHub repository of a package in the web browser.

More information: https://github.com/sindresorhus/npm-home.

- Open the npm page of a specific package in the web browser:

```
npm-home {{package}}
```

- Open the GitHub repository of a specific package in the web browser:

```
npm-home {{[-g|--github]}} {{package}}
```

- Open the Yarn page of a specific package in the web browser:

```
npm-home {{[-y|--yarn]}} {{package}}
```

npm hook

Manage **npm** registry hooks for packages.

Note: This command has been deprecated.

More information: https://docs.npmjs.com/cli/v10/hook/.

- List all active hooks:

```
npm hook ls
```

- Add a new hook for a package:

```
npm hook add {{package_name}} {{event}} {{target_url}}
```

- Remove a specific hook by its ID:

```
npm hook rm {{hook_id}}
```

- Update a hook with new information:

```
npm hook update {{hook_id}} {{target_url}}
```

npm init

Create a **`package.json`** file.

More information: https://docs.npmjs.com/cli/npm-init/.

- Initialize a new package with prompts:

  ```
  npm init
  ```

- Initialize a new package with default values:

  ```
  npm init {{[-y|--yes]}}
  ```

- Initialize a new package using a specific initializer:

  ```
  npm init {{create-react-app}} {{my-app}}
  ```

npm install-ci-test

Install project dependencies and run tests in a single command, mainly used in continuous integration (CI) environments.

Equivalent to running **`npm ci && npm test`**.

More information: https://docs.npmjs.com/cli/install-ci-test/.

- Install dependencies and run tests:

  ```
  npm {{[cit|install-ci-test]}}
  ```

- Display detailed logs during installation and testing:

  ```
  npm {{[cit|install-ci-test]}} --verbose
  ```

npm install-test

Equivalent to running **`npm install`** followed by **`npm test`**.

Note: **`it`** can be used as shorthand for **`install-test`**.

More information: https://docs.npmjs.com/cli/npm-install-test/.

- Install all dependencies and then run tests:

  ```
  npm {{[it|install-test]}}
  ```

- Install a specific package and then run tests:

  ```
  npm {{[it|install-test]}} {{package_name}}
  ```

- Install a package and save it as a dependency before running tests:

  ```
  npm {{[it|install-test]}} {{package_name}} {{[-S|--save]}}
  ```

- Install dependencies globally and then run tests:

  ```
  npm {{[it|install-test]}} {{[-g|--global]}}
  ```

npm install

Install Node packages.

More information: https://docs.npmjs.com/cli/npm-install/.

- Install dependencies listed in `package.json`:

  ```
  npm {{[i|install]}}
  ```

- Download a specific version of a package and add it to the list of dependencies in `package.json`:

  ```
  npm {{[i|install]}} {{package_name}}@{{version}}
  ```

- Download the latest version of a package and add it to the list of dev dependencies in `package.json`:

  ```
  npm {{[i|install]}} {{package_name}} {{[-D|--save-dev]}}
  ```

- Download the latest version of a package and install it globally:

  ```
  npm {{[i|install]}} {{package_name}} {{[-g|--global]}}
  ```

npm it

This command is an alias of **`npm install-test`**.

- View documentation for the original command:

  ```
  tldr npm install-test
  ```

npm link

Symlink a local package into the global **`node_modules`** or another project for development.

More information: https://docs.npmjs.com/cli/npm-link/.

- Symlink the current package globally:

  ```
  npm {{[ln|link]}}
  ```

- Link a globally linked package into another project's `node_modules`:

  ```
  npm {{[ln|link]}} {{package_name}}
  ```

- Unlink a package from the current project:

  ```
  npm {{[r|unlink]}} {{package_name}}
  ```

npm list

This command is an alias of **`npm ls`**.

- View documentation for the original command:

  ```
  tldr npm ls
  ```

npm login

Log in to a registry user account.

See also: **`npm logout`** for logging out.

More information: https://docs.npmjs.com/cli/npm-login/.

- Log in to a registry user account and save the credentials to the `.npmrc` file:

```
npm login
```

- Log in using a custom registry:

```
npm login --registry {{registry_url}}
```

- Log in using a specific authentication strategy:

```
npm login --auth-type {{legacy|web}}
```

npm logout

Log out of the registry user account.

See also: **`npm login`** for logging in.

More information: https://docs.npmjs.com/cli/npm-logout/.

- Log out of the registry user account:

```
npm logout
```

- Log out using a custom registry:

```
npm logout --registry {{registry_url}}
```

npm ls

Print installed packages to **`stdout`**.

More information: https://docs.npmjs.com/cli/npm-ls/.

- Print all versions of direct dependencies in the current project to `stdout`:

```
npm {{[ls|list]}}
```

- Print all installed packages including peer dependencies:

```
npm {{[ls|list]}} {{[-a|--all]}}
```

- Print all globally installed packages:

```
npm {{[ls|list]}} {{[-g|--global]}}
```

- Print dependencies with extended information:

```
npm {{[ls|list]}} {{[-l|--long]}}
```

- Print dependencies in parseable format:

```
npm {{[ls|list]}} {{[-p|--parseable]}}
```

- Print dependencies in JSON format:

```
npm {{[ls|list]}} --json
```

npm-name

Check whether a package or organization name is available on npm.

More information: https://github.com/sindresorhus/npm-name-cli.

- Check if a specific package name is available in the `npm` registry:

```
npm-name {{package}}
```

- Find similar package names in the `npm` registry:

```
npm-name --similar {{package}}
```

npm org

Manage organizations.

More information: https://docs.npmjs.com/cli/npm-org/.

- Add a new user to an organization:

```
npm org set {{organization_name}} {{username}}
```

- Change a user's role in an organization:

```
npm org set {{organization_name}} {{username}} {{developer|admin|owner}}
```

- Remove a user from an organization:

```
npm org rm {{organization_name}} {{username}}
```

- List all users in an organization:

```
npm org ls {{organization_name}}
```

- List all users in an organization, output in JSON format:

```
npm org ls {{organization_name}} --json
```

- Display a user's role in an organization:

```
npm org ls {{organization_name}} {{username}}
```

npm outdated

Check for outdated npm package dependencies.

More information: https://docs.npmjs.com/cli/npm-outdated/.

- Find packages that are outdated in a project:

```
npm outdated
```

- Find packages that are outdated regardless of the current project:

```
npm outdated {{[-a|--all]}}
```

npm owner

Manage ownership of published packages.

More information: https://docs.npmjs.com/cli/npm-owner/.

- Add a new user as a maintainer of a package:

```
npm owner add {{username}} {{package_name}}
```

- Remove a user from a package's owner list:

```
npm owner rm {{username}} {{package_name}}
```

- List all owners of a package:

```
npm owner ls {{package_name}}
```

npm pack

Create a tarball from a package.

More information: https://docs.npmjs.com/cli/pack/.

- Create a tarball from the current package in the current directory:

```
npm pack
```

- Create a tarball from a specific package folder:

```
npm pack {{path/to/package_directory}}
```

- Run a dry run to preview the tarball contents without creating it:

```
npm pack --dry-run
```

- Create a tarball without running lifecycle scripts:

```
npm pack --ignore-scripts
```

- Specify a custom registry to fetch package metadata from:

```
npm pack --registry {{https://registry.npmjs.org/}}
```

npm ping

Ping **`npm`** registry.

More information: https://docs.npmjs.com/cli/npm-ping/.

- Ping the default `npm` registry:

  ```
  npm ping
  ```

- Ping custom `npm` registry:

  ```
  npm ping --registry {{custom_registry_url}}
  ```

npm pkg

Show or modify **`package.json`** properties.

More information: https://docs.npmjs.com/cli/npm-pkg/.

- Get the value of a specific property:

```
npm pkg get {{name}}
```

- Get multiple properties at once:

```
npm pkg get {{name|version|...}}
```

- Get multiple values across all workspaces:

```
npm pkg get {{name}} {{version}} {{[--ws|--workspaces]}}
```

- Get a nested or array property value:

```
npm pkg get {{contributors[0].email}}
```

- Set a property to a specific value:

```
npm pkg set {{property}}={{value}}
```

- Set multiple properties at once:

```
npm pkg set {{property1}}={{value1}} {{property2}}={{value2}}
```

- Delete a property from `package.json`:

```
npm pkg delete {{scripts.build}}
```

- Auto-fix common errors in `package.json`:

```
npm pkg fix
```

npm prefix

Print the local or global prefix to **`stdout`**.

More information: https://docs.npmjs.com/cli/npm-prefix/.

- Print the local prefix:

```
npm prefix
```

- Print the global prefix:

```
npm prefix {{[-g|--global]}}
```

npm profile

Manage the npm profile and related settings.

Note: This command is unaware of workspaces.

More information: https://docs.npmjs.com/cli/npm-profile/.

- View the npm profile details:

  ```
  npm profile get
  ```

- View a specific property of the profile:

  ```
  npm profile get {{property}}
  ```

- Set or update a profile property:

  ```
  npm profile set {{property}} {{value}}
  ```

- Set the public email address:

  ```
  npm profile set email {{email}}
  ```

- Set the public name:

  ```
  npm profile set fullname {{name}}
  ```

- Set a new password interactively:

  ```
  npm profile set password
  ```

- Enable two-factor authentication (2FA) (defaults to `auth-and-writes`):

  ```
  npm profile enable-2fa {{auth-only|auth-and-writes}}
  ```

- Disable two-factor authentication (2FA):

  ```
  npm profile disable-2fa
  ```

npm prune

Remove extraneous packages from **`node_modules`**.

Note: Extraneous packages are those present in the node_modules folder that are not listed as any package's dependency list.

More information: https://docs.npmjs.com/cli/npm-prune/.

- Remove all extraneous packages not listed in dependencies:

  ```
  npm prune
  ```

- Remove extraneous packages and devDependencies (useful for production builds):

  ```
  npm prune --production
  ```

- Show what would be removed without making any changes:

  ```
  npm prune --dry-run
  ```

- Output the changes as JSON:

  ```
  npm prune --json
  ```

- Remove specific packages by name:

  ```
  npm prune {{package_name}}
  ```

npm publish

Publish a package to the npm registry.

More information: https://docs.npmjs.com/cli/publish/.

- Publish the current package to the default npm registry:

```
npm publish
```

- Publish a package from a specific directory:

```
npm publish {{path/to/package_directory}}
```

- Publish a scoped package with public access:

```
npm publish --access public
```

- Publish a scoped package with restricted (private) access:

```
npm publish --access restricted
```

- Publish a package to a custom registry:

```
npm publish --registry {{https://registry.npmjs.org/}}
```

- Run a dry run to see what would be published without uploading:

```
npm publish --dry-run
```

- Publish a package with a specific distribution tag (e.g., beta):

```
npm publish --tag {{beta}}
```

- Publish with a one-time password for 2FA-enabled accounts:

```
npm publish --otp {{one_time_password}}
```

npm query

Print an array of dependency objects using CSS-like selectors.

More information: https://docs.npmjs.com/cli/npm-query/.

- Print direct dependencies:

```
npm query ':root > *'
```

- Print all direct production/development dependencies:

```
npm query ':root > .{{prod|dev}}'
```

- Print dependencies with a specific name:

```
npm query '#{{package}}'
```

- Print dependencies with a specific name and within a semantic versioning range:

```
npm query '#{{package}}@{{semantic_version}}'
```

- Print dependencies which have no dependencies:

```
npm query ':empty'
```

- Find all dependencies with postinstall scripts and uninstall them:

```
npm query ":attr(scripts, [postinstall])" | jq 'map(.name) |
join("\n")' {{[-r|--raw-output]}} | xargs -I _ npm uninstall
_
```

- Find all Git dependencies and print which application requires them:

```
npm query ":type(git)" | jq 'map(.name)' | xargs -I _ npm why
_
```

npm-rb

This command is an alias of **`npm-rebuild`**.

- View documentation for the original command:

  ```
  tldr npm-rebuild
  ```

npm rebuild

Rebuild native Node.js packages after Node or dependency changes.

More information: https://docs.npmjs.com/cli/npm-rebuild/.

- Rebuild a specific package:

  ```
  npm {{[rb|rebuild]}} {{package}}
  ```

- Rebuild all installed packages:

  ```
  npm {{[rb|rebuild]}}
  ```

- Rebuild with verbose output:

  ```
  npm {{[rb|rebuild]}} --verbose
  ```

- Rebuild a package in a specific directory:

  ```
  npm {{[rb|rebuild]}} --prefix {{path/to/dir}} {{package}}
  ```

- Rebuild without using the npm cache:

  ```
  npm {{[rb|rebuild]}} --no-cache
  ```

- Rebuild in global mode:

  ```
  npm {{[rb|rebuild]}} {{[-g|--global]}}
  ```

npm repo

Open the repository page of a package in the browser.

More information: https://docs.npmjs.com/cli/npm-repo/.

- Open the repository page of the current project (based on `package.json`):

  ```
  npm repo
  ```

- Open the repository page of a specific package from the registry:

  ```
  npm repo {{package_name}}
  ```

- Open repository pages for multiple packages:

  ```
  npm repo {{package_name1 package_name2 ...}}
  ```

- Print the repository URL instead of opening it in the browser:

  ```
  npm repo --browser false
  ```

- Open the repository page for a package in a specific browser:

  ```
  npm repo --browser {{browser_name}}
  ```

- Open the repository page of a package in a specific workspace:

  ```
  npm repo --workspace {{workspace_name}}
  ```

npm restart

This command is an alias of **`npm run restart`**.

- View documentation for the original command:

  ```
  tldr npm run
  ```

npm root

Display path to **`node_modules`** directory.

More information: https://docs.npmjs.com/cli/npm-root/.

- Display path to the local `node_modules` directory:

```
npm root
```

- Display path to the global `node_modules` directory:

```
npm root {{[-g|--global]}}
```

npm run-script

This command is an alias of **`npm run`**.

- View documentation for the original command:

```
tldr npm run
```

npm run

Run a script.

More information: https://docs.npmjs.com/cli/npm-run/.

- List available scripts:

  ```
  npm run
  ```

- Run a script:

  ```
  npm run {{script_name}}
  ```

- Pass arguments to a script:

  ```
  npm run {{script_name}} -- {{argument}} {{--option}}
  ```

- Run a script named `start`:

  ```
  npm start
  ```

- Run a script named `stop`:

  ```
  npm stop
  ```

- Run a script named `restart`:

  ```
  npm restart
  ```

- Run a script named `test`:

  ```
  npm {{[t|test]}}
  ```

npm sbom

Generate a Software Bill of Materials (SBOM) for your Node.js project.

More information: https://docs.npmjs.com/cli/npm-sbom/.

- Output a list of all dependencies in your project:

```
npm sbom
```

- Exclude both `dev` and `optional` dependencies:

```
npm sbom --omit dev --omit optional
```

- Generate an SBOM based only on the `package-lock.json`:

```
npm sbom --package-lock-only
```

npm search

Search for packages in the **npm** registry.

More information: https://docs.npmjs.com/cli/npm-search/.

- Search for a package by name:

```
npm {{[s|search]}} {{package}}
```

- Search for packages by a specific keyword:

```
npm {{[s|search]}} {{keyword}}
```

- Search for packages, including detailed information (e.g., description, author, version):

```
npm {{[s|search]}} {{package}} --long
```

- Search for packages maintained by a specific author:

```
npm {{[s|search]}} --author {{author}}
```

- Search for packages with a specific organization:

```
npm {{[s|search]}} --scope {{organization}}
```

- Search for packages with a specific combination of terms:

```
npm {{[s|search]}} {{term1 term2 ...}}
```

npm shrinkwrap

Lock down the dependencies of a package, creating a **`npm-shrinkwrap.json`** file.

Similar to **`package-lock.json`** but intended for published packages.

More information: https://docs.npmjs.com/cli/shrinkwrap/.

- Generate a `npm-shrinkwrap.json` file from the current `package-lock.json`:

  ```
  npm shrinkwrap
  ```

- Run in production mode (excludes devDependencies):

  ```
  npm shrinkwrap --production
  ```

- Force recreate the shrinkwrap file even if it already exists:

  ```
  npm shrinkwrap --force
  ```

npm star

Mark a package as favorite.

More information: https://docs.npmjs.com/cli/npm-star/.

- Star a public package from the default registry:

```
npm star {{package_name}}
```

- Star a package within a specific scope:

```
npm star @{{scope}}/{{package_name}}
```

- Star a package from a specific registry:

```
npm star {{package_name}} --registry {{registry_url}}
```

- Star a private package that requires authentication:

```
npm star {{package_name}} --auth-type {{legacy|oauth|web|saml}}
```

- Star a package by providing an OTP for two-factor authentication:

```
npm star {{package_name}} --otp {{otp}}
```

- Star a package with detailed logging:

```
npm star {{package_name}} --loglevel verbose
```

- List all your starred packages:

```
npm star --list
```

- List your starred packages from a specific registry:

```
npm star --list --registry {{registry_url}}
```

npm stars

View packages marked as favorites.

More information: https://docs.npmjs.com/cli/npm-stars/.

- Show all starred packages by the currently logged-in user:

```
npm stars
```

- Show your starred packages from a specific registry:

```
npm stars --registry {{registry_url}}
```

- Show packages starred by a specific user:

```
npm stars {{username}}
```

- Show packages starred by a specific user from a specific registry:

```
npm stars {{username}} --registry {{registry_url}}
```

- Display help:

```
npm stars {{[-h|--help]}}
```

npm start

This command is an alias of **`npm run start`**.

- View documentation for the original command:

```
tldr npm run
```

npm stop

This command is an alias of **`npm run stop`**.

- View documentation for the original command:

  ```
  tldr npm run
  ```

npm team

Manage teams in an organization on the **npm** registry.

More information: https://docs.npmjs.com/cli/npm-team/.

- Add a user to a team in an organization:

  ```
  npm team add {{organization:team}} {{username}}
  ```

- Remove a user from a team:

  ```
  npm team rm {{organization:team}} {{username}}
  ```

- Create a new team in an organization:

  ```
  npm team create {{organization:team}}
  ```

- Delete a team from an organization:

  ```
  npm team destroy {{organization:team}}
  ```

- List all teams in an organization:

  ```
  npm team ls {{organization}}
  ```

- List all users in a specific team:

  ```
  npm team ls {{organization:team}}
  ```

npm test

This command is an alias of **`npm run test`**.

- View documentation for the original command:

```
tldr npm run
```

npm token

Manage and generate authentication tokens for the npm registry.

More information: https://docs.npmjs.com/cli/npm-token/.

- Create a new authentication token:

  ```
  npm token create
  ```

- List all tokens associated with an account:

  ```
  npm token list
  ```

- Delete a specific token using its token ID:

  ```
  npm token revoke {{token_id}}
  ```

- Create a token with read-only access:

  ```
  npm token create --read-only
  ```

- Create a token with publish access:

  ```
  npm token create --publish
  ```

- Automatically configure an npm token in your global `.npmrc` file when you log in:

  ```
  npm login
  ```

- Remove a token from the global configuration:

  ```
  npm token revoke {{token_id}}
  ```

npm uninstall

Remove a package.

More information: https://docs.npmjs.com/cli/npm-uninstall/.

- Remove a package from the current project:

```
npm {{[r|uninstall]}} {{package_name}}
```

- Remove a package globally:

```
npm {{[r|uninstall]}} {{package_name}} {{[-g|--global]}}
```

- Remove multiple packages at once:

```
npm {{[r|uninstall]}} {{package_name1 package_name2 ...}}
```

npm unpublish

Remove a package from the npm registry.

More information: https://docs.npmjs.com/cli/npm-unpublish/.

- Unpublish a specific package version:

```
npm unpublish {{package_name}}@{{version}}
```

- Unpublish the entire package:

```
npm unpublish {{package_name}} {{[-f|--force]}}
```

- Unpublish a package that is scoped:

```
npm unpublish @{{scope}}/{{package_name}}
```

- Specify a timeout period before unpublishing:

```
npm unpublish {{package_name}} --timeout
{{time_in_milliseconds}}
```

- Dry run to see what would be unpublished without actually doing it:

```
npm unpublish {{package_name}} --dry-run
```

npm unstar

Remove the favorite/star mark from a package.

More information: https://docs.npmjs.com/cli/npm-unstar/.

- Unstar a public package from the default registry:

```
npm unstar {{package_name}}
```

- Unstar a package within a specific scope:

```
npm unstar @{{scope}}/{{package_name}}
```

- Unstar a package from a specific registry:

```
npm unstar {{package_name}} --registry {{registry_url}}
```

- Unstar a private package that requires authentication:

```
npm unstar {{package_name}} --auth-type {{legacy|oauth|web|
saml}}
```

- Unstar a package by providing an OTP for two-factor authentication:

```
npm unstar {{package_name}} --otp {{otp}}
```

- Unstar a package with a specific logging level:

```
npm unstar {{package_name}} --loglevel {{silent|error|warn|
notice|http|timing|info|verbose|silly}}
```

npm update

Update packages in the current project.

More information: https://docs.npmjs.com/cli/npm-update/.

- Update all packages in the current project:

```
npm {{[up|update]}}
```

- Update a specific package in the current project:

```
npm {{[up|update]}} {{package}}
```

- Update a package globally:

```
npm {{[up|update]}} {{package}} {{[-g|--global]}}
```

- Update multiple packages at once:

```
npm {{[up|update]}} {{package1 package2 ...}}
```

npm version

Bump a node package version.

More information: https://docs.npmjs.com/cli/npm-version/.

- Display version:

```
npm version
```

- Bump the minor version:

```
npm version minor
```

- Set a specific version:

```
npm version {{version}}
```

- Bump the patch version without creating a Git tag:

```
npm version patch --no-git-tag-version
```

- Bump the major version with a custom commit message:

```
npm version major {{[-m|--message]}} "{{Upgrade to %s for reasons}}"
```

npm view

View registry information about a package.

More information: https://docs.npmjs.com/cli/npm-view/.

- View information about the latest version of a package:

```
npm {{[v|view]}} {{package}}
```

- View information about a specific version of a package:

```
npm {{[v|view]}} {{package}}@{{version}}
```

- View all available versions of a package:

```
npm {{[v|view]}} {{package}} versions
```

- View the description of a package:

```
npm {{[v|view]}} {{package}} description
```

- View the dependencies of the latest version of a package:

```
npm {{[v|view]}} {{package}} dependencies
```

- View the repository URL of a package:

```
npm {{[v|view]}} {{package}} repository
```

- View the maintainers of a package:

```
npm {{[v|view]}} {{package}} maintainers
```

npm whoami

Display npm username.

More information: https://docs.npmjs.com/cli/whoami/.

- Display username of the currently logged-in user:

```
npm whoami
```

- Display username of the current user in the specific registry:

```
npm whoami --registry {{registry_url}}
```

npm-why

Identifies why an npm package is installed.

More information: https://github.com/amio/npm-why.

- Show why an `npm` package is installed:

```
npm-why {{package}}
```

npm

JavaScript and Node.js package manager.

Manage Node.js projects and their module dependencies.

More information: https://docs.npmjs.com/cli/npm/.

- Create a `package.json` file with default values (omit `--yes` to do it interactively):

```
npm init {{[-y|--yes]}}
```

- Download all the packages listed as dependencies in `package.json`:

```
npm {{[i|install]}}
```

- Download a specific version of a package and add it to the list of dependencies in `package.json`:

```
npm {{[i|install]}} {{package_name}}@{{version}}
```

- Download the latest version of a package and add it to the list of dev dependencies in `package.json`:

```
npm {{[i|install]}} {{package_name}} {{[-D|--save-dev]}}
```

- Download the latest version of a package and install it globally:

```
npm {{[i|install]}} {{package_name}} {{[-g|--global]}}
```

- Uninstall a package and remove it from the list of dependencies in `package.json`:

```
npm {{[r|uninstall]}} {{package_name}}
```

- List all locally installed dependencies:

```
npm {{[ls|list]}}
```

- List all top-level globally installed packages:

```
npm {{[ls|list]}} {{[-g|--global]}} --depth {{0}}
```

nproc

Print the number of processing units (normally CPUs) available.

More information: https://www.gnu.org/software/coreutils/manual/html_node/nproc-invocation.html.

- Display the number of available processing units:

```
nproc
```

- Display the number of installed processing units, including any inactive ones:

```
nproc --all
```

- If possible, subtract a given number of units from the returned value:

```
nproc --ignore {{count}}
```

npx

This command is an alias of **`npm exec`**.

- View documentation for the original command:

```
tldr npm exec
```

nrm

npm registry manager.

Helps to easily switch between different npm registries.

More information: https://github.com/Pana/nrm#usage.

- List all registries:

```
nrm ls
```

- Change to a particular registry:

```
nrm use {{registry}}
```

- Show the response time for all registries:

```
nrm test
```

- Add a custom registry:

```
nrm add {{registry}} {{url}}
```

- Delete a registry:

```
nrm del {{registry}}
```

nslookup

Query name servers for various domain records.

More information: https://manned.org/nslookup.

- Query your system's default name server for an IP address (A record) of the domain:

```
nslookup {{example.com}}
```

- Query a given name server for a NS record of the domain:

```
nslookup -type=NS {{example.com}} {{8.8.8.8}}
```

- Query for a reverse lookup (PTR record) of an IP address:

```
nslookup -type=PTR {{54.240.162.118}}
```

- Query for ANY available records using TCP protocol:

```
nslookup -vc -type=ANY {{example.com}}
```

- Query a given name server for the whole zone file (zone transfer) of the domain using TCP protocol:

```
nslookup -vc -type=AXFR {{example.com}} {{name_server}}
```

- Query for a mail server (MX record) of the domain, showing details of the transaction:

```
nslookup -type=MX -debug {{example.com}}
```

- Query a given name server on a specific port number for a TXT record of the domain:

```
nslookup -port={{port_number}} -type=TXT {{example.com}}
{{name_server}}
```

ntfs-read.py

A read-only NTFS explorer for accessing and extracting files from NTFS volumes.

Part of the Impacket suite.

More information: https://github.com/fortra/impacket.

- Open an NTFS volume for exploration (e.g., `C:\.\\` or `/dev/disk1s1`):

```
ntfs-read.py {{volume}}
```

- Extract a specific file from an NTFS volume (e.g., `\windows\system32\config\sam`):

```
ntfs-read.py -extract {{\windows\system32\config\sam}} {{volume}}
```

- Enable debug output:

```
ntfs-read.py -debug {{volume}}
```

- Display help:

```
ntfs-read.py --help
```

ntfy

Send and receive HTTP POST notifications.

More information: https://github.com/binwiederhier/ntfy.

- Send a message to the `security` topic:

```
ntfy pub security "{{Front door has been opened.}}"
```

- Send with a title, priority, and tags:

```
ntfy publish --title="{{Someone bought your item}}" --
priority={{high}} --tags={{duck}} {{ebay}} "{{Someone just
bought your item: Platypus Sculpture}}"
```

- Send at 8:30am:

```
ntfy pub --at=8:30am {{delayed_topic}} "{{Time for school,
sleepyhead...}}"
```

- Trigger a webhook:

```
ntfy trigger {{my_webhook}}
```

- Subscribe to a topic (`<Ctrl c>` to stop listening):

```
ntfy sub {{home_automation}}
```

- Display help:

```
ntfy --help
```

ntfyme

A notification tool to track and notify you about your long-running termination process.

Send notifications with success/error messages with Gmail, Telegram, and more.

More information: https://github.com/AnirudhG07/ntfyme.

- Directly run your command:

```
ntfyme exec {{[-c|--cmd]}} {{command}}
```

- Pipe your command and run:

```
echo {{command}} | ntfyme exec
```

- Run multiple commands by enclosing them in quotes:

```
echo "{{command1; command2; command3}}" | ntfyme exec
```

- Track and terminate the process after prolonged suspension:

```
ntfyme exec {{[-t|--track-process]}} {{[-c|--cmd]}}
{{command}}
```

- Setup the tool configurations interactively:

```
ntfyme setup
```

- Encrypt your password:

```
ntfyme enc
```

- See the log history:

```
ntfyme log
```

- Open and edit the configuration file:

```
ntfyme config
```

nth

Name That Hash - Instantly name the type of any hash.

More information: https://github.com/bee-san/Name-That-Hash.

- Name a hash:

```
nth {{[-t|--text]}} {{5f4dcc3b5aa765d61d8327deb882cf99}}
```

- Name hashes in a file:

```
nth {{[-f|--file]}} {{path/to/hashes}}
```

- Print in JSON format:

```
nth {{[-t|--text]}} {{5f4dcc3b5aa765d61d8327deb882cf99}} {{[-g|--greppable]}}
```

- Decode hash in Base64 before naming it:

```
nth {{[-t|--text]}} {{NWY0ZGNjM2I1YWE3NjVkNjFkODMyN2RlYjg4MmNmOTkK}} {{[-b64|--base64]}}
```

ntl

This command is an alias of **`netlify`**.

- View documentation for the original command:

```
tldr netlify
```

ntp-ctl

Management client for the **`ntpd-rs`** daemon.

More information: https://docs.ntpd-rs.pendulum-project.org/man/ntp-ctl.8/.

- Display information about the current state of the NTP daemon:

```
ntp-ctl status
```

- Check if the specified configuration file (default: `/etc/ntpd-rs/ntp.toml`) is valid:

```
ntp-ctl {{[-c|--config]}} {{path/to/config}} validate
```

- Interactively run a single synchronization of the clock:

```
sudo ntp-ctl force-sync
```

ntpctl

Display information about the running instance of OpenNTPD.

More information: https://man.openbsd.org/ntpctl.

- Show all data:

```
ntpctl -s {{[a|all]}}
```

- Show information about each peer:

```
ntpctl -s {{[p|peers]}}
```

- Show the status of peers and sensors, and whether the system clock is synced:

```
ntpctl -s {{[s|status]}}
```

- Show information about each sensor:

```
ntpctl -s {{[S|Sensors]}}
```

nu

Nushell ("a new type of shell") takes a modern, structured approach to your command-line.

See also: **`elvish`**.

More information: https://www.nushell.sh/book/configuration.html#flag-behavior.

- Start an interactive shell session:

```
nu
```

- Execute specific commands:

```
nu {{[-c|--commands]}} "{{echo 'nu is executed'}}"
```

- Execute a specific script:

```
nu {{path/to/script.nu}}
```

- Execute a specific script with logging:

```
nu --log-level {{error|warn|info|debug|trace}} {{path/to/
script.nu}}
```

nuclei

Fast and customizable vulnerability scanner using a simple YAML-based DSL.

More information: https://docs.projectdiscovery.io/opensource/nuclei/running.

- Update `nuclei` templates to the latest released version (downloaded to `~/nuclei-templates` on macOS/Linux or `%USERPROFILE%\nuclei-templates` on Windows):

```
nuclei {{[-ut|-update-templates]}}
```

- [l]ist all [t]emplates by specific [p]rotocol [t]ype:

```
nuclei -tl {{[-pt|-type]}} {{dns|file|http|headless|tcp|workflow|ssl|websocket|whois|code|javascript}}
```

- Run an automatic web scan using Wappalyzer technology detection for a specific target [u]RL/host:

```
nuclei {{[-as|-automatic-scan]}} {{[-u|-target]}} {{example.com}}
```

- Run HTTP [p]rotocol [t]ype templates of specific severity, exporting results to markdown files inside a specific directory:

```
nuclei {{[-s|-severity]}} {{high,critical,...}} {{[-pt|-type]}} http {{[-u|-target]}} {{https://example.com}} {{[-me|-markdown-export]}} {{path/to/directory}}
```

- Run all templates with a custom rate limit, maximum bulk size, and silent output (only findings shown):

```
nuclei {{[-rl|-rate-limit]}} {{150}} {{[-bs|-bulk-size]}} {{25}} {{[-c|-concurrency]}} {{25}} -silent {{[-u|-target]}} {{https://example.com}}
```

- Run a specific nuclei-bundled workflow against a target:

```
nuclei {{[-w|-workflows]}} {{workflows/wordpress-workflow.yaml}} {{[-u|-target]}} {{https://example.com}}
```

- Run one or more specific templates or directory with templates with verbose output in `stderr` and output detected issues/vulnerabilities to a file:

```
nuclei {{[-t|-templates]}} {{path/to/nuclei-templates/http}}
{{[-u|-target]}} {{https://example.com}} {{[-v|-verbose]}}
{{[-o|-output]}} {{path/to/results}}
```

- Use an AI prompt to dynamically generate a template to scan a target (projectdiscovery cloud pdcp API key needs to be configured using `nuclei -auth`):

```
nuclei {{[-u|-target]}} {{https://example.com}} {{[-ai|-
prompt]}} "{{find admin login endpoints}}"
```

nudoku

Sudoku game in terminal.

More information: https://jubalh.github.io/nudoku/.

- Start a sudoku game:

  ```
  nudoku
  ```

- Choose the difficulty of the game:

  ```
  nudoku -d {{easy|normal|hard}}
  ```

- Navigate the board:

  ```
  {{<h>|<j>|<k>|<l>|<ArrowKeys>}}
  ```

- Delete a number:

  ```
  {{<Backspace>|<x>}}
  ```

- Get a hint:

  ```
  <H>
  ```

- See the complete solution:

  ```
  <S>
  ```

- Create a new puzzle:

  ```
  <N>
  ```

- Quit the game:

  ```
  <Q>
  ```

numfmt

Convert numbers to and from human-readable strings.

More information: https://www.gnu.org/software/coreutils/manual/html_node/numfmt-invocation.html.

- Convert 1.5K (SI Units) to 1500:

```
numfmt --from si 1.5K
```

- Convert 1500 to 1.5K (SI Units):

```
numfmt --to si 1500
```

- Convert 1.5K (IEC Units) to 1536:

```
numfmt --from iec 1.5K
```

- Use appropriate conversion based on the suffix:

```
numfmt --from auto {{1.5Ki}}
```

- Convert 5th field (1-indexed) to IEC Units without converting header:

```
ls -l | numfmt --header=1 --field 5 --to iec
```

- Convert to IEC units, pad with 5 characters, left aligned:

```
du {{[-s|--summarize]}} * | numfmt --to iec --format "%-5f"
```

nvcc

The NVIDIA CUDA Compiler Driver.

More information: https://docs.nvidia.com/cuda/cuda-compiler-driver-nvcc/.

- Compile a CUDA program:

```
nvcc {{path/to/source.cu}} {{[-o|--output-file]}} {{path/to/executable}}
```

- Generate debug information:

```
nvcc {{path/to/source.cu}} {{[-o|--output-file]}} {{path/to/executable}} {{[-g|--debug]}} {{[-G|--device-debug]}}
```

- Include libraries from a different path:

```
nvcc {{path/to/source.cu}} {{[-o|--output-file]}} {{path/to/executable}} {{[-I|--include-path]}} {{path/to/includes}} {{[-L|--library-path]}} {{path/to/library}} {{[-l|--library]}} {{library_name}}
```

- Specify the compute capability for a specific GPU architecture:

```
nvcc {{path/to/source.cu}} {{[-o|--output-file]}} {{path/to/executable}} {{[-gencode|--generate-code]}} arch={{arch_name}},code={{gpu_code_name}}
```

nvidia-smi mig

Manage Nvidia multi-instance GPUs.

More information: https://docs.nvidia.com/datacenter/tesla/mig-user-guide/index.html.

- Create a compute instance from device 0:

```
nvidia-smi mig {{[-cgi|--create-gpu-instance]}} {{0}} {{[-C|--default-compute-instance]}}
```

- List GPU instances:

```
nvidia-smi mig {{[-lgi|--list-gpu-instances]}}
```

- Display help:

```
nvidia-smi mig {{[-h|--help]}}
```

nvidia-smi

Aid the management and monitoring of NVIDIA GPU devices.

More information: https://developer.nvidia.com/system-management-interface.

- Display information on all available GPUs and processes using them:

```
nvidia-smi
```

- Display more detailed GPU information:

```
nvidia-smi {{[-q|--query]}}
```

- Monitor overall GPU usage with 1-second update interval:

```
nvidia-smi dmon
```

nvim

Neovim, a programmer's text editor based on Vim, provides several modes for different kinds of text manipulation.

Pressing **`<i>`** in normal mode enters insert mode. **`<Esc>`** or **`<Ctrl c>`** goes back to normal mode, which doesn't allow regular text insertion.

See also: **`vim`**, **`vimtutor`**, **`vimdiff`**.

More information: https://neovim.io/.

- Open a file:

  `nvim {{path/to/file}}`

- Enter text editing mode (insert mode):

  `<Esc><i>`

- Copy ("yank") or cut ("delete") the current line (paste it with `<p>`):

  `<Esc>{{<y><y>|<d><d>}}`

- Enter normal mode and undo the last operation:

  `<Esc><u>`

- Search for a pattern in the file (press `<n>`/`<N>` to go to next/previous match):

  `<Esc></>{{search_pattern}}<Enter>`

- Perform a `regex` substitution in the whole file:

  `<Esc><:>%s/{{regex}}/{{replacement}}/g<Enter>`

- Enter normal mode and save (write) the file, and quit:

  `{{<Esc><Z><Z>|<Esc><:>x<Enter>|<Esc><:>wq<Enter>}}`

- Quit without saving:

  `<Esc><:>q!<Enter>`

nvm

Install, uninstall, or switch between Node.js versions under the fish shell.

Supports version numbers like "12.8" or "v16.13.1", and labels like "stable", "system", etc.

More information: https://github.com/jorgebucaran/nvm.fish.

- Install a specific version of Node.js:

```
nvm install {{node_version}}
```

- Use a specific version of Node.js in the current shell:

```
nvm use {{node_version}}
```

- Set the default Node.js version:

```
set nvm_default_version {{node_version}}
```

- List all available Node.js versions and highlight the default one:

```
nvm list
```

- Uninstall a given Node.js version:

```
nvm uninstall {{node_version}}
```

nvm

Install, uninstall, or switch between Node.js versions.

Supports version numbers like "12.8" or "v16.13.1", and labels like "stable", "system", etc.

See also: **`asdf`**.

More information: https://github.com/nvm-sh/nvm#usage.

- Install a specific version of Node.js:

```
nvm install {{node_version}}
```

- Use a specific version of Node.js in the current shell:

```
nvm use {{node_version}}
```

- Set the default Node.js version:

```
nvm alias default {{node_version}}
```

- List all available Node.js versions and highlight the default one:

```
nvm list
```

- Uninstall a given Node.js version:

```
nvm uninstall {{node_version}}
```

- Launch the REPL of a specific version of Node.js:

```
nvm run {{node_version}} --version
```

- Execute a script in a specific version of Node.js:

```
nvm exec {{node_version}} node {{app.js}}
```

nvme

NVMe storage user space utility.

More information: https://manned.org/nvme.

- List all NVMe devices:

```
sudo nvme list
```

- Show device information:

```
sudo nvme smart-log {{device}}
```

- Secure erase user data on NVMe device:

```
sudo nvme format {{[-s|--ses]}} 1 {{[-r|--reset]}} {{device}}
```

nx

Manage **nx** workspaces.

More information: https://nx.dev/docs/reference/nx-commands.

- Build a specific project:

```
nx build {{project}}
```

- Test a specific project:

```
nx test {{project}}
```

- Execute a target on a specific project:

```
nx run {{project}}:{{target}}
```

- Execute a target on multiple projects:

```
nx run-many --target {{target}} --projects {{project1}},
{{project2}}
```

- Execute a target on all projects in the workspace:

```
nx run-many --target {{target}} --all
```

- Execute a target only on projects that have been changed:

```
nx affected --target {{target}}
```

nxc ftp

Pentest and exploit FTP servers.

More information: https://www.netexec.wiki/ftp-protocol/password-spraying.

- Search for valid credentials by trying out every combination in the specified lists of usernames and passwords:

```
nxc ftp {{192.168.178.2}} {{[-u|--username]}} {{path/to/
usernames.txt}} {{[-p|--password]}} {{path/to/passwords.txt}}
```

- Continue searching for valid credentials even after valid credentials have been found:

```
nxc ftp {{192.168.178.2}} {{[-u|--username]}} {{path/to/
usernames.txt}} {{[-p|--password]}} {{path/to/passwords.txt}}
--continue-on-success
```

- Perform directory listings on each FTP server the supplied credentials are valid on:

```
nxc ftp {{192.168.178.0/24}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} --ls
```

- Download the specified file from the target server:

```
nxc ftp {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} --get {{path/to/file}}
```

- Upload the specified file to the target server at the specified location:

```
nxc ftp {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} --put {{path/to/local_file}}
{{path/to/remote_location}}
```

nxc ldap

Pentest and exploit Windows Active Directory Domains via LDAP.

More information: https://www.netexec.wiki/ldap-protocol/authentication.

- Search for valid domain credentials by trying out every combination in the specified lists of usernames and passwords:

```
nxc ldap {{192.168.178.2}} {{[-u|--username]}} {{path/to/
usernames.txt}} {{[-p|--password]}} {{path/to/passwords.txt}}
```

- Enumerate active domain users:

```
nxc ldap {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} --active-users
```

- Collect data about the targeted domain and automatically import these data into BloodHound:

```
nxc ldap {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} --bloodhound {{[-c|--
collection]}} {{All}}
```

- Attempt to collect AS_REP messages for the specified user in order to perform an ASREPRoasting attack:

```
nxc ldap {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} '' --asreproast {{path/to/output.txt}}
```

- Attempt to extract the passwords of group managed service accounts on the domain:

```
nxc ldap {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} --gmsa
```

nxc mssql

Pentest and exploit Microsoft SQL servers.

More information: https://www.netexec.wiki/mssql-protocol/mssql-passwordspray.

- Search for valid credentials by trying out every combination in the specified lists of usernames and passwords:

```
nxc mssql {{192.168.178.2}} {{[-u|--username]}} {{path/to/
usernames.txt}} {{[-p|--password]}} {{path/to/passwords.txt}}
```

- Execute the specified SQL query on the target server:

```
nxc mssql {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} {{[-q|--query]}} '{{SELECT *
FROM sys.databases;}}'
```

- Execute the specified shell command on the target server through MSSQL:

```
nxc mssql {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} -x {{whoami}}
```

- Execute the specified PowerShell command on the target server through MSSQL without retrieving output:

```
nxc mssql {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} -X {{whoami}} --no-output
```

- Download a remote file from the target server and store it in the specified location:

```
nxc mssql {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} --get-file {{C:
\path\to\remote_file}} {{path/to/local_file}}
```

- Upload a local file to the specified location on the target server:

```
nxc mssql {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} --put-file {{path/to/
local_file}} {{C:\path\to\remote_file}}
```

nxc nfs

Pentest and exploit NFS servers. Currently supports anonymous mode only.

More information: https://www.netexec.wiki/nfs-protocol/enumeration.

- Detect the version of a remote NFS server:

```
nxc nfs {{192.168.178.0/24}}
```

- List the available NFS shares:

```
nxc nfs {{192.168.178.2}} --shares
```

- Enumerate the exposed shares recursively to the specified depth:

```
nxc nfs {{192.168.178.2}} --enum-shares {{5}}
```

- Download the specified remote file:

```
nxc nfs {{192.168.178.2}} --get-file {{path/to/remote_file}}
{{path/to/local_file}}
```

- Upload the specified local file to the remote share:

```
nxc nfs {{192.168.178.2}} --put-file {{path/to/local_file}}
{{path/to/remote_file}}
```

nxc rdp

Pentest and exploit RDP servers.

More information: https://www.netexec.wiki/rdp-protocol/password-spraying.

- Search for valid credentials by trying out every combination in the specified lists of usernames and passwords:

```
nxc rdp {{192.168.178.2}} {{[-u|--username]}} {{path/to/
usernames.txt}} {{[-p|--password]}} {{path/to/passwords.txt}}
```

- Take a screenshot after waiting the for specified number of seconds:

```
nxc rdp {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} --screenshot --screentime
{{10}}
```

- Take a screenshot in the specified resolution:

```
nxc rdp {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} --screenshot --res
{{1024x768}}
```

- Take a screenshot of the RDP login prompt if Network Level Authentication is disabled:

```
nxc rdp {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} --nla-screenshot
```

nxc smb

Pentest and exploit SMB servers.

More information: https://www.netexec.wiki/smb-protocol/generate-hosts-file.

- Search for valid domain credentials by trying out every combination in the specified lists of usernames and passwords:

```
nxc smb {{192.168.178.2}} {{[-u|--username]}} {{path/to/
usernames.txt}} {{[-p|--password]}} {{path/to/passwords.txt}}
```

- Search for valid credentials for local accounts instead of domain accounts:

```
nxc smb {{192.168.178.2}} {{[-u|--username]}} {{path/to/
usernames.txt}} {{[-p|--password]}} {{path/to/passwords.txt}}
--local-auth
```

- Enumerate SMB shares and the specified users' access rights to them on the target hosts:

```
nxc smb {{192.168.178.0/24}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} --shares
```

- Enumerate network interfaces on the target hosts, performing authentication via pass-the-hash:

```
nxc smb {{192.168.178.30-45}} {{[-u|--username]}}
{{username}} {{[-H|--hash]}} {{NTLM_hash}} --interfaces
```

- Scan the target hosts for common vulnerabilities:

```
nxc smb {{path/to/target_list.txt}} {{[-u|--username]}}
'' {{[-p|--password]}} '' {{[-M|--module]}} zerologon {{[-
M|--module]}} petitpotam
```

- Attempt to execute a command on the target hosts:

```
nxc smb {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} -x {{command}}
```

nxc ssh

Pentest and exploit SSH servers.

See also: **`hydra`**.

More information: https://www.netexec.wiki/ssh-protocol/password-spraying.

- Spray the specified password against a list of usernames on the specified target:

```
nxc ssh {{192.168.178.2}} {{[-u|--username]}} {{path/to/
usernames.txt}} {{[-p|--password]}} {{password}}
```

- Search for valid credentials by trying out every combination in the specified lists of usernames and passwords:

```
nxc ssh {{192.168.178.2}} {{[-u|--username]}} {{path/to/
usernames.txt}} {{[-p|--password]}} {{path/to/passwords.txt}}
```

- Use the specified private key for authentication, using the supplied password as the key's passphrase:

```
nxc ssh {{192.186.178.2}} {{[-u|--username]}} {{path/to/
usernames.txt}} {{[-p|--password]}} {{password}} --key-file
{{path/to/id_rsa}}
```

- Try a combination of username and password on a number of targets:

```
nxc ssh {{192.168.178.0/24}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}}
```

- Check for `sudo` privileges on a successful login:

```
nxc ssh {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{path/to/passwords.txt}} --sudo-check
```

nxc vnc

Pentest and exploit VNC servers.

More information: https://www.netexec.wiki/getting-started/selecting-and-using-a-protocol.

- Search for valid credentials by trying out every combination in the specified lists of usernames and passwords:

```
nxc vnc {{192.168.178.2}} {{[-u|--username]}} {{path/to/usernames.txt}} {{[-p|--password]}} {{path/to/passwords.txt}}
```

- Avoid rate limiting through VNC-sleep:

```
nxc vnc {{192.168.178.2}} {{[-u|--username]}} {{path/to/usernames.txt}} {{[-p|--password]}} {{path/to/passwords.txt}} --vnc-sleep {{10}}
```

- Take a screenshot on the remote system after waiting the specified amount of time:

```
nxc vnc {{192.168.178.2}} {{[-u|--username]}} {{username}} {{[-p|--password]}} {{password}} --screenshot --screentime {{10}}
```

nxc winrm

Pentest and exploit Windows Remote Management (winrm).

More information: https://www.netexec.wiki/winrm-protocol/password-spraying.

- Search for valid credentials by trying out every combination in the specified lists of usernames and passwords:

```
nxc winrm {{192.168.178.2}} {{[-u|--username]}} {{path/to/
usernames.txt}} {{[-p|--password]}} {{path/to/passwords.txt}}
```

- Specify the domain to authenticate to (avoids an initial SMB connection):

```
nxc winrm {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} -d {{domain_name}}
```

- Execute the specified command on the host:

```
nxc winrm {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} -x {{whoami}}
```

- Execute the specified PowerShell command on the host as administrator using LAPS:

```
nxc winrm {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} --laps -X {{whoami}}
```

nxc wmi

Pentest and exploit the Windows Management Instrumentation (WMI).

More information: https://www.netexec.wiki/wmi-protocol/password-spraying.

- Search for valid credentials by trying out every combination in the specified lists of usernames and passwords:

```
nxc wmi {{192.168.178.2}} {{[-u|--username]}} {{path/to/
usernames.txt}} {{[-p|--password]}} {{path/to/passwords.txt}}
```

- Authenticate via local authentication (as opposed to authenticating to the domain):

```
nxc wmi {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} --local-auth
```

- Issue the specified WMI query:

```
nxc wmi {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} --wmi {{wmi_query}}
```

- Execute the specified command on the targeted host:

```
nxc wmi {{192.168.178.2}} {{[-u|--username]}} {{username}}
{{[-p|--password]}} {{password}} -x {{command}}
```

nxc

Network service enumeration and exploitation tool.

Some subcommands such as **`smb`** have their own usage documentation.

More information: https://www.netexec.wiki/getting-started/selecting-and-using-a-protocol.

- List available modules for the specified protocol:

```
nxc {{smb|ssh|ldap|ftp|wmi|winrm|rdp|vnc|mssql}} {{[-L|--list-modules]}}
```

- List the options available for the specified module:

```
nxc {{smb|ssh|ldap|ftp|wmi|winrm|rdp|vnc|mssql}} {{[-M|--module]}} {{module_name}} --options
```

- Specify an [o]ption for a module:

```
nxc {{smb|ssh|ldap|ftp|wmi|winrm|rdp|vnc|mssql}} {{[-M|--module]}} {{module_name}} -o {{OPTION_NAME}}={{option_value}}
```

- View the options available for the specified protocol:

```
nxc {{smb|ssh|ldap|ftp|wmi|winrm|rdp|vnc|mssql}} {{[-h|--help]}}
```

nxcdb

Interact with the NetExec database.

More information: https://www.netexec.wiki/getting-started/database-general-usage.

- Enter an interactive database session:

```
nxcdb
```

- Display the currently active workspace:

```
nxcdb --get-workspace
```

- Create a new workspace:

```
nxcdb --create-workspace {{workspace_name}}
```

- Activate the specified workspace:

```
nxcdb --set-workspace {{workspace_name}}
```

nyxt

A keyboard-driven web browser for power users.

More information: https://nyxt-browser.com/documentation.

- List all profiles:

```
nyxt --list-data-profiles
```

- Set the `init.lisp` file path:

```
nyxt --init {{path/to/file}}
```

- Change the path to the auto-config file:

```
nyxt --auto-config {{path/to/file}}
```

- Print system information:

```
nyxt --system-information
```

o

Orbiton, a simple configuration-free text editor.

More information: https://github.com/xyproto/orbiton.

- Open a file in editor:

```
o {{path/to/file}}
```

- Open a file as read-only:

```
o {{[-m|-monitor]}} {{path/to/file}}
```

- Save the file:

```
<Ctrl s>
```

- Quit Orbiton:

```
<Ctrl q>
```

- Display help:

```
o {{[-h|--help]}}
```

oathtool

OATH one-time password tool.

More information: https://www.nongnu.org/oath-toolkit/oathtool.1.html.

- Generate TOTP token (behaves like Google Authenticator):

```
oathtool --totp {{[-b|--base32]}} "{{secret}}"
```

- Generate a TOTP token for a specific time:

```
oathtool --totp {{[-N|--now]}} "{{2004-02-29 16:21:42}}" {{[-b|--base32]}} "{{secret}}"
```

- Validate a TOTP token:

```
oathtool --totp {{[-b|--base32]}} "{{secret}}" "{{token}}"
```

oauth2c

Interact with OAuth 2.0 authorization servers.

More information: https://github.com/cloudentity/oauth2c#usage.

- Fetch an access token using client credentials:

```
oauth2c {{issuer_url}} --client-id {{client_id}} --client-secret {{client_secret}}
```

- Fetch a token using authorization code flow:

```
oauth2c {{issuer_url}} --client-id {{client_id}} --response-types code
```

- Fetch a token using authorization code with PKCE:

```
oauth2c {{issuer_url}} --client-id {{client_id}} --pkce
```

- Fetch a token using password credentials:

```
oauth2c {{issuer_url}} --client-id {{client_id}} --username {{username}} --password {{password}}
```

- Refresh an existing access token:

```
oauth2c {{issuer_url}} --client-id {{client_id}} --refresh-token {{refresh_token}}
```

- Fetch a token with specific scopes:

```
oauth2c {{issuer_url}} --client-id {{client_id}} --scopes {{scope1,scope2}}
```

- Use device authorization flow:

```
oauth2c {{issuer_url}} --client-id {{client_id}} --grant-type device_code
```

- Run in silent mode without browser:

```
oauth2c {{issuer_url}} --client-id {{client_id}} {{[-s|--silent]}} --no-browser
```

objdump

View information about object files.

More information: https://manned.org/objdump.

- Display the file header information:

```
objdump {{[-f|--file-headers]}} {{path/to/binary}}
```

- Display all header information:

```
objdump {{[-x|--all-headers]}} {{path/to/binary}}
```

- Display the disassembled output of executable sections:

```
objdump {{[-d|--disassemble]}} {{path/to/binary}}
```

- Display the disassembled executable sections in Intel syntax:

```
objdump {{[-d|--disassemble]}} {{path/to/binary}} {{[-M|--disassembler-options]}} intel
```

- Display the disassembled executable sections with jump visualizations and syntax highlighting:

```
objdump {{[-d|--disassemble]}} {{path/to/binary}} --visualize-jumps={{color|extended-color}} --disassembler-color={{color|extended-color}}
```

- Display the symbol [t]able:

```
objdump {{[-t|--syms]}} {{path/to/binary}}
```

- Display a complete binary hex dump of all sections:

```
objdump {{[-s|--full-contents]}} {{path/to/binary}}
```

obs

Open Broadcaster Software.

Video recording and livestreaming program.

More information: https://obsproject.com/kb/launch-parameters.

- Launch OBS:

```
obs
```

- Launch OBS in portable mode:

```
obs {{[-p|--portable]}}
```

- Automatically start recording a video on launch:

```
obs --startrecording
```

- Automatically start the replay buffer on launch:

```
obs --startreplaybuffer
```

- Automatically start streaming on launch:

```
obs --startstreaming
```

- Minimise to the system tray on launch:

```
obs --minimize-to-tray
```

- Make the log more verbose (for debugging):

```
obs --verbose
```

oc

The OpenShift Container Platform CLI.

Allows for application and container management.

More information: https://docs.redhat.com/en/documentation/openshift_container_platform/4.18/html/cli_tools/index.

- Log in to the OpenShift Container Platform server:

```
oc login
```

- Create a new project:

```
oc new-project {{project_name}}
```

- Switch to an existing project:

```
oc project {{project_name}}
```

- Add a new application to a project:

```
oc new-app {{repo_url}} --name {{application}}
```

- Open a remote shell session to a container:

```
oc rsh {{pod_name}}
```

- List pods in a project:

```
oc get pods
```

- Log out from the current session:

```
oc logout
```

ocaml

The OCaml repl (read-evaluate-print-loop).

Interprets Ocaml commands.

More information: https://manned.org/ocaml.

- Read OCaml commands from the user and execute them:

  ```
  ocaml
  ```

- Read OCaml commands from a file and execute them:

  ```
  ocaml {{path/to/file.ml}}
  ```

- Run OCaml script with modules:

  ```
  ocaml {{module1}} {{module2}} {{path/to/file.ml}}
  ```

ocamlc

The OCaml bytecode compiler.

Produces executables runnable by the OCaml interpreter.

More information: https://manned.org/ocamlc.

- Create a binary from a source file:

```
ocamlc {{path/to/source_file.ml}}
```

- Create a named binary from a source file:

```
ocamlc -o {{path/to/binary}} {{path/to/source_file.ml}}
```

- Automatically generate a module signature (interface) file:

```
ocamlc -i {{path/to/source_file.ml}}
```

ocamlfind

The findlib package manager for OCaml.

Simplifies linking executables with external libraries.

More information: https://manned.org/ocamlfind.

- Compile a source file to a native binary and link with packages:

```
ocamlfind ocamlopt -package {{package1,package2,...}} -
linkpkg -o {{path/to/executable}} {{path/to/source.ml}}
```

- Compile a source file to a bytecode binary and link with packages:

```
ocamlfind ocamlc -package {{package1,package2,...}} -linkpkg
-o {{path/to/executable}} {{path/to/source.ml}}
```

- Cross-compile for a different platform:

```
ocamlfind -toolchain {{cross-toolchain}} ocamlopt -o {{path/
to/executable}} {{path/to/source.ml}}
```

ocamlopt

The OCaml native code compiler.

Produces native executables, e.g. ELF on Linux.

More information: https://manned.org/ocamlopt.

- Compile a source file:

```
ocamlopt -o {{path/to/binary}} {{path/to/source_file.ml}}
```

- Compile with debugging enabled:

```
ocamlopt -g -o {{path/to/binary}} {{path/to/source_file.ml}}
```

ocrmypdf

Generate a searchable PDF or PDF/A from a scanned PDF or an image of text.

More information: https://ocrmypdf.readthedocs.io/en/latest/cookbook.html.

- Create a new searchable PDF/A file from a scanned PDF or image file:

```
ocrmypdf {{path/to/input}} {{path/to/output.pdf}}
```

- Skip pages of a mixed-format input PDF file that already contain text:

```
ocrmypdf --skip-text {{path/to/input.pdf}} {{path/to/
output.pdf}}
```

- Clean, de-skew, and rotate pages of a poor scan:

```
ocrmypdf --clean --deskew --rotate-pages {{path/to/
input.pdf}} {{path/to/output.pdf}}
```

- Perform lossy optimization on a PDF without performing any OCR:

```
ocrmypdf --tesseract-timeout 0 --optimize 2 --skip-text
{{path/to/input.pdf}} {{path/to/output.pdf}}
```

- Set the metadata of a searchable PDF file:

```
ocrmypdf --title "{{title}}" --author "{{author}}" --subject
"{{subject}}" --keywords "{{keyword; key
phrase; ...}}" {{path/to/input.pdf}} {{path/to/output.pdf}}
```

- Display help:

```
ocrmypdf --help
```

octave

A programming language for scientific computing.

More information: https://manned.org/octave.

- Start an interactive session:

```
octave
```

- Execute a specific script file:

```
octave {{path/to/script.m}}
```

- Execute a script file with specific arguments:

```
octave {{path/to/script.m}} {{argument1 argument2 ...}}
```

- Start an interactive session with a GUI:

```
octave --gui
```

- Display help:

```
octave --help
```

- Display version:

```
octave --version
```

octez-client

Interact with the Tezos blockchain.

More information: https://tezos.gitlab.io/introduction/howtouse.html#client.

- Configure the client with a connection to a Tezos RPC node such as https://rpc.ghostnet.teztnets.com:

```
octez-client -E {{endpoint}} config update
```

- Create an account and assign a local alias to it:

```
octez-client gen keys {{alias}}
```

- Get the balance of an account by alias or address:

```
octez-client get balance for {{alias_or_address}}
```

- Transfer tez to a different account:

```
octez-client transfer {{5}} from {{alias|address}} to
{{alias|address}}
```

- Originate (deploy) a smart contract, assign it a local alias, and set its initial storage as a Michelson-encoded value:

```
octez-client originate contract {{alias}} transferring {{0}}
from {{alias|address}} running {{path/to/source_file.tz}} --
init "{{initial_storage}}" --burn_cap {{1}}
```

- Call a smart contract by its alias or address and pass a Michelson-encoded parameter:

```
octez-client transfer {{0}} from {{alias|address}} to
{{contract}} --entrypoint "{{entrypoint}}" --arg
"{{parameter}}" --burn-cap {{1}}
```

- Display help:

```
octez-client man
```

od

Display file contents in octal, decimal, or hexadecimal format.

Optionally display the byte offsets and/or printable representation for each line.

See also: **`hexyl`**, **`xxd`**, **`hexdump`**.

More information: https://www.gnu.org/software/coreutils/manual/html_node/od-invocation.html.

- Display file using default settings: octal format, 8 bytes per line, byte offsets in octal, and duplicate lines replaced with *:

```
od {{path/to/file}}
```

- Display file in verbose mode, i.e. without replacing duplicate lines with *:

```
od {{[-v|--output-duplicates]}} {{path/to/file}}
```

- Display file in hexadecimal format (2-byte units), with byte offsets in decimal format:

```
od {{[-t|--format]}} {{x}} {{[-A|--address-radix]}} {{d}} {{[-v|--output-duplicates]}} {{path/to/file}}
```

- Display file in hexadecimal format (1-byte units), and 4 bytes per line:

```
od {{[-t|--format]}} {{x1}} {{[-w|--width=]}}4 {{[-v|--output-duplicates]}} {{path/to/file}}
```

- Display file in hexadecimal format along with its character representation, and do not print byte offsets:

```
od {{[-t|--format]}} {{xz}} {{[-A|--address-radix]}} {{n}} {{[-v|--output-duplicates]}} {{path/to/file}}
```

- Read only 100 bytes of a file starting from the 500th byte:

```
od {{[-N|--read-bytes]}} 100 {{[-j|--skip-bytes]}} 500 {{[-v|--output-duplicates]}} {{path/to/file}}
```

odpscmd auth

User authorities in ODPS (Open Data Processing Service).

See also: **`odpscmd`**.

More information: https://www.alibabacloud.com/help/en/maxcompute/user-guide/maxcompute-client.

- [Interactive] Add a user to the current project:

```
add user {{username}};
```

- [Interactive] Grant a set of authorities to a user:

```
grant {{action_list}} on {{object_type}} {{object_name}} to user {{username}};
```

- [Interactive] Show authorities of a user:

```
show grants for {{username}};
```

- [Interactive] Create a user role:

```
create role {{role_name}};
```

- [Interactive] Grant a set of authorities to a role:

```
grant {{action_list}} on {{object_type}} {{object_name}} to role {{role_name}};
```

- [Interactive] Describe authorities of a role:

```
desc role {{role_name}};
```

- [Interactive] Grant a role to a user:

```
grant {{role_name}} to {{username}};
```

odpscmd func

Manage functions in ODPS (Open Data Processing Service).

See also: **`odpscmd`**.

More information: https://www.alibabacloud.com/help/en/maxcompute/user-guide/maxcompute-client.

- [Interactive] Show functions in the current project:

```
list functions;
```

- [Interactive] Create a Java function using a `.jar` resource:

```
create function {{func_name}} as {{path.to.package.Func}}
using '{{package.jar}}';
```

- [Interactive] Create a Python function using a `.py` resource:

```
create function {{func_name}} as {{script.Func}} using
'{{script.py}}';
```

- [Interactive] Delete a function:

```
drop function {{func_name}};
```

odpscmd inst

Manage instances in ODPS (Open Data Processing Service).

See also: **`odpscmd`**.

More information: https://www.alibabacloud.com/help/en/maxcompute/user-guide/maxcompute-client.

- [Interactive] Show instances created by current user:

```
show instances;
```

- [Interactive] Describe the details of an instance:

```
desc instance {{instance_id}};
```

- [Interactive] Check the status of an instance:

```
status {{instance_id}};
```

- [Interactive] Wait on the termination of an instance, printing log and progress information until then:

```
wait {{instance_id}};
```

- [Interactive] Kill an instance:

```
kill {{instance_id}};
```

odpscmd resource

Manage resources in ODPS (Open Data Processing Service).

See also: **`odpscmd`**.

More information: https://www.alibabacloud.com/help/en/maxcompute/user-guide/maxcompute-client.

- [Interactive] Show resources in the current project:

```
list resources;
```

- [Interactive] Add file resource:

```
add file {{filename}} as {{alias}};
```

- [Interactive] Add archive resource:

```
add archive {{archive.tar.gz}} as {{alias}};
```

- [Interactive] Add `.jar` resource:

```
add jar {{package.jar}};
```

- [Interactive] Add `.py` resource:

```
add py {{script.py}};
```

- [Interactive] Delete resource:

```
drop resource {{resource_name}};
```

odpscmd table

Create and modify tables in ODPS (Open Data Processing Service).

See also: **`odpscmd`**.

More information: https://www.alibabacloud.com/help/en/maxcompute/user-guide/maxcompute-client.

- [Interactive] Create a table with partition and lifecycle:

```
create table {{table_name}} ({{col}} {{type}}) partitioned by
({{col}} {{type}}) lifecycle {{days}};
```

- [Interactive] Create a table based on the definition of another table:

```
create table {{table_name}} like {{another_table}};
```

- [Interactive] Add partition to a table:

```
alter table {{table_name}} add partition
({{partition_spec}});
```

- [Interactive] Delete partition from a table:

```
alter table {{table_name}} drop partition
({{partition_spec}});
```

- [Interactive] Delete table:

```
drop table {{table_name}};
```

odpscmd tunnel

Data tunnel in ODPS (Open Data Processing Service).

See also: **`odpscmd`**.

More information: https://www.alibabacloud.com/help/en/maxcompute/user-guide/maxcompute-client.

- [Interactive] Download table to local file:

```
tunnel download {{table_name}} {{path/to/file}};
```

- [Interactive] Upload local file to a table partition:

```
tunnel upload {{path/to/file}} {{table_name}}/
{{partition_spec}};
```

- [Interactive] Upload table specifying field and record delimiters:

```
tunnel upload {{path/to/file}} {{table_name}} -fd
{{field_delim}} -rd {{record_delim}};
```

- [Interactive] Upload table using multiple threads:

```
tunnel upload {{path/to/file}} {{table_name}} -threads
{{num}};
```

odpscmd

Aliyun ODPS (Open Data Processing Service) command-line tool.

Some subcommands such as **`inst`** have their own usage documentation.

More information: https://www.alibabacloud.com/help/en/maxcompute/user-guide/maxcompute-client.

- Start the command-line with a custom configuration file:

```
odpscmd --config={{odps_config.ini}}
```

- [Interactive] Switch current project:

```
use {{project_name}};
```

- [Interactive] Show tables in the current project:

```
show tables;
```

- [Interactive] Describe a table:

```
desc {{table_name}};
```

- [Interactive] Show table partitions:

```
show partitions {{table_name}};
```

- [Interactive] Describe a partition:

```
desc {{table_name}} partition ({{partition_spec}});
```

offlineimap

Synchronize a remote IMAP server with local Maildir folders.

More information: https://www.offlineimap.org/doc/offlineimap.html.

- Synchronize once, without enabling autorefresh:

```
offlineimap -o
```

- Synchronize a specific account:

```
offlineimap -a {{account}}
```

- Synchronize a specific folder:

```
offlineimap -f {{folder}}
```

ogr2ogr

Convert geospatial vector data between file formats.

More information: https://gdal.org/en/stable/programs/ogr2ogr.html.

- Convert a Shapefile into a GeoPackage:

```
ogr2ogr -f GPKG {{path/to/output.gpkg}} {{path/to/input.shp}}
```

- Reduce a GeoJSON to features matching a condition:

```
ogr2ogr -where '{{myProperty > 42}}' -f {{GeoJSON}} {{path/to/output.geojson}} {{path/to/input.geojson}}
```

- Change coordinate reference system of a GeoPackage from `EPSG:4326` to `EPSG:3857`:

```
ogr2ogr -s_srs {{EPSG:4326}} -t_srs {{EPSG:3857}} -f GPKG {{path/to/output.gpkg}} {{path/to/input.gpkg}}
```

- Convert a CSV file into a GeoPackage, specifying the names of the coordinate columns and assigning a coordinate reference system:

```
ogr2ogr -f GPKG {{path/to/output.gpkg}} {{path/to/input.csv}} -oo X_POSSIBLE_NAMES={{longitude}} -oo Y_POSSIBLE_NAMES={{latitude}} -a_srs {{EPSG:4326}}
```

- Load a GeoPackage into a PostGIS database:

```
ogr2ogr -f PostgreSQL PG:dbname="{{database_name}}" {{path/to/input.gpkg}}
```

- Clip layers of a GeoPackage file to the given bounding box:

```
ogr2ogr -spat {{min_x}} {{min_y}} {{max_x}} {{max_y}} -f GPKG {{path/to/output.gpkg}} {{path/to/input.gpkg}}
```

ogrinfo

List information about an OGR-supported data source.

More information: https://gdal.org/en/stable/programs/ogrinfo.html.

- List supported formats:

```
ogrinfo --formats
```

- List layers of a data source:

```
ogrinfo {{path/to/input.gpkg}}
```

- Get detailed information about a specific layer of a data source:

```
ogrinfo {{path/to/input.gpkg}} {{layer_name}}
```

- Show summary information about a specific layer of a data source:

```
ogrinfo -so {{path/to/input.gpkg}} {{layer_name}}
```

- Show summary of all layers of the data source:

```
ogrinfo -so -al {{path/to/input.gpkg}}
```

- Show detailed information of features matching a condition:

```
ogrinfo -where '{{attribute_name > 42}}' {{path/to/
input.gpkg}} {{layer_name}}
```

- Update a layer in the data source with SQL:

```
ogrinfo {{path/to/input.geojson}} -dialect SQLite -sql
"{{UPDATE input SET attribute_name = 'foo'}}"
```

ogrmerge.py

Merge several vector datasets into a single one.

More information: https://gdal.org/en/stable/programs/ogrmerge.html.

- Create a GeoPackage with a layer for each input Shapefile:

```
ogrmerge.py -f {{GPKG}} -o {{path/to/output.gpkg}} {{path/to/input1.shp path/to/input2.shp ...}}
```

- Create a virtual datasource (VRT) with a layer for each input GeoJSON:

```
ogrmerge.py -f {{VRT}} -o {{path/to/output.vrt}} {{path/to/input1.geojson path/to/input2.geojson ...}}
```

- Concatenate two vector datasets and store source name of dataset in attribute 'source_name':

```
ogrmerge.py -single -f {{GeoJSON}} -o {{path/to/output.geojson}} -src_layer_field_name country {{source_name}} {{path/to/input1.shp path/to/input2.shp ...}}
```

oh-my-posh

Cross platform prompt engine for any shell.

More information: https://ohmyposh.dev/docs/installation/customize.

- Display current shell name:

```
oh-my-posh get shell
```

- Initialize for Bash:

```
eval "$(oh-my-posh init bash --config {{path/to/theme}})"
```

- Initialize for PowerShell:

```
oh-my-posh init pwsh --config {{path/to/theme}} | Invoke-Expression
```

- Initialize for Zsh:

```
eval "$(oh-my-posh init zsh --config {{path/to/theme}})"
```

- Enable live reloading:

```
oh-my-posh enable reload
```

- Disable live reloading:

```
oh-my-posh disable reload
```

- Print debug information for troubleshooting:

```
oh-my-posh debug
```

- Update to latest version:

```
oh-my-posh upgrade
```

ohdear-cli

An unofficial Oh Dear CLI written with Laravel Zero.

More information: https://github.com/ohdearapp/ohdear-cli.

- Display details about the currently authenticated user:

  ```
  ohdear-cli me
  ```

- Add a new site to Oh Dear:

  ```
  ohdear-cli sites:add {{url}}
  ```

- Display a list of sites and their current status:

  ```
  ohdear-cli sites:list
  ```

- Display details about a specific site:

  ```
  ohdear-cli sites:show {{site_id}}
  ```

okular

View documents.

More information: https://docs.kde.org/stable5/en/okular/okular/command-line-options.html.

- Launch document viewer:

```
okular
```

- Open specific documents:

```
okular {{path/to/file1 path/to/file2 ...}}
```

- Open a document at a specific page:

```
okular {{[-p|--page]}} {{page_number}} {{path/to/file}}
```

- Open a specific document in presentation mode:

```
okular --presentation {{path/to/file}}
```

- Open a specific document and start a print dialog:

```
okular --print {{path/to/file}}
```

- Open a document and search for a specific string:

```
okular --find {{search_string}} {{path/to/file}}
```

olevba

Parse OLE and OpenXML files (e.g., DOC, XLS, PPT, etc.) to extract VBA macros, deobfuscate, and analyze malicious code.

Part of the **`python-oletools`** suite.

More information: https://github.com/decalage2/oletools.

- Analyze a file, showing both macro code and analysis results:

```
olevba {{path/to/file}}
```

- Recursively analyze all supported files in a directory:

```
olevba -r {{path/to/directory}}
```

- Provide a password for encrypted Microsoft Office files (may be repeated):

```
olevba {{[-p|--password]}} {{password}} {{path/to/
encrypted_file}}
```

- Display only analysis results, without showing macro source code:

```
olevba {{[-a|--analysis]}} {{path/to/file}}
```

- Display only macro source code:

```
olevba {{[-c|--code]}} {{path/to/file}}
```

- Show obfuscated strings and their decoded content:

```
olevba --decode {{path/to/file}}
```

ollama

A large language model runner.

For a list of available models, see https://ollama.com/library.

More information: https://github.com/ollama/ollama#cli-reference.

- Start the daemon required to run other commands:

  ```
  ollama serve
  ```

- Run a model and chat with it:

  ```
  ollama run {{model}}
  ```

- Run a model with a single prompt:

  ```
  ollama run {{model}} {{prompt}}
  ```

- List downloaded models:

  ```
  ollama {{[ls|list]}}
  ```

- Pull a specific model:

  ```
  ollama pull {{model}}
  ```

- List running models:

  ```
  ollama ps
  ```

- Delete a model:

  ```
  ollama rm {{model}}
  ```

- Create a model from a `Modelfile`:

  ```
  ollama create {{new_model_name}} {{[-f|--file]}} {{path/to/Modelfile}}
  ```

omf

Oh My Fish, the Fishshell Framework.

Install packages to extend and modify the fish shell.

More information: https://github.com/oh-my-fish/oh-my-fish.

- Install one or more packages:

```
omf install {{name}}
```

- List installed packages:

```
omf list
```

- List available themes:

```
omf theme
```

- Apply a theme:

```
omf theme {{name}}
```

- Remove a theme or package:

```
omf remove {{name}}
```

- Uninstall Oh My Fish:

```
omf destroy
```

omz

Oh My Zsh command-line tool.

More information: https://github.com/ohmyzsh/ohmyzsh.

- Update Oh My Zsh:

```
omz update
```

- Print the changes from the latest update of Oh My Zsh:

```
omz changelog
```

- Restart the current Zsh session and Oh My Zsh:

```
omz reload
```

- List all available plugins:

```
omz plugin list
```

- List all enabled plugins:

```
omz plugin list --enabled
```

- Enable/Disable an Oh My Zsh plugin:

```
omz plugin {{enable|disable}} {{plugin}}
```

- List all available themes:

```
omz theme list
```

- Set an Oh My Zsh theme in `~/.zshrc`:

```
omz theme set {{theme}}
```

on_ac_power

A simple utility which tests if a computer is running on line power.

Returns **0** if yes, and **1** if no.

More information: https://manned.org/on_ac_power.

- Test if a computer is running on line power:

```
on_ac_power
```

onefetch

Display project information and code statistics for a local Git repository.

More information: https://github.com/o2sh/onefetch/wiki/command-line-options.

- Display statistics for the Git repository in the current working directory:

```
onefetch
```

- Display statistics for the Git repository in the specified directory:

```
onefetch {{path/to/directory}}
```

- Ignore commits made by bots:

```
onefetch --no-bots
```

- Ignore merge commits:

```
onefetch --no-merges
```

- Don't print the ASCII art of the language logo:

```
onefetch --no-art
```

- Show n authors, languages, or file churns (default: 3, 6, and 3 respectively):

```
onefetch --number-of-{{authors|languages|file-churns}} {{n}}
```

- Ignore the specified files and directories:

```
onefetch {{[-e|--exclude]}} {{path/to/file_or_directory|
regex}}
```

- Only detect languages from the specified categories (default: programming and markup):

```
onefetch {{[-T|--type]}} {{programming|markup|prose|data}}
```

oneliner

Turn plain English into shell commands using OpenAI, Claude, or local LLMs, designed to teach, not replace your knowledge.

More information: https://github.com/dorochadev/oneliner#-usage-flags.

- Generate a shell command from plain English:

```
oneliner "{{find all jpg files larger than 10MB}}"
```

- Explain what a command does:

```
oneliner {{[-e|--explain]}} "{{delete node_modules recursively}}"
```

- Copy a generated command to the clipboard:

```
oneliner {{[-c|--clipboard]}} "{{compress all pdfs}}"
```

- Show a detailed, educational breakdown of a command:

```
oneliner {{[-b|--breakdown]}} "{{list all active network connections}}"
```

- Execute a generated command (use with caution):

```
oneliner {{[-r|--run]}} "{{list files larger than 1GB}}"
```

- Interactively confirm before executing a generated command:

```
oneliner {{[-i|--interactive]}} "{{delete temporary files in /tmp}}"
```

onionsearch

Scrape URLs on different **`.onion`** search engines.

Note: **`onionsearch`** requires a Tor proxy running on **`localhost:9050`**; a Tor enabled browser is needed to visit the **`.onion`** websites.

More information: https://github.com/megadose/OnionSearch#--usage.

- Request results from all the search engines:

```
onionsearch "{{string}}"
```

- Request search results from specific search engines:

```
onionsearch "{{string}}" --engines {{tor66|deeplink|
phobos|...}}
```

- Exclude certain search engines when searching:

```
onionsearch "{{string}}" --exclude {{candle|ahmia|...}}
```

- Limit the number of pages to load per engine:

```
onionsearch "{{stuxnet}}" --engines {{tor66|deeplink|
phobos|...}} --limit {{3}}
```

- List all supported search engines:

```
onionsearch --help | grep {{[-A|--after-context]}} 1 {{[-i|--
ignore-case]}} "supported engines"
```

ooniprobe

Open Observatory of Network Interference (OONI).

Test the blocking of websites and apps. Measure the speed and performance of your network.

More information: https://ooni.org/support/ooni-probe-cli/.

- List all tests performed:

  ```
  ooniprobe list
  ```

- Show information about a specific test:

  ```
  ooniprobe list {{7}}
  ```

- Run all available tests:

  ```
  ooniprobe run all
  ```

- Perform a specific test:

  ```
  ooniprobe run {{performance}}
  ```

- Check the availability of a specific website:

  ```
  ooniprobe run websites --input {{https://ooni.org/}}
  ```

- Check the availability of all websites listed in a file:

  ```
  ooniprobe run websites --input-file {{path/to/my-websites.txt}}
  ```

- Display detailed information about a test in JSON format:

  ```
  ooniprobe show {{9}}
  ```

op

Official CLI for 1Password's desktop app.

More information: https://developer.1password.com/docs/cli/reference/.

- Sign in to a 1Password account:

```
op signin
```

- List all vaults:

```
op vault list
```

- Print item details in JSON format:

```
op item get {{item_name}} --format json
```

- Create a new item with a category in the default vault:

```
op item create --category {{category_name}}
```

- Print a referenced secret to `stdout`:

```
op read {{secret_reference}}
```

- Pass secret references from exported environment variables to a command:

```
op run -- {{command}}
```

- Pass secret references from an environment file to a command:

```
op run --env-file {{path/to/env_file.env}} -- {{command}}
```

- Read secret references from a file and save plaintext secrets to a file:

```
op inject --in-file {{path/to/input_file}} --out-file {{path/to/output_file}}
```

opam

OCaml Package Manager.

Manage OCaml compilers, tools, and libraries.

More information: https://opam.ocaml.org/doc/Usage.html.

- Initialize opam for first use:

```
opam init
```

- Search for packages:

```
opam search {{query}}
```

- Install a package and all of its dependencies:

```
opam install {{package}}
```

- Display detailed information about a package:

```
opam show {{package}}
```

- List all installed packages:

```
opam list
```

- Update the local package database:

```
opam update
```

- Upgrade all installed packages:

```
opam upgrade
```

- Display help:

```
opam help
```

open

Open files, directories, and URIs with default applications.

This command is available through fish on operating systems without the built-in **open** command (e.g. Haiku and macOS).

More information: https://fishshell.com/docs/current/cmds/open.html.

- Open a file with the associated application:

```
open {{path/to/file.ext}}
```

- Open all the files of a given extension in the current directory with the associated application:

```
open {{*.ext}}
```

- Open a directory using the default file manager:

```
open {{path/to/directory}}
```

- Open a website using the default web browser:

```
open {{https://example.com}}
```

- Open a specific URI using the default application that can handle it:

```
open {{tel:123}}
```

open

open can refer to multiple commands with the same name.

- View documentation for the command available in macOS:

  `tldr open {{[-p|--platform]}} osx`

- View documentation for the command available through fish:

  `tldr open.fish`

openai

CLI tool providing access to the OpenAI API.

More information: https://github.com/openai/openai-python.

- List models:

```
openai api models.list
```

- Create a completion:

```
openai api completions.create --model {{ada}} --prompt
"{{Hello world}}"
```

- Create a chat completion:

```
openai api chat_completions.create --model {{gpt-3.5-turbo}}
--message {{user "Hello world"}}
```

- Generate images via DALL·E API:

```
openai api image.create --prompt "{{two dogs playing chess,
cartoon}}" --num-images {{1}}
```

opencode

An AI coding agent.

More information: https://opencode.ai/docs/cli/.

- Start the interactive TUI:

```
opencode
```

- Run opencode in non-interactive mode by passing a prompt directly:

```
opencode run "{{message}}"
```

- Use a specific model and agent:

```
opencode run {{[-m|--model]}} {{provider}}/{{model}} --agent {{agent_name}} "{{message}}"
```

- List all available models from configured providers:

```
opencode models
```

- Manage credentials and login for providers:

```
opencode auth login
```

- Start a headless opencode server for API access:

```
opencode serve {{[-h|--hostname]}} {{hostname}} {{[-p|--port]}} {{port}}
```

- Manage AI assistant agents for OpenCode:

```
opencode agent {{command}}
```

- Create a new agent with custom configuration:

```
opencode agent create
```

openconnect

A VPN client, for Cisco AnyConnect VPNs and others.

More information: https://www.infradead.org/openconnect/manual.html.

- Connect to a server:

```
openconnect {{vpn.example.org}}
```

- Connect to a server, forking into the background:

```
openconnect --background {{vpn.example.org}}
```

- Terminate the connection that is running in the background:

```
killall -SIGINT openconnect
```

- Connect to a server, reading options from a configuration file:

```
openconnect --config={{path/to/file}} {{vpn.example.org}}
```

- Connect to a server and authenticate with a specific SSL client certificate:

```
openconnect --certificate={{path/to/file}}
{{vpn.example.org}}
```

openocd

Debug and program embedded systems with OpenOCD.

More information: https://manned.org/openocd.

- Attach OpenOCD session to a board with a configuration file:

```
openocd {{[-f|--file]}} {{config_file.cfg}}
```

- Attach OpenOCD session to a board with multiple configuration files:

```
openocd {{[-f|--file]}} {{config_file1.cfg}} {{[-f|--file]}} {{config_file2.cfg}}
```

- Attach OpenOCD session to a board with configuration files and a list of commands to be executed on server startup:

```
openocd {{[-f|--file]}} {{config_file.cfg}} {{[-c|--command]}} "{{command}}"
```

- Use configuration files in the specified path:

```
openocd {{[-s|--search]}} {{path/to/search}} {{[-f|--file]}} {{config_file.cfg}}
```

- [Interactive] After OpenOCD startup, connect GDB to OpenOCD default port 3333:

```
target extended-remote localhost
```

- List site-wide script library:

```
ls /usr/local/share/openocd/scripts
```

openrgb

Control RGB lighting.

More information: https://gitlab.com/OpenRGBDevelopers/OpenRGB-Wiki/-/blob/stable/User-Documentation/Using-OpenRGB.md.

- Start the OpenRGB GUI:

```
openrgb
```

- List devices supported by OpenRGB:

```
openrgb --noautoconnect {{[-l|--list-devices]}}
```

- Set the mode and color of a device:

```
openrgb {{[-m|--mode]}} {{off|static|breathing|rainbow|
flashing|...}} {{[-c|--color]}} {{random|red|00AAFF|...}}
```

- Display help:

```
openrgb {{[-h|--help]}}
```

openscad

Software for creating solid 3D CAD objects.

More information: https://manned.org/openscad.

- Open a file:

```
openscad {{path/to/button.scad}}
```

- Convert a file to STL:

```
openscad -o {{path/to/button.stl}} {{path/to/button.scad}}
```

- Render a file to PNG in a specific colorscheme:

```
openscad -o {{path/to/button.png}} --colorscheme {{Sunset}}
{{path/to/button.scad}}
```

openssl dgst

OpenSSL command to generate digest values and perform signature operations.

More information: https://docs.openssl.org/master/man1/openssl-dgst/.

- Calculate the SHA256 digest for a file, saving the result to a specific file:

```
openssl dgst -sha256 -binary -out {{output_file}} {{input_file}}
```

- Sign a file using an RSA key, saving the result to a specific file:

```
openssl dgst -sign {{private_key_file}} -sha256 -sigopt rsa_padding_mode:pss -out {{output_file}} {{input_file}}
```

- Verify an RSA signature:

```
openssl dgst -verify {{public_key_file}} -signature {{signature_file}} -sigopt rsa_padding_mode:pss {{signature_message_file}}
```

- Sign a file using and ECDSA key:

```
openssl dgst -sign {{private_key_file}} -sha256 -out {{output_file}} {{input_file}}
```

- Verify an ECDSA signature:

```
openssl dgst -verify {{public_key_file}} -signature {{signature_file}} {{signature_message_file}}
```

openssl genpkey

OpenSSL command to generate asymmetric key pairs.

More information: https://docs.openssl.org/master/man1/openssl-genpkey/.

- Generate an RSA private key of 2048 bits, saving it to a specific file:

```
openssl genpkey -algorithm rsa -pkeyopt rsa_keygen_bits:{{2048}} -out {{filename.key}}
```

- Generate an elliptic curve private key using the curve `prime256v1`, saving it to a specific file:

```
openssl genpkey -algorithm EC -pkeyopt ec_paramgen_curve:{{prime256v1}} -out {{filename.key}}
```

- Generate an `ED25519` elliptic curve private key, saving it to a specific file:

```
openssl genpkey -algorithm {{ED25519}} -out {{filename.key}}
```

openssl genrsa

OpenSSL command to generate RSA private keys.

More information: https://docs.openssl.org/master/man1/openssl-genrsa/.

- Generate an RSA private key of 2048 bits to `stdout`:

```
openssl genrsa
```

- Save an RSA private key of an arbitrary number of bits to the output file:

```
openssl genrsa -out {{output_file.key}} {{1234}}
```

- Generate an RSA private key and encrypt it with AES256 (you will be prompted for a passphrase):

```
openssl genrsa {{-aes256}}
```

openssl prime

OpenSSL command to compute prime numbers.

More information: https://docs.openssl.org/master/man1/openssl-prime/.

- Generate a 2048bit prime number and display it in hexadecimal:

```
openssl prime -generate -bits 2048 -hex
```

- Check if a given number is prime:

```
openssl prime {{number}}
```

openssl req

OpenSSL command to manage PKCS#10 Certificate Signing Requests.

More information: https://docs.openssl.org/master/man1/openssl-req/.

- Generate a certificate signing request to be sent to a certificate authority:

```
openssl req -new -sha256 -key {{filename.key}} -out
{{filename.csr}}
```

- Generate a self-signed certificate and a corresponding key-pair, storing both in a file:

```
openssl req -new -x509 -newkey {{rsa}}:{{4096}} -keyout
{{filename.key}} -out {{filename.cert}} -subj "{{/C=XX/
CN=foobar}}" -days {{365}}
```

openssl s_client

OpenSSL command to create TLS client connections.

More information: https://docs.openssl.org/master/man1/openssl-s_client/.

- Display the start and expiry dates for a domain's certificate:

```
openssl s_client -connect {{host}}:{{port}} 2>/dev/null |
openssl x509 -noout -dates
```

- Display the certificate presented by an SSL/TLS server:

```
openssl < /dev/null s_client -connect {{host}}:{{port}}
```

- Set the Server Name Indicator (SNI) when connecting to the SSL/TLS server:

```
openssl s_client -connect {{host}}:{{port}} -servername
{{hostname}}
```

- Display the complete certificate chain of an HTTPS server:

```
openssl < /dev/null s_client -connect {{host}}:443 -showcerts
```

openssl ts

OpenSSL command to generate and verify timestamps.

More information: https://docs.openssl.org/master/man1/openssl-ts/.

- Generate a SHA-512 timestamp request of a specific file and output to `file.tsq`:

```
openssl ts -query -data {{path/to/file}} -sha512 -out {{path/to/file.tsq}}
```

- Check the date and metadata of a specific timestamp response file:

```
openssl ts -reply -in {{path/to/file.tsr}} -text
```

- Verify a timestamp request file and a timestamp response file from the server with an SSL certificate file:

```
openssl ts -verify -in {{path/to/file.tsr}} -queryfile {{path/to/file.tsq}} -partial_chain -CAfile {{path/to/cert.pem}}
```

- Create a timestamp response for request using key and signing certificate and output it to `file.tsr`:

```
openssl ts -reply -queryfile {{path/to/file.tsq}} -inkey {{path/to/tsakey.pem}} -signer tsacert.pem -out {{path/to/file.tsr}}
```

openssl x509

OpenSSL command to manage X.509 certificates.

More information: https://docs.openssl.org/master/man1/openssl-x509/.

- Display certificate information:

```
openssl x509 -in {{filename.crt}} -noout -text
```

- Display a certificate's expiration date:

```
openssl x509 -enddate -noout -in {{filename.pem}}
```

- Convert a certificate between binary DER encoding and textual PEM encoding:

```
openssl x509 -inform {{der}} -outform {{pem}} -in
{{original_certificate_file}} -out
{{converted_certificate_file}}
```

- Store a certificate's public key in a file:

```
openssl x509 -in {{certificate_file}} -noout -pubkey -out
{{output_file}}
```

openssl

OpenSSL cryptographic toolkit.

Some subcommands such as **req** have their own usage documentation.

More information: https://docs.openssl.org/master/man1/openssl/.

- Generate a private key and encrypt the output file using AES256:

```
openssl genpkey -algorithm {{rsa|ec}} -out {{private.key}} -aes256
```

- Generate the corresponding public key from private key `private.key` using `rsa`:

```
openssl rsa -in {{private.key}} -pubout -out {{public.key}}
```

- Generate a self-signed certificate valid for a specified number of days (`365`):

```
openssl req -new -x509 -key {{private.key}} -out {{certificate.crt}} -days {{365}}
```

- Convert certificate to `pem` or `der` format:

```
openssl x509 -in {{certificate.crt}} -out {{certificate.pem|certificate.der}} -outform {{pem|der}}
```

- Check certificate details:

```
openssl x509 -in {{certificate.crt}} -text -noout
```

- Generate a certificate signing request (CSR):

```
openssl req -new -key {{private.key}} -out {{request.csr}}
```

- Display help:

```
openssl help
```

- Display version:

```
openssl version
```

openstack flavor

Manage OpenStack instance flavors (virtual hardware templates).

More information: https://docs.openstack.org/python-openstackclient/latest/cli/command-objects/flavor.html.

- List all flavors:

```
openstack flavor list
```

- Show details of a flavor:

```
openstack flavor show {{flavor_id_or_name}}
```

- Create a new flavor with 2 vCPUs, 4GB RAM, and 20GB disk:

```
openstack flavor create {{flavor_name}} --vcpus 2 --ram 4096
--disk 20
```

- Delete a flavor:

```
openstack flavor delete {{flavor_id_or_name}}
```

- Create a flavor with 10GB ephemeral disk and 512MB swap space:

```
openstack flavor create {{flavor_name}} --vcpus 4 --ram 8192
--disk 40 --ephemeral 10 --swap 512
```

openstack help

Display help information about the openstackclient cli.

More information: https://docs.openstack.org/python-openstackclient/latest/cli/man/openstack.html.

- Display a description of a particular command:

```
openstack help {{command_name}}
```

- Get help for Identity v3:

```
openstack --os-identity-api-version 3 --help
```

- Display help:

```
openstack --help
```

openstack image

OpenStack Image service, aka OpenStack Glance, allows users to upload and discover data assets meant to be used with other services.

More information: https://docs.openstack.org/python-openstackclient/latest/cli/command-objects/image-v2.html.

- List available images:

  ```
  openstack image list {{--private|--shared|--all}}
  ```

- Display image details:

  ```
  openstack image show --human-readable {{image_id}}
  ```

- Create/upload an image:

  ```
  openstack image create --file {{path/to/file}} {{--private|--shared|--all}} {{image_name}}
  ```

- Delete image(s):

  ```
  openstack image delete {{image_id1 image_id2 ...}}
  ```

- Save an image locally:

  ```
  openstack image save --file {{filename}} {{image_id}}
  ```

openstack network

Manage OpenStack network resources.

More information: https://docs.openstack.org/python-openstackclient/latest/cli/command-objects/network.html.

- List all networks:

  ```
  openstack network list
  ```

- Show details of a network:

  ```
  openstack network show {{network_id_or_name}}
  ```

- Create a new network with a given name:

  ```
  openstack network create {{network_name}}
  ```

- Delete a network:

  ```
  openstack network delete {{network_id_or_name}}
  ```

- Enable a network:

  ```
  openstack network set --enable {{network_id_or_name}}
  ```

- Disable a network:

  ```
  openstack network set --disable {{network_id_or_name}}
  ```

openstack port

Manage OpenStack network ports (virtual network interfaces).

More information: https://docs.openstack.org/python-openstackclient/latest/cli/command-objects/port.html.

- List all ports:

```
openstack port list
```

- Show detailed information about a specific port:

```
openstack port show {{port_id_or_name}}
```

- Create a port on a specific network:

```
openstack port create --network {{network_id_or_name}} {{port_name}}
```

- Create a port and assign it a fixed IP `192.168.1.50`:

```
openstack port create --network {{network_id}} --fixed-ip subnet={{subnet_id}},ip-address=192.168.1.50 {{port_name}}
```

- Delete a port:

```
openstack port delete {{port_id_or_name}}
```

openstack server

Manage OpenStack virtual machines.

OpenStack Compute service, aka OpenStack Nova, mainly hosts and manages cloud computing systems.

More information: https://docs.openstack.org/python-openstackclient/latest/cli/command-objects/server.html.

- List servers:

```
openstack server list
```

- Start server(s):

```
openstack server start {{instance_id1 instance_id2 ...}}
```

- Stop server:

```
openstack server stop {{instance_id1 instance_id2 ...}}
```

- Create new server:

```
openstack server create --image {{image_id}} --flavor
{{flavor_id}} --network {{network_id}} --wait {{server_name}}
```

- Delete server(s):

```
openstack server delete {{instance_id1 instance_id2 ...}}
```

- Migrate server to different host:

```
openstack server migrate --live {{host_hostname}} {{--shared-
migration|--block-migration}} --wait {{instance_id}}
```

- Perform a soft or hard reset to the server:

```
openstack server reboot {{--soft|--hard}} --wait
{{instance_id}}
```

openstack subnet

Manage OpenStack subnets (IP address blocks within a network).

More information: https://docs.openstack.org/python-openstackclient/latest/cli/command-objects/subnet.html.

- List all subnets:

```
openstack subnet list
```

- Show details of a specific subnet:

```
openstack subnet show {{subnet_id_or_name}}
```

- List subnets associated with a network:

```
openstack subnet list --network {{network_id_or_name}}
```

- Create a subnet with subnet range `192.168.0.0/24` in a given network:

```
openstack subnet create --network {{network_id_or_name}} --subnet-range 192.168.0.0/24 {{subnet_name}}
```

- Delete a subnet:

```
openstack subnet delete {{subnet_id_or_name}}
```

- Update a subnet with DNS `8.8.8.8` and set a new name:

```
openstack subnet set --dns-nameserver 8.8.8.8 --name {{new_subnet_name}} {{subnet_id}}
```

openstack volume

Manage OpenStack volumes.

OpenStack Block Storage service, aka OpenStack Cinder, provides volumes to Nova vm's, Ironic bare-metal hosts, containers, and others.

More information: https://docs.openstack.org/python-openstackclient/latest/cli/command-objects/volume.html.

- List volumes:

```
openstack volume list --all-projects
```

- Show volume details:

```
openstack volume show {{volume_id}}
```

- Create new volume:

```
openstack volume create --size {{size_in_GB}} --image
{{image_id}} --snapshot {{snapshot_id}} {{--bootable|--non-
bootable}} {{volume_name}}
```

- Delete volumes(s):

```
openstack volume delete {{volume_id1 volume_id2 ...}}
```

- Migrate volume to a new host:

```
openstack volume migrate --host {{host_hostname}}
{{instance_id}}
```

- Set volume properties:

```
openstack volume set --name {{volume_new_name}} --size
{{volume_new_size}} {{--attached|--detached}} {{--bootable|--
non-bootable}} {{volume_id}}
```

openttd

Open source clone of the Microprose game "Transport Tycoon Deluxe".

More information: https://wiki.openttd.org/en/Manual/Command%20line.

- Start a new game:

```
openttd -g
```

- Load save game at start:

```
openttd -g {{path/to/file}}
```

- Start with the specified window resolution:

```
openttd -r {{1920x1080}}
```

- Start with a custom configuration file:

```
openttd -c {{path/to/file}}
```

- Start with selected video, sound, and music drivers:

```
openttd -v {{video_driver}} -s {{sound_driver}} -m
{{music_driver}}
```

- Start a dedicated server, forked in the background:

```
openttd -f -D {{host}}:{{port}}
```

- Join a server with a password:

```
openttd -n {{host}}:{{port}}#{{player_name}} -p {{password}}
```

openvpn

OpenVPN client and daemon binary.

More information: https://openvpn.net/community-docs/community-articles/openvpn-2-6-manual.html.

- Connect to server using a configuration file:

```
sudo openvpn {{path/to/client.conf}}
```

- Try to set up an insecure peer-to-peer tunnel on bob.example.com host:

```
sudo openvpn --remote {{alice.example.com}} --dev {{tun1}} --ifconfig {{10.4.0.1}} {{10.4.0.2}}
```

- Connect to the awaiting bob.example.com host without encryption:

```
sudo openvpn --remote {{bob.example.com}} --dev {{tun1}} --ifconfig {{10.4.0.2}} {{10.4.0.1}}
```

- Create a cryptographic key and save it to file:

```
openvpn --genkey secret {{path/to/key}}
```

- Try to set up a peer-to-peer tunnel on bob.example.com host with a static key:

```
sudo openvpn --remote {{alice.example.com}} --dev {{tun1}} --ifconfig {{10.4.0.1}} {{10.4.0.2}} --secret {{path/to/key}}
```

- Connect to the awaiting bob.example.com host with the same static key as on bob.example.com:

```
sudo openvpn --remote {{bob.example.com}} --dev {{tun1}} --ifconfig {{10.4.0.2}} {{10.4.0.1}} --secret {{path/to/key}}
```

opera

This command is an alias of **`chromium`**.

More information: https://www.opera.com/.

- View documentation for the original command:

```
tldr chromium
```

opt

Run optimizations and analyze LLVM source files.

More information: https://llvm.org/docs/CommandGuide/opt.html.

- Run an optimization or analysis on a bitcode file:

```
opt -{{passname}} {{path/to/file.bc}} -S -o {{file_opt.bc}}
```

- Output the Control Flow Graph of a function to a `.dot` file:

```
opt {{-dot-cfg}} -S {{path/to/file.bc}} -disable-output
```

- Optimize the program at level 2 and output the result to another file:

```
opt -O2 {{path/to/file.bc}} -S -o {{path/to/output_file.bc}}
```

optipng

PNG file optimization utility.

More information: https://optipng.sourceforge.net/optipng-7.9.1.man1.html.

- Compress a PNG with default settings:

```
optipng {{path/to/file.png}}
```

- Compress a PNG with the best compression:

```
optipng -o {{7}} {{path/to/file.png}}
```

- Compress a PNG with the fastest compression:

```
optipng -o {{0}} {{path/to/file.png}}
```

- Compress a PNG and add interlacing:

```
optipng -i {{1}} {{path/to/file.png}}
```

- Compress a PNG and preserve all metadata (including file timestamps):

```
optipng -preserve {{path/to/file.png}}
```

- Compress a PNG and remove all metadata:

```
optipng -strip all {{path/to/file.png}}
```

opusenc

Convert WAV or FLAC audio to Opus.

More information: https://opus-codec.org/docs/opus-tools/opusenc.html.

- Convert WAV to Opus using default options:

```
opusenc {{path/to/input.wav}} {{path/to/output.opus}}
```

- Convert stereo audio at the highest quality level:

```
opusenc --bitrate {{512}} {{path/to/input.wav}} {{path/to/output.opus}}
```

- Convert 5.1 surround sound audio at the highest quality level:

```
opusenc --bitrate {{1536}} {{path/to/input.flac}} {{path/to/output.opus}}
```

- Convert speech audio at the lowest quality level:

```
opusenc {{path/to/input.wav}} --downmix-mono --bitrate {{6}} {{path/to/out.opus}}
```

orca-c

A C-port of the ORCA live programming environment.

ORCA is an esoteric programming language for creating procedural sequencers.

More information: https://github.com/hundredrabbits/Orca-c.

- Start ORCA with an empty workspace:

```
orca-c
```

- Start ORCA and open a specific file:

```
orca-c {{path/to/file.orca}}
```

- Start ORCA and set a specific tempo (defaults to 120):

```
orca-c --bpm {{beats_per_minute}}
```

- Start ORCA and set the size of the grid:

```
orca-c --initial-size {{columns}}x{{rows}}
```

- Start ORCA and set the maximum number of undo steps (defaults to 100):

```
orca-c --undo-limit {{limit}}
```

- Show the main menu inside of ORCA:

```
<F1>
```

- Show all shortcuts inside of ORCA:

```
<?>
```

- Show all ORCA operators inside of ORCA:

```
<Ctrl g>
```

osage

Render an image of a **clustered** network graph from a **graphviz** file.

Layouts: **dot**, **neato**, **twopi**, **circo**, **fdp**, **sfdp**, **osage** & **patchwork**.

More information: https://graphviz.org/doc/info/command.html.

- Render a PNG image with a filename based on the input filename and output format (uppercase -O):

```
osage -T {{png}} -O {{path/to/input.gv}}
```

- Render a SVG image with the specified output filename (lowercase -o):

```
osage -T {{svg}} -o {{path/to/image.svg}} {{path/to/input.gv}}
```

- Render the output in PS, PDF, SVG, Fig, PNG, GIF, JPEG, JSON, or DOT format:

```
osage -T {{format}} -O {{path/to/input.gv}}
```

- Render a GIF image using `stdin` and `stdout`:

```
echo "{{digraph {this -> that} }}" | osage -T {{gif}} > {{path/to/image.gif}}
```

- Display help:

```
osage -?
```

osmium

Multipurpose tool for handling OpenStreetMap (OSM) files.

More information: https://osmcode.org/osmium-tool/manual.

- Show file information:

```
osmium fileinfo {{path/to/input.osm}}
```

- Display contents:

```
osmium show {{path/to/input.osm}}
```

- Convert file format from PBF into XML:

```
osmium cat {{path/to/input.osm.pbf}} {{[-o|--output]}}
{{path/to/output.osm}}
```

- Extract a geographic region by the given [b]ounding box:

```
osmium extract {{[-b|--bbox]}} {{min_longitude}},
{{min_latitude}},{{max_longitude}},{{max_latitude}} {{path/
to/input.pbf}} {{[-o|--output]}} {{path/to/output.pbf}}
```

- Extract a geographic region by a GeoJSON file:

```
osmium extract {{[-p|--polygon]}} {{path/to/polygon.geojson}}
{{path/to/input.pbf}} {{[-o|--output]}} {{path/to/
output.pbf}}
```

- Filter all objects tagged as "restaurant":

```
osmium tags-filter {{path/to/input.pbf}} amenity=restaurant
{{[-o|--output]}} {{path/to/output.pbf}}
```

- Filter for "way" objects tagged as "highway":

```
osmium tags-filter {{path/to/input.pbf}} w/highway {{[-o|--
output]}} {{path/to/output.pbf}}
```

- Filter "way" and "relation" objects tagged as "building":

```
osmium tags-filter {{path/to/input.pbf}} wr/building {{[-o|--
output]}} {{path/to/output.pbf}}
```

osv-scanner

Scan various mediums for dependencies and matches them against the OSV database.

More information: https://google.github.io/osv.dev/faq/.

- Scan a Docker image:

```
osv-scanner -D {{docker_image_name}}
```

- Scan a package lockfile:

```
osv-scanner -L {{path/to/lockfile}}
```

- Scan an SBOM file:

```
osv-scanner -S {{path/to/sbom_file}}
```

- Scan multiple directories recursively:

```
osv-scanner -r {{directory1 directory2 ...}}
```

- Skip scanning Git repositories:

```
osv-scanner --skip-git {{-r|-D}} {{target}}
```

- Output result in JSON format:

```
osv-scanner --json {{-D|-L|-S|-r}} {{target}}
```

ouch

Utility for compressing and decompressing files and directories.

More information: https://crates.io/crates/ouch.

- Decompress a specific file:

```
ouch decompress {{path/to/archive.tar.xz}}
```

- Decompress a file to a specific location:

```
ouch decompress {{path/to/archive.tar.xz}} --dir {{path/to/
directory}}
```

- Decompress multiple files:

```
ouch decompress {{path/to/archive1.tar path/to/
archive2.tar.gz ...}}
```

- Compress files:

```
ouch compress {{path/to/file1 path/to/file2 ...}} {{path/to/
archive.zip}}
```

oxipng

Losslessly improve compression of PNG files.

More information: https://manned.org/oxipng.

- Compress a PNG file (overwrites the file by default):

```
oxipng {{path/to/file.png}}
```

- Compress a PNG file and save the output to a new file:

```
oxipng --out {{path/to/output.png}} {{path/to/file.png}}
```

- Compress all PNG files in the current directory using multiple threads:

```
oxipng "*.png"
```

- Compress a file with a set optimization level (default is 2):

```
oxipng {{[-o|--opt]}} {{0|1|2|3|4|5|6|max}} {{path/to/
file.png}}
```

- Set the PNG interlacing type (`0` removes interlacing, `1` applies Adam7 interlacing, `keep` preserves existing interlacing; default is `0`):

```
oxipng {{[-i|--interlace]}} {{0|1|keep}} {{path/to/file.png}}
```

- Perform additional optimization on images with an alpha channel:

```
oxipng {{[-a|--alpha]}} {{path/to/file.png}}
```

- Use the much slower but stronger Zopfli compressor with max optimization:

```
oxipng {{[-Z|--zopfli]}} {{[-o|--opt]}} max {{path/to/
file.png}}
```

- Strip all non-critical metadata chunks:

```
oxipng --strip all {{path/to/file.png}}
```

p10k

Manage configurations for powerlevel10k.

More information: https://github.com/romkatv/powerlevel10k.

- Configure powerlevel10k interactively:

```
p10k configure
```

- Reload powerlevel10k:

```
p10k reload
```

- Display help:

```
p10k help
```

p4

Perforce Version Control System.

More information: https://help.perforce.com/helix-core/server-apps/cmdref/current/Content/CmdRef/commands.html.

- Log in to the Perforce service:

```
p4 login -a
```

- Create a client:

```
p4 client
```

- Copy files from depot into the client workspace:

```
p4 sync
```

- Create or edit changelist description:

```
p4 change
```

- Open a file to edit:

```
p4 edit -c {{changelist_number}} {{path/to/file}}
```

- Open a new file to add it to the depot:

```
p4 add
```

- Display list of files modified by changelist:

```
p4 describe -c {{changelist_number}}
```

- Submit a changelist to the depot:

```
p4 submit -c {{changelist_number}}
```

p5

Template builder and sketch manager for p5.js.

More information: https://github.com/chiunhau/p5-manager.

- Create a new p5 collection:

  ```
  p5 new {{collection_name}}
  ```

- Generate a new p5 project (should be run from collection directory):

  ```
  p5 generate {{project_name}}
  ```

- Run the p5 manager server:

  ```
  p5 server
  ```

- Update libraries to their latest versions:

  ```
  p5 update
  ```

p7zip

Wrapper of 7-Zip file archiver with high compression ratio.

Internally executes either 7za or 7zr command.

More information: https://manned.org/p7zip.

- Archive a file, replacing it with a 7zipped compressed version:

```
p7zip {{path/to/file}}
```

- Archive a file keeping the input file:

```
p7zip {{[-k|--keep]}} {{path/to/file}}
```

- Decompress a file, replacing it with the original uncompressed version:

```
p7zip {{[-d|--decompress]}} {{compressed.ext}}.7z
```

- Decompress a file keeping the input file:

```
p7zip {{[-d|--decompress]}} {{[-k|--keep]}}
{{compressed.ext}}.7z
```

- Skip some checks and force compression or decompression:

```
p7zip {{[-f|--force]}} {{path/to/file}}
```

paci

A package manager for Bash scripts.

More information: https://github.com/tradebyte/paci#usage.

- Update the list of available packages and versions (it's recommended to run this before other `paci` commands):

```
paci refresh
```

- Configure its behavior:

```
paci configure
```

- Search for a given package:

```
paci search {{package}}
```

- Install a package:

```
paci install {{package}}
```

- Update a package:

```
paci update {{package}}
```

packer

Build automated machine images.

More information: https://developer.hashicorp.com/packer/docs/commands.

- Build an image:

  ```
  packer build {{path/to/config.json}}
  ```

- Check the syntax of a Packer image config:

  ```
  packer validate {{path/to/config.json}}
  ```

- Format a Packer image config:

  ```
  packer fmt {{path/to/config.pkr.hcl}}
  ```

packtpub

Download freely offered books from packtpub.com.

More information: https://github.com/vladimyr/packtpub-cli.

- Download the daily offer book into the current directory with the specified book format (defaults to `pdf`):

```
packtpub download {{[-t|--type]}} {{pdf|ebup|mobi}}
```

- Download the daily offer book into the specified directory:

```
packtpub download {{[-d|--dir]}} {{path/to/directory}}
```

- Start an interactive login to packtpub.com:

```
packtpub login
```

- Log out from packtpub.com:

```
packtpub logout
```

- Display the daily offer:

```
packtpub view-offer
```

- Open the daily offer in the default web browser:

```
packtpub view-offer
```

- Display the currently logged-in user:

```
packtpub whoami
```

packwiz

Create, edit, and manage Minecraft modpacks.

More information: https://packwiz.infra.link/reference/commands/packwiz/.

- Interactively create a new modpack in the current directory:

  ```
  packwiz init
  ```

- Add a mod from Modrinth or Curseforge:

  ```
  packwiz {{modrinth|curseforge}} add {{url|slug|search_term}}
  ```

- List all mods in the modpack:

  ```
  packwiz list
  ```

- Update `index.toml` after manually editing files:

  ```
  packwiz refresh
  ```

- Export as a Modrinth (`.mrpack`) or Curseforge (Zip) file:

  ```
  packwiz {{modrinth|curseforge}} export
  ```

pactl

Control a running PulseAudio sound server.

More information: https://manned.org/pactl.

- Show information about the sound server:

```
pactl info
```

- List all sinks (or other types - sinks are outputs and sink-inputs are active audio streams):

```
pactl list {{sinks}} short
```

- Change the default sink (output) to 1 (the number can be retrieved via the `list` subcommand):

```
pactl set-default-sink {{1}}
```

- Move sink-input 627 to sink 1:

```
pactl move-sink-input {{627}} {{1}}
```

- Set the volume of sink 1 to 75%:

```
pactl set-sink-volume {{1}} {{0.75}}
```

- Toggle mute on the default sink (using the special name `@DEFAULT_SINK@`):

```
pactl set-sink-mute {{@DEFAULT_SINK@}} toggle
```

pageres

Capture screenshots of websites in various resolutions.

More information: https://github.com/sindresorhus/pageres-cli.

- Take multiple screenshots of multiple URLs at different resolutions:

```
pageres {{https://example.com/}} {{https://example2.com/}}
{{1366x768}} {{1600x900}}
```

- Provide specific options for a URL, overriding global options:

```
pageres [{{https://example.com/}} {{1366x768}} --no-crop]
[{{https://example2.com/}} {{1024x768}}] {{[-c|--crop]}}
```

- Provide a custom filename template:

```
pageres {{https://example.com/}} {{1024x768}} --
filename='{{<%= date %> - <%= url %>}}'
```

- Capture a specific element on a page:

```
pageres {{https://example.com/}} {{1366x768}} --
selector='{{.page-header}}'
```

- Hide a specific element:

```
pageres {{https://example.com/}} {{1366x768}} --
hide='{{.page-header}}'
```

- Capture a screenshot of a local file:

```
pageres {{path/to/local_file.html}} {{1366x768}}
```

pake

Turn any webpage into a desktop app with Rust/Tauri.

More information: https://github.com/tw93/Pake.

- Package a web page:

```
pake {{https://www.example.com/}}
```

- Package a web page with a specific window size:

```
pake --width {{800}} --height {{600}} {{https://
www.example.com/}}
```

- Package a web page with a custom application name and icon:

```
pake --name {{application_name}} --icon {{path/to/icon.ico}}
{{https://www.example.com/}}
```

- Package a web page with a non-resizable window:

```
pake --no-resizable {{https://www.example.com/}}
```

- Package a web page with fullscreen mode:

```
pake --fullscreen {{https://www.example.com/}}
```

- Package a web page with a transparent title bar:

```
pake --transparent {{https://www.example.com/}}
```

palmtopnm

Convert a Palm bitmap file to a PNM image.

More information: https://netpbm.sourceforge.net/doc/palmtopnm.html.

- Convert a Palm bitmap to a PNM image:

```
palmtopnm {{path/to/file.palm}} > {{path/to/file.pnm}}
```

- Display information about the input file:

```
palmtopnm {{[-verb|-verbose]}} {{path/to/file.palm}} >
{{path/to/file.pnm}}
```

- Convert the n'th rendition of the image contained in the input file:

```
palmtopnm {{[-r|-rendition]}} {{n}} {{path/to/file.palm}} >
{{path/to/file.pnm}}
```

- Write a histogram of the colors in the input file to `stdout`:

```
palmtopnm {{[-s|-showhist]}} {{path/to/file.palm}} > {{path/
to/file.pnm}}
```

- Output the transparent color of the input image if set:

```
palmtopnm {{[-t|-transparent]}} {{path/to/file.palm}}
```

pamarith

Apply a binary function on two Netpbm images.

See also: **pamfunc**.

More information: https://netpbm.sourceforge.net/doc/pamarith.html.

- Apply the specified binary function pixel-wise on the two specified images (which must be of the same size):

```
pamarith -{{add|subtract|multiply|divide|difference|minimum|maximum|...}} {{path/to/image1.pam|pbm|pgm|ppm}} {{path/to/image2.pam|pbm|pgm|ppm}}
```

pambackground

Create a mask of the background in a PAM image.

See also: **pbmmask**.

More information: https://netpbm.sourceforge.net/doc/pambackground.html.

- Create a mask of the background in a PAM image:

```
pambackground {{path/to/image.pam}} > {{path/to/output.pam}}
```

pambrighten

Change a PAM image's saturation and value.

More information: https://netpbm.sourceforge.net/doc/pambrighten.html.

- Increase the saturation of each pixel by the specified percentage:

```
pambrighten {{[-s|-saturation]}} {{value_percent}} {{path/to/image.pam}} > {{path/to/output.pam}}
```

- Increase the value (from the HSV color space) of each pixel by the specified percentage:

```
pambrighten {{[-va|-value]}} {{value_percent}} {{path/to/image.pam}} > {{path/to/output.pam}}
```

pamcomp

Overlay two PAM images.

More information: https://netpbm.sourceforge.net/doc/pamcomp.html.

- Overlay two images such with the overlay blocking parts of the underlay:

```
pamcomp {{path/to/overlay.pam}} {{path/to/underlay.pam}} > {{path/to/output.pam}}
```

- Set the horizontal alignment of the overlay:

```
pamcomp {{[-ali|-align]}} {{left|center|right|beyondleft|beyondright}} {{[-x|-xoff]}} {{x_offset}} {{path/to/overlay.pam}} {{path/to/underlay.pam}} > {{path/to/output.pam}}
```

- Set the vertical alignment of the overlay:

```
pamcomp {{[-va|-valign]}} {{top|middle|bottom|above|below}} {{[-y|-yoff]}} {{y_offset}} {{path/to/overlay.pam}} {{path/to/underlay.pam}} > {{path/to/output.pam}}
```

- Set the opacity of the overlay:

```
pamcomp {{[-o|-opacity]}} {{0.7}} {{path/to/overlay.pam}} {{path/to/underlay.pam}} > {{path/to/output.pam}}
```

pamcrater

Create a PAM image of cratered terrain.

See also: **pamshadedrelief**, **ppmrelief**.

More information: https://netpbm.sourceforge.net/doc/pamcrater.html.

- Create an image of cratered terrain with the specified dimensions:

```
pamcrater {{[-h|-height]}} {{height}} {{[-w|-width]}}
{{width}} > {{path/to/output.pam}}
```

- Create an image containing the specified number of craters:

```
pamcrater {{[-n|-number]}} {{n_craters}} > {{path/to/
output.pam}}
```

pamcut

Cut out a rectangular region from a Netpbm image.

See also: **pamdice**, **pamcomp**.

More information: https://netpbm.sourceforge.net/doc/pamcut.html.

- Discard the specified number of columns/rows on each side of the image:

```
pamcut {{[-cropl|-cropleft]}} {{value}} {{[-cropr|-
cropright]}} {{value}} {{[-cropt|-croptop]}} {{value}} {{[-
cropb|-cropbottom]}} {{value}} {{path/to/image.ppm}} >
{{path/to/output.ppm}}
```

- Keep only the columns between the specified columns (inclusively):

```
pamcut {{[-l|-left]}} {{value}} {{[-ri|-right]}} {{value}}
{{path/to/image.ppm}} > {{path/to/output.ppm}}
```

- Fill missing areas with black pixels if the specified rectangle does not entirely lie within the input image:

```
pamcut {{[-t|-top]}} {{value}} {{[-b|-bottom]}} {{value}} -
pad {{path/to/image.ppm}} > {{path/to/output.ppm}}
```

pamdeinterlace

Remove every other row in a Netpbm image.

See also: **pammixinterlace**.

More information: https://netpbm.sourceforge.net/doc/pamdeinterlace.html.

- Produce an image consisting of the input's even-numbered rows:

```
pamdeinterlace {{path/to/image.ppm}} > {{path/to/output.ppm}}
```

- Produce an image consisting of the input's odd-numbered rows:

```
pamdeinterlace {{[-takeo|-takeodd]}} {{path/to/image.ppm}} >
{{path/to/output.ppm}}
```

pamdepth

Reduce the depth (i.e. color resolution) in an image.

More information: https://netpbm.sourceforge.net/doc/pamdepth.html.

- Read a PBM image, set its maxval and save it to a file:

```
pamdepth {{maxval}} {{path/to/image.pbm}} > {{path/to/file.pbm}}
```

pamdice

Slice a Netpbm image vertically or horizontally.

See also: **pamundice**.

More information: https://netpbm.sourceforge.net/doc/pamdice.html.

- Slice a Netpbm image such that the resulting tiles have the specified height and width:

```
pamdice {{[-o|-outstem]}} {{path/to/filename_stem}} {{[-he|-height]}} {{value}} {{[-w|-width]}} {{value}} {{path/to/input.ppm}}
```

- Make the produced pieces overlap by the specified amount horizontally and vertically:

```
pamdice {{[-o|-outstem]}} {{path/to/filename_stem}} {{[-he|-height]}} {{value}} {{[-w|-width]}} {{value}} {{[-ho|-hoverlap]}} {{value}} {{[-vo|-voverlap]}} {{value}} {{path/to/input.ppm}}
```

pamditherbw

Apply dithering to a greyscale image, i.e. turn it into a pattern of black and white pixels that look the same as the original greyscale.

See also: **pbmreduce**.

More information: https://netpbm.sourceforge.net/doc/pamditherbw.html.

- Read a PGM image, apply dithering and save it to a file:

```
pamditherbw {{path/to/image.pgm}} > {{path/to/file.pgm}}
```

- Use the specified quantization method:

```
pamditherbw -{{floyd|fs|atkinson|threshold|hilbert|...}}
{{path/to/image.pgm}} > {{path/to/file.pgm}}
```

- Use the atkinson quantization method and the specified seed for a pseudo-random number generator:

```
pamditherbw {{[-a|-atkinson]}} {{[-r|-randomseed]}} {{1337}}
{{path/to/image.pgm}} > {{path/to/file.pgm}}
```

- Specify the thresholding value for quantization methods that perform some sort of thresholding:

```
pamditherbw -{{fs|atkinson|thresholding}} {{[-va|-value]}}
{{0.3}} {{path/to/image.pgm}} > {{path/to/file.pgm}}
```

pamedge

Perform edge-detection on a Netpbm image.

More information: https://netpbm.sourceforge.net/doc/pamedge.html.

- Perform edge-detection on a Netpbm image:

```
pamedge {{path/to/input.pam}} > {{path/to/output.pam}}
```

pamenlarge

Enlarge a PAM image by duplicating pixels.

See also: **pbmreduce**, **pamditherbw**, **pbmpscale**.

More information: https://netpbm.sourceforge.net/doc/pamenlarge.html.

- Enlarge the specified image by the specified factor:

```
pamenlarge {{[-s|-scale]}} {{n}} {{path/to/image.pam}} >
{{path/to/output.pam}}
```

- Enlarge the specified image by the specified factors horizontally and vertically:

```
pamenlarge {{[-x|-xscale]}} {{xn}} {{[-y|-yscale]}} {{yn}}
{{path/to/image.pam}} > {{path/to/output.pam}}
```

pamexec

Execute a shell command on each image in a Netpbm file.

See also: **pamfile**, **pampick**, **pamsplit**.

More information: https://netpbm.sourceforge.net/doc/pamexec.html.

- Execute a shell command on each image in a Netpbm file:

```
pamexec {{command}} {{path/to/image.pam}}
```

- Stop processing if a command terminates with a nonzero exit status:

```
pamexec {{command}} {{path/to/image.pam}} {{[-c|-check]}}
```

pamfile

Describe Netpbm (PAM or PNM) files.

More information: https://netpbm.sourceforge.net/doc/pamfile.html.

- Describe the specified Netpbm files:

```
pamfile {{path/to/file1 path/to/file2 ...}}
```

- Describe every image in each input file (as opposed to only the first image in each file) in a machine-readable format:

```
pamfile {{[-a|-allimages]}} -machine {{path/to/file}}
```

- Display a count on how many images the input files contain:

```
pamfile {{[-cou|-count]}} {{path/to/file}}
```

pamfix

Fix errors in PAM, PBM, PGM, and PPM files.

See also: **`pamfile`**, **`pamvalidate`**.

More information: https://netpbm.sourceforge.net/doc/pamfix.html.

- Fix a Netpbm file that is missing its last part:

```
pamfix {{[-t|-truncate]}} {{path/to/corrupted.ext}} > {{path/to/output.ext}}
```

- Fix a Netpbm file where pixel values exceed the image's `maxval` by lowering the offending pixels' values:

```
pamfix {{[-cl|-clip]}} {{path/to/corrupted.ext}} > {{path/to/output.ext}}
```

- Fix a Netpbm file where pixel values exceed the image's `maxval` by increasing it:

```
pamfix {{[-ch|-changemaxval]}} {{path/to/corrupted.pam|pbm|pgm|ppm}} > {{path/to/output.pam|pbm|pgm|ppm}}
```

pamfixtrunc

This command has been superseded by **`pamfix -truncate`**.

More information: https://netpbm.sourceforge.net/doc/pamfixtrunc.html.

- View documentation for the current command:

```
tldr pamfix
```

pamflip

Flip or rotate a PAM or PNM image.

More information: https://netpbm.sourceforge.net/doc/pamflip.html.

- Rotate the input image counter-clockwise for a specific degree:

```
pamflip {{[-r|-rotate]}}{{90|180|270}} {{path/to/input.pam}}
> {{path/to/output.pam}}
```

- Flip left for right:

```
pamflip {{[-lr|-leftright]}} {{path/to/input.pam}} > {{path/
to/output.pam}}
```

- Flip top for bottom:

```
pamflip {{[-tb|-topbottom]}} {{path/to/input.pam}} > {{path/
to/output.pam}}
```

- Flip the input image on the main diagonal:

```
pamflip {{[-xy|-transpose]}} {{path/to/input.pam}} > {{path/
to/output.pam}}
```

pamfunc

Apply a simple arithmetic function to a Netpbm image.

More information: https://netpbm.sourceforge.net/doc/pamfunc.html.

- Apply the specified arithmetic function with n as the second argument to each sample in the specified PAM image:

```
pamfunc -{{multiplier|divisor|adder|subtractor|min|max}}
{{n}} {{path/to/input.pam}} > {{path/to/output.pam}}
```

- Apply the specified bit string function with n as the second argument to each sample in the specified PAM image:

```
pamfunc -{{andmask|ormask|xormask|shiftleft|shiftright}}
{{n}} {{path/to/input.pam}} > {{path/to/output.pam}}
```

pamixer

A simple command-line mixer for PulseAudio.

More information: https://github.com/cdemoulins/pamixer#installation.

- List all sinks and sources with their corresponding IDs:

```
pamixer --list-sinks --list-sources
```

- Set the volume to 75% on the default sink:

```
pamixer --set-volume {{75}}
```

- Toggle mute on a sink other than the default:

```
pamixer --toggle-mute --sink {{ID}}
```

- Increase the volume on default sink by 5%:

```
pamixer {{[-i|--increase]}} {{5}}
```

- Decrease the volume on a source by 5%:

```
pamixer {{[-d|--decrease]}} {{5}} --source {{ID}}
```

- Use the allow boost option to increase, decrease, or set the volume above 100%:

```
pamixer --set-volume {{105}} --allow-boost
```

- Mute the default sink (use `--unmute` instead to unmute):

```
pamixer {{[-m|--mute]}}
```

pammixinterlace

Merge each row in an image with its two neighbours.

See also: **pamdeinterlace**.

More information: https://netpbm.sourceforge.net/doc/pammixinterlace.html.

- Merge each row in an image with its two neighbours:

```
pammixinterlace {{path/to/image.ppm}} > {{path/to/
output.ppm}}
```

- Use the specified filtering mechanism:

```
pammixinterlace {{[-f|-filter]}} {{linear|fir|ffmpeg}}
{{path/to/image.ppm}} > {{path/to/output.ppm}}
```

- Turn on adaptive filtering mode, i.e., only modify pixels that are obviously part of a comb pattern:

```
pammixinterlace {{[-a|-adaptive]}} {{path/to/image.ppm}} >
{{path/to/output.ppm}}
```

pamnoraw

This command is an alias of **`pamtopnm -plain`**.

- View documentation for the original command:

  `tldr pamtopnm`

pamoil

Turn a PAM image into an oil painting.

More information: https://netpbm.sourceforge.net/doc/pamoil.html.

- Turn a PAM image into an oil painting:

```
pamoil {{path/to/input_file.pam}} > {{path/to/
output_file.pam}}
```

- Consider a neighborhood of n pixels for the "smearing" effect:

```
pamoil -n {{n}} {{path/to/input_file.pam}} > {{path/to/
output_file.pam}}
```

pampick

Pick images out of a multi-image Netpbm stream.

See also: **pamfile**, **pamsplit**.

More information: https://netpbm.sourceforge.net/doc/pampick.html.

- Execute a shell command on each image in a Netpbm file:

```
pampick < {{path/to/image.pam}} {{image_number1 image_number2 ...}} > {{path/to/output.pam}}
```

pampop9

Simulate a multi-lens camera such as the Pop9.

More information: https://netpbm.sourceforge.net/doc/pampop9.html.

- Tile the input image xtiles by ytiles times, increasing the offset each time as determined by xdelta and ydelta:

```
pampop9 {{path/to/input.pam}} {{xtiles}} {{ytiles}}
{{xdelta}} {{ydelta}} > {{path/to/output.pam}}
```

pamrgbatopng

This command has been superseded by **pamtopng**.

More information: https://netpbm.sourceforge.net/doc/pamrgbatopng.html.

- View documentation for the current command:

```
tldr pamtopng
```

pamscale

Scale a Netpbm image.

More information: https://netpbm.sourceforge.net/doc/pamscale.html.

- Scale an image such that the result has the specified dimensions:

```
pamscale {{[-wid|-width]}} {{width}} {{[-h|-height]}} {{height}} {{path/to/input.pam}} > {{path/to/output.pam}}
```

- Scale an image such that the result has the specified width, keeping the aspect ratio:

```
pamscale {{[-wid|-width]}} {{width}} {{path/to/input.pam}} > {{path/to/output.pam}}
```

- Scale an image such that its width and height is changed by the specified factors:

```
pamscale {{[-xsc|-xscale]}} {{x_factor}} {{[-ysc|-yscale]}} {{y_factor}} {{path/to/input.pam}} > {{path/to/output.pam}}
```

- Scale an image such that it fits into the specified bounding box while preserving its aspect ratio:

```
pamscale -xyfit {{bbox_width}} {{bbox_height}} {{path/to/input.pam}} > {{path/to/output.pam}}
```

- Scale an image such that it completely fills the specified box while preserving its aspect ratio:

```
pamscale -xyfill {{box_width}} {{box_height}} {{path/to/input.pam}} > {{path/to/output.pam}}
```

pamshadedrelief

Generate a shaded relief from an elevation map.

See also: **pamcrater**, **ppmrelief**.

More information: https://netpbm.sourceforge.net/doc/pamshadedrelief.html.

- Generate a shaded relief image with the input image interpreted as an elevation map:

```
pamshadedrelief < {{path/to/input.pam}} > {{path/to/
output.pam}}
```

- Gamma adjust the image by the specified factor:

```
pamshadedrelief < {{path/to/input.pam}} {{[-g|-gamma]}}
{{factor}} > {{path/to/output.pam}}
```

pamslice

Extract one line of values out of a PAM image.

More information: https://netpbm.sourceforge.net/doc/pamslice.html.

- Print the values of the pixels in the n'th row in a table:

```
pamslice {{[-r|-row]}} {{n}} {{path/to/image.pam}}
```

- Print the values of the pixels in the n'th column in a table:

```
pamslice {{[-c|-column]}} {{n}} {{path/to/image.pam}}
```

- Consider the m'th plane of the input image only:

```
pamslice {{[-r|-row]}} {{n}} -plane {{m}} {{path/to/
image.pam}}
```

- Produce output in a format suitable for input to an `xmgr` for visualisation:

```
pamslice {{[-r|-row]}} {{n}} {{[-x|-xmgr]}} {{path/to/
image.pam}}
```

pamsplit

Split a multi-image Netpbm file into multiple single-image Netpbm files.

See also: **`pamfile`**, **`pampick`**, **`pamexec`**.

More information: https://netpbm.sourceforge.net/doc/pamsplit.html.

- Split a multi-image Netpbm file into multiple single-image Netpbm files:

```
pamsplit {{path/to/image.pam}}
```

- Specify a pattern for naming output files:

```
pamsplit {{path/to/image.pam}} {{file_%d.pam}}
```

pamstack

Stack the planes of multiple PAM images into one PAM image.

More information: https://netpbm.sourceforge.net/doc/pamstack.html.

- Stack the planes of the specified PAM images in the specified order:

```
pamstack {{path/to/image1.pam path/to/image2.pam ...}} >
{{path/to/output.pam}}
```

- Specify the tuple type name of the output PAM file (maximum of 255 characters):

```
pamstack {{[-t|-tupletype]}} {{tuple_type}} {{path/to/
image1.pam path/to/image2.pam ...}} > {{path/to/output.pam}}
```

pamstretch-gen

Scale up a PAM image by decimal values.

See also: **pamstretch**, **pamenlarge**, **pamscale**.

More information: https://netpbm.sourceforge.net/doc/pamstretch-gen.html.

- Scale up a PAM image by the specified decimal factor:

```
pamstretch-gen {{n}} {{path/to/image.pam}} > {{path/to/
output.pam}}
```

pamstretch

Scale up a PAM image by interpolating between pixels.

See also: **pamstretch-gen**, **pamenlarge**, **pamscale**.

More information: https://netpbm.sourceforge.net/doc/pamstretch.html.

- Scale up a PAM image by an integer factor:

```
pamstretch {{n}} {{path/to/image.pam}} > {{path/to/
output.pam}}
```

- Scale up a PAM image by the specified factors in the horizontal and vertical directions:

```
pamstretch {{[-x|-xscale]}} {{xn}} {{[-y|-yscale]}} {{yn}}
{{path/to/image.pam}} > {{path/to/output.pam}}
```

pamtofits

Convert a Netpbm image to the Flexible Image Transport System (FITS) format.

See also: **`fitstopnm`**.

More information: https://netpbm.sourceforge.net/doc/pamtofits.html.

- Convert a Netpbm image to the FITS format:

```
pamtofits {{path/to/image.pam}} > {{path/to/output.fits}}
```

pamtogif

Convert a Netpbm image into an unanimated GIF image.

See also: **`giftopnm`**, **`gifsicle`**.

More information: https://netpbm.sourceforge.net/doc/pamtogif.html.

- Convert a Netpbm image into an unanimated GIF image:

```
pamtogif {{path/to/image.pam}} > {{path/to/output.gif}}
```

- Mark the specified color as transparent in the output GIF file:

```
pamtogif {{[-t|-transparent]}} {{color}} {{path/to/
image.pam}} > {{path/to/output.gif}}
```

- Include the specified text as a comment in the output GIF file:

```
pamtogif {{[-c|-comment]}} "{{Hello World!}}" {{path/to/
image.pam}} > {{path/to/output.gif}}
```

pamtopam

Copy a PAM image.

More information: https://netpbm.sourceforge.net/doc/pamtopam.html.

- Copy a PAM image (i.e. a PBM, PGM, PPM, or PAM image) from `stdin` to `stdout`:

```
pamtopam < {{path/to/image.pam}} > {{path/to/output.pam}}
```

- Display version:

```
pamtopam {{[-v|-version]}}
```

pamtopng

Convert a PAM image to PNG.

See also: **pnmtopng**, **pngtopam**.

More information: https://netpbm.sourceforge.net/doc/pamtopng.html.

- Convert the specified PAM image to PNG:

```
pamtopng {{path/to/image.pam}} > {{path/to/output.png}}
```

- Mark the specified color as transparent in the output image:

```
pamtopng {{[-t|-transparent]}} {{color}} {{path/to/
image.pam}} > {{path/to/output.png}}
```

- Include the text in the specified file as tEXt chunks in the output:

```
pamtopng {{[-te|-text]}} {{path/to/file.txt}} {{path/to/
image.pam}} > {{path/to/output.png}}
```

- Cause the output file to be interlaced in Adam7 format:

```
pamtopng {{[-in|-interlace]}} {{path/to/image.pam}} > {{path/
to/output.png}}
```

pamtopnm

Convert a PAM image to an equivalent PNM image.

More information: https://netpbm.sourceforge.net/doc/pamtopnm.html.

- Convert a PAM image to an equivalent PNM image, i.e. a PBM, PGM, or PPM image:

```
pamtopnm {{path/to/image.pam}} > {{path/to/output.pbm|pgm|ppm}}
```

- Display version:

```
pamtopnm {{[-v|-version]}}
```

pamtoqoi

Convert a Netpbm image to a QOI image (Quite OK Image format).

More information: https://netpbm.sourceforge.net/doc/pamtoqoi.html.

- Convert a Netpbm image to the QOI format:

```
pamtoqoi {{path/to/image.pnm}} > {{path/to/output.qoi}}
```

pamtosrf

Convert Netpbm images to SRF format.

See also: **srftopam**.

More information: https://netpbm.sourceforge.net/doc/pamtosrf.html.

- Convert a Netpbm image or a stream of Netpbm images to SRF format:

```
pamtosrf {{path/to/file.pam}} > {{path/to/output.srf}}
```

pamtotga

Convert a Netpbm image to a TrueVision Targa file.

More information: https://netpbm.sourceforge.net/doc/pamtotga.html.

- Convert a Netpbm image to a TrueVision Targa file:

```
pamtotga {{path/to/file.pam}} > {{path/to/output.tga}}
```

- Specify the color map of the output image:

```
pamtotga -{{cmap|cmap16|mono|rgb}} {{path/to/file.pam}} >
{{path/to/output.tga}}
```

- Display version:

```
pamtotga {{[-v|-version]}}
```

pamtotiff

Convert a PAM image to a TIFF file.

More information: https://netpbm.sourceforge.net/doc/pamtotiff.html.

- Convert a PAM image to a TIFF image:

```
pamtotiff {{path/to/input_file.pam}} > {{path/to/
output_file.tiff}}
```

- Explicitly specify a compression method for the output file:

```
pamtotiff -{{none|packbits|lzw|g3|g4|flate|adobeflate}}
{{path/to/input_file.pam}} > {{path/to/output_file.tiff}}
```

- Always produce a color TIFF image, even if the input image is greyscale:

```
pamtotiff {{[-c|-color]}} {{path/to/input_file.pam}} >
{{path/to/output_file.tiff}}
```

pamtouil

Convert a PNM or PAM file into a Motif UIL icon file.

More information: https://netpbm.sourceforge.net/doc/pamtouil.html.

- Convert a PNM or PAM file into a Motif UIL icon file:

```
pamtouil {{path/to/input.pnm|pam}} > {{path/to/output.uil}}
```

- Specify a prefix string to be printed in the output UIL file:

```
pamtouil {{[-n|-name]}} {{uilname}} {{path/to/input.pnm|pam}}
> {{path/to/output.uil}}
```

pamtowinicon

Convert a PAM image to a Windows ICO file.

More information: https://netpbm.sourceforge.net/doc/pamtowinicon.html.

- Convert a PAM image file to an ICO file:

```
pamtowinicon {{path/to/input_file.pam}} > {{path/to/
output.ico}}
```

- Encode images with resolutions smaller than `t` in the BMP format and all other images in the PNG format:

```
pamtowinicon {{[-pn|-pngthreshold]}} {{t}} {{path/to/
input_file.pam}} > {{path/to/output.ico}}
```

- Make all pixels outside the non-opaque area black:

```
pamtowinicon {{[-t|-truetransparent]}} {{path/to/
input_file.pam}} > {{path/to/output.ico}}
```

pamtoxvmini

Convert a Netpbm image to an XV thumbnail picture.

More information: https://netpbm.sourceforge.net/doc/pamtoxvmini.html.

- Convert a PAM image to an XV thumbnail picture:

```
pamtoxvmini {{path/to/input_file.pam}} > {{path/to/
output_file}}
```

pamundice

Combine a grid of Netpbm images into one.

See also: **pamdice**.

More information: https://netpbm.sourceforge.net/doc/pamundice.html.

- Combine the images whose names match the `printf`-style filename expression. Assume a grid with a specific size:

```
pamundice {{filename_%1d_%1a.ppm}} {{[-a|-across]}} {{grid_width}} {{[-d|-down]}} {{grid_height}} > {{path/to/output.ppm}}
```

- Assume that the tiles overlap horizontally and vertically by the specified amount:

```
pamundice {{filename_%1d_%1a.ppm}} {{[-a|-across]}} {{x_value}} {{[-d|-down]}} {{y_value}} {{[-ho|-hoverlap]}} {{value}} {{[-vo|-voverlap]}} {{value}} > {{path/to/output.ppm}}
```

- Specify the images to be combined through a text file containing one filename per line:

```
pamundice {{[-l|-listfile]}} {{path/to/file.txt}} {{[-a|-across]}} {{x_value}} {{[-d|-down]}} {{y_value}} > {{path/to/output.ppm}}
```

pamvalidate

Validate PAM, PGM, PBM, and PPM files.

See also: **`pamfile`**, **`pamfix`**.

More information: https://netpbm.sourceforge.net/doc/pamvalidate.html.

- Copy a Netpbm file from `stdin` to `stdout` if and only if it valid; fail otherwise:

```
{{command}} | pamvalidate > {{path/to/output.ext}}
```

pandoc

Convert documents between various formats.

More information: https://pandoc.org/MANUAL.html.

- Convert a Markdown file to PDF using `pdflatex` (the formats are determined by file extensions):

```
pandoc {{path/to/input.md}} {{[-o|--output]}} {{path/to/output.pdf}}
```

- Convert the output from another command to PDF, using a specific PDF engine:

```
{{command}} | pandoc {{[-f|--from]}} {{input_format}} --pdf-engine {{tectonic|weasyprint|typst|...}} {{[-o|--output]}} {{path/to/output.pdf}}
```

- Convert to a standalone file with the appropriate headers/footers (for LaTeX, HTML, etc.):

```
pandoc {{path/to/input.md}} {{[-s|--standalone]}} {{[-o|--output]}} {{path/to/output.html}}
```

- Manually specify formats (overriding automatic format detection using the filename extension, or when there is no extension):

```
pandoc {{[-f|--from]}} {{docx|...}} {{path/to/input}} {{[-t|--to]}} {{pdf|...}} {{[-o|--output]}} {{path/to/output}}
```

- Transform a document using a Lua script (see https://pandoc.org/lua-filters.html for more information):

```
pandoc {{path/to/input}} {{[-L|--lua-filter]}} {{path/to/filter.lua}} {{[-o|--output]}} {{path/to/output}}
```

- Convert a remote HTML file to markdown and print the result to `stdout`:

```
pandoc {{[-f|--from]}} html {{[-t|--to]}} markdown {{https://example.com}}
```

- List all supported input formats:

```
pandoc --list-input-formats
```

- List all supported output formats:

```
pandoc --list-output-formats
```

pangolin

Implements the dynamic nomenclature of SARS-CoV-2 lineages (Pango nomenclature).

More information: https://cov-lineages.org/resources/pangolin/usage.html.

- Run `pangolin` on the specified FASTA file:

  ```
  pangolin {{path/to/file.fa}}
  ```

- Use the specified analysis engine:

  ```
  pangolin --analysis-mode {{accurate|fast|pangolearn|usher}}
  ```

pants

Fast, scalable, user-friendly, open-source build and developer workflow tool.

More information: https://www.pantsbuild.org/stable/docs/using-pants/command-line-help.

- List all targets:

```
pants list ::
```

- Run all tests:

```
pants test ::
```

- Fix, format, and lint only uncommitted files:

```
pants --changed-since=HEAD fix fmt lint
```

- Typecheck only uncommitted files and their dependents:

```
pants --changed-since=HEAD --changed-dependents=transitive check
```

- Create a distributable package for the specified target:

```
pants package {{path/to/directory:target-name}}
```

- Auto-generate BUILD file targets for new source files:

```
pants tailor ::
```

- Display help:

```
pants help
```

paperkey

An OpenPGP key archiver.

More information: https://www.jabberwocky.com/software/paperkey/.

- Take a specific secret key and generate a text file with the secret data:

```
paperkey --secret-key {{path/to/secret_key.gpg}} --output
{{path/to/secret_data.txt}}
```

- Take the secret key data in `secret_data.txt` and combine it with the public key to reconstruct the secret key:

```
paperkey --pubring {{path/to/public_key.gpg}} --secrets
{{path/to/secret_data.txt}} --output {{secret_key.gpg}}
```

- Export a specific secret key and generate a text file with the secret data:

```
gpg --export-secret-key {{key}} | paperkey --output {{path/
to/secret_data.txt}}
```

papermc

Manage a Minecraft server.

More information: https://github.com/Edenhofer/minecraft-server/blob/main/minecraftd.sh.in#L480.

- Start a server:

```
papermc start
```

- Stop a server:

```
papermc stop
```

- Restart a server:

```
papermc restart
```

- Backup a world:

```
papermc backup
```

- Restore world data from a backup:

```
papermc restore {{path/to/file}}
```

- Display help:

```
papermc
```

par2

File verification and repair using PAR 2.0 compatible parity archives (.par2 files).

More information: https://github.com/Parchive/par2cmdline/.

- Create a parity archive with a set percentage level of redundancy:

```
par2 create -r{{1..100}} -- {{path/to/file}}
```

- Create a parity archive with a chosen number of volume files (in addition to the index file):

```
par2 create -n{{1..32768}} -- {{path/to/file}}
```

- Verify a file with a parity archive:

```
par2 verify -- {{path/to/file.par2}}
```

- Repair a file with a parity archive:

```
par2 repair -- {{path/to/file.par2}}
```

parallel-lint

Check the syntax of PHP files in parallel.

More information: https://github.com/JakubOnderka/PHP-Parallel-Lint.

- Lint a specific directory:

```
parallel-lint {{path/to/directory}}
```

- Lint a directory using the specified number of parallel processes:

```
parallel-lint -j {{processes}} {{path/to/directory}}
```

- Lint a directory, excluding the specified directory:

```
parallel-lint --exclude {{path/to/excluded_directory}}
{{path/to/directory}}
```

- Lint a directory of files using a comma-separated list of extension(s):

```
parallel-lint -e {{php,html,phpt}} {{path/to/directory}}
```

- Lint a directory and output the results as JSON:

```
parallel-lint --json {{path/to/directory}}
```

- Lint a directory and show Git Blame results for rows containing errors:

```
parallel-lint --blame {{path/to/directory}}
```

parallel

Run commands on multiple CPU cores.

More information: https://www.gnu.org/software/parallel/man.html.

- Gzip several files at once, using all cores:

```
parallel gzip ::: {{path/to/file1 path/to/file2 ...}}
```

- Read arguments from `stdin`, run 4 jobs at once:

```
ls *.txt | parallel {{[-j|--jobs]}} 4 gzip
```

- Convert JPEG images to PNG using replacement strings:

```
parallel convert {} {.}.png ::: *.jpg
```

- Parallel xargs, cram as many args as possible onto one command:

```
{{args}} | parallel -X {{command}}
```

- Break `stdin` into ~1M blocks, feed each block to `stdin` of new command:

```
cat {{big_file.txt}} | parallel --pipe --block 1M {{command}}
```

- Run on multiple machines via SSH:

```
parallel {{[-S|--sshlogin]}} {{machine1}},{{machine2}}
{{command}} ::: {{arg1}} {{arg2}}
```

- Download 4 files simultaneously from a text file containing links showing progress:

```
parallel {{[-j|--jobs]}} 4 --bar --eta curl {{[-sO|--silent
--remote-name]}} {} :::: {{path/to/links.txt}}
```

- Print the jobs which `parallel` is running in `stderr`:

```
parallel {{[-t|--verbose]}} {{command}} ::: {{args}}
```

parquet-tools

Show, inspect, and manipulate Parquet file.

More information: https://github.com/apache/parquet-java.

- Display the content of a Parquet file:

```
parquet-tools cat {{path/to/parquet}}
```

- Display the first few lines of a Parquet file:

```
parquet-tools head {{path/to/parquet}}
```

- Print the schema of a Parquet file:

```
parquet-tools schema {{path/to/parquet}}
```

- Print the metadata of a Parquet file:

```
parquet-tools meta {{path/to/parquet}}
```

- Print the content and metadata of a Parquet file:

```
parquet-tools dump {{path/to/parquet}}
```

- Concatenate several Parquet files into the target one:

```
parquet-tools merge {{path/to/parquet1}} {{path/to/parquet2}}
{{path/to/target_parquet}}
```

- Print the count of rows in a Parquet file:

```
parquet-tools rowcount {{path/to/parquet}}
```

- Print the column and offset indexes of a Parquet file:

```
parquet-tools column-index {{path/to/parquet}}
```

particle

Interact with Particle devices.

More information: https://docs.particle.io/tutorials/developer-tools/cli/.

- Log in or create an account for the Particle CLI:

  ```
  particle setup
  ```

- Display a list of devices:

  ```
  particle list
  ```

- Create a new Particle project interactively:

  ```
  particle project create
  ```

- Compile a Particle project:

  ```
  particle compile {{device_type}} {{path/to/source_code.ino}}
  ```

- Update a device to use a specific app remotely:

  ```
  particle flash {{device_name}} {{path/to/program.bin}}
  ```

- Update a device to use the latest firmware via serial:

  ```
  particle flash --serial {{path/to/firmware.bin}}
  ```

- Execute a function on a device:

  ```
  particle call {{device_name}} {{function_name}}
  {{function_arguments}}
  ```

pass otp

A pass extension for managing one-time-password (OTP) tokens.

More information: https://manned.org/pass-otp.

- Prompt for an otpauth URI token and create a new pass file:

```
pass otp insert {{path/to/pass}}
```

- Prompt for an otpauth URI token and append to an existing pass file:

```
pass otp append {{path/to/pass}}
```

- Print a 2FA code using the OTP token in a pass file:

```
pass otp {{path/to/pass}}
```

- Copy and don't print a 2FA code using the OTP token in a pass file:

```
pass otp {{[-c|--clip]}} {{path/to/pass}}
```

- Display a QR code using the OTP token stored in a pass file:

```
pass otp uri {{[-q|--qrcode]}} {{path/to/pass}}
```

- Prompt for an OTP secret value specifying issuer and account (at least one must be specified) and append to existing pass file:

```
pass otp append {{[-s|--secret]}} {{[-i|--issuer]}} {{issuer_name}} {{[-a|--account]}} {{account_name}} {{path/to/pass}}
```

pass

Store and read passwords or other sensitive data.

All data is GPG-encrypted, and managed with a Git repository.

More information: https://git.zx2c4.com/password-store/about/.

- Initialize (or re-encrypt) the storage using one or more GPG IDs:

```
pass init {{gpg_id_1 gpg_id_2 ...}}
```

- Save a new password and additional information (press `<Ctrl d>` on a new line to complete):

```
pass insert {{[-m|--multiline]}} {{path/to/data}}
```

- Edit an entry:

```
pass edit {{path/to/data}}
```

- Copy a password (first line of the data file) to the clipboard:

```
pass {{[-c|--clip]}} {{path/to/data}}
```

- List the whole store tree:

```
pass
```

- Generate a new random password with a given length, and copy it to the clipboard:

```
pass generate {{[-c|--clip]}} {{path/to/data}} {{num}}
```

- Initialize a new Git repository (any changes done by pass will be committed automatically):

```
pass git init
```

- Run a Git command on behalf of the password storage:

```
pass git {{command}}
```

passwd

Change a user's password.

See also: **`chpasswd`**.

More information: https://manned.org/passwd.

- Change the password of the current user interactively:

```
passwd
```

- Change the password of a specific user:

```
sudo passwd {{username}}
```

- Get the current status of the user:

```
passwd {{[-S|--status]}}
```

- Make the password of the account blank (it will set the named account passwordless):

```
passwd {{[-d|--delete]}}
```

- Set password programmatically (ideal for install scripts):

```
yes {{password}} | passwd
```

paste

Merge lines of files.

More information: https://www.gnu.org/software/coreutils/manual/html_node/paste-invocation.html.

- Join all the lines into a single line, using TAB as delimiter:

```
paste {{[-s|--serial]}} {{path/to/file}}
```

- Join all the lines into a single line, using the specified delimiter:

```
paste {{[-s|--serial]}} {{[-d|--delimiters]}} {{delimiter}} {{path/to/file}}
```

- Merge two files side by side, each in its column, using TAB as delimiter:

```
paste {{path/to/file1}} {{path/to/file2}}
```

- Merge two files side by side, each in its column, using the specified delimiter:

```
paste {{[-d|--delimiters]}} {{delimiter}} {{path/to/file1}} {{path/to/file2}}
```

- Merge two files, with lines added alternatively:

```
paste {{[-d|--delimiters]}} '\n' {{path/to/file1}} {{path/to/file2}}
```

pastel

Generate, analyze, convert, and manipulate colors.

More information: https://manned.org/pastel.

- Convert colors from one format to another. Here from RGB to HSL:

```
pastel format {{hsl}} {{ff8000}}
```

- Show and analyze colors on the terminal:

```
pastel color "{{rgb(255,50,127)}}"
```

- Pick a color from somewhere on the screen:

```
pastel pick
```

- Generate a set of n visually distinct colors:

```
pastel distinct {{n}}
```

- List all X11/CSS color names:

```
pastel list
```

patator

A multi-purpose brute-forcer, with a modular design and a flexible usage.

More information: https://github.com/lanjelot/patator/wiki/Usage.

- Brute force ssh login with rate limit and timeout options (successful login will show login banner or something similar):

```
patator ssh_login host={{ip_or_host}} user=FILE0
password=FILE1 0={{path/to/users.txt}} 1={{path/to/
passwords.txt}} --rate_limit={{seconds}} --
timeout={{seconds}} -x ignore:mesg='Authentication failed.'
```

- Brute force encrypted zip file:

```
patator unzip_pass zipfile={{path/to/file.zip}}
password=FILE0 0={{path/to/passwords.txt}} -x ignore:code!=0
```

- Brute force http basic auth (payload file `userpass.txt` should be in the format `username:password`):

```
patator http_fuzz url={{http://host:port}} auth_type=basic
user_pass=COMBO00:COMBO01 0={{path/to/userpass.txt}} -x
ignore:code=401
```

- Brute force FTP/FTPS login:

```
patator ftp_login host={{ip_or_host}} user=FILE0
password=FILE1 0={{path/to/users.txt}} 1={{path/to/
passwords.txt}} tls={{0|1}} -x ignore:mesg='Login incorrect.'
-x ignore,reset,retry:code=500
```

- List all available modules:

```
patator --help
```

- Display help for a particular module:

```
patator {{module_name}} --help
```

patch

Patch a file (or files) with a diff file.

Note that diff files should be generated by the **`diff`** command.

More information: https://manned.org/patch.

- Apply a patch using a diff file (filenames must be included in the diff file):

```
patch < {{patch.diff}}
```

- Apply a patch to a specific file:

```
patch < {{patch.diff}} {{path/to/file}}
```

- Patch a file writing the result to a different file:

```
patch < {{patch.diff}} {{path/to/input_file}} {{[-o|--output]}} {{path/to/output_file}}
```

- Apply a patch to the current directory:

```
patch < {{patch.diff}} {{[-p|--strip]}} 1
```

- Apply the reverse of a patch:

```
patch < {{patch.diff}} {{[-R|--reverse]}}
```

patchwork

Render an image of a **squareified treemap** network graph from a **graphviz** file.

Layouts: **dot**, **neato**, **twopi**, **circo**, **fdp**, **sfdp**, **osage** & **patchwork**.

More information: https://graphviz.org/doc/info/command.html.

- Render a PNG image with a filename based on the input filename and output format (uppercase -O):

```
patchwork -T {{png}} -O {{path/to/input.gv}}
```

- Render a SVG image with the specified output filename (lowercase -o):

```
patchwork -T {{svg}} -o {{path/to/image.svg}} {{path/to/input.gv}}
```

- Render the output in PS, PDF, SVG, Fig, PNG, GIF, JPEG, JSON, or DOT format:

```
patchwork -T {{format}} -O {{path/to/input.gv}}
```

- Render a `gif` image using `stdin` and `stdout`:

```
echo "{{digraph {this -> that} }}" | patchwork -T {{gif}} > {{path/to/image.gif}}
```

- Display help:

```
patchwork -?
```

pathchk

Check the validity and portability of pathnames.

More information: https://www.gnu.org/software/coreutils/manual/html_node/pathchk-invocation.html.

- Check pathnames for validity in the current system:

```
pathchk {{path1 path2 ...}}
```

- Check pathnames for validity on a wider range of POSIX compliant systems:

```
pathchk -p {{path1 path2 ...}}
```

- Check pathnames for validity on all POSIX compliant systems:

```
pathchk {{[-p -P|--portability]}} {{path1 path2 ...}}
```

- Only check for empty pathnames or leading dashes (-):

```
pathchk -P {{path1 path2 ...}}
```

pax

Archiving and copying utility.

More information: https://manned.org/pax.1p.

- List the contents of an archive:

```
pax -f {{archive.tar}}
```

- List the contents of a `gzip` archive:

```
pax -zf {{archive.tar.gz}}
```

- Create an archive from files:

```
pax -wf {{target.tar}} {{path/to/file1 path/to/file2 ...}}
```

- Create an archive from files, using output redirection:

```
pax -w {{path/to/file1 path/to/file2 ...}} > {{target.tar}}
```

- Extract an archive into the current directory:

```
pax -rf {{source.tar}}
```

- Copy to a directory, while keeping the original metadata; `target/` must exist:

```
pax -rw {{path/to/file1}} {{path/to/directory1 path/to/
directory2 ...}} {{target/}}
```

pbmclean

Clean up a PBM image by erasing isolated black and white pixels.

More information: https://netpbm.sourceforge.net/doc/pbmclean.html.

- Clean up a PBM image by erasing isolated black and white pixels:

```
pbmclean {{path/to/image.pbm}} > {{path/to/output.pbm}}
```

- Clean up only black/white pixels:

```
pbmclean -{{black|white}} {{path/to/image.pbm}} > {{path/to/output.pbm}}
```

- Specify the minimum number of neighbouring pixels of the same color in order for a pixel not to be considered isolated:

```
pbmclean {{[-m|-minneighbours]}} {{3}} {{path/to/image.pbm}} > {{path/to/output.pbm}}
```

pbmlife

Apply Conway's Rules of Life to a PBM image.

More information: https://netpbm.sourceforge.net/doc/pbmlife.html.

- Apply the Rules of Life to an input PBM image file for one generation and the output the result as a PBM image file:

```
pbmlife {{path/to/file.pbm}}
```

- Display version:

```
pbmlife {{[-v|-version]}}
```

pbmmake

Create a blank bitmap.

More information: https://netpbm.sourceforge.net/doc/pbmmake.html.

- Create a blank bitmap of the specified dimensions:

```
pbmmake {{width}} {{height}} > {{path/to/output_file.pbm}}
```

- Specify the color of the created bitmap:

```
pbmmake -{{white|black|grey}} {{width}} {{height}} > {{path/
to/output_file.pbm}}
```

pbmmask

Create a mask bitmap from a regular bitmap.

See also: **pambackground**.

More information: https://netpbm.sourceforge.net/doc/pbmmask.html.

- Create a mask bitmap separating background from foreground:

```
pbmmask {{path/to/image.pbm}} > {{path/to/output.pbm}}
```

- Expand the generated mask by one pixel:

```
pbmmask {{[-r|-expand]}} {{path/to/image.pbm}} > {{path/to/output.pbm}}
```

pbmnoise

Generate white noise.

More information: https://netpbm.sourceforge.net/doc/pbmnoise.html.

- Generate a PGM image containing white noise:

```
pbmnoise {{width}} {{height}} > {{path/to/output.pbm}}
```

- Specify the seed for the pseudo-random number generator:

```
pbmnoise {{width}} {{height}} -randomseed {{value}} > {{path/to/output.pbm}}
```

- Specify the desired rate of white to black pixels:

```
pbmnoise {{width}} {{height}} -ratio {{1/3}} > {{path/to/output.pbm}}
```

pbmpage

Generate a test pattern for printing.

More information: https://netpbm.sourceforge.net/doc/pbmpage.html.

- Generate a test pattern for printing onto US standard paper:

```
pbmpage > {{path/to/file.pbm}}
```

- Generate a test pattern for printing onto A4 paper:

```
pbmpage -a4 > {{path/to/file.pbm}}
```

- Specify the pattern to use:

```
pbmpage {{1|2|3}} > {{path/to/file.pbm}}
```

pbmpscale

Enlarge a PBM image with edge smoothing.

See also: **`pamenlarge`**.

More information: https://netpbm.sourceforge.net/doc/pbmpscale.html.

- Enlarge a PBM image by the specified factor with edge smoothing:

```
pbmpscale {{n}} {{path/to/image.pbm}} > {{path/to/file.pbm}}
```

pbmreduce

Proportionally reduce a PBM image.

See also: **pamenlarge**, **pamditherbw**.

More information: https://netpbm.sourceforge.net/doc/pbmreduce.html.

- Reduce the specified image by the specified factor:

```
pbmreduce {{n}} {{path/to/image.pbm}} > {{path/to/
output.pbm}}
```

- Use simple thresholding when reducing:

```
pbmreduce {{[-t|-threshold]}} {{n}} {{path/to/image.pbm}} >
{{path/to/output.pbm}}
```

- Use the specified threshold for all quantizations:

```
pbmreduce {{[-va|-value]}} {{0.6}} {{n}} {{path/to/
image.pbm}} > {{path/to/output.pbm}}
```

pbmtext

Render text as a PBM image.

See also: **pbmtextps**.

More information: https://netpbm.sourceforge.net/doc/pbmtext.html.

- Render a single line of text as a PBM image:

```
pbmtext "{{Hello World!}}" > {{path/to/output.pbm}}
```

- Render multiple lines of text as a PBM image:

```
echo "{{Hello\nWorld!}}" | pbmtext > {{path/to/output.pbm}}
```

- Render text using a custom font supplied as a PBM file:

```
pbmtext {{[-f|-font]}} {{path/to/font.pbm}} "{{Hello
World!}}" > {{path/to/output.pbm}}
```

- Specify the number of pixels between characters and lines:

```
echo "{{Hello\nWorld!}}" | pbmtext {{[-s|-space]}} {{3}} {{[-
ls|-lspace]}} {{10}} > {{path/to/output.pbm}}
```

pbmtextps

Render text as a PBM image using PostScript.

See also: **pbmtext**.

More information: https://netpbm.sourceforge.net/doc/pbmtextps.html.

- Render a single line of text as a PBM image:

```
pbmtextps "{{Hello World!}}" > {{path/to/output.pbm}}
```

- Specify the font and font size:

```
pbmtextps -font {{Times-Roman}} -fontsize {{30}} "{{Hello World!}}" > {{path/to/output.pbm}}
```

- Specify the desired left and top margins:

```
pbmtextps {{[-l|-leftmargin]}} {{70}} {{[-t|-topmargin]}} {{162}} "{{Hello World!}}" > {{path/to/output.pbm}}
```

- Do not output the rendered text as a PBM image, but a PostScript program that would create this image:

```
pbmtextps {{[-du|-dump-ps]}} "{{Hello World!}}" > {{path/to/output.ps}}
```

pbmto4425

Display a PBM image on an AT&T 4425 terminal.

See also: **`ppmtoterm`**, **`pbmtoascii`**.

More information: https://netpbm.sourceforge.net/doc/pbmto4425.html.

- Display a PBM image on an AT&T 4425 terminal using the terminal's mosaic graphics character set:

```
pbmto4425 {{path/to/image.pbm}}
```

pbmtoascii

Convert a PBM image to ASCII graphics.

See also: **`ppmtoascii`**, **`asciitopgm`**, **`ppmtoterm`**.

More information: https://netpbm.sourceforge.net/doc/pbmtoascii.html.

- Read a PBM file as input and produce an ASCII output:

```
pbmtoascii {{path/to/input_file.pbm}}
```

- Read a PBM file as input and save an ASCII output into a file:

```
pbmtoascii {{path/to/input_file.pbm}} > {{path/to/
output_file}}
```

- Read a PBM file as input while setting the pixel mapping (defaults to 1x2):

```
pbmtoascii -{{1x2|2x4}} {{path/to/input_file.pbm}}
```

- Display version:

```
pbmtoascii {{[-v|-version]}}
```

pbmtoatk

Convert a PBM image to an Andrew Toolkit raster object.

See also: **`atktopbm`**.

More information: https://netpbm.sourceforge.net/doc/pbmtoatk.html.

- Convert a PBM image to an Andrew Toolkit raster object:

```
pbmtoatk {{path/to/image.pbm}} > {{path/to/output.atk}}
```

pbmtobbnbg

Convert a PBM image to a BitGraph graphic.

More information: https://netpbm.sourceforge.net/doc/pbmtobbnbg.html.

- Convert a PBM image to a BitGraph terminal Display Pixel Data sequence:

```
pbmtobbnbg < {{path/to/image.pbm}} > {{path/to/output.dpd}}
```

- Specify the rasterop:

```
pbmtobbnbg < {{path/to/image.pbm}} {{3}} > {{path/to/
output.dpd}}
```

pbmtocmuwm

Convert a PBM image to a CMU window manager bitmap.

See also: **`cmuwmtopbm`**.

More information: https://netpbm.sourceforge.net/doc/pbmtocmuwm.html.

- Convert a PBM image to a CMU window manager bitmap:

```
pbmtocmuwm {{path/to/image.pbm}} > {{path/to/output.bmp}}
```

pbmtoepsi

Convert a PBM image to an encapsulated PostScript style preview bitmap.

More information: https://netpbm.sourceforge.net/doc/pbmtoepsi.html.

- Convert a PBM image to an encapsulated PostScript style preview bitmap:

```
pbmtoepsi {{path/to/image.pbm}} > {{path/to/output.bmp}}
```

- Produce a quadratic output image with the specified resolution:

```
pbmtoepsi {{[-d|-dpi]}} {{144}} {{path/to/image.pbm}} >
{{path/to/output.bmp}}
```

- Produce an output image with the specified horizontal and vertical resolution:

```
pbmtoepsi {{[-d|-dpi]}} {{72x144}} {{path/to/image.pbm}} >
{{path/to/output.bmp}}
```

- Only create a boundary box:

```
pbmtoepsi {{[-b|-bbonly]}} {{path/to/image.pbm}} > {{path/to/
output.bmp}}
```

pbmtoepson

Convert a PBM image to an Epson printer graphic.

See also: **pbmtoescp2**.

More information: https://netpbm.sourceforge.net/doc/pbmtoepson.html.

- Convert a PBM image to an Epson printer graphic:

```
pbmtoepson {{path/to/image.pbm}} > {{path/to/output.epson}}
```

- Specify the printer protocol of the output:

```
pbmtoepson {{[-pr|-protocol]}} {{escp9|escp}} {{path/to/
image.pbm}} > {{path/to/output.epson}}
```

- Specify the horizontal DPI of the output:

```
pbmtoepson {{[-d|-dpi]}} {{60|72|80|90|120|144|240}} {{path/
to/image.pbm}} > {{path/to/output.epson}}
```

pbmtoescp2

Convert a PBM image to a ESC/P2 printer file.

See also: **pbmtoepson**, **escp2topbm**.

More information: https://netpbm.sourceforge.net/doc/pbmtoescp2.html.

- Convert a PBM image to a ESC/P2 printer file:

```
pbmtoescp2 {{path/to/image.pbm}} > {{path/to/output.escp2}}
```

- Specify the compression of the output:

```
pbmtoescp2 {{[-c|-compression]}} {{0|1}} {{path/to/
image.pbm}} > {{path/to/output.escp2}}
```

- Specify the horizontal and vertical resolution of the output in dots per inch:

```
pbmtoescp2 {{[-re|-resolution]}} {{180|360|720}} {{path/to/
image.pbm}} > {{path/to/output.escp2}}
```

- Place a formfeed command at the end of the output:

```
pbmtoescp2 {{[-f|-formfeed]}} {{path/to/image.pbm}} > {{path/
to/output.escp2}}
```

pbmtogem

Read a PBM image as input and produce a compressed GEM **`.img`** file as output.

`pbmtogem` cannot compress repeated lines.

More information: https://netpbm.sourceforge.net/doc/pbmtogem.html.

- Convert a PBM image into a GEM `.img` file:

```
pbmtogem {{path/to/file.pbm}} > {{path/to/file.img}}
```

- Suppress all informational messages:

```
pbmtogem {{[-q|-quiet]}}
```

- Display version:

```
pbmtogem {{[-v|-version]}}
```

pbmtogo

Convert a PBM image to a compressed GraphOn graphic.

More information: https://netpbm.sourceforge.net/doc/pbmtogo.html.

- Convert a PBM image to a compressed GraphOn graphic:

```
pbmtogo {{path/to/image.pbm}} > {{path/to/output.go}}
```

pbmtoicon

This command has been superseded by **pbmtosunicon**.

More information: https://netpbm.sourceforge.net/doc/pbmtoicon.html.

- View documentation for the current command:

```
tldr pbmtosunicon
```

pbmtolj

Convert a PBM file to an HP LaserJet file.

More information: https://netpbm.sourceforge.net/doc/pbmtolj.html.

- Convert a PBM file to an HP LaserJet file:

```
pbmtolj {{path/to/input.pbm}} > {{path/to/output.lj}}
```

- Compress the output file using the specified method:

```
pbmtolj -{{packbits|delta|compress}} {{path/to/input.pbm}} >
{{path/to/output.lj}}
```

- Specify the required resolution:

```
pbmtolj {{[-r|-resolution]}} {{75|100|150|300|600}} {{path/
to/input.pbm}} > {{path/to/output.lj}}
```

pbmtomacp

Convert a PBM image to a MacPaint file.

See also: **macptopbm**.

More information: https://netpbm.sourceforge.net/doc/pbmtomacp.html.

- Convert a PBM image to a MACP file:

```
pbmtomacp {{path/to/image.pbm}} > {{path/to/output.macp}}
```

- Do not compress the output file:

```
pbmtomacp {{[-n|-norle]}} {{path/to/image.pbm}} > {{path/to/output.macp}}
```

pbmtomda

Convert a PBM image to a Microdesign MDA file.

See also: **`mdatopbm`**.

More information: https://netpbm.sourceforge.net/doc/pbmtomda.html.

- Convert a PBM image to a MDA file:

```
pbmtomda {{path/to/image.pbm}} > {{path/to/output.mda}}
```

- Invert the colors in the input image:

```
pbmtomda -i {{path/to/image.pbm}} > {{path/to/output.mda}}
```

- Halve the input image's height:

```
pbmtomda -d {{path/to/image.pbm}} > {{path/to/output.mda}}
```

pbmtomgr

Convert a PBM image into a MGR bitmap.

See also: **mgrtopbm**.

More information: https://netpbm.sourceforge.net/doc/pbmtomgr.html.

- Convert a PBM image into a MGR bitmap:

```
pbmtomgr {{path/to/image.pbm}} > {{path/to/output.mgr}}
```

pbmtonokia

Convert a PBM image to one of Nokia's Smart Messaging Formats.

More information: https://netpbm.sourceforge.net/doc/pbmtonokia.html.

- Convert a PBM image into a Nokia Operator Logo as hexcode:

```
pbmtonokia {{[-f|-fmt]}} NEX_NOL -net
{{network_operator_code}} {{path/to/image.pbm}} > {{path/to/
output.hex}}
```

- Convert a PBM image into a Nokia Group Graphic as hexcode:

```
pbmtonokia {{[-f|-fmt]}} NEX_NGG {{path/to/image.pbm}} >
{{path/to/output.hex}}
```

- Convert a PBM image into a Nokia Picture Message with the specified text as hexcode:

```
pbmtonokia {{[-f|-fmt]}} NEX_NPM -txt {{text_message}}
{{path/to/image.pbm}} > {{path/to/output.hex}}
```

- Convert a PBM image into a Nokia Operator Logo as a NOL file:

```
pbmtonokia {{[-f|-fmt]}} NOL {{path/to/image.pbm}} > {{path/
to/output.nol}}
```

- Convert a PBM image into a Nokia Group Graphic as an NGG file:

```
pbmtonokia {{[-f|-fmt]}} NGG {{path/to/image.pbm}} > {{path/
to/output.ngg}}
```

- Convert a PBM image into a Nokia Picture Message as an NPM file:

```
pbmtonokia {{[-f|-fmt]}} NPM {{path/to/image.pbm}} > {{path/
to/output.npm}}
```

pbmtopgm

Convert a PBM image to PGM by averaging areas surrounding individual pixels.

See also: **pnmconvol**, **pamditherbw**.

More information: https://netpbm.sourceforge.net/doc/pbmtopgm.html.

- Convert PBM image to PGM by averaging the wxh-sized area surrounding each pixel:

```
pbmtopgm {{w}} {{h}} {{path/to/image.pbm}} > {{path/to/output.pgm}}
```

pbmtopi3

Convert a PBM image to an Atari Degas PI3 image.

See also: **`pi3topbm`**.

More information: https://netpbm.sourceforge.net/doc/pbmtopi3.html.

- Convert a PBM image to an Atari Degas PI3 image:

```
pbmtopi3 {{path/to/image.pbm}} > {{path/to/atari_image.pi3}}
```

pbmtoplot

Convert a PBM image into a UNIX plot file.

More information: https://netpbm.sourceforge.net/doc/pbmtoplot.html.

- Convert a PBM image into a UNIX plot file:

```
pbmtoplot {{path/to/image.pbm}} > {{path/to/output.plot}}
```

pbmtoppa

Convert a PBM image to HP Printer Performance Architecture format.

More information: https://netpbm.sourceforge.net/doc/pbmtoppa.html.

- Convert a PBM image into a PPA file:

```
pbmtoppa {{path/to/image.pbm}} > {{path/to/output.ppa}}
```

- Specify the desired dots-per-inch and paper size:

```
pbmtoppa -d {{300}} -s {{a4}} {{path/to/image.pbm}} > {{path/
to/output.ppa}}
```

pbmtoptx

Convert a PBM image into Printronix printer graphics.

More information: https://netpbm.sourceforge.net/doc/pbmtoptx.html.

- Convert a PBM image into a PTX file:

```
pbmtoptx {{path/to/image.pbm}} > {{path/to/output.ptx}}
```

pbmtosunicon

Convert a PBM image into a Sun icon.

More information: https://netpbm.sourceforge.net/doc/pbmtosunicon.html.

- Convert a PBM image into a Sun icon:

```
pbmtosunicon {{path/to/input.pbm}} > {{path/to/output.ico}}
```

pbmtowbmp

Convert a PBM image to a wireless bitmap file.

More information: https://netpbm.sourceforge.net/doc/pbmtowbmp.html.

- Convert a PBM image to a WBMP file:

```
pbmtowbmp {{path/to/input_file.pbm}} > {{path/to/
output_file.wbmp}}
```

pbmtox10bm

This command has been superseded by **`pbmtoxbm -x10`**.

More information: https://netpbm.sourceforge.net/doc/pbmtox10bm.html.

- View documentation for the current command:

```
tldr pbmtoxbm
```

pbmtoxbm

Convert a PBM image to a X11 or X10 bitmap.

More information: https://netpbm.sourceforge.net/doc/pbmtoxbm.html.

- Convert a PBM image to a X11 XBM file:

```
pbmtoxbm {{path/to/input_file.pbm}} > {{path/to/
output_file.xbm}}
```

- Explicitly specify whether an X11 or X10 bitmap should be generated:

```
pbmtoxbm -{{x11|x10}} {{path/to/input_file.pbm}} > {{path/to/
output_file.xbm}}
```

pbmtoybm

Convert a PBM file to a Bennet Yee "face" file.

More information: https://netpbm.sourceforge.net/doc/pbmtoybm.html.

- Convert a PBM image file to YBM:

```
pbmtoybm {{path/to/input_file.pbm}} > {{path/to/
output_file.ybm}}
```

pbmtozinc

Convert a PBM image to a Zinc bitmap as used by the Zinc Interface Library Version 1.0.

More information: https://netpbm.sourceforge.net/doc/pbmtozinc.html.

- Convert a PBM image to a Zinc bitmap:

```
pbmtozinc {{path/to/image.pbm}} > {{path/to/output.zinc}}
```

pbmupc

Generate a PBM image of a Universal Product Code (UPC).

More information: https://netpbm.sourceforge.net/doc/pbmupc.html.

- Generate a UPC image for the specified product type, manufacturer code, and product code:

```
pbmupc {{product_type}} {{manufacturer_code}}
{{product_code}} > {{path/to/output.pbm}}
```

- Use an alternative style that does not display the checksum:

```
pbmupc -s2 {{product_type}} {{manufacturer_code}}
{{product_code}} > {{path/to/output.pbm}}
```

pbzip2

A parallel implementation of the **bzip2** file compressor.

See also: **bzip2**, **tar**.

More information: https://manned.org/pbzip2.

- Compress a file:

```
pbzip2 {{path/to/file}}
```

- Compress a file using the specified number of processors:

```
pbzip2 -p{{4}} {{path/to/file}}
```

- Compress in combination with tar (options can be passed to pbzip2):

```
tar -cf {{path/to/compressed_file}}.tar.bz2 {{[-I|--use-
compress-program]}} "pbzip2 {{-option1 -
option2 ...}}" {{path/to/file}}
```

- Decompress a file:

```
pbzip2 {{[-d|--decompress]}} {{path/to/compressed_file.bz2}}
```

- Display help:

```
pbzip2 {{[-h|--help]}}
```

pcapfix

Repair damaged or corrupted PCAP and PcapNG files.

More information: https://f00l.de/pcapfix/.

- Repair a PCAP/PCapNG file (Note: For PCAP files, only the first 262144 bytes of each packet are scanned):

```
pcapfix {{path/to/file.pcapng}}
```

- Repair an entire PCAP file:

```
pcapfix --deep-scan {{path/to/file.pcap}}
```

- Repair a PCAP/PcapNG file and write the repaired file to the specified location:

```
pcapfix --outfile {{path/to/repaired.pcap}} {{path/to/
file.pcap}}
```

- Treat the specified file as a PcapNG file, ignoring automatic recognition:

```
pcapfix --pcapng {{path/to/file.pcapng}}
```

- Repair a file and show the process in detail:

```
pcapfix --verbose {{path/to/file.pcap}}
```

pcdindex

This command has been renamed to **`pcdovtoppm`**.

More information: https://netpbm.sourceforge.net/doc/pcdindex.html.

- View documentation for the command under its current name:

```
tldr pcdovtoppm
```

pcdovtoppm

Create an index image for a photo CD based on its overview file.

More information: https://netpbm.sourceforge.net/doc/pcdovtoppm.html.

- Create a PPM index image from a PCD overview file:

```
pcdovtoppm {{path/to/file.pcd}} > {{path/to/output.ppm}}
```

- Specify the maximum width of the output image and the maximum size of each of the images contained in the output:

```
pcdovtoppm {{[-m|-maxwidth]}} {{width}} {{[-s|-size]}}
{{size}} {{path/to/file.pcd}} > {{path/to/output.ppm}}
```

- Specify the maximum number of images across and the maximum number of colours:

```
pcdovtoppm {{[-a|-across]}} {{n_images}} {{[-c|-colors]}}
{{n_colours}} {{path/to/file.pcd}} > {{path/to/output.ppm}}
```

- Use the specified font for annotations and paint the background white:

```
pcdovtoppm {{[-f|-font]}} {{font}} {{[-w|-white]}} {{path/to/
file.pcd}} > {{path/to/output.ppm}}
```

pcxtoppm

Convert a PCX file to a PPM image.

More information: https://netpbm.sourceforge.net/doc/pcxtoppm.html.

- Convert a PCX file to a PPM image:

```
pcxtoppm {{path/to/file.pcx}} > {{path/to/file.ppm}}
```

- Use a predefined standard palette even if the PCX file provides one:

```
pcxtoppm {{[-s|-stdpalette]}} {{path/to/file.pcx}} > {{path/to/file.ppm}}
```

- Print information on the PCX header to `stdout`:

```
pcxtoppm {{[-verb|-verbose]}} {{path/to/file.pcx}} > {{path/to/file.ppm}}
```

pdf-parser

Identify fundamental elements of a PDF file without rendering it.

More information: https://blog.didierstevens.com/programs/pdf-tools/.

- Display statistics for a PDF file:

```
pdf-parser {{[-a|--stats]}} {{path/to/file.pdf}}
```

- Display objects of a specific type (`/Font`, `/URI`, ...) in a PDF file:

```
pdf-parser {{[-t|--type]}} {{/object_type}} {{path/to/
file.pdf}}
```

- Search for strings in indirect objects:

```
pdf-parser {{[-s|--search]}} {{search_string}} {{path/to/
file.pdf}}
```

pdffonts

Portable Document Format (PDF) file fonts information viewer.

More information: https://www.xpdfreader.com/pdffonts-man.html.

- Print PDF file fonts information:

```
pdffonts {{path/to/file.pdf}}
```

- Specify user password for PDF file to bypass security restrictions:

```
pdffonts -upw {{password}} {{path/to/file.pdf}}
```

- Specify owner password for PDF file to bypass security restrictions:

```
pdffonts -opw {{password}} {{path/to/file.pdf}}
```

- Print additional information on location of the font that will be used when the PDF file is rasterized:

```
pdffonts -loc {{path/to/file.pdf}}
```

- Print additional information on location of the font that will be used when the PDF file is converted to PostScript:

```
pdffonts -locPS {{path/to/file.pdf}}
```

pdfgrep

Search text in PDF files.

More information: https://pdfgrep.org/doc.html.

- Find lines that match pattern in a PDF:

```
pdfgrep {{pattern}} {{file.pdf}}
```

- Include file name and page number for each matched line:

```
pdfgrep {{[-H|--with-filename]}} {{[-n|--page-number]}}
{{pattern}} {{file.pdf}}
```

- Do a case-insensitive search for lines that begin with `file_name` and return the first 3 matches:

```
pdfgrep {{[-m|--max-count]}} {{3}} {{[-i|--ignore-case]}}
'{{^file_name}}' {{file.pdf}}
```

- Find pattern in files with a `.pdf` extension in the current directory recursively:

```
pdfgrep {{[-r|--recursive]}} {{pattern}}
```

- Find pattern on files that match a specific glob in the current directory recursively:

```
pdfgrep {{[-r|--recursive]}} --include
'{{*book.pdf}}' {{pattern}}
```

pdfimages

Utility for extracting images from PDFs.

More information: https://manned.org/pdfimages.

- Extract all images from a PDF file and save them as PNGs:

```
pdfimages -png {{path/to/file.pdf}} {{filename_prefix}}
```

- Extract images from pages 3 to 5:

```
pdfimages -f {{3}} -l {{5}} {{path/to/file.pdf}}
{{filename_prefix}}
```

- Extract images from a PDF file and include the page number in the output filenames:

```
pdfimages -p {{path/to/file.pdf}} {{filename_prefix}}
```

- List information about all the images in a PDF file:

```
pdfimages -list {{path/to/file.pdf}}
```

pdfinfo

Portable Document Format (PDF) file information viewer.

More information: https://www.xpdfreader.com/pdfinfo-man.html.

- Print PDF file information:

```
pdfinfo {{path/to/file.pdf}}
```

- Specify user password for PDF file to bypass security restrictions:

```
pdfinfo -upw {{password}} {{path/to/file.pdf}}
```

- Specify owner password for PDF file to bypass security restrictions:

```
pdfinfo -opw {{password}} {{path/to/file.pdf}}
```

pdfjam

Shell frontend for the LaTeX pdfpages package for mingling PDFs.

More information: https://github.com/pdfjam/pdfjam/blob/master/doc/pdfjam-help.txt.

- Merge two (or more) PDFs:

```
pdfjam {{path/to/file1.pdf path/to/file2.pdf ...}} {{[-o|--outfile]}} {{path/to/output_file.pdf}}
```

- Merge the first page of each file together:

```
pdfjam {{path/to/file1.pdf 1 path/to/file2.pdf 1 ...}} {{[-o|--outfile]}} {{path/to/output_file.pdf}}
```

- Merge subranges from two PDFs:

```
pdfjam {{path/to/file1.pdf 3-5,1}} {{path/to/file2.pdf 4-6}} {{[-o|--outfile]}} {{path/to/output_file.pdf}}
```

- Sign an A4 page (adjust delta to height for other formats) with a scanned signature by overlaying them:

```
pdfjam {{path/to/file.pdf}} {{path/to/signature}} --fitpaper true {{[-o|--outfile]}} {{path/to/signed.pdf}} --nup "{{1x2}}" --delta "{{0 -842pt}}"
```

- Arrange the pages from the input file into a fancy 2x2 grid:

```
pdfjam {{path/to/file.pdf}} --nup {{2x2}} --suffix {{4up}} --preamble '{{\usepackage{fancyhdr} \pagestyle{fancy}}}'
```

- Reverse the order of pages within each given file and concatenate them:

```
pdfjam {{path/to/file1.pdf last-1 path/to/file2.pdf last-1 ...}} --suffix {{reversed}}
```

pdfjoin

PDF merging utility based on pdfjam.

More information: https://github.com/pdfjam/pdfjam-extras.

- Merge two PDFs into one with the default suffix "joined":

```
pdfjoin {{path/to/file1.pdf}} {{path/to/file2.pdf}}
```

- Merge the first page of each given file together:

```
pdfjoin {{path/to/file1.pdf path/to/file2.pdf ...}} {{1}} --
outfile {{output_file}}
```

- Save pages 3 to 5 followed by page 1 to a new PDF with custom suffix:

```
pdfjoin {{path/to/file.pdf}} {{3-5,1}} --suffix
{{rearranged}}
```

- Merge page subranges from two PDFs:

```
pdfjoin /{{path/to/file1.pdf}} {{2-}} {{file2}} {{last-3}} --
outfile {{output_file}}
```

pdflatex

Compile a PDF document from LaTeX source files.

More information: https://manned.org/pdflatex.

- Compile a PDF document:

```
pdflatex {{source.tex}}
```

- Compile a PDF document specifying an output directory:

```
pdflatex -output-directory={{path/to/directory}}
{{source.tex}}
```

- Compile a PDF document, exiting on each error:

```
pdflatex -halt-on-error {{source.tex}}
```

pdfposter

Convert a large-sheeted PDF into multiple A4 pages for printing.

More information: https://pdfposter.readthedocs.io/en/stable/Usage.html.

- Convert an A2 poster into 4 A4 pages:

```
pdfposter {{[-p|--poster-size]}} a2 {{input_file.pdf}}
{{output_file.pdf}}
```

- Scale an A4 poster to A3 and then generate 2 A4 pages:

```
pdfposter {{[-s|--scale]}} 2 {{input_file.pdf}}
{{output_file.pdf}}
```

pdfseparate

Portable Document Format (PDF) file page extractor.

More information: https://manned.org/pdfseparate.

- Extract pages from PDF file and make a separate PDF file for each page:

```
pdfseparate {{path/to/source_filename.pdf}} {{path/to/
destination_filename-%d.pdf}}
```

- Specify the first/start page for extraction:

```
pdfseparate -f {{3}} {{path/to/source_filename.pdf}} {{path/
to/destination_filename-%d.pdf}}
```

- Specify the last page for extraction:

```
pdfseparate -l {{10}} {{path/to/source_filename.pdf}} {{path/
to/destination_filename-%d.pdf}}
```

pdftex

Compile a PDF document from TeX source files.

More information: https://www.tug.org/applications/pdftex/.

- Compile a PDF document:

```
pdftex {{source.tex}}
```

- Compile a PDF document, specifying an output directory:

```
pdftex -output-directory={{path/to/directory}} {{source.tex}}
```

- Compile a PDF document, exiting on each error:

```
pdftex -halt-on-error {{source.tex}}
```

pdftk

PDF toolkit.

More information: https://www.pdflabs.com/docs/pdftk-man-page/.

- Extract pages 1-3, 5, and 6-10 from a PDF file and save them as another one:

```
pdftk {{input.pdf}} cat {{1-3 5 6-10}} output {{output.pdf}}
```

- Merge (concatenate) a list of PDF files and save the result as another one:

```
pdftk {{file1.pdf file2.pdf ...}} cat output {{output.pdf}}
```

- Split each page of a PDF file into a separate file, with a given filename output pattern:

```
pdftk {{input.pdf}} burst output {{out_%d.pdf}}
```

- Rotate all pages by 180 degrees clockwise:

```
pdftk {{input.pdf}} cat {{1-endsouth}} output {{output.pdf}}
```

- Rotate third page by 90 degrees clockwise and leave others unchanged:

```
pdftk {{input.pdf}} cat {{1-2 3east 4-end}} output
{{output.pdf}}
```

pdftocairo

Convert PDF files to PNG/JPEG/TIFF/PDF/PS/EPS/SVG using cairo.

More information: https://manned.org/pdftocairo.

- Convert a PDF file to JPEG:

```
pdftocairo {{path/to/file.pdf}} -jpeg
```

- Convert to PDF expanding the output to fill the paper:

```
pdftocairo {{path/to/file.pdf}} {{output.pdf}} -pdf -expand
```

- Convert to SVG specifying the first/last page to convert:

```
pdftocairo {{path/to/file.pdf}} {{output.svg}} -svg -f
{{first_page}} -l {{last_page}}
```

- Convert to PNG with 200ppi resolution:

```
pdftocairo {{path/to/file.pdf}} {{output.png}} -png -r 200
```

- Convert to grayscale TIFF setting paper size to A3:

```
pdftocairo {{path/to/file.pdf}} -tiff -gray -paper A3
```

- Convert to PNG cropping x and y pixels from the top-left corner:

```
pdftocairo {{path/to/file.pdf}} -png -x {{x_pixels}} -y
{{y_pixels}}
```

pdftotext

Convert PDF files to plain text format.

More information: https://www.xpdfreader.com/pdftotext-man.html.

- Convert `filename.pdf` to plain text and print it to `stdout`:

```
pdftotext {{filename.pdf}} -
```

- Convert `filename.pdf` to plain text and save it as `filename.txt`:

```
pdftotext {{filename.pdf}}
```

- Convert `filename.pdf` to plain text and preserve the layout:

```
pdftotext -layout {{filename.pdf}}
```

- Convert `input.pdf` to plain text and save it as `output.txt`:

```
pdftotext {{input.pdf}} {{output.txt}}
```

- Convert pages 2, 3, and 4 of `input.pdf` to plain text and save them as `output.txt`:

```
pdftotext -f {{2}} -l {{4}} {{input.pdf}} {{output.txt}}
```

pdfunite

PDF merging utility.

More information: https://github.com/mtgrosser/pdfunite.

- Merge 2 PDFs into a single PDF:

```
pdfunite {{path/to/fileA.pdf}} {{path/to/fileB.pdf}} {{path/to/merged_output.pdf}}
```

- Merge a directory of PDFs into a single PDF:

```
pdfunite {{path/to/directory/*.pdf}} {{path/to/merged_output.pdf}}
```

pecl

Manage PHP extensions from the PHP Extension Community Library.

More information: https://manned.org/pecl.

- Display a list of available commands:

```
pecl
```

- Install a package:

```
pecl install {{package}}
```

- List installed packages:

```
pecl list
```

- Upgrade all packages:

```
pecl upgrade
```

- Upgrade a specific package:

```
pecl upgrade {{package}}
```

- Uninstall a specific package:

```
pecl uninstall {{package}}
```

- Display information about a specific package:

```
pecl info {{package}}
```

- Update the available package sources:

```
pecl update-channels
```

peco

Interactive filtering tool.

More information: https://github.com/peco/peco#command-line-options.

- Start `peco` on all files in the specified directory:

```
find {{path/to/directory}} -type f | peco
```

- Start `peco` for running processes:

```
ps aux | peco
```

- Start `peco` with a specified query:

```
peco --query "{{query}}"
```

pee

Tee **`stdin`** to pipes.

See also: **`tee`**.

More information: https://manned.org/pee.

- Run each command, providing each one with a distinct copy of `stdin`:

```
pee {{command1 command2 ...}}
```

- Write a copy of `stdin` to `stdout` (like `tee`):

```
pee cat {{command1 command2 ...}}
```

- Immediately terminate upon SIGPIPEs and write errors:

```
pee --no-ignore-sigpipe --no-ignore-write-errors {{command1 command2 ...}}
```

peerflix

Stream video- or audio-based torrents to a media player.

More information: https://github.com/mafintosh/peerflix.

- Stream the largest media file in a torrent:

```
peerflix "{{torrent_url|magnet_link}}"
```

- List all streamable files contained in a torrent (given as a magnet link):

```
peerflix "{{magnet:?xt=urn:btih:
0123456789abcdef0123456789abcdef01234567}}" {{[-l|--list]}}
```

- Stream the largest file in a torrent, given as a torrent URL, to VLC:

```
peerflix "{{http://example.net/music.torrent}}" {{[-v|--
vlc]}}
```

- Stream the largest file in a torrent to MPlayer, with subtitles:

```
peerflix "{{torrent_url|magnet_link}}" {{[-m|--mplayer]}}
{{[-t|--subtitles]}} {{subtitle-file.srt}}
```

- Stream all files from a torrent to Airplay:

```
peerflix "{{torrent_url|magnet_link}}" {{[-a|--all]}} {{[-
s|--airplay]}}
```

peerindex

Inspect MRT TABLE_DUMPV2 Peer Index Table.

Can read files compressed with **`gzip`**, **`bzip2`**, and **`xz`**.

More information: https://codeberg.org/1414codeforge/ubgpsuite.

- List all peers:

  ```
  peerindex {{master6.mrt}}
  ```

- Display all peers that have provided routing information:

  ```
  peerindex {{[-r|--only-refs]}} {{master6.mrt}}
  ```

peludna-prognoza

Fetch pollen measurement data for Croatian cities from your terminal using Pliva's allergies data API.

More information: https://github.com/vladimyr/peludna-prognoza.

- Start an interactive search for a city and fetch data for it:

  ```
  peludna-prognoza
  ```

- Fetch data for a city:

  ```
  peludna-prognoza "{{city}}"
  ```

- Display data in a machine-readable format:

  ```
  peludna-prognoza "{{city}}" --{{json|xml}}
  ```

- Display the pollen measurement page for a city at https://plivazdravlje.hr in the default web browser:

  ```
  peludna-prognoza "{{city}}" {{[-w|--web]}}
  ```

perl-rename

This command is an alias of **rename**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} common rename
```

perl

The Perl 5 language interpreter.

See also: **`perldoc`**.

More information: https://perldoc.perl.org/perl.

- Print lines from `stdin` [m]atching `regex1` and case [i]nsensitive `regex2`:

```
perl -n -e 'print if m/regex1/ and m/regex2/i'
```

- Say ([-E]) first match group, using a `regex`, ignoring space ([x]) in `regex`:

```
perl -n -E 'say $1 if m/{{before}} ( {{group_regex}} ) {{after}}/x'
```

- [i]n-place, with backup, [s]ubstitute all occurrence ([g]) of `regex` with a replacement:

```
perl -i'.bak' -p -e 's/regex/{{replacement}}/g' {{path/to/files}}
```

perlbrew

Manage Perl installations in the home directory.

See also: **`asdf`**.

More information: https://github.com/gugod/App-perlbrew.

- Initialize a `perlbrew` environment:

```
perlbrew init
```

- List available Perl versions:

```
perlbrew available
```

- Install/uninstall a Perl version:

```
perlbrew {{install|uninstall}} {{version}}
```

- List perl installations:

```
perlbrew list
```

- Switch to an installation and set it as default:

```
perlbrew switch perl-{{version}}
```

- Use the system Perl again:

```
perlbrew off
```

- List installed CPAN modules for the installation in use:

```
perlbrew list-modules
```

- Clone CPAN modules from one installation to another:

```
perlbrew clone-modules {{source_installation}}
{{destination_installation}}
```

perldoc

Look up Perl documentation in `.pod` format.

More information: https://perldoc.perl.org/perldoc.

- View documentation for a builtin [f]unction, a [v]ariable or an [a]PI:

```
perldoc -{{f|v|a}} {{name}}
```

- Search in the [q]uestion headings of Perl FAQ:

```
perldoc -q {{regex}}
```

- Send output directly to `stdout` (by default, it is send to a pager):

```
perldoc -T {{page|module|program|URL}}
```

- Specify the language code of the desired translation:

```
perldoc -L {{language_code}} {{page|module|program|URL}}
```

pest

A PHP testing framework with a focus on simplicity.

More information: https://pestphp.com/docs/cli-api-reference.

- Initialize a standard Pest configuration in the current directory:

```
pest --init
```

- Run tests in the current directory:

```
pest
```

- Run tests annotated with the given group:

```
pest --group {{name}}
```

- Run tests and print the coverage report to `stdout`:

```
pest --coverage
```

- Run tests with coverage and fail if the coverage is less than the minimum percentage:

```
pest --coverage --min={{80}}
```

- Run tests in parallel:

```
pest --parallel
```

- Run tests with mutations:

```
pest --mutate
```

pfetch

Display system information.

More information: https://github.com/dylanaraps/pfetch.

- Display the ASCII art and default fields:

```
pfetch
```

- Display only the ASCII art and color palette fields:

```
PF_INFO="{{ascii palette}}" pfetch
```

- Display all possible fields:

```
PF_INFO="{{ascii title os host kernel uptime pkgs memory
shell editor wm de palette}}" pfetch
```

- Display a different username and hostname:

```
USER="{{user}}" HOSTNAME="{{hostname}}" pfetch
```

- Display without colors:

```
PF_COLOR={{0}} pfetch
```

pg_amcheck

Check for corruption in one or more PostgreSQL databases.

More information: https://www.postgresql.org/docs/current/app-pgamcheck.html.

- Check a specific database:

```
pg_amcheck {{dbname}}
```

- Check all databases:

```
pg_amcheck {{[-a|--all]}}
```

- Check databases matching the specified pattern:

```
pg_amcheck {{[-d|--database]}} {{pattern}}
```

- Check specific tables within a database:

```
pg_amcheck {{[-t|--table]}} {{pattern}} {{dbname}}
```

- Check specific schemas within a database:

```
pg_amcheck {{[-s|--schema]}} {{pattern}} {{dbname}}
```

- Display help:

```
pg_amcheck {{[-?|--help]}}
```

pg_archivecleanup

Remove old WAL archive files in PostgreSQL.

More information: https://www.postgresql.org/docs/current/pgarchivecleanup.html.

- Clean an archive directory up to a given WAL file:

```
pg_archivecleanup {{path/to/archive}} {{path/to/walfile}}
```

- Perform a dry run (list files that would be removed without actually doing it):

```
pg_archivecleanup {{[-n|--dry-run]}} {{path/to/archive}} {{path/to/walfile}}
```

- Strip a file extension before deciding deletion:

```
pg_archivecleanup {{[-x|--strip-extension]}} {{extension}} {{path/to/archive}} {{path/to/walfile}}
```

- Remove backup history files too:

```
pg_archivecleanup {{[-b|--clean-backup-history]}} {{path/to/archive}} {{path/to/walfile}}
```

- Enable debug logging output:

```
pg_archivecleanup {{[-d|--debug]}} {{path/to/archive}} {{path/to/walfile}}
```

pg_basebackup

Take a base backup of a running PostgreSQL cluster.

Used for full or incremental backups, point-in-time recovery, or setting up replication standbys.

More information: https://www.postgresql.org/docs/current/app-pgbasebackup.html.

- Take a base backup from a remote PostgreSQL server:

```
pg_basebackup {{[-h|--host]}} {{host}} {{[-D|--pgdata]}} {{path/to/backup_dir}}
```

- Take a backup with progress shown:

```
pg_basebackup {{[-h|--host]}} {{host}} {{[-D|--pgdata]}} {{path/to/backup_dir}} {{[-P|--progress]}}
```

- Create a compressed backup (`gzip`) in tar format:

```
pg_basebackup {{[-D|--pgdata]}} {{path/to/backup_dir}} {{[-F|--format]}} {{[t|tar]}} {{[-z|--gzip]}}
```

- Create an incremental backup using a previous manifest file:

```
pg_basebackup {{[-D|--pgdata]}} {{path/to/backup_dir}} {{[-i|--incremental]}} {{path/to/old_manifest}}
```

- Write a recovery configuration for setting up a standby:

```
pg_basebackup {{[-D|--pgdata]}} {{path/to/backup_dir}} {{[-R|--write-recovery-conf]}}
```

- Relocate a tablespace during backup:

```
pg_basebackup {{[-D|--pgdata]}} {{path/to/backup_dir}} {{[-T|--tablespace-mapping]}} {{path/to/old_tablespace}}={{path/to/new_tablespace}}
```

- Limit transfer rate to reduce server load:

```
pg_basebackup {{[-D|--pgdata]}} {{path/to/backup_dir}} {{[-r|--max-rate]}} {{100M}}
```

- Stream WAL logs while taking the backup:

```
pg_basebackup {{[-D|--pgdata]}} {{path/to/backup_dir}} {{[-
X|--wal-method]}} stream
```

pg_checksums

Enable, disable, or check data checksums in a PostgreSQL database cluster.

More information: https://www.postgresql.org/docs/current/app-pgchecksums.html.

- Check data checksums in a database cluster:

```
pg_checksums {{[-D|--pgdata]}} {{path/to/data}}
```

- Enable data checksums in a database cluster:

```
pg_checksums {{[-e|--enable]}} {{[-D|--pgdata]}} {{path/to/data}}
```

- Disable data checksums in a database cluster:

```
pg_checksums {{[-d|--disable]}} {{[-D|--pgdata]}} {{path/to/data}}
```

- Check data checksums with verbose output:

```
pg_checksums {{[-v|--verbose]}} {{[-D|--pgdata]}} {{path/to/data}}
```

- Check data checksums showing progress:

```
pg_checksums {{[-P|--progress]}} {{[-D|--pgdata]}} {{path/to/data}}
```

- Display help:

```
pg_checksums {{[-?|--help]}}
```

pg_combinebackup

Reconstruct a full (synthetic) PostgreSQL backup from an incremental backup chain.

When specifying multiple backups order them from oldest to newest.

More information: https://www.postgresql.org/docs/current/app-pgcombinebackup.html.

- Combine a full and incremental backup into one synthetic full backup:

```
pg_combinebackup {{path/to/full_backup}} {{path/to/incremental_backup}} {{[-o|--output]}} {{path/to/output_directory}}
```

- Perform a dry run to show what would be done, without creating files:

```
pg_combinebackup {{[-n|--dry-run]}} {{path/to/full_backup}} {{path/to/incremental_backup}} {{[-o|--output]}} {{path/to/output_directory}}
```

- Use hard links instead of copying files (faster, same filesystem required):

```
pg_combinebackup {{[-k|--link]}} {{path/to/full_backup}} {{path/to/incremental_backup}} {{[-o|--output]}} {{path/to/output_directory}}
```

- Use file cloning (reflinks) for efficient copy if supported:

```
pg_combinebackup --clone {{path/to/full_backup}} {{path/to/incremental_backup}} {{[-o|--output]}} {{path/to/output_directory}}
```

- Use the `copy_file_range` system call for efficient copying:

```
pg_combinebackup --copy-file-range {{path/to/full_backup}} {{path/to/incremental_backup}} {{[-o|--output]}} {{path/to/output_directory}}
```

- Relocate a tablespace during reconstruction:

```
pg_combinebackup {{path/to/backup1 path/to/backup2 ...}} {{[-T|--tablespace-mapping]}} /{{path/to/old_tablespace}}=/{{path/to/new_tablespace}} {{[-o|--output]}} {{path/to/output_directory}}
```

- Disable fsync for faster but unsafe writes (testing only):

```
pg_combinebackup {{[-N|--no-sync]}} {{path/to/backup1 path/
to/backup2 ...}} {{[-o|--output]}} {{path/to/
output_directory}}
```

- Show detailed debug output:

```
pg_combinebackup {{[-d|--debug]}} {{path/to/backup1 path/to/
backup2 ...}} {{[-o|--output]}} {{path/to/output_directory}}
```

pg_config

Display information about the installed PostgreSQL version.

More information: https://www.postgresql.org/docs/current/app-pgconfig.html.

- Show the directory where PostgreSQL binaries are installed:

```
pg_config --bindir
```

- Show the directory for library files:

```
pg_config --libdir
```

- Show the directory for include files (C headers):

```
pg_config --includedir
```

- Show the directory for shared data files:

```
pg_config --sharedir
```

- Show the directory for locale data:

```
pg_config --localedir
```

- Display help:

```
pg_config {{[-?|--help]}}
```

- Display version:

```
pg_config --version
```

pg_controldata

Display control information of a PostgreSQL database cluster.

More information: https://www.postgresql.org/docs/current/app-pgcontroldata.html.

- Display control information for a specific data directory:

```
pg_controldata {{[-D|--pgdata]}} {{path/to/data}}
```

- Display help:

```
pg_controldata {{[-?|--help]}}
```

- Display version:

```
pg_controldata {{[-V|--version]}}
```

pg_createsubscriber

Convert a physical replica into a new logical replica.

More information: https://www.postgresql.org/docs/current/app-pgcreatesubscriber.html.

- Convert a physical replica to a logical replica for a specific database:

```
pg_createsubscriber {{[-d|--database]}} {{dbname}} {{[-D|--pgdata]}} {{path/to/data}} {{[-P|--publisher-server]}} {{connstr}}
```

- Perform a dry run without modifying the target directory:

```
pg_createsubscriber {{[-n|--dry-run]}} {{[-d|--database]}} {{dbname}} {{[-D|--pgdata]}} {{path/to/data}} {{[-P|--publisher-server]}} {{connstr}}
```

- Enable two-phase commit for the subscription:

```
pg_createsubscriber {{[-T|--enable-two-phase]}} {{[-d|--database]}} {{dbname}} {{[-D|--pgdata]}} {{path/to/data}} {{[-P|--publisher-server]}} {{connstr}}
```

- Convert with verbose output:

```
pg_createsubscriber {{[-v|--verbose]}} {{[-d|--database]}} {{dbname}} {{[-D|--pgdata]}} {{path/to/data}} {{[-P|--publisher-server]}} {{connstr}}
```

- Display help:

```
pg_createsubscriber {{[-?|--help]}}
```

pg_ctl

Utility for controlling a PostgreSQL server and database cluster.

More information: https://www.postgresql.org/docs/current/app-pg-ctl.html.

- Initialize a new PostgreSQL database cluster:

```
pg_ctl {{[-D|--pgdata]}} {{data_directory}} init
```

- Start a PostgreSQL server:

```
pg_ctl {{[-D|--pgdata]}} {{data_directory}} start
```

- Stop a PostgreSQL server:

```
pg_ctl {{[-D|--pgdata]}} {{data_directory}} stop
```

- Restart a PostgreSQL server:

```
pg_ctl {{[-D|--pgdata]}} {{data_directory}} restart
```

- Reload the PostgreSQL server configuration:

```
pg_ctl {{[-D|--pgdata]}} {{data_directory}} reload
```

pg_dump

Extract a PostgreSQL database into a script file or other archive file.

More information: https://www.postgresql.org/docs/current/app-pgdump.html.

- Dump database into an SQL-script file:

```
pg_dump {{db_name}} > {{output_file.sql}}
```

- Same as above, customize username:

```
pg_dump {{[-U|--username]}} {{username}} {{db_name}} >
{{output_file.sql}}
```

- Same as above, customize host and port:

```
pg_dump {{[-h|--host]}} {{host}} {{[-p|--port]}} {{port}}
{{db_name}} > {{output_file.sql}}
```

- Dump a database into a custom-format archive file:

```
pg_dump {{[-F|--format]}} {{[c|custom]}} {{db_name}} >
{{output_file.dump}}
```

- Dump only database data into an SQL-script file:

```
pg_dump {{[-a|--data-only]}} {{db_name}} > {{path/to/
output_file.sql}}
```

- Dump only schema (data definitions) into an SQL-script file:

```
pg_dump {{[-s|--schema-only]}} {{db_name}} > {{path/to/
output_file.sql}}
```

pg_dumpall

Extract a PostgreSQL database cluster into a script file or other archive file.

More information: https://www.postgresql.org/docs/current/app-pg-dumpall.html.

- Dump all databases:

```
pg_dumpall > {{path/to/file.sql}}
```

- Dump all databases using a specific username:

```
pg_dumpall {{[-U|--username]}} {{username}} > {{path/to/file.sql}}
```

- Same as above, customize host and port:

```
pg_dumpall {{[-h|--host]}} {{host}} {{[-p|--port]}} {{port}} > {{output_file.sql}}
```

- Dump only database data into an SQL-script file:

```
pg_dumpall {{[-a|--data-only]}} > {{path/to/file.sql}}
```

- Dump only schema (data definitions) into an SQL-script file:

```
pg_dumpall {{[-s|--schema-only]}} > {{output_file.sql}}
```

pg_isready

Check the connection status of a PostgreSQL server.

More information: https://www.postgresql.org/docs/current/app-pg-isready.html.

- Check connection:

```
pg_isready
```

- Check connection with a specific hostname and port:

```
pg_isready {{[-h|--host]}} {{hostname}} {{[-p|--port]}} {{port}}
```

- Check connection displaying a message only when the connection fails:

```
pg_isready {{[-q|--quiet]}}
```

pg_receivewal

Stream the write-ahead log from a running PostgreSQL cluster.

More information: https://www.postgresql.org/docs/current/app-pgreceivewal.html.

- Stream WAL to a local directory (minimum required):

```
pg_receivewal {{[-D|--directory]}} {{directory}}
```

- Same as above, specify host, port, username including verbose output:

```
pg_receivewal {{[-v|--verbose]}} {{[-h|--host]}} {{host}}
{{[-p|--port]}} {{port}} {{[-U|--username]}} {{username}}
{{[-D|--directory]}} {{directory}}
```

- Use replication slot (create-if-needed):

```
pg_receivewal {{[-S|--slot]}} {{slot_name}} --create-slot
{{[-h|--host]}} {{host}} {{[-p|--port]}} {{port}} {{[-U|--
username]}} {{username}} {{[-D|--directory]}} {{directory}}
```

- Stop at a given WAL position (LSN):

```
pg_receivewal {{[-E|--endpos]}} {{lsn}} {{[-D|--directory]}}
{{directory}} {{[-h|--host]}} {{host}} {{[-p|--port]}}
{{port}} {{[-U|--username]}} {{username}}
```

- Control looping on failure:

```
pg_receivewal {{[-n|--no-loop]}} {{[-D|--directory]}}
{{directory}} {{[-h|--host]}} {{host}} {{[-p|--port]}}
{{port}} {{[-U|--username]}} {{username}}
```

- Flush data synchronously (force WAL writes immediately):

```
pg_receivewal --synchronous {{[-D|--directory]}}
{{directory}} {{[-h|--host]}} {{host}} {{[-p|--port]}}
{{port}} {{[-U|--username]}} {{username}}
```

- Compress WAL output (gzip, level 0-9):

```
pg_receivewal {{[-Z|--compress]}} {{level|method}} {{[-D|--
directory]}} {{directory}} {{[-h|--host]}} {{host}} {{[-p|--
port]}} {{port}} {{[-U|--username]}} {{username}}
```

- Set status reporting interval:

```
pg_receivewal {{[-s|--status-interval]}} {{seconds}} {{[-D|--
directory]}} {{directory}} {{[-h|--host]}} {{host}} {{[-p|--
port]}} {{port}} {{[-U|--username]}} {{username}}
```

pg_recvlogical

Control PostgreSQL logical decoding streams.

More information: https://www.postgresql.org/docs/current/app-pgrecvlogical.html.

- Create a new logical replication slot:

```
pg_recvlogical {{[-d|--dbname]}} {{dbname}} {{[-S|--slot]}} {{slot_name}} --create-slot
```

- Start streaming changes from a logical replication slot to a file:

```
pg_recvlogical {{[-d|--dbname]}} {{dbname}} {{[-S|--slot]}} {{slot_name}} --start {{[-f|--file]}} {{filename}}
```

- Drop a logical replication slot:

```
pg_recvlogical {{[-d|--dbname]}} {{dbname}} {{[-S|--slot]}} {{slot_name}} --drop-slot
```

- Create a slot with two-phase commit enabled:

```
pg_recvlogical {{[-d|--dbname]}} {{dbname}} {{[-S|--slot]}} {{slot_name}} --create-slot {{[-t|--enable-two-phase]}}
```

- Display help:

```
pg_recvlogical {{[-?|--help]}}
```

pg_resetwal

Reset the write-ahead log and other control information of a PostgreSQL database cluster.

More information: https://www.postgresql.org/docs/current/app-pgresetwal.html.

- Reset the WAL and control information for a specific data directory:

```
pg_resetwal {{[-D|--pgdata]}} {{path/to/data}}
```

- Perform a dry run:

```
pg_resetwal {{[-D|--pgdata]}} {{path/to/data}} {{[-n|--dry-run]}}
```

- Force the WAL and control information reset:

```
pg_resetwal {{[-D|--pgdata]}} {{path/to/data}} {{[-f|--force]}}
```

- Display help:

```
pg_resetwal {{[-?|--help]}}
```

- Display version:

```
pg_resetwal {{[-V|--version]}}
```

pg_restore

Restore a PostgreSQL database from an archive file created by pg_dump.

More information: https://www.postgresql.org/docs/current/app-pgrestore.html.

- Restore an archive into an existing database:

```
pg_restore {{[-d|--dbname]}} {{db_name}}
{{archive_file.dump}}
```

- Same as above, customize username:

```
pg_restore {{[-U|--username]}} {{username}} {{[-d|--dbname]}}
{{db_name}} {{archive_file.dump}}
```

- Same as above, customize host and port:

```
pg_restore {{[-h|--host]}} {{host}} {{[-p|--port]}} {{port}}
{{[-d|--dbname]}} {{db_name}} {{archive_file.dump}}
```

- List database objects included in the archive:

```
pg_restore {{[-l|--list]}} {{archive_file.dump}}
```

- Clean database objects before creating them:

```
pg_restore {{[-c|--clean]}} {{[-d|--dbname]}} {{db_name}}
{{archive_file.dump}}
```

- Use multiple jobs to do the restoring:

```
pg_restore {{[-j|--jobs]}} {{2}} {{[-d|--dbname]}}
{{db_name}} {{archive_file.dump}}
```

pg_rewind

Synchronize a PostgreSQL data directory with another data directory that was forked from it.

More information: https://www.postgresql.org/docs/current/app-pgrewind.html.

- Synchronize target directory with source directory:

```
pg_rewind {{[-D|--target-pgdata]}} {{path/to/target_data}} --source-pgdata {{path/to/source_data}}
```

- Synchronize target with source server using connection string:

```
pg_rewind {{[-D|--target-pgdata]}} {{path/to/target_data}} --source-server {{connstr}}
```

- Perform a dry run:

```
pg_rewind {{[-D|--target-pgdata]}} {{path/to/target_data}} --source-pgdata {{path/to/source_data}} {{[-n|--dry-run]}}
```

- Show progress during synchronization:

```
pg_rewind {{[-D|--target-pgdata]}} {{path/to/target_data}} --source-pgdata {{path/to/source_data}} {{[-P|--progress]}}
```

- Display help:

```
pg_rewind {{[-?|--help]}}
```

pg_test_fsync

Determine the fastest wal_sync_method on your system.

More information: https://www.postgresql.org/docs/current/pgtestfsync.html.

- Run the default fsync benchmark (5 seconds):

```
pg_test_fsync
```

- Specify a custom test duration:

```
pg_test_fsync {{[-s|--secs-per-test]}} {{seconds}}
```

- Use a specific filename (it must be in same file system that the pg_wal directory is or will be placed in):

```
pg_test_fsync {{[-f|--filename]}} {{path/to/file}}
```

pg_test_timing

Measure timing overhead on your system (ensure clock monotonicity).

More information: https://www.postgresql.org/docs/current/pgtesttiming.html.

- Run the default timing test (3 seconds):

```
pg_test_timing
```

- Run for a custom duration:

```
pg_test_timing {{[-d|--duration]}} {{seconds}}
```

pg_upgrade

Upgrade a PostgreSQL database cluster to a new major version.

More information: https://www.postgresql.org/docs/current/pgupgrade.html.

- Check clusters before upgrading:

```
pg_upgrade {{[-c|--check]}} {{[-b|--old-bindir]}} {{path/to/old_bin}} {{[-B|--new-bindir]}} {{path/to/new_bin}} {{[-d|--old-datadir]}} {{path/to/old_data}} {{[-D|--new-datadir]}} {{path/to/new_data}}
```

- Perform the actual upgrade:

```
pg_upgrade {{[-b|--old-bindir]}} {{path/to/old_bin}} {{[-B|--new-bindir]}} {{path/to/new_bin}} {{[-d|--old-datadir]}} {{path/to/old_data}} {{[-D|--new-datadir]}} {{path/to/new_data}}
```

- Use multiple parallel jobs during the upgrade:

```
pg_upgrade {{[-j|--jobs]}} {{njobs}} {{[-b|--old-bindir]}} {{path/to/old_bin}} {{[-B|--new-bindir]}} {{path/to/new_bin}} {{[-d|--old-datadir]}} {{path/to/old_data}} {{[-D|--new-datadir]}} {{path/to/new_data}}
```

- Specify the old and new PostgreSQL ports:

```
pg_upgrade {{[-p|--old-port]}} {{port}} {{[-P|--new-port]}} {{port}} {{[-b|--old-bindir]}} {{path/to/old_bin}} {{[-B|--new-bindir]}} {{path/to/new_bin}} {{[-d|--old-datadir]}} {{path/to/old_data}} {{[-D|--new-datadir]}} {{path/to/new_data}}
```

- Use hard links instead of copying files to the new cluster:

```
pg_upgrade {{[-k|--link]}} {{[-b|--old-bindir]}} {{path/to/old_bin}} {{[-B|--new-bindir]}} {{path/to/new_bin}} {{[-d|--old-datadir]}} {{path/to/old_data}} {{[-D|--new-datadir]}} {{path/to/new_data}}
```

- Display help:

```
pg_upgrade {{[-?|--help]}}
```

pg_verifybackup

Verify the integrity of a base backup of a PostgreSQL cluster.

More information: https://www.postgresql.org/docs/current/app-pgverifybackup.html.

- Verify a backup stored in a specific directory:

```
pg_verifybackup {{path/to/backup}}
```

- Verify a backup showing progress information:

```
pg_verifybackup {{[-P|--progress]}} {{path/to/backup}}
```

- Verify a backup and exit immediately on first error:

```
pg_verifybackup {{[-e|--exit-on-error]}} {{path/to/backup}}
```

- Verify a backup ignoring specific files or directories:

```
pg_verifybackup {{[-i|--ignore]}} {{path/to/
file_or_directory}} {{path/to/backup}}
```

- Verify a backup with a manifest file in a different location:

```
pg_verifybackup {{[-m|--manifest-path]}} {{path/to/
backup_manifest}} {{path/to/backup}}
```

- Display help:

```
pg_verifybackup {{[-?|--help]}}
```

pg_waldump

Display a human-readable rendering of the write-ahead log (WAL) of a PostgreSQL database cluster.

More information: https://www.postgresql.org/docs/current/pgwaldump.html.

- Display WAL records from a specific segment:

```
pg_waldump {{start_segment}}
```

- Display WAL records between two segments:

```
pg_waldump {{start_segment}} {{end_segment}}
```

- Specify the WAL file directory:

```
pg_waldump {{start_segment}} {{end_segment}} {{[-p|--path]}} {{path}}
```

- Follow new WAL entries as they arrive:

```
pg_waldump {{start_segment}} {{end_segment}} {{[-f|--follow]}}
```

- Limit number of records shown:

```
pg_waldump {{start_segment}} {{end_segment}} {{[-n|--limit]}} {{count}}
```

- Display summary statistics instead of individual records:

```
pg_waldump {{start_segment}} {{end_segment}} {{[-z|--stats]}}
```

- Filter by resource manager:

```
pg_waldump {{start_segment}} {{end_segment}} {{[-r|--rmgr]}} {{rmgr_name}}
```

- Display help:

```
pg_waldump {{[-?|--help]}}
```

pg_walsummary

Print contents of WAL summary files.

More information: https://www.postgresql.org/docs/current/app-pgwalsummary.html.

- Convert a WAL summary file to text:

```
pg_walsummary {{path/to/file}}
```

- Print one line per individual modified block (rather than ranges):

```
pg_walsummary {{[-i|--individual]}} {{path/to/file}}
```

- Suppress normal output (only errors):

```
pg_walsummary {{[-q|--quiet]}} {{path/to/file}}
```

pgbench

Run a benchmark test on PostgreSQL.

More information: https://www.postgresql.org/docs/current/pgbench.html.

- Initialize a database with a scale factor of 50 times the default size:

```
pgbench --initialize --scale={{50}} {{database_name}}
```

- Benchmark a database with 10 clients, 2 worker threads, and 10,000 transactions per client:

```
pgbench --client={{10}} --jobs={{2}} --transactions={{10000}}
{{database_name}}
```

pgcli

A modern PostgreSQL CLI with auto-completion and syntax highlighting.

More information: https://www.pgcli.com/#usage.

- Connect to a PostgreSQL database using a connection string:

```
pgcli postgresql://{{user}}@{{host}}/{{database}}
```

- Connect to a database using flags:

```
pgcli {{[-h|--host]}} {{host}} {{[-U|--username]}}
{{username}} {{[-d|--dbname]}} {{database}}
```

- Display help:

```
pgcli --help
```

pgmbentley

Bentleyize a PGM image.

More information: https://netpbm.sourceforge.net/doc/pgmbentley.html.

- Apply the Bentley Effect on a PGM image:

```
pgmbentley {{path/to/input_file.pgm}} > {{path/to/
output_file.pgm}}
```

pgmcrater

This command has been superseded by **`pamcrater`**, **`pamshadedrelief`**, and **`pamtopnm`**.

More information: https://netpbm.sourceforge.net/doc/pgmcrater.html.

- View documentation for `pamcrater`:

```
tldr pamcrater
```

- View documentation for `pamshadedrelief`:

```
tldr pamshadedrelief
```

- View documentation for `pamtopnm`:

```
tldr pamtopnm
```

pgmdeshadow

Deshadow a PGM image.

More information: https://netpbm.sourceforge.net/doc/pgmdeshadow.html.

- Remove grey shadows from a PGM image:

```
pgmdeshadow {{path/to/input_file.pgm}} > {{path/to/
output_file.pgm}}
```

pgmedge

This command has been superseded by **pamedge**.

More information: https://netpbm.sourceforge.net/doc/pgmedge.html.

- View documentation for the current command:

```
tldr pamedge
```

pgmenhance

Edge-enhance a PGM image.

See also: **pamedge**.

More information: https://netpbm.sourceforge.net/doc/pgmenhance.html.

- Edge-enhance a PGM image:

```
pgmenhance {{path/to/image.pgm}} > {{path/to/output.pgm}}
```

- Specify the level of enhancement:

```
pgmenhance -{{1..9}} {{path/to/image.pgm}} > {{path/to/
output.pgm}}
```

pgmhist

Print a histogram of the values present in a PGM image.

See also: **`ppmhist`**.

More information: https://netpbm.sourceforge.net/doc/pgmhist.html.

- Display the histogram for human reading:

```
pgmhist {{path/to/image.pgm}}
```

- Display the median grey value:

```
pgmhist {{[-me|-median]}} {{path/to/image.pgm}}
```

- Display four quartile grey value:

```
pgmhist {{[-qua|-quartile]}} {{path/to/image.pgm}}
```

- Report the existence of invalid grey values:

```
pgmhist {{[-f|-forensic]}} {{path/to/image.pgm}}
```

- Display machine-readable output:

```
pgmhist {{[-ma|-machine]}} {{path/to/image.pgm}}
```

pgmkernel

Generate a convolution kernel to be used with **pnmconvol**.

See also: **pnmconvol**.

More information: https://netpbm.sourceforge.net/doc/pgmkernel.html.

- Generate a convolution kernel:

```
pgmkernel {{width}} {{height}} > {{path/to/output.pgm}}
```

- Generate a quadratic convolution kernel:

```
pgmkernel {{size}} > {{path/to/output.pgm}}
```

- Specify the weight of the center in the generated kernel:

```
pgmkernel {{[-w|-weight]}} {{value}} {{width}} {{height}} >
{{path/to/output.pgm}}
```

pgmmake

Create PGM image with a uniform gray level.

More information: https://netpbm.sourceforge.net/doc/pgmmake.html.

- Create PGM image with a uniform gray level (specified as a number between 0 and 1) and the specified dimensions:

```
pgmmake {{graylevel}} {{width}} {{height}} > {{path/to/output_file.pgm}}
```

pgmnoise

Generate white noise.

More information: https://netpbm.sourceforge.net/doc/pgmnoise.html.

- Generate a PGM image containing white noise:

```
pgmnoise {{width}} {{height}} > {{path/to/output.pgm}}
```

- Specify the seed for the pseudo-random number generator:

```
pgmnoise {{width}} {{height}} -randomseed {{value}} > {{path/to/output.pgm}}
```

pgmnorm

This command has been superseded by **pnmnorm**.

More information: https://netpbm.sourceforge.net/doc/pgmnorm.html.

- View documentation for the current command:

```
tldr pnmnorm
```

pgmoil

This command has been superseded by **`pamoil`**.

More information: https://netpbm.sourceforge.net/doc/pgmoil.html.

- View documentation for the current command:

```
tldr pamoil
```

pgmramp

Generate a greyscale map.

More information: https://netpbm.sourceforge.net/doc/pgmramp.html.

- Generate a left-to-right greyscale map:

```
pgmramp -lr > {{path/to/output.pgm}}
```

- Generate a top-to-bottom greyscale map:

```
pgmramp -tb > {{path/to/output.pgm}}
```

- Generate a rectangular greyscale map:

```
pgmramp -rectangle > {{path/to/output.pgm}}
```

- Generate a elliptical greyscale map:

```
pgmramp -ellipse {{path/to/image.pgm}} > {{path/to/
output.pgm}}
```

- Generate a greyscale map from the top-left corner to the bottom-right corner:

```
pgmramp -diagonal {{path/to/image.pgm}} > {{path/to/
output.pgm}}
```

pgmslice

This command has been superseded by **`pamslice`**.

More information: https://netpbm.sourceforge.net/doc/pgmslice.html.

- View documentation for the current command:

```
tldr pamslice
```

pgmtexture

Extract textural features from a PGM image.

More information: https://netpbm.sourceforge.net/doc/pgmtexture.html.

- Extract textural features from a PGM image:

```
pgmtexture {{path/to/image.pgm}} > {{path/to/output.pgm}}
```

- Specify the distance parameter for the feature extraction algorithm:

```
pgmtexture -d {{distance}} {{path/to/image.pgm}} > {{path/to/
output.pgm}}
```

pgmtofs

Convert a PGM image to Usenix FaceSaver format.

See also: **`fstopgm`**.

More information: https://netpbm.sourceforge.net/doc/pgmtofs.html.

- Convert the specified PGM image to Usenix FaceSave format:

```
pgmtofs {{path/to/input.pgm}} > {{path/to/output.fs}}
```

pgmtolispm

Convert a PGM image to Lisp Machine format.

See also: **`lispmtopgm`**.

More information: https://netpbm.sourceforge.net/doc/pgmtolispm.html.

- Convert the specified PGM image to Lisp Machine format:

```
pgmtolispm {{path/to/input.pgm}} > {{path/to/output.lispm}}
```

pgmtopbm

This command has been superseded by **pamditherbw**.

More information: https://netpbm.sourceforge.net/doc/pgmtopbm.html.

- View documentation for the current command:

```
tldr pamditherbw
```

pgmtopgm

Copy a PGM image file.

More information: https://netpbm.sourceforge.net/doc/pgmtopgm.html.

- Copy PGM file from `stdin` to `stderr`:

  `pgmtopgm`

- Display version:

  `pgmtopgm -version`

pgmtoppm

Colorize a PGM image.

More information: https://netpbm.sourceforge.net/doc/pgmtoppm.html.

- Map all greyscale values of the input image to all colors between the two specified colors:

```
pgmtoppm {{[-b|-black]}} {{red}} {{[-w|-white]}} {{blue}} {{path/to/input.pgm}} > {{path/to/output.ppm}}
```

- Map all greyscale values of the input image to colors according to the specified colormap:

```
pgmtoppm {{[-m|-map]}} {{path/to/colormap.ppm}} {{path/to/input.pgm}} > {{path/to/output.ppm}}
```

pgmtosbig

Convert a PGM image to the SBIG CCDOPS format.

More information: https://netpbm.sourceforge.net/doc/pgmtosbig.html.

- Convert a PGM image file to the SBIG CCDOPS format:

```
pgmtosbig {{path/to/input_file.pgm}} > {{path/to/
output.sbig}}
```

pgmtost4

Convert a PGM image to the SBIG ST-4 format.

More information: https://netpbm.sourceforge.net/doc/pgmtost4.html.

- Convert a PGM image file to the SBIG ST-4 format:

```
pgmtost4 {{path/to/input_file.pgm}} > {{path/to/output.st4}}
```

pgrep

Find or signal processes by name.

More information: https://manned.org/pgrep.

- Return PIDs of any running processes with a matching command string:

```
pgrep {{process_name}}
```

- Search for processes including their command-line options:

```
pgrep {{[-f|--full]}} "{{process_name}} {{parameter}}"
```

- Search for processes run by a specific user:

```
pgrep {{[-u|--euid]}} root {{process_name}}
```

phan

A static analysis tool for PHP.

More information: https://github.com/phan/phan.

- Generate a `.phan/config.php` in the current directory:

```
phan --init
```

- Generate a Phan configuration file using a specific level (1 being strictest to 5 being the least strict):

```
phan --init --init-level {{level}}
```

- Analyze the current directory:

```
phan
```

- Analyze one or more directories:

```
phan {{--directory path/to/directory1 --directory path/to/directory2 ...}}
```

- Specify a configuration file (defaults to `.phan/config.php`):

```
phan --config-file {{path/to/config.php}}
```

- Specify the output mode:

```
phan --output-mode {{text|verbose|json|csv|codeclimate|checkstyle|pylint|html}}
```

- Specify the number of parallel processes:

```
phan --processes {{number_of_processes}}
```

phing

A PHP build tool based on Apache Ant.

More information: https://www.phing.info/guide/chunkhtml/ch03s03.html.

- Perform the default task in the `build.xml` file:

```
phing
```

- Initialize a new build file:

```
phing {{[-i|--init]}} {{path/to/build.xml}}
```

- Perform a specific task:

```
phing {{task_name}}
```

- Use the given build file path:

```
phing {{[-f|-buildfile]}} {{path/to/build.xml}} {{task_name}}
```

- Log to the given file:

```
phing -logfile {{path/to/log_file}} {{task_name}}
```

- Use custom properties in the build:

```
phing -D{{property}}={{value}} {{task_name}}
```

- Specify a custom listener class:

```
phing -listener {{class_name}} {{task_name}}
```

- Build using verbose output:

```
phing -verbose {{task_name}}
```

phive

The Phar Installation and Verification Environment for secure PHP application deployment.

More information: https://phar.io/#Usage.

- Display a list of available aliased Phars:

```
phive list
```

- Install a specified Phar to the local directory:

```
phive install {{alias|url}}
```

- Install a specified Phar globally:

```
phive install {{alias|url}} {{[-g|--global]}}
```

- Install a specified Phar to a target directory:

```
phive install {{alias|url}} {{[-t|--target]}} {{path/to/directory}}
```

- Update all Phar files to the latest version:

```
phive update
```

- Remove a specified Phar file:

```
phive remove {{alias|url}}
```

- Remove unused Phar files:

```
phive purge
```

- List all available commands:

```
phive help
```

php artisan

Laravel's Artisan command-line interface.

More information: https://laravel.com/docs/artisan.

- Start PHP's built-in web server for the current Laravel application:

  ```
  php artisan serve
  ```

- Start an interactive PHP command-line interface:

  ```
  php artisan tinker
  ```

- Generate a new Eloquent model class with a migration, factory, and resource controller:

  ```
  php artisan make:model {{ModelName}} --all
  ```

- Display a list of all available commands:

  ```
  php artisan help
  ```

php-coveralls

A PHP client for Coveralls.

More information: https://php-coveralls.github.io/php-coveralls/#cli-options.

- Send coverage information to Coveralls:

```
php-coveralls
```

- Send coverage information to Coveralls for a specific directory:

```
php-coveralls {{[-r|--root_dir]}} {{path/to/directory}}
```

- Send coverage information to Coveralls with a specific config:

```
php-coveralls {{[-c|--config]}} {{path/to/.coveralls.yml}}
```

- Send coverage information to Coveralls with verbose output:

```
php-coveralls {{[-v|--verbose]}}
```

- Send coverage information to Coveralls excluding source files with no executable statements:

```
php-coveralls --exclude-no-stmt
```

- Send coverage information to Coveralls with a specific environment name:

```
php-coveralls {{[-e|--env]}} {{test|dev|prod}}
```

- Specify multiple Coverage Clover XML files to upload:

```
php-coveralls {{[-x|--coverage_clover]}} {{path/to/
first_clover.xml}} --coverage_clover {{path/to/
second_clover.xml}}
```

- Output the JSON that will be sent to Coveralls to a specific file:

```
php-coveralls {{[-o|--json_path]}} {{path/to/coveralls-
upload.json}}
```

php-cs-fixer

Automatic coding style fixer for PHP.

More information: https://github.com/PHP-CS-Fixer/PHP-CS-Fixer.

- Execute code style fixing in the current directory:

```
php-cs-fixer fix
```

- Execute code style fixing for a specific directory:

```
php-cs-fixer fix {{path/to/directory}}
```

- Execute code style linting without applying changes:

```
php-cs-fixer fix --dry-run
```

- Execute code style fixes using specific rules:

```
php-cs-fixer fix --rules={{rules}}
```

- Display the rules that have been applied:

```
php-cs-fixer fix --verbose
```

- Output the results in a different format:

```
php-cs-fixer fix --format={{txt|json|xml|checkstyle|junit|gitlab}}
```

- Display files that require fixing:

```
php-cs-fixer list-files
```

- Describe a rule or ruleset:

```
php-cs-fixer describe {{rule}}
```

php yii

Yii Framework's command-line interface.

More information: https://www.yiiframework.com/doc/guide/2.0/en/tutorial-console.

- Start PHP's built-in web server for the current Yii application:

```
php yii {{serve}}
```

- Generate a controller, views, and related files for the CRUD actions on the specified model class:

```
php yii {{gii/crud}} --modelClass={{ModelName}} --controllerClass={{ControllerName}}
```

- Display help:

```
php yii {{help}}
```

php

PHP command-line interface.

More information: https://www.php.net/manual/en/features.commandline.options.php.

- Parse and execute a PHP script:

```
php {{path/to/file}}
```

- Check syntax on (i.e. [l]int) a PHP script:

```
php {{[-l|--syntax-check]}} {{path/to/file}}
```

- Run PHP inter[a]ctively:

```
php {{[-a|--interactive]}}
```

- Run PHP code (Notes: Don't use `<? ?>` tags; escape double quotes with backslash):

```
php {{[-r|--run]}} "{{code}}"
```

- Start a PHP built-in web server in the current directory:

```
php {{[-S|--server]}} {{host}}:{{port}}
```

- List installed PHP extensions:

```
php {{[-m|--modules]}}
```

- Display information about the current PHP configuration:

```
php {{[-i|--info]}}
```

- Display information about a specific function:

```
php {{[--rf|--rfunction]}} {{function_name}}
```

phpbu

A backup utility framework for PHP.

More information: https://phpbu.de/manual/current/en/phpbu-manual.html#cli.

- Run backups using the default `phpbu.xml` configuration file:

  ```
  phpbu
  ```

- Run backups using a specific configuration file:

  ```
  phpbu --configuration={{path/to/configuration_file.xml}}
  ```

- Only run the specified backups:

  ```
  phpbu --limit={{backup_task_name}}
  ```

- Simulate the actions that would have been performed:

  ```
  phpbu --simulate
  ```

phpcbf

Fix violations detected by phpcs.

More information: https://github.com/squizlabs/PHP_CodeSniffer.

- Fix issues in the specified directory (defaults to the PEAR standard):

```
phpcbf {{path/to/directory}}
```

- Display a list of installed coding standards:

```
phpcbf -i
```

- Specify a coding standard to validate against:

```
phpcbf {{path/to/directory}} --standard {{standard}}
```

- Specify comma-separated file extensions to include when sniffing:

```
phpcbf {{path/to/directory}} --extensions
{{file_extension1,file_extension2,...}}
```

- A comma-separated list of files to load before processing:

```
phpcbf {{path/to/directory}} --bootstrap {{path/to/
file1,path/to/file2,...}}
```

- Don't recurse into subdirectories:

```
phpcbf {{path/to/directory}} -l
```

phpcpd

A copy and paste detector for PHP code.

More information: https://github.com/sebastianbergmann/phpcpd.

- Analyze duplicated code for a specific file or directory:

```
phpcpd {{path/to/file_or_directory}}
```

- Analyze using fuzzy matching for variable names:

```
phpcpd --fuzzy {{path/to/file_or_directory}}
```

- Specify a minimum number of identical lines (defaults to 5):

```
phpcpd --min-lines {{number_of_lines}} {{path/to/
file_or_directory}}
```

- Specify a minimum number of identical tokens (defaults to 70):

```
phpcpd --min-tokens {{number_of_tokens}} {{path/to/
file_or_directory}}
```

- Exclude a directory from analysis (must be relative to the source):

```
phpcpd --exclude {{path/to/excluded_directory}} {{path/to/
file_or_directory}}
```

- Output the results to a PHP-CPD XML file:

```
phpcpd --log-pmd {{path/to/log_file}} {{path/to/
file_or_directory}}
```

phpcs

Tokenize PHP, JavaScript, and CSS files to detect violations of a defined set of coding standards.

More information: https://github.com/squizlabs/PHP_CodeSniffer.

- Sniff the specified directory for issues (defaults to the PEAR standard):

```
phpcs {{path/to/directory}}
```

- Display a list of installed coding standards:

```
phpcs -i
```

- Specify a coding standard to validate against:

```
phpcs {{path/to/directory}} --standard {{standard}}
```

- Specify comma-separated file extensions to include when sniffing:

```
phpcs {{path/to/directory}} --extensions
{{file_extension1,file_extension2,...}}
```

- Specify the format of the output report (e.g. `full`, `xml`, `json`, `summary`):

```
phpcs {{path/to/directory}} --report {{format}}
```

- Set configuration variables to be used during the process:

```
phpcs {{path/to/directory}} --config-set {{key}} {{value}}
```

- A comma-separated list of files to load before processing:

```
phpcs {{path/to/directory}} --bootstrap {{path/to/file1,path/
to/file2,...}}
```

- Don't recurse into subdirectories:

```
phpcs {{path/to/directory}} -l
```

phpdox

A PHP documentation generator.

More information: https://manned.org/phpdox.

- Display an annotated skeleton configuration XML file:

```
phpdox --skel
```

- Generate documentation for the current working directory:

```
phpdox
```

- Generate documentation using a specific configuration file:

```
phpdox {{[-f|--file]}} {{path/to/phpdox.xml}}
```

- Only run the metadata collection process:

```
phpdox {{[-c|--collector]}}
```

- Only run the documentation generator process:

```
phpdox {{[-g|--generator]}}
```

phpenv

A PHP version manager for development purposes.

More information: https://github.com/phpenv/phpenv.

- Install a PHP version globally:

```
phpenv install {{version}}
```

- Refresh shim files for all PHP binaries known to `phpenv`:

```
phpenv rehash
```

- List all installed PHP versions:

```
phpenv versions
```

- Display the currently active PHP version:

```
phpenv version
```

- Set the global PHP version:

```
phpenv global {{version}}
```

- Set the local PHP version, which overrides the global version:

```
phpenv local {{version}}
```

- Unset the local PHP version:

```
phpenv local --unset
```

phpize

Prepare a PHP extension for compiling.

More information: https://manned.org/phpize.

- Prepare the PHP extension in the current directory for compiling:

```
phpize
```

- Delete files previously created by phpize:

```
phpize --clean
```

phploc

Quickly measure the size and analyzing the structure of a PHP project.

More information: https://github.com/sebastianbergmann/phploc.

- Analyze a directory and print the result:

```
phploc {{path/to/directory}}
```

- Include only specific files from a comma-separated list (globs are allowed):

```
phploc {{path/to/directory}} --names '{{path/to/file1,path/to/file2,...}}'
```

- Exclude specific files from a comma-separated list (globs are allowed):

```
phploc {{path/to/directory}} --names-exclude '{{path/to/file1,path/to/file2,...}}'
```

- Exclude a specific directory from analysis:

```
phploc {{path/to/directory}} --exclude {{path/to/exclude_directory}}
```

- Log the results to a specific CSV file:

```
phploc {{path/to/directory}} --log-csv {{path/to/file}}
```

- Log the results to a specific XML file:

```
phploc {{path/to/directory}} --log-xml {{path/to/file}}
```

- Count PHPUnit test case classes and test methods:

```
phploc {{path/to/directory}} --count-tests
```

phpmd

PHP mess detector: check for common potential problems.

More information: https://github.com/phpmd/phpmd#command-line-options.

- Display a list of available rulesets and formats:

```
phpmd
```

- Scan a file or directory for problems using comma-separated rulesets:

```
phpmd {{path/to/file_or_directory}} {{xml|text|html}}
{{ruleset1,ruleset2,...}}
```

- Specify the minimum priority threshold for rules:

```
phpmd {{path/to/file_or_directory}} {{xml|text|html}}
{{ruleset1,ruleset2,...}} --minimumpriority {{priority}}
```

- Include only the specified extensions in analysis:

```
phpmd {{path/to/file_or_directory}} {{xml|text|html}}
{{ruleset1,ruleset2,...}} --suffixes {{extensions}}
```

- Exclude the specified comma-separated directories:

```
phpmd {{path/to/file_or_directory1,path/to/
file_or_directory2,...}} {{xml|text|html}}
{{ruleset1,ruleset2,...}} --exclude {{directory_patterns}}
```

- Output the results to a file instead of `stdout`:

```
phpmd {{path/to/file_or_directory}} {{xml|text|html}}
{{ruleset1,ruleset2,...}} --reportfile {{path/to/
report_file}}
```

- Ignore the use of warning-suppressive PHPDoc comments:

```
phpmd {{path/to/file_or_directory}} {{xml|text|html}}
{{ruleset1,ruleset2,...}} --strict
```

phpspec

A Behaviour Driven Development tool for PHP.

More information: https://phpspec.net/en/stable/cookbook/console.html.

- Create a specification for a class:

  ```
  phpspec describe {{class_name}}
  ```

- Run all specifications in the "spec" directory:

  ```
  phpspec run
  ```

- Run a single specification:

  ```
  phpspec run {{path/to/class_specification_file}}
  ```

- Run specifications using a specific configuration file:

  ```
  phpspec run {{[-c|--config]}} {{path/to/configuration_file}}
  ```

- Run specifications using a specific bootstrap file:

  ```
  phpspec run {{[-b|--bootstrap]}} {{path/to/bootstrap_file}}
  ```

- Disable code generation prompts:

  ```
  phpspec run --no-code-generation
  ```

- Enable fake return values:

  ```
  phpspec run --fake
  ```

phpstan

A PHP static analysis tool to discover bugs in code.

More information: https://phpstan.org/user-guide/command-line-usage.

- Analyze one or more directories:

```
phpstan analyse {{path/to/directory1 path/to/directory2 ...}}
```

- Analyze a directory using a configuration file:

```
phpstan analyse {{path/to/directory}} {{[-c|--
configuration]}} {{path/to/config}}
```

- Analyze using a specific rule level (0-10, higher is stricter):

```
phpstan analyse {{path/to/directory}} {{[-l|--level]}}
{{level}}
```

- Specify an autoload file to load before analyzing:

```
phpstan analyse {{path/to/directory}} {{[-a|--autoload-
file]}} {{path/to/autoload_file}}
```

- Specify a memory limit during analysis:

```
phpstan analyse {{path/to/directory}} --memory-limit
{{memory_limit}}
```

- Display available options for analysis:

```
phpstan analyse --help
```

phpstorm

A cross-platform IDE for PHP based on the JetBrains IntelliJ platform.

More information: https://www.jetbrains.com/help/phpstorm/working-with-the-ide-features-from-command-line.html#arguments.

- Open a specific directory:

```
phpstorm {{path/to/directory}}
```

- Open a file:

```
phpstorm {{path/to/file}}
```

- Open a file at a specific line:

```
phpstorm --line {{line_number}} {{path/to/file}}
```

- View the differences between two files:

```
phpstorm diff {{path/to/left_file}} {{path/to/right_file}}
```

phpunit

PHPUnit test runner.

More information: https://docs.phpunit.de/en/12.4/textui.html#command-line-options.

- Run tests in the current directory. Note: Expects you to have a 'phpunit.xml':

```
phpunit
```

- Run tests in a specific file:

```
phpunit {{path/to/TestFile.php}}
```

- Run tests annotated with the given group:

```
phpunit --group {{name}}
```

- Run tests and generate a coverage report in HTML:

```
phpunit --coverage-html {{path/to/directory}}
```

pi1toppm

Convert an Atari Degas PI1 image to a PPM image.

See also: **ppmtopi1**.

More information: https://netpbm.sourceforge.net/doc/pi1toppm.html.

- Convert an Atari Degas PI1 image into PPM image:

```
pi1toppm {{path/to/atari_image.pi1}} > {{path/to/image.ppm}}
```

pi3topbm

Convert an Atari Degas PI3 image to PBM image.

See also: **pbmtopi3**.

More information: https://netpbm.sourceforge.net/doc/pi3topbm.html.

- Convert an Atari Degas PI3 image to PBM image:

```
pi3topbm {{path/to/atari_image.pi3}} > {{path/to/
output_image.pbm}}
```

piactl

The tool for Private Internet Access, a commercial VPN provider.

More information: https://helpdesk.privateinternetaccess.com/kb/articles/pia-desktop-command-line-interface-2.

- Log in to Private Internet Access:

```
piactl login {{path/to/login_file}}
```

- Connect to Private Internet Access:

```
piactl connect
```

- Disconnect from Private Internet Access:

```
piactl disconnect
```

- Enable or disable the Private Internet Access daemon in the background:

```
piactl background {{enable|disable}}
```

- List all available VPN regions:

```
piactl get regions
```

- Display the current VPN region:

```
piactl get region
```

- Set your VPN region:

```
piactl set region {{region}}
```

- Log out of Private Internet Access:

```
piactl logout
```

pic

Picture preprocessor for the groff (GNU Troff) document formatting system.

See also: **`groff`**, **`troff`**.

More information: https://manned.org/pic.

- Process input with pictures, saving the output for future typesetting with groff to PostScript:

```
pic {{path/to/input.pic}} > {{path/to/output.roff}}
```

- Typeset input with pictures to PDF using the [me] macro package:

```
pic -T {{pdf}} {{path/to/input.pic}} | groff -{{me}} -T
{{pdf}} > {{path/to/output.pdf}}
```

picard

Next generation MusicBrainz tagging application.

More information: https://picard-docs.musicbrainz.org/en/getting_started/starting.html.

- Start Picard:

  ```
  picard
  ```

- Open a set of files:

  ```
  picard {{path/to/file1.mp3 path/to/file2.mp3 ...}}
  ```

- Display version:

  ```
  picard {{[-V|--long-version]}}
  ```

picgo

Upload an image to an image hosting service (default is SM.MS).

More information: https://github.com/PicGo/PicGo-Core.

- Interactively select a hosting service:

  ```
  picgo set uploader
  ```

- Upload the image in current clipboard:

  ```
  picgo upload
  ```

- Upload an image from a specific path:

  ```
  picgo upload {{path/to/image}}
  ```

pickle

A PHP extension installer based on Composer.

More information: https://github.com/FriendsOfPHP/pickle#usage.

- Install a specific PHP extension:

```
pickle install {{extension_name}}
```

- Convert an existing PECL extension configuration to a Pickle configuration file:

```
pickle convert {{path/to/directory}}
```

- Validate a PECL extension:

```
pickle validate {{path/to/directory}}
```

- Package a PECL extension for release:

```
pickle release {{path/to/directory}}
```

pico

Text editor styled after the Alpine Composer.

More information: https://manned.org/pico.

- Start the editor:

```
pico {{path/to/file}}
```

- Start the editor with the cursor located n lines into the file:

```
pico +{{n}} {{path/to/file}}
```

- Start the editor with the cursor shown before the current selection:

```
pico -g {{path/to/file}}
```

- Define the quote string for files such as email:

```
pico -Q "{{quotestring}}" {{path/to/file}}
```

- Enable mouse functionality when run within an `xterm` window:

```
pico -m {{path/to/file}}
```

- Set the operating directory for `pico`:

```
pico -o {{path/to/directory}}
```

- Enable "view only" mode, which disallows any edits:

```
pico -v {{path/to/file}}
```

- Display all files including those beginning with a period:

```
pico -a
```

picocom

Minimal program to emulate serial consoles.

More information: https://manned.org/picocom.

- Connect to a serial console with the default baud rate of 9600:

```
sudo picocom {{/dev/ttyXYZ}}
```

- Connect to a serial console with a specified baud rate:

```
sudo picocom {{/dev/ttyXYZ}} {{[-b|--baud]}} {{baud_rate}}
```

- Map special characters (e.g. LF to CRLF):

```
sudo picocom {{/dev/ttyXYZ}} --imap {{lfcrlf}}
```

- Exit picocom:

```
<Ctrl a><Ctrl x>
```

- Display help:

```
picocom {{[-h|--help]}}
```

picom-trans

Set the window opacity for the **picom** window compositor.

More information: https://github.com/yshui/picom/blob/next/man/picom-trans.1.adoc.

- Set the currently focused window opacity to a specific percentage:

```
picom-trans {{[-c|--current]}} {{[-o|--opacity]}} {{percentage}}
```

- Set the opacity of a window with a specific name:

```
picom-trans {{[-n|--name]}} {{Firefox}} {{[-o|--opacity]}} {{percentage}}
```

- Set the opacity of a specific window selected via mouse cursor:

```
picom-trans {{[-s|--select]}} {{[-o|--opacity]}} {{percentage}}
```

- Toggle the opacity of a specific window:

```
picom-trans {{[-n|--name]}} {{Firefox}} {{[-t|--toggle]}}
```

picom

Standalone compositor for Xorg.

More information: https://github.com/yshui/picom/blob/next/man/picom.1.adoc.

- Enable `picom` during a session:

```
picom &
```

- Start `picom` as a background process:

```
picom {{[-b|--daemon]}}
```

- Use a custom configuration file:

```
picom --config {{path/to/config_file}}
```

picotool

Manage Raspberry Pi Pico boards.

More information: https://github.com/raspberrypi/picotool#overview.

- Display information about the currently loaded program on a Pico:

```
picotool info
```

- Load a binary onto a Pico:

```
picotool load {{path/to/binary}}
```

- Convert an ELF or BIN file to UF2:

```
picotool uf2 convert {{path/to/elf_or_bin}} {{path/to/output}}
```

- Reboot a Pico:

```
picotool reboot
```

- List all known registers:

```
picotool otp list
```

- Display help:

```
picotool help
```

- Display version:

```
picotool version
```

picttoppm

Convert a Macintosh PICT file to a PPM image.

More information: https://netpbm.sourceforge.net/doc/picttoppm.html.

- Convert a PICT file to a PPM image:

```
picttoppm {{path/to/file.pict}} > {{path/to/file.ppm}}
```

- Force any images in the PICT file to be output at full resolution:

```
picttoppm {{[-fu|-fullres]}} {{path/to/file.pict}} > {{path/to/file.ppm}}
```

- Do not assume that the input file contains a PICT header and execute quickdraw operations only:

```
picttoppm {{[-n|-noheader]}} {{[-quic|-quickdraw]}} {{path/to/file.pict}} > {{path/to/file.ppm}}
```

pie

The PHP Installer for Extensions.

More information: https://github.com/php/pie/blob/1.4.x/docs/usage.md.

- Install or update an extension:

```
pie install {{vendor}}/{{extension}}
```

- List installed extensions and their versions:

```
pie show
```

- Display information about a specific package:

```
pie info {{vendor}}/{{extension}}
```

- List the configured repositories:

```
pie repository:list
```

- Add a repository:

```
pie repository:add {{type}} {{url}}
```

- Remove a repository:

```
pie repository:remove {{url}}
```

pigz

Multithreaded zlib compression utility.

More information: https://manned.org/pigz.

- Compress a file with default options:

```
pigz {{path/to/file}}
```

- Compress a file using the best compression method:

```
pigz {{[-9|--best]}} {{path/to/file}}
```

- Compress a file using no compression and 4 processors:

```
pigz -0 {{[-p|--processes]}} {{4}} {{path/to/file}}
```

- Compress a directory using tar:

```
tar cf - {{path/to/directory}} | pigz > {{path/to/
file.tar.gz}}
```

- Decompress a file:

```
pigz {{[-d|--decompress]}} {{archive.gz}}
```

- List the contents of an archive:

```
pigz {{[-l|--list]}} {{archive.tar.gz}}
```

ping

Send ICMP ECHO_REQUEST packets to network hosts.

More information: https://manned.org/ping.

- Ping host:

```
ping {{host}}
```

- Ping a host only a specific number of times:

```
ping -c {{count}} {{host}}
```

- Ping host, specifying the interval in seconds between requests (default is 1 second):

```
ping -i {{seconds}} {{host}}
```

- Ping host without trying to lookup symbolic names for addresses:

```
ping -n {{host}}
```

- Ping host and ring the bell when a packet is received (if your terminal supports it):

```
ping -a {{host}}
```

- Also display a message if no response was received:

```
ping -O {{host}}
```

- Ping a host with specific number of pings, per-packet response timeout (`-W`), and total time limit (`-w`) of the entire ping run:

```
ping -c {{count}} -W {{seconds}} -w {{seconds}} {{host}}
```

ping.py

Simple ICMP ping using Impacket to check if an IPv4 host is reachable.

Sends ICMP echo requests and listens for echo replies. Requires root privileges for raw socket access (e.g., run with **sudo**).

More information: https://github.com/fortra/impacket.

- Ping a host from a specified source IPv4 address:

```
ping.py {{source_ipv4}} {{destination_ipv4}}
```

- Ping 192.168.1.100 from 192.168.1.10:

```
ping.py 192.168.1.10 192.168.1.100
```

ping6

Send ICMP ECHO_REQUEST packets to network hosts via IPv6 address.

Note: **`ping6`** has been merged to **`ping`** in modern systems.

More information: https://manned.org/ping6.

- Ping a host:

```
ping6 {{host}}
```

- Ping a host only a specific number of times:

```
ping6 -c {{count}} {{host}}
```

- Ping a host, specifying the interval in seconds between requests (default is 1 second):

```
ping6 -i {{seconds}} {{host}}
```

- Ping a host without trying to lookup symbolic names for addresses:

```
ping6 -n {{host}}
```

- Ping a host and ring the bell when a packet is received (if your terminal supports it):

```
ping6 -a {{host}}
```

ping6.py

Simple ICMPv6 ping using Impacket to check if an IPv6 host is reachable.

Sends ICMPv6 echo requests and listens for echo replies. Requires root privileges for raw socket access (e.g., run with **sudo**).

More information: https://github.com/fortra/impacket.

- Ping an IPv6 host from a specified source IPv6 address:

```
ping6.py {{source_ipv6}} {{destination_ipv6}}
```

- Ping 2001:db8::2 from 2001:db8::1:

```
ping6.py 2001:db8::1 2001:db8::2
```

pinky

Print user information using the **`finger`** protocol.

More information: https://manned.org/pinky.

- Display details about the current user:

```
pinky
```

- Display details for a specific user:

```
pinky {{user}}
```

- Display details in the long format:

```
pinky {{user}} -l
```

- Omit the user's home directory and shell in long format:

```
pinky {{user}} -lb
```

- Omit the user's project file in long format:

```
pinky {{user}} -lh
```

- Omit the column headings in short format:

```
pinky {{user}} -f
```

pint

An opinionated PHP code style fixer based on PHP-CS-Fixer.

More information: https://laravel.com/docs/pint.

- Execute code style fixing:

  ```
  pint
  ```

- Display all files that are changed:

  ```
  pint -v
  ```

- Execute code style linting without applying changes:

  ```
  pint --test
  ```

- Execute code style fixes using a specific configuration file:

  ```
  pint --config {{path/to/pint.json}}
  ```

- Execute code style fixes using a specific preset:

  ```
  pint --preset {{psr12}}
  ```

pinta

A free, open source program for drawing and image editing.

More information: https://www.pinta-project.com/user-guide/overview/.

- Start Pinta:

```
pinta
```

- Open specific files:

```
pinta {{path/to/image1 path/to/image2 ...}}
```

pio access

Set the access level on published resources (packages) in the registry.

More information: https://docs.platformio.org/en/latest/core/userguide/access/.

- Grant a user access to a resource:

```
pio access grant {{guest|maintainer|admin}} {{username}}
{{resource_urn}}
```

- Remove a user's access to a resource:

```
pio access revoke {{username}} {{resource_urn}}
```

- Show all resources that a user or team has access to and the access level:

```
pio access list {{username}}
```

- Restrict access to a resource to specific users or team members:

```
pio access private {{resource_urn}}
```

- Allow all users access to a resource:

```
pio access public {{resource_urn}}
```

pio account

Manage your PlatformIO account.

More information: https://docs.platformio.org/en/latest/core/userguide/account/.

- Register a new PlatformIO account:

```
pio account register {{[-u|--username]}} {{username}} {{[-e|--email]}} {{email}} {{[-p|--password]}} {{password}} --firstname {{firstname}} --lastname {{lastname}}
```

- Permanently delete your PlatformIO account and related data:

```
pio account destroy
```

- Log in to your PlatformIO account:

```
pio account login {{[-u|--username]}} {{username}} {{[-p|--password]}} {{password}}
```

- Log out of your PlatformIO account:

```
pio account logout
```

- Update your PlatformIO profile:

```
pio account update {{[-u|--username]}} {{username}} {{[-e|--email]}} {{email}} --firstname {{firstname}} --lastname {{lastname}} --current-password {{password}}
```

- Show detailed information about your PlatformIO account:

```
pio account show
```

- Reset your password using your username or email:

```
pio account forgot {{[-u|--username]}} {{username_or_email}}
```

pio boards

List pre-configured embedded boards available in PlatformIO.

More information: https://docs.platformio.org/en/latest/core/userguide/cmd_boards.html.

- List all available boards:

```
pio boards
```

- List only boards from installed platforms:

```
pio boards --installed
```

pio check

Perform a static analysis check on a PlatformIO project.

More information: https://docs.platformio.org/en/latest/core/userguide/cmd_check.html.

- Perform a basic analysis check on the current project:

```
pio check
```

- Perform a basic analysis check on a specific project:

```
pio check {{[-d|--project-dir]}} {{project_directory}}
```

- Perform an analysis check for a specific environment:

```
pio check {{[-e|--environment]}} {{environment}}
```

- Perform an analysis check and only report a specified defect severity type:

```
pio check --severity {{low|medium|high}}
```

- Perform an analysis check and show detailed information when processing environments:

```
pio check {{[-v|--verbose]}}
```

pio ci

Build PlatformIO projects with an arbitrary source code structure.

This will create a new temporary project which the source code will be copied into.

More information: https://docs.platformio.org/en/latest/core/userguide/cmd_ci.html.

- Build a PlatformIO project in the default system temporary directory and delete it afterwards:

  ```
  pio ci {{path/to/project}}
  ```

- Build a PlatformIO project and specify specific libraries:

  ```
  pio ci {{[-l|--lib]}} {{path/to/library_directory}} {{path/to/project}}
  ```

- Build a PlatformIO project and specify a specific board (`pio boards` lists all of them):

  ```
  pio ci {{[-b|--board]}} {{board}} {{path/to/project}}
  ```

- Build a PlatformIO project in a specific directory:

  ```
  pio ci --build-dir {{path/to/build_directory}} {{path/to/project}}
  ```

- Build a PlatformIO project and don't delete the build directory:

  ```
  pio ci --keep-build-dir {{path/to/project}}
  ```

- Build a PlatformIO project using a specific configuration file:

  ```
  pio ci {{[-c|--project-conf]}} {{path/to/platformio.ini}}
  ```

pio debug

Debug PlatformIO projects.

More information: https://docs.platformio.org/en/latest/core/userguide/cmd_debug.html.

- Debug the PlatformIO project in the current directory:

```
pio debug
```

- Debug a specific PlatformIO project:

```
pio debug {{[-d|--project-dir]}} {{path/to/
platformio_project}}
```

- Debug a specific environment:

```
pio debug {{[-e|--environment]}} {{environment}}
```

- Debug a PlatformIO project using a specific configuration file:

```
pio debug {{[-c|--project-conf]}} {{path/to/platformio.ini}}
```

- Debug a PlatformIO project using the `gdb` debugger:

```
pio debug --interface {{gdb}} {{gdb_options}}
```

pio device

Manage and monitor PlatformIO devices.

More information: https://docs.platformio.org/en/latest/core/userguide/device/.

- List all available serial ports:

```
pio device list
```

- List all available logical devices:

```
pio device list --logical
```

- Start an interactive device monitor:

```
pio device monitor
```

- Start an interactive device monitor and listen to a specific port:

```
pio device monitor {{[-p|--port]}} {{/dev/ttyUSBX}}
```

- Start an interactive device monitor and set a specific baud rate (defaults to 9600):

```
pio device monitor {{[-b|--baud]}} {{57600}}
```

- Start an interactive device monitor and set a specific EOL character (defaults to CRLF):

```
pio device monitor --eol {{CRLF|CR|LF}}
```

- Go to the menu of the interactive device monitor:

```
<Ctrl t>
```

pio home

Launch the PlatformIO Home web server.

More information: https://docs.platformio.org/en/latest/core/userguide/cmd_home.html.

- Open PlatformIO Home in the default web browser:

  ```
  pio home
  ```

- Use a specific HTTP port (defaults to 8008):

  ```
  pio home --port {{port}}
  ```

- Bind to a specific IP address (defaults to 127.0.0.1):

  ```
  pio home --host {{ip_address}}
  ```

- Do not automatically open PlatformIO Home in the default web browser:

  ```
  pio home --no-open
  ```

- Automatically shutdown the server on timeout (in seconds) when no clients are connected:

  ```
  pio home --shutdown-timeout {{time}}
  ```

- Specify a unique session identifier to keep PlatformIO Home isolated from other instances and protected from 3rd party access:

  ```
  pio home --session-id {{id}}
  ```

pio init

This command is an alias of **`pio project init`**.

- View documentation for the original command:

  ```
  tldr pio project
  ```

pio lib

Manage PlatformIO libraries.

More information: https://docs.platformio.org/en/latest/core/userguide/lib/.

- List installed libraries:

```
pio lib list
```

- List built-in libraries based on installed development platforms and their frameworks:

```
pio lib builtin
```

- Search for existing libraries:

```
pio lib search {{keyword}}
```

- Show details about a library:

```
pio lib show {{library}}
```

- Install a library:

```
pio lib install {{library}}
```

- Update installed libraries:

```
pio lib update
```

- Uninstall a library:

```
pio lib uninstall {{library}}
```

- Show PlatformIO library registry statistics:

```
pio lib stats
```

pio org

Manage PlatformIO organizations and their owners.

More information: https://docs.platformio.org/en/latest/core/userguide/org/.

- Create a new organization:

```
pio org create {{organization_name}}
```

- Delete an organization:

```
pio org destroy {{organization_name}}
```

- Add a user to an organization:

```
pio org add {{organization_name}} {{username}}
```

- Remove a user from an organization:

```
pio org remove {{organization_name}} {{username}}
```

- List all organizations the current user is a member of and their owners:

```
pio org list
```

- Update the name, email, or display name of an organization:

```
pio org update --orgname {{new_organization_name}} --email
{{new_email}} --displayname {{new_display_name}}
{{organization_name}}
```

pio pkg

Manage packages in the registry.

Packages can only be removed within 72 hours (3 days) from the date that they are published.

More information: https://docs.platformio.org/en/latest/core/userguide/package/.

- Create a package tarball from the current directory:

```
pio pkg pack {{[-o|--output]}} {{path/to/package.tar.gz}}
```

- Create and publish a package tarball from the current directory:

```
pio pkg publish
```

- Publish the current directory and restrict public access to it:

```
pio pkg publish --private
```

- Publish a package:

```
pio pkg publish {{path/to/package.tar.gz}}
```

- Publish a package with a custom release date (UTC):

```
pio pkg publish {{path/to/package.tar.gz}} --released-at
"{{2021-04-08 21:15:38}}"
```

- Remove all versions of a published package from the registry:

```
pio pkg unpublish {{package}}
```

- Remove a specific version of a published package from the registry:

```
pio pkg unpublish {{package}}@{{version}}
```

- Undo the removal, putting all versions or a specific version of the package back into the registry:

```
pio pkg unpublish --undo {{package}}@{{version}}
```

pio platform

Manage PlatformIO development platforms.

More information: https://docs.platformio.org/en/latest/core/userguide/platforms/.

- List all installed development platforms:

```
pio platform list
```

- Search for existing development platforms:

```
pio platform search {{platform}}
```

- Show details about a development platform:

```
pio platform show {{platform}}
```

- Install a development platform:

```
pio platform install {{platform}}
```

- Update installed development platforms:

```
pio platform update
```

- Uninstall a development platform:

```
pio platform uninstall {{platform}}
```

- List all supported frameworks:

```
pio platform frameworks
```

pio project

Manage PlatformIO projects.

More information: https://docs.platformio.org/en/latest/core/userguide/project/.

- Initialize a new PlatformIO project:

```
pio project init
```

- Initialize a new PlatformIO project in a specific directory:

```
pio project init {{[-d|--project-dir]}} {{path/to/
project_directory}}
```

- Initialize a new PlatformIO project, specifying a board ID:

```
pio project init {{[-b|--board]}} {{ATmega328P|uno|...}}
```

- Initialize a new PlatformIO based project, specifying one or more project options:

```
pio project init {{[-O|--project-option]}} "{{option}}
={{value}}" {{[-O|--project-option]}} "{{option}}={{value}}"
```

- Print the configuration of a project:

```
pio project config
```

pio remote

Helper command for PlatformIO Remote Development.

`pio remote [command]` takes the same arguments as its locally executing counterpart **`pio [command]`**.

More information: https://docs.platformio.org/en/latest/core/userguide/remote/index.html.

- List all active Remote Agents:

  ```
  pio remote agent list
  ```

- Start a new Remote Agent with a specific name and share it with friends:

  ```
  pio remote agent start {{[-n|--name]}} {{agent_name}} {{[-s|--share]}} {{example1@example.com}} {{[-s|--share]}} {{example2@example.com}}
  ```

- List devices from specified Agents (omit `--agent` to specify all Agents):

  ```
  pio remote --agent {{agent_name1}} --agent {{agent_name2}} device list
  ```

- Connect to the serial port of a remote device:

  ```
  pio remote --agent {{agent_name}} device monitor
  ```

- Run all targets on a specified Agent:

  ```
  pio remote --agent {{agent_name}} run
  ```

- Update installed core packages, development platforms and global libraries on a specific Agent:

  ```
  pio remote --agent {{agent_name}} update
  ```

- Run all tests in all environments on a specific Agent:

  ```
  pio remote --agent {{agent_name}} test
  ```

pio run

Run PlatformIO project targets.

More information: https://docs.platformio.org/en/latest/core/userguide/cmd_run.html.

- List all available project targets:

```
pio run --list-targets
```

- List all available project targets of a specific environment:

```
pio run --list-targets {{[-e|--environment]}} {{environment}}
```

- Run all targets:

```
pio run
```

- Run all targets of specified environments:

```
pio run {{[-e|--environment]}} {{environment1}} {{[-e|--environment]}} {{environment2}}
```

- Run specified targets:

```
pio run {{[-t|--target]}} {{target1}} {{[-t|--target]}} {{target2}}
```

- Run the targets of a specified configuration file:

```
pio run {{[-c|--project-conf]}} {{path/to/platformio.ini}}
```

pio settings

View and modify PlatformIO settings.

More information: https://docs.platformio.org/en/latest/core/userguide/cmd_settings.html.

- Display the names, values, and descriptions of all PlatformIO settings:

```
pio settings get
```

- Display the name, value, and description of a specific PlatformIO setting:

```
pio settings get {{setting}}
```

- Set a specific setting value:

```
pio settings set {{setting}} {{value}}
```

- Reset the values of all modified settings to their factory defaults:

```
pio settings reset
```

pio system

Miscellaneous system commands for PlatformIO.

More information: https://docs.platformio.org/en/latest/core/userguide/system/.

- Install shell completion for the current shell (supports Bash, fish, Zsh, and PowerShell):

```
pio system completion install
```

- Uninstall shell completion for the current shell:

```
pio system completion uninstall
```

- Display system-wide PlatformIO information:

```
pio system info
```

- Remove unused PlatformIO data:

```
pio system prune
```

- Remove only cached data:

```
pio system prune --cache
```

- List unused PlatformIO data that would be removed but do not actually remove it:

```
pio system prune --dry-run
```

pio team

Manage PlatformIO teams.

More information: https://docs.platformio.org/en/latest/core/userguide/team/.

- Create a new team with the specified description:

```
pio team create --description {{description}}
{{organization_name}}:{{team_name}}
```

- Delete a team:

```
pio team destroy {{organization_name}}:{{team_name}}
```

- Add a new user to a team:

```
pio team add {{organization_name}}:{{team_name}} {{username}}
```

- Remove a user from a team:

```
pio team remove {{organization_name}}:{{team_name}}
{{username}}
```

- List all teams that the user is part of and their members:

```
pio team list
```

- List all teams in an organization:

```
pio team list {{organization_name}}
```

- Rename a team:

```
pio team update --name {{new_team_name}}
{{organization_name}}:{{team_name}}
```

- Change the description of a team:

```
pio team update --description {{new_description}}
{{organization_name}}:{{team_name}}
```

pio test

Run local tests on a PlatformIO project.

More information: https://docs.platformio.org/en/latest/core/userguide/cmd_test.html.

- Run all tests in all environments of the current PlatformIO project:

```
pio test
```

- Test only specific environments:

```
pio test {{[-e|--environment]}} {{environment1}} {{[-e|--environment]}} {{environment2}}
```

- Run only tests whose name matches a specific glob pattern:

```
pio test {{[-f|--filter]}} "{{pattern}}"
```

- Ignore tests whose name matches a specific glob pattern:

```
pio test {{[-i|--ignore]}} "{{pattern}}"
```

- Specify a port for firmware uploading:

```
pio test --upload-port {{upload_port}}
```

- Specify a custom configuration file for running the tests:

```
pio test {{[-c|--project-conf]}} {{path/to/platformio.ini}}
```

pio update

Update installed PlatformIO Core packages, development platforms, and global libraries.

More information: https://docs.platformio.org/en/latest/core/userguide/cmd_update.html.

- Perform a full update of all packages, development platforms, and global libraries:

```
pio update
```

- Update core packages only (skips platforms and libraries):

```
pio update --core-packages
```

- Check for new versions of packages, platforms, and libraries but do not actually update them:

```
pio update --dry-run
```

pio upgrade

Update PlatformIO to the latest version.

More information: https://docs.platformio.org/en/latest/core/userguide/cmd_upgrade.html.

- Update PlatformIO to the latest version:

```
pio upgrade
```

- Update PlatformIO to the latest development (unstable) version:

```
pio upgrade --dev
```

pio

Development environment for embedded boards.

Some subcommands such as **`run`** have their own usage documentation.

More information: https://docs.platformio.org/en/latest/core/userguide/.

- Display help and list subcommands:

```
pio {{[-h|--help]}}
```

- Display help for a specific subcommand:

```
pio {{subcommand}} {{[-h|--help]}}
```

- Display version:

```
pio --version
```

piodebuggdb

This command is an alias of **`pio debug --interface gdb`**.

- View documentation for the original command:

  ```
  tldr pio debug
  ```

pip cache

Inspect and manage pip's wheel cache.

More information: https://pip.pypa.io/en/stable/cli/pip_cache/.

- Show the location of the pip cache directory:

```
pip cache dir
```

- List filenames of all packages currently stored in the cache:

```
pip cache list
```

- Remove all files from the pip cache:

```
pip cache purge
```

- Remove cached files matching a specific package name:

```
pip cache remove {{package_name}}
```

pip check

Check installed packages for broken or incompatible dependencies.

More information: https://pip.pypa.io/en/stable/cli/pip_check/.

- Check for broken or missing requirements:

```
pip check
```

- Check and log output to a file:

```
pip check --log {{path/to/file}}
```

pip config

Manage local and global configuration for pip.

More information: https://pip.pypa.io/en/stable/cli/pip_config/.

- List all configuration values:

```
pip config list
```

- Show configuration files and their values:

```
pip config debug
```

- Set the value for a command option:

```
pip config set {{command.option}} {{value}} {{--global|--user|--site}}
```

- Get the value for a command option:

```
pip config get {{command.option}} {{--global|--user|--site}}
```

- Unset the value for a command option:

```
pip config unset {{command.option}} {{--global|--user|--site}}
```

- Edit the configuration file with the default editor:

```
pip config edit {{--global|--user|--site}}
```

- Edit the configuration file with a specific editor:

```
pip config edit {{--global|--user|--site}} --editor {{path/to/editor_binary}}
```

pip debug

Display debug information about the current pip environment and configuration.

Intended for debugging; options and output may change without notice.

More information: https://pip.pypa.io/en/stable/cli/pip_debug/.

- Show general debug information:

```
pip debug
```

- Show debug information for a specific platform:

```
pip debug --platform {{platform}}
```

- Show debug information for a specific Python version:

```
pip debug --python-version {{version}}
```

- Show debug information for a specific Python implementation:

```
pip debug --implementation {{implementation}}
```

- Show debug information for a specific ABI:

```
pip debug --abi {{abi}}
```

pip download

Download Python packages without installing them.

More information: https://pip.pypa.io/en/stable/cli/pip_download/.

- Download a package wheel or source archive to the current directory:

```
pip download {{package}}
```

- Download a specific version of a package:

```
pip download {{package}}=={{version}}
```

- Download a package and its dependencies to a specific directory:

```
pip download {{package}} {{[-d|--dest]}} {{path/to/
directory}}
```

- Download a package for a specific platform and Python version:

```
pip download {{package}} --only-binary :all: --platform
{{platform}} --python-version {{version}}
```

- Download a package from a specific index URL:

```
pip download {{package}} {{[-i|--index-url]}} {{url}}
```

pip freeze

List installed packages in requirements format.

More information: https://pip.pypa.io/en/stable/cli/pip_freeze/.

- List installed packages:

```
pip freeze
```

- Write installed packages to the `requirements.txt` file:

```
pip freeze > requirements.txt
```

- List installed packages in a virtual environment, excluding globally installed packages:

```
pip freeze {{[-l|--local]}}
```

- List installed packages in the user-site:

```
pip freeze --user
```

- List all packages, including `pip`, `distribute`, `setuptools`, and `wheel` (they are skipped by default):

```
pip freeze --all
```

pip hash

Compute hashes of package archives for verification.

More information: https://pip.pypa.io/en/stable/cli/pip_hash/.

- Generate hash for a package file:

```
pip hash {{path/to/package.whl}}
```

- Generate hash using a specific algorithm:

```
pip hash {{[-a|--algorithm]}} {{sha256|sha384|sha512|...}} {{path/to/package.whl}}
```

- Generate hashes for multiple files:

```
pip hash {{path/to/package1.whl path/to/package2.whl ...}}
```

- Generate hash for downloaded archive:

```
pip hash {{path/to/package.tar.gz}}
```

pip index

Inspect information available from package indexes.

More information: https://pip.pypa.io/en/stable/cli/pip_index/.

- List all available versions of a package:

```
pip index versions {{package}}
```

- List versions from a specific index:

```
pip index versions {{package}} --index-url {{https://test.pypi.org/simple/}}
```

- Include pre-release versions:

```
pip index versions {{package}} --pre
```

- Include an additional index:

```
pip index versions {{package}} --extra-index-url {{https://example.com/simple/}}
```

- List versions for a specific platform:

```
pip index versions {{package}} --platform {{linux_x86_64}}
```

pip inspect

Inspect the Python environment and produce a report in JSON format.

More information: https://pip.pypa.io/en/stable/cli/pip_inspect/.

- Inspect the current environment:

```
pip inspect
```

- Inspect and save output to a file:

```
pip inspect > {{environment_report.json}}
```

- Inspect only locally installed packages (not global):

```
pip inspect --local
```

- Inspect only user-installed packages:

```
pip inspect --user
```

- Inspect packages in a specific path:

```
pip inspect --path {{path/to/environment}}
```

- Inspect with verbose output (Note: the `-v` flag can be repeated to increase verbosity):

```
pip inspect {{[-v|--verbose]}}
```

pip install

Install Python packages.

More information: https://pip.pypa.io/en/stable/cli/pip_install/.

- Install one or more packages:

```
pip install {{package1 package2 ...}}
```

- Upgrade all specified packages to the latest version, installing any that are not already present:

```
pip install {{package1 package2 ...}} {{[-U|--upgrade]}}
```

- Install a specific version of a package:

```
pip install {{package}}=={{version}}
```

- Install packages listed in a file:

```
pip install {{[-r|--requirement]}} {{path/to/
requirements.txt}}
```

- Install packages from a URL or local file archive (e.g. `.tar.gz`, `.whl`):

```
pip install {{[-f|--find-links]}} {{url|path/to/file}}
```

- Install the local package in the current directory in develop (editable) mode:

```
pip install {{[-e|--editable]}} .
```

pip list

List installed Python packages.

More information: https://pip.pypa.io/en/stable/cli/pip_list/.

- List installed packages:

```
pip list
```

- List outdated packages that can be upgraded:

```
pip list {{[-o|--outdated]}}
```

- List up-to-date packages:

```
pip list {{[-u|--uptodate]}}
```

- List packages with JSON formatting:

```
pip list --format json
```

- List packages that are not required by other packages:

```
pip list --not-required
```

- List packages installed in user-site only:

```
pip list --user
```

- List packages and exclude editable packages from output:

```
pip list --exclude-editable
```

- List packages in freeze format (unlike `pip freeze`, does not show editable install information):

```
pip list --format freeze
```

pip lock

Lock Python packages and their dependencies into a reproducible file.

Experimental feature of **`pip`**.

More information: https://pip.pypa.io/en/stable/cli/pip_lock/.

- Generate a `pylock.toml` for the current project:

  ```
  pip lock {{[-e|--editable]}} .
  ```

- Lock dependencies from a requirements file:

  ```
  pip lock {{[-r|--requirement]}} {{path/to/requirements.txt}}
  ```

- Specify a custom output file for the lock:

  ```
  pip lock {{[-o|--output]}} {{path/to/lockfile.toml}}
  ```

- Lock a specific package and its dependencies:

  ```
  pip lock {{package}}
  ```

pip search

Search for Python packages by name or summary.

Doesn't work with PyPI; may work with other package indexes.

More information: https://pip.pypa.io/en/stable/cli/pip_search/.

- Search for packages using a custom package index:

```
pip search {{[-i|--index]}} {{example.com}} {{query}}
```

pip show

Show information about installed packages.

More information: https://pip.pypa.io/en/stable/cli/pip_show/.

- Show information about a package:

```
pip show {{package}}
```

- Show all information about a package:

```
pip show {{[-v|--verbose]}} {{package}}
```

- Show all installed files for a package:

```
pip show {{[-f|--files]}} {{package}}
```

pip uninstall

Uninstall Python packages.

More information: https://pip.pypa.io/en/stable/cli/pip_uninstall/.

- Uninstall a package:

```
pip uninstall {{package}}
```

- Uninstall packages listed in a specific file:

```
pip uninstall {{[-r|--requirement]}} {{path/to/
requirements.txt}}
```

- Uninstall package without asking for confirmation:

```
pip uninstall {{[-y|--yes]}} {{package}}
```

pip wheel

Build wheel archives for packages and dependencies.

More information: https://pip.pypa.io/en/stable/cli/pip_wheel/.

- Build a wheel for a package:

```
pip wheel {{package}}
```

- Build wheels for packages in requirements file:

```
pip wheel {{[-r|--requirement]}} {{path/to/requirements.txt}}
```

- Build wheel to a specific directory:

```
pip wheel {{package}} {{[-w|--wheel-dir]}} {{path/to/
directory}}
```

- Build wheel without dependencies:

```
pip wheel {{package}} --no-deps
```

- Build wheel from local project:

```
pip wheel {{path/to/project}}
```

- Build wheel from Git repository:

```
pip wheel git+{{https://github.com/user/repo.git}}
```

pip

Python package manager.

Some subcommands such as **`install`** have their own usage documentation.

More information: https://pip.pypa.io/en/stable/cli/pip/.

- Install a package (see `pip install` for more install examples):

```
pip install {{package}}
```

- Install a package to the user's directory instead of the system-wide default location:

```
pip install --user {{package}}
```

- Upgrade a package:

```
pip install {{[-U|--upgrade]}} {{package}}
```

- Uninstall a package:

```
pip uninstall {{package}}
```

- Save installed packages to file:

```
pip freeze > {{requirements.txt}}
```

- List installed packages:

```
pip list
```

- Show installed package info:

```
pip show {{package}}
```

- Install packages from a file:

```
pip install {{[-r|--requirement]}} {{requirements.txt}}
```

pip3

This command is an alias of **pip**.

- View documentation for the original command:

```
tldr pip
```

pipenv

Simple and unified Python development workflow.

Manage packages and the virtual environment for a project.

More information: https://pypi.org/project/pipenv.

- Create a new project:

  ```
  pipenv
  ```

- Create a new project using Python 3:

  ```
  pipenv --three
  ```

- Install a package:

  ```
  pipenv install {{package}}
  ```

- Install all the dependencies for a project:

  ```
  pipenv install
  ```

- Install all the dependencies for a project (including dev packages):

  ```
  pipenv install --dev
  ```

- Uninstall a package:

  ```
  pipenv uninstall {{package}}
  ```

- Start a shell within the created virtual environment:

  ```
  pipenv shell
  ```

- Generate a `requirements.txt` (list of dependencies) for a project:

  ```
  pipenv lock --requirements
  ```

piper

A fast, local neural text to speech system.

Try out and download speech models from https://rhasspy.github.io/piper-samples.

More information: https://github.com/OHF-Voice/piper1-gpl.

- Output a WAV [f]ile using a text-to-speech [m]odel (assuming a configuration file at model_path + .json):

```
echo {{Thing to say}} | piper -m {{path/to/model.onnx}} -f {{outputfile.wav}}
```

- Output a WAV [f]ile using a [m]odel and specifying its JSON [c]onfig file:

```
echo {{Thing to say}} | piper -m {{path/to/model.onnx}} -c {{path/to/model.onnx.json}} -f {{outputfile.wav}}
```

- Select a particular speaker in a voice with multiple speakers by specifying the speaker's ID number:

```
echo {{Warum?}} | piper -m {{de_DE-thorsten_emotional-medium.onnx}} --speaker {{1}} -f {{angry.wav}}
```

- Stream the output to the mpv media player:

```
echo {{Hello world}} | piper -m {{en_GB-northern_english_male-medium.onnx}} --output-raw -f - | mpv -
```

- Speak twice as fast, with huge gaps between sentences:

```
echo {{Speaking twice the speed. With added drama!}} | piper -m {{file.onnx}} --length_scale {{0.5}} --sentence_silence {{2}} -f {{drama.wav}}
```

pipes.sh

A Bash script which draws randomly pathed pipes over the terminal.

See also: **`cmatrix`**, **`cbonsai`**, **`asciiquarium`**.

More information: https://github.com/pipeseroni/pipes.sh#options.

- Change the pa[t]tern of the pipes:

```
pipes.sh -t {{0..9}}
```

- Change the [c]olor of the pipes:

```
pipes.sh -c {{0..7}}
```

- Change the [f]ramerate of the pipes:

```
pipes.sh -f {{20..100}}
```

- Disable [C]olors:

```
pipes.sh -C
```

- Display [v]ersion:

```
pipes.sh -v
```

pipx

Install and run Python applications in isolated environments.

More information: https://manned.org/pipx.

- Run an app in a temporary virtual environment:

```
pipx run {{pycowsay}} {{moo}}
```

- Install a package in a virtual environment and add entry points to path:

```
pipx install {{package}}
```

- List installed packages:

```
pipx list
```

- Run an app in a temporary virtual environment with a package name different from the executable:

```
pipx run --spec {{httpx-cli}} {{httpx}} {{http://
www.github.com}}
```

- Inject dependencies into an existing virtual environment:

```
pipx inject {{package}} {{dependency1 dependency2 ...}}
```

- Install a package in a virtual environment with pip arguments:

```
pipx install --pip-args='{{pip-args}}' {{package}}
```

- Upgrade/reinstall/uninstall all installed packages:

```
pipx {{upgrade-all|uninstall-all|reinstall-all}}
```

pixi config

Manage the configuration file.

More information: https://pixi.sh/latest/reference/cli/#config.

- Edit the configuration file:

```
pixi config edit
```

- List all configurations:

```
pixi config list
```

- Prepend a value to a list configuration key:

```
pixi config prepend {{key}} {{value}}
```

- Append a value to a list configuration key:

```
pixi config append {{key}} {{value}}
```

- Set a configuration key to a value:

```
pixi config set {{key}} {{value}}
```

- Unset a configuration key:

```
pixi config unset {{key}}
```

pixi global

Manage global packages.

More information: https://pixi.sh/latest/reference/cli/#global.

- Install a package globally and add to path:

```
pixi global install {{package1 package2 ...}}
```

- Uninstall a package globally:

```
pixi global remove {{package1 package2 ...}}
```

- List all globally installed packages:

```
pixi global list
```

- Update a globally installed package:

```
pixi global upgrade {{package}}
```

- Update all globally installed packages:

```
pixi global upgrade-all
```

pixi project

Modify the project configuration file.

More information: https://pixi.sh/latest/reference/cli/#project.

- Manage project channels:

```
pixi project channel {{command}}
```

- Manage project description:

```
pixi project description {{command}}
```

- Manage project platform:

```
pixi project platform {{command}}
```

- Manage project version:

```
pixi project version {{command}}
```

- Manage project environment:

```
pixi project environment {{command}}
```

pixi task

Manage tasks in the project environment.

More information: https://pixi.sh/latest/reference/cli/#task.

- Create a new task:

```
pixi task add {{task_name}} {{task_command}}
```

- List all tasks in the project:

```
pixi task list
```

- Remove a task:

```
pixi task remove {{task_name}}
```

- Create an alias for a task:

```
pixi task alias {{alias_name}} {{task1 task2 ...}}
```

pixi

Developer Workflow and Environment Management for projects.

More information: https://pixi.prefix.dev/latest/getting_started/.

- Initialize a new project:

```
pixi init {{path/to/project}}
```

- Add project dependencies:

```
pixi add {{dependency1 dependency2 ...}}
```

- Start a pixi shell in the project environment:

```
pixi shell
```

- Run a task in the project environment:

```
pixi run {{task}}
```

- Manage tasks in the project environment:

```
pixi task {{command}}
```

- Display help:

```
pixi {{command}} --help
```

- Clean environment and task cache:

```
pixi clean
```

pixiecore

Manage the network booting of machines.

More information: https://github.com/danderson/netboot/tree/main/pixiecore.

- Start a PXE boot server which provides a `netboot.xyz` boot image:

```
pixiecore {{quick}} xyz --dhcp-no-bind
```

- Start a new PXE boot server which provides an Ubuntu boot image:

```
pixiecore {{quick}} ubuntu --dhcp-no-bind
```

- List all available boot images for quick mode:

```
pixiecore quick --help
```

pixterm

Image printing in the terminal.

See also: **`chafa`**, **`catimg`**.

More information: https://github.com/eliukblau/pixterm#cool-screenshots.

- Render a static image directly in the terminal:

```
pixterm {{path/to/file}}
```

- Use the image's original aspect ratio:

```
pixterm -s 2 {{path/to/file}}
```

- Specify a custom aspect ratio using a specific number of [t]erminal [r]ows and [c]olumns:

```
pixterm -tr {{24}} -tc {{80}} {{path/to/file}}
```

- Filter the output with a [m]atte background color and character [d]ithering:

```
pixterm -m {{000000}} -d 2 {{path/to/file}}
```

pjtoppm

Convert a HP PaintJet file to PPM.

More information: https://netpbm.sourceforge.net/doc/pjtoppm.html.

- Convert a HP PaintJet file to PPM:

```
pjtoppm {{path/to/input.pj}} > {{path/to/output.ppm}}
```

pkcs11-tool

Utility for managing and using PKCS #11 security tokens.

More information: https://github.com/OpenSC/OpenSC/wiki/Using-pkcs11-tool-and-OpenSSL.

- List slots and their potential token, using a specific module (e.g. `/usr/lib/softhsm/libsofthsm2.so`):

```
pkcs11-tool --module {{path/to/module.so}} {{[-L|--list-slots]}} {{[-T|--list-token-slots]}}
```

- List objects in a specific slot. (Note: `slot_id` is not the slot index shown as "Slot X"):

```
pkcs11-tool {{[-O|--list-objects]}} {{[-p|--pin]}} {{auth_pin}} --slot {{slot_id}}
```

- Create a new object with a specific label and type:

```
pkcs11-tool --slot {{slot_id}} {{[-p|--pin]}} {{auth_pin}} {{[-y|--type]}} {{cert|privkey|pubkey|secrkey|data|...}} {{[-a|--label]}} "{{label}}" {{[-d|--id]}} {{01}} {{[-w|--write-object]}} {{path/to/cert.crt}}
```

- Delete an object by its label and type:

```
pkcs11-tool --slot {{slot_id}} {{[-p|--pin]}} {{auth_pin}} {{[-y|--type]}} {{cert|privkey|pubkey|secrkey|data|...}} {{[-a|--label]}} "{{label}}" {{[-b|--delete-object]}}
```

pkg-config

Provide the details of installed libraries for compiling applications.

More information: https://manned.org/pkg-config.

- Get the list of libraries and their dependencies:

```
pkg-config --libs {{library1 library2 ...}}
```

- Get the list of libraries, their dependencies, and proper cflags for gcc:

```
pkg-config --cflags --libs {{library1 library2 ...}}
```

- Compile your code with libgtk-3, libwebkit2gtk-4.0 and all their dependencies:

```
c++ example.cpp $(pkg-config --cflags --libs gtk+-3.0
webkit2gtk-4.0) -o example
```

pkgz

Unified package manager for multiple sources.

More information: https://github.com/roguehashrate/pkgz#-usage.

- Install a package:

```
pkgz install {{package_name}}
```

- Remove a package:

```
pkgz remove {{package_name}}
```

- Search for a package:

```
pkgz search {{package_name}}
```

- Show how many packages are installed per source:

```
pkgz info
```

- Show where a package is installed or available:

```
pkgz info {{package_name}}
```

- Update all packages in all sources:

```
pkgz update
```

- Remove cache of all supported sources:

```
pkgz clean
```

- Display version:

```
pkgz --version
```

pkill

Signal process by name.

Mostly used for stopping processes.

More information: https://manned.org/pkill.

- Kill all processes which match:

```
pkill "{{process_name}}"
```

- Kill all processes which match their full command instead of just the process name:

```
pkill {{[-f|--full]}} "{{command_name}}"
```

- Force kill matching processes (can't be blocked):

```
pkill -9 "{{process_name}}"
```

- Send SIGUSR1 signal to processes which match:

```
pkill -USR1 "{{process_name}}"
```

- Kill the main `firefox` process to close the browser:

```
pkill {{[-o|--oldest]}} "{{firefox}}"
```

pkl

Manage, evaluate, and test Pkl configuration modules.

More information: https://pkl-lang.org/main/current/pkl-cli/.

- Evaluate the given Pkl modules and produce their rendering results:

```
pkl eval {{module.pkl}}
```

- Run as a server that communicates over `stdin` and `stdout`:

```
pkl server
```

- Evaluate Pkl modules as tests and produces a report:

```
pkl test {{module.pkl}}
```

- Start a REPL session:

```
pkl repl
```

- Prepare a Pkl project for publishing as a package:

```
pkl project package {{path/to/project_directory}}
```

- Resolve project dependencies and writes the resolved versions to a file at path `PklProject.deps.json`:

```
pkl project resolve {{path/to/project_directory}}
```

plantuml

Create UML diagrams from a plain text language and render them in different formats.

More information: https://plantuml.com/en/command-line.

- Render diagrams to default format (PNG):

```
plantuml {{diagram1.puml}} {{diagram2.puml}}
```

- Render a diagram in given format (e.g. `png`, `pdf`, `svg`, `txt`):

```
plantuml -t {{format}} {{diagram.puml}}
```

- Render all diagrams of a directory:

```
plantuml {{path/to/diagrams}}
```

- Render a diagram to the output directory:

```
plantuml -o {{path/to/output}} {{diagram.puml}}
```

- Render a diagram without storing the diagram's source code (Note: It's stored by default when the `-nometadata` option isn't specified):

```
plantuml -nometadata {{diagram.png}} > {{diagram.puml}}
```

- Retrieve source from a `plantuml` diagram's metadata:

```
plantuml -metadata {{diagram.png}} > {{diagram.puml}}
```

- Render a diagram with the configuration file:

```
plantuml -config {{config.cfg}} {{diagram.puml}}
```

- Display help:

```
plantuml -help
```

platformio

This command is an alias of **pio**.

- View documentation for the original command:

```
tldr pio
```

play

Audio player of SoX - Sound eXchange.

Plays any audio, with audio formats identified by the extension.

More information: https://manned.org/play.

- Play the given audio file:

```
play {{path/to/audio_file}}
```

- Play the given audio files:

```
play {{path/to/audio_file1 path/to/audio_file2 ...}}
```

- Play the given audio at twice the speed:

```
play {{path/to/audio_file}} speed 2.0
```

- Play the given audio in reverse:

```
play {{path/to/audio_file}} reverse
```

plenv

Switch between multiple versions of Perl.

More information: https://github.com/tokuhirom/plenv#name.

- Show the currently selected Perl version and how it was selected:

```
plenv version
```

- List all available installed Perl versions:

```
plenv versions
```

- Set the global Perl version (used unless a local or shell version takes priority):

```
plenv global {{version}}
```

- Set the local application-specific Perl version (used in the current directory and all directories below it):

```
plenv local {{version}}
```

- Set the shell-specific Perl version (used for the current session only):

```
plenv shell {{version}}
```

- Display help:

```
plenv
```

- Display help for a command:

```
plenv help {{command}}
```

plesk

Plesk hosting control panel.

More information: https://docs.plesk.com/en-US/obsidian/cli-linux/plesk-utility.75661/.

- Generate an auto login link for the admin user and print it:

```
plesk login
```

- Show product version information:

```
plesk version
```

- List all hosted domains:

```
plesk bin domain --list
```

- Start watching for changes in the `panel.log` file:

```
plesk log {{panel.log}}
```

- Start the interactive MySQL console:

```
plesk db
```

- Open the Plesk main configuration file in the default editor:

```
plesk conf {{panel.ini}}
```

plink

PuTTy's command line utility.

See also: **ssh**.

More information: https://manned.org/plink.

- Connect to an address:

```
plink {{IP_address}}
```

plocate

Find filenames quickly.

Make sure to run **`sudo updatedb`** to include new files.

More information: https://plocate.sesse.net/plocate.1.html.

- Look for patterns in the database (recomputed periodically):

```
plocate {{pattern}}
```

- Look for a file by its exact filename (a pattern containing no globbing characters is interpreted as `*pattern*`):

```
plocate */{{filename}}
```

pm2

Process manager for Node.js.

Used for log management, monitoring, and configuring processes.

More information: https://pm2.keymetrics.io/docs/usage/quick-start/.

- Start a process with a name that can be used for later operations:

```
pm2 start {{app.js}} --name {{application_name}}
```

- List processes:

```
pm2 list
```

- Monitor all processes:

```
pm2 monit
```

- Stop a process:

```
pm2 stop {{application_name}}
```

- Restart a process:

```
pm2 restart {{application_name}}
```

- Dump all processes for resurrecting them later:

```
pm2 save
```

- Resurrect previously dumped processes:

```
pm2 resurrect
```

pngcheck

Forensics tool for validating the integrity of PNG based (PNG, JNG, MNG) image files.

Can also extract embedded images and text from a file.

More information: https://manned.org/pngcheck.

- Verify the integrity of an image file (width, height, and color depth):

```
pngcheck {{path/to/image.png}}
```

- Print information for an image with [c]olorized output:

```
pngcheck -c {{path/to/image.png}}
```

- Print [v]erbose information for an image:

```
pngcheck -cvt {{path/to/image.png}}
```

- Receive an image from `stdin` and display detailed information:

```
cat {{path/to/image.png}} | pngcheck -cvt
```

- [s]earch for PNGs within a specific file and display information about them:

```
pngcheck -s {{path/to/image.png}}
```

- Search for PNGs within another file and e[x]tract them:

```
pngcheck -x {{path/to/image.png}}
```

pngcrush

PNG compression utility.

More information: https://pmt.sourceforge.io/pngcrush/.

- Compress a PNG file:

```
pngcrush {{in.png}} {{out.png}}
```

- Compress all PNGs and output them to the specified directory:

```
pngcrush -d {{path/to/output}} *.png
```

- Compress PNG file with all 114 available algorithms and pick the best result:

```
pngcrush -rem allb -brute -reduce {{in.png}} {{out.png}}
```

pngquant

PNG converter and lossy image compressor.

More information: https://manned.org/pngquant.

- Compress a specific PNG as much as possible and write result to a new file:

```
pngquant {{path/to/file.png}}
```

- Compress a specific PNG and override original:

```
pngquant --ext .png --force {{path/to/file.png}}
```

- Try to compress a specific PNG with custom quality (skip if below the min value):

```
pngquant --quality {{0-100}} {{path/to/file.png}}
```

- Compress a specific PNG with the number of colors reduced to 64:

```
pngquant {{64}} {{path/to/file.png}}
```

- Compress a specific PNG and skip if the file is larger than the original:

```
pngquant --skip-if-larger {{path/to/file.png}}
```

- Compress a specific PNG and remove metadata:

```
pngquant --strip {{path/to/file.png}}
```

- Compress a specific PNG and save it to the given path:

```
pngquant {{path/to/file.png}} --output {{path/to/file.png}}
```

- Compress a specific PNG and show progress:

```
pngquant --verbose {{path/to/file.png}}
```

pngtopam

Convert a PNG image to a Netpbm image.

See also: **pamtopng**.

More information: https://netpbm.sourceforge.net/doc/pngtopam.html.

- Convert the specified PNG image to a Netpbm image:

```
pngtopam {{path/to/image.png}} > {{path/to/output.pam}}
```

- Create an output image that includes both the main image and transparency mask of the input image:

```
pngtopam -alphapam {{path/to/image.png}} > {{path/to/
output.pam}}
```

- Replace transparent pixels by the specified color:

```
pngtopam {{[-m|-mix]}} {{[-ba|-background]}} {{color}}
{{path/to/image.png}} > {{path/to/output.pam}}
```

- Write tEXt chunks found in the input image to the specified text file:

```
pngtopam {{[-te|-text]}} {{path/to/file.txt}} {{path/to/
image.png}} > {{path/to/output.pam}}
```

pngtopnm

This command has been superseded by **`pngtopam`**.

More information: https://netpbm.sourceforge.net/doc/pngtopnm.html.

- View documentation for the current command:

```
tldr pngtopam
```

pnmalias

Apply antialiasing onto a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmalias.html.

- Perform antialiasing on a PNM image, taking black pixels as background and white pixels as foreground:

```
pnmalias {{path/to/input.pnm}} > {{path/to/output.ppm}}
```

- Explicitly specify the background and foreground color:

```
pnmalias -bcolor {{background_color}} -fcolor
{{foreground_color}} {{path/to/input.pnm}} > {{path/to/
output.ppm}}
```

- Apply altialiasing to foreground pixels only:

```
pnmalias {{[-fo|-fonly]}} {{path/to/input.pnm}} > {{path/to/
output.ppm}}
```

- Apply antialiasing to all surrounding pixels of background pixels:

```
pnmalias {{[-ba|-balias]}} {{path/to/input.pnm}} > {{path/to/
output.ppm}}
```

pnmarith

This command has been superseded by **pamarith**.

More information: https://netpbm.sourceforge.net/doc/pnmarith.html.

- View documentation for the current command:

```
tldr pamarith
```

pnmcolormap

Create quantization color map for a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmcolormap.html.

- Generate an image using only `n_colors` or less colors as close as possible to the input image:

```
pnmcolormap {{n_colors}} {{path/to/input.pnm}} > {{path/to/output.ppm}}
```

- Use the splitspread strategy for determining the output colors, possibly producing a better result for images with small details:

```
pnmcolormap {{[-splits|-splitspread]}} {{n_colors}} {{path/to/input.pnm}} > {{path/to/output.ppm}}
```

- Sort the resulting colormap, which is useful for comparing colormaps:

```
pnmcolormap {{[-so|-sort]}} {{path/to/input.pnm}} > {{path/to/output.ppm}}
```

pnmcomp

This command has been superseded by **pamcomp**.

More information: https://netpbm.sourceforge.net/doc/pnmcomp.html.

- View documentation for the current command:

```
tldr pamcomp
```

pnmconvol

Convolute a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmconvol.html.

- Convolve a PNM image with the specified convolution matrix:

```
pnmconvol -matrix=-1,3,-1 {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Convolve a PNM image with the convolution matrix in the specified files, one for each layer in the input image:

```
pnmconvol -matrixfile {{path/to/matrix1,path/to/matrix2,...}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Convolve a PNM image with the convolution matrix in the specified PNM file:

```
pnmconvol {{path/to/matrix.pnm}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Normalize the weights in the convolution matrix such that they add up to one:

```
pnmconvol -matrix=-1,3,-1 -normalize {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

pnmcrop

Crop PNM images.

More information: https://netpbm.sourceforge.net/doc/pnmcrop.html.

- Remove white borders on a PNM image:

```
pnmcrop {{[-w|-white]}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Remove borders of the specified color that are on the top and left side of the image:

```
pnmcrop -bg-color {{color}} {{[-t|-top]}} {{[-l|-left]}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Determine the color of the borders to be removed by the color of the pixel in the specified corner:

```
pnmcrop -bg-corner {{topleft|topright|bottomleft|bottomright}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Leave a border with a width of n pixels. Additionally, specify the behavior if the image is entirely made out of background:

```
pnmcrop {{[-m|-margin]}} {{n}} {{[-blan|-blank-image]}} {{pass|minimize|maxcrop}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

pnmcut

This command has been superseded by **`pamcut`**.

More information: https://netpbm.sourceforge.net/doc/pnmcut.html.

- View documentation for the current command:

```
tldr pamcut
```

pnmdepth

This command is an alias of **pamdepth**.

- View documentation for the original command:

  ```
  tldr pamdepth
  ```

pnmenlarge

This command has been superseded by **`pamenlarge`**.

More information: https://netpbm.sourceforge.net/doc/pnmenlarge.html.

- View documentation for the current command:

```
tldr pamenlarge
```

pnmfile

This command has been superseded by **`pamfile`**.

More information: https://netpbm.sourceforge.net/doc/pnmfile.html.

- View documentation for the current command:

```
tldr pamfile
```

pnmflip

This command has been superseded by **`pamflip`**.

More information: https://netpbm.sourceforge.net/doc/pnmflip.html.

- View documentation for the current command:

```
tldr pamflip
```

pnmgamma

Perform gamma correction on PNM images.

More information: https://netpbm.sourceforge.net/doc/pnmgamma.html.

- Convert the image from BT.709 luminance to radiance or sRGB luminance:

```
pnmgamma -{{bt709tolinear|bt709tosrgb}} {{path/to/image.pnm}}
> {{path/to/output.pnm}}
```

- Convert the image from radiance or sRGB luminance to BT.709 luminance:

```
pnmgamma -{{lineartobt709|srgbtobt709}} {{path/to/image.pnm}}
> {{path/to/output.pnm}}
```

- Specify the gamma value used for the gamma transfer function:

```
pnmgamma {{[-ga|-gamma]}} {{value}} {{path/to/image.pnm}} >
{{path/to/output.pnm}}
```

- Specify the gamma value used for the gamma transfer function per color component:

```
pnmgamma {{[-rg|-rgamma]}} {{value}} {{[-gg|-ggamma]}}
{{value}} {{[-bg|-bgamma]}} {{value}} {{path/to/image.pnm}} >
{{path/to/output.pnm}}
```

pnmhisteq

Histogram-equalize a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmhisteq.html.

- Increase the contrast of a PNM image using histogram equalization:

```
pnmhisteq {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

- Only modify grey pixels:

```
pnmhisteq {{[-g|-grey]}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

- Do not include black or white pixels in the histogram equalization:

```
pnmhisteq -no{{black|white}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

pnmhistmap

Draw a histogram of a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmhistmap.html.

- Draw a histogram of a PNM image:

```
pnmhistmap {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

- Draw the histogram as dots instead of bars:

```
pnmhistmap {{[-d|-dots]}} {{path/to/input.pnm}} > {{path/to/
output.pnm}}
```

- Specify the range of intensity values to include:

```
pnmhistmap {{[-l|-lval]}} {{minval}} {{[-rv|-rval]}}
{{maxval}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

pnmindex

Build a visual index of multiple PNM images.

See also: **pamundice**.

More information: https://netpbm.sourceforge.net/doc/pnmindex.html.

- Produce an image containing thumbnails of the specified images in a grid:

```
pnmindex {{path/to/input1.pnm path/to/input2.pnm ...}} > {{path/to/output.pnm}}
```

- Specify the size of the (quadratic) thumbnails:

```
pnmindex {{[-s|-size]}} {{50}} {{path/to/input1.pnm path/to/input2.pnm ...}} > {{path/to/output.pnm}}
```

- Specify the number of thumbnails per row:

```
pnmindex {{[-a|-across]}} {{10}} {{path/to/input1.pnm path/to/input2.pnm ...}} > {{path/to/output.pnm}}
```

- Specify the maximum number of colors in the output:

```
pnmindex {{[-c|-colors]}} {{512}} {{path/to/input1.pnm path/to/input2.pnm ...}} > {{path/to/output.pnm}}
```

pnminterp

This command has been superseded by **pamstretch**.

More information: https://netpbm.sourceforge.net/doc/pnminterp.html.

- View documentation for the current command:

```
tldr pamstretch
```

pnminvert

Invert a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnminvert.html.

- Invert the colors or greyscale values in a PNM image:

```
pnminvert {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

pnmmargin

Add a border to a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmmargin.html.

- Add a border of the specified size to a PNM image:

```
pnmmargin {{size}} {{path/to/image.pnm}} > {{path/to/
output.pnm}}
```

- Specify the color of the border:

```
pnmmargin {{[-c|-color]}} {{color}} {{size}} {{path/to/
image.pnm}} > {{path/to/output.pnm}}
```

pnmmercator

Perform Mercator transformations on Netpbm images.

More information: https://netpbm.sourceforge.net/doc/pnmmercator.html.

- Convert a rectangular projection worldmap to Mercator projection:

```
pnmmercator {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Convert a Mercator projection worldmap to rectangular projection:

```
pnmmercator {{[-i|-inverse]}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

pnmmontage

Create a montage from multiple PNM images.

More information: https://netpbm.sourceforge.net/doc/pnmmontage.html.

- Produce a packing of the specified images:

```
pnmmontage {{path/to/image1.pnm path/to/image2.pnm ...}} > {{path/to/output.pnm}}
```

- Specify the quality of the packing (Note: Larger values produce smaller packings but take longer to compute.):

```
pnmmontage -{{0..9}} {{path/to/image1.pnm path/to/image2.pnm ...}} > {{path/to/output.pnm}}
```

- Produce a packing that is not larger than p percent of the optimal packing:

```
pnmmontage {{[-qua|-quality]}} {{p}} {{path/to/image1.pnm path/to/image2.pnm ...}} > {{path/to/output.pnm}}
```

- Write the positions of the input files within the packed image to a machine-readable file:

```
pnmmontage {{[-d|-data]}} {{path/to/datafile}} {{path/to/image1.pnm path/to/image2.pnm ...}} > {{path/to/output.pnm}}
```

pnmnlfilt

Apply a non-linear filter onto a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmnlfilt.html.

- Apply the "alpha trimmed mean" filter with the specified alpha and radius values onto the PNM image:

```
pnmnlfilt {{0.0..0.5}} {{radius}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Apply the "optimal estimation smoothing" filter with the specified noise threshold and radius onto the PNM image:

```
pnmnlfilt {{1.0..2.0}} {{radius}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Apply the "edge enhancement" filter with the specified alpha and radius onto the PNM image:

```
pnmnlfilt {{-0.9..(-0.1)}} {{radius}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

pnmnorm

Normalize the contrast in a PNM image.

See also: **pnmhisteq**.

More information: https://netpbm.sourceforge.net/doc/pnmnorm.html.

- Force the brightest pixels to be white, the darkest pixels to be black and spread out the ones in between linearly:

```
pnmnorm {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Force the brightest pixels to be white, the darkest pixels to be black and spread out the ones in between quadratically such that pixels with a brightness of n become 50 % bright:

```
pnmnorm {{[-midv|-midvalue]}} {{n}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Keep the pixels' hue, only modify the brightness:

```
pnmnorm {{[-k|-keephues]}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Specify a method to calculate a pixel's brightness:

```
pnmnorm -{{luminosity|colorvalue|saturation}} {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

pnmpad

Add borders to a PNM image.

See also: **pnmmargin**, **pamcut**, **pamcomp**.

More information: https://netpbm.sourceforge.net/doc/pnmpad.html.

- Add borders of the specified sizes to the image:

```
pnmpad {{[-l|-left]}} {{100}} {{[-ri|-right]}} {{150}} {{[-
t|-top]}} {{123}} {{[-bo|-bottom]}} {{456}} {{path/to/
image.pnm}} > {{path/to/output.pnm}}
```

- Pad the image to the specified size:

```
pnmpad {{[-wi|-width]}} {{1000}} {{[-he|-height]}} {{500}}
{{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Pad the width of the image to the specified size, controlling the ratio between right and left padding:

```
pnmpad {{[-wi|-width]}} {{1000}} {{[-ha|-halign]}} {{0.7}}
{{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Pad the width of the image using the specified color:

```
pnmpad {{[-wi|-width]}} {{1000}} {{[-c|-color]}} {{red}}
{{path/to/image.pnm}} > {{path/to/output.pnm}}
```

pnmpaste

Paste a PNM image into another PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmpaste.html.

- Paste a PNM image into another PNM image at the specified coordinates:

```
pnmpaste {{x}} {{y}} {{path/to/image1.pnm}} {{path/to/
image2.pnm}} > {{path/to/output.pnm}}
```

- Paste the image read from `stdin` into the specified image:

```
{{command}} | pnmpaste {{x}} {{y}} {{path/to/image.pnm}} >
{{path/to/output.pnm}}
```

- Combine the overlapping pixels by the specified boolean operation, where white pixels represent `true` while black pixels represent `false`:

```
pnmpaste -{{and|nand|or|nor|xor|xnor}} {{x}} {{y}} {{path/to/
image1.pnm}} {{path/to/image2.pnm}} > {{path/to/output.pnm}}
```

pnmpsnr

Compute the difference between two images.

More information: https://netpbm.sourceforge.net/doc/pnmpsnr.html.

- Compute the difference, i.e. the peak signal-to-noise ratio (PSNR) between two images:

```
pnmpsnr {{path/to/file1.pnm}} {{path/to/file2.pnm}}
```

- Compare the color components rather than the luminance and chrominance components of the images:

```
pnmpsnr {{path/to/file1.pnm}} {{path/to/file2.pnm}} -rgb
```

- Run in comparison mode, i.e. only output `nomatch` or `match` depending on whether the computing PSNR exceeds `n` or not:

```
pnmpsnr {{path/to/file1.pnm}} {{path/to/file2.pnm}} -target {{n}}
```

- Run in comparison mode and compare the individual image components, i.e. Y, Cb, and Cr, to the corresponding thresholds:

```
pnmpsnr {{path/to/file1.pnm}} {{path/to/file2.pnm}} -target1 {{threshold_Y}} -target2 {{threshold_Cb}} -target3 {{threshold_Cr}}
```

- Run in comparison mode and compare the individual image components, i.e. red, green, and blue to the corresponding thresholds:

```
pnmpsnr {{path/to/file1.pnm}} {{path/to/file2.pnm}} -rgb -target1 {{threshold_red}} -target2 {{threshold_green}} -target3 {{threshold_blue}}
```

- Produce machine-readable output:

```
pnmpsnr {{path/to/file1.pnm}} {{path/to/file2.pnm}} -machine
```

pnmquant

Quantize the colors in a PNM image into a smaller set.

This command is a combination of **pnmcolormap** and **pnmremap** and accepts the union of their options, except **-mapfile**.

See also: **pnmquantall**.

More information: https://netpbm.sourceforge.net/doc/pnmquant.html.

- Generate an image using only `n_colors` or less colors as close as possible to the input image:

```
pnmquant {{n_colors}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

pnmquantall

Run **pnmquant** on multiple files at once such that they share a common colormap.

See also: **pnmquant**.

More information: https://netpbm.sourceforge.net/doc/pnmquantall.html.

- Run pnmquant on multiple files with the specified parameters, overwriting the original files:

```
pnmquantall {{n_colors}} {{path/to/input1.pnm path/to/input2.pnm ...}}
```

- Save the quantised images to files named the same as the input files, but with the specified extension appended:

```
pnmquantall {{[-e|-ext]}} {{extension}} {{n_colors}} {{path/to/input1.pnm path/to/input2.pnm ...}}
```

pnmremap

Replace the colors in a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmremap.html.

- Replace the colors in an image with those in the specified color palette:

```
pnmremap {{[-ma|-mapfile]}} {{path/to/palette_file.ppm}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

- Use Floyd-Steinberg dithering for representing colors missing in the color palette:

```
pnmremap {{[-ma|-mapfile]}} {{path/to/palette_file.ppm}} {{[-fs|-floyd]}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

- Use the first color in the palette for representing colors missing in the color palette:

```
pnmremap {{[-ma|-mapfile]}} {{path/to/palette_file.ppm}} {{[-fi|-firstisdefault]}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

- Use the specified color for representing colors missing in the color palette:

```
pnmremap {{[-ma|-mapfile]}} {{path/to/palette_file.ppm}} {{[-m|-missingcolor]}} {{color}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

pnmrotate

Rotate a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmrotate.html.

- Rotate a PNM image by some angle (measured in degrees, counter-clockwise):

```
pnmrotate {{angle}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

- Specify the background color exposed by rotating the input image:

```
pnmrotate {{[-b|-background]}} {{color}} {{angle}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

- Disable anti-aliasing, improving performance but decreasing quality:

```
pnmrotate {{[-n|-noantialias]}} {{angle}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

pnmscale

This command has been replaced by **`pamscale`**.

More information: https://netpbm.sourceforge.net/doc/pnmscale.html.

- View documentation for `pamscale`:

```
tldr pamscale
```

pnmscalefixed

Scale a PNM file quickly with possibly reduced quality.

See also: **pamscale**.

More information: https://netpbm.sourceforge.net/doc/pnmscalefixed.html.

- Scale an image such that the result has the specified dimensions:

```
pnmscalefixed {{[-w|-width]}} {{width}} {{[-h|-height]}}
{{height}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

- Scale an image such that the result has the specified width, keeping the aspect ratio:

```
pnmscalefixed {{[-w|-width]}} {{width}} {{path/to/input.pnm}}
> {{path/to/output.pnm}}
```

- Scale an image such that its width and height is changed by the specified factors:

```
pnmscalefixed {{[-xsc|-xscale]}} {{x_factor}} {{[-ysc|-
yscale]}} {{y_factor}} {{path/to/input.pnm}} > {{path/to/
output.pnm}}
```

pnmshear

Shear a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmshear.html.

- Shear a PNM image by the specified angle:

```
pnmshear {{angle}} {{path/to/input.pnm}} > {{path/to/
output.pnm}}
```

- Specify the color of the background in the sheared image:

```
pnmshear {{[-b|-background]}} {{blue}} {{angle}} {{path/to/
input.pnm}} > {{path/to/output.pnm}}
```

- Do not perform anti-aliasing:

```
pnmshear {{[-n|-noantialias]}} {{angle}} {{path/to/
input.pnm}} > {{path/to/output.pnm}}
```

pnmsmooth

Smooth out a PNM image.

More information: https://netpbm.sourceforge.net/doc/pnmsmooth.html.

- Smooth out a PNM image using a convolution matrix of size 3x3:

```
pnmsmooth {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

- Smooth out a PNM image using a convolution matrix of size width times height:

```
pnmsmooth {{[-w|-width]}} {{width}} {{[-h|-height]}} {{height}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

pnmsplit

This command has been superseded by **pamsplit**.

More information: https://netpbm.sourceforge.net/doc/pnmsplit.html.

- View documentation for the current command:

```
tldr pamsplit
```

pnmtile

Replicate an image to fill a specified area.

More information: https://netpbm.sourceforge.net/doc/pnmtile.html.

- Replicate an image to fill an area of the specified dimensions:

```
pnmtile {{width}} {{height}} {{path/to/input.pnm}} > {{path/to/output.pnm}}
```

pnmtoddif

Convert a PNM image to a DDIF image file.

More information: https://netpbm.sourceforge.net/doc/pnmtoddif.html.

- Convert a PNM image to a DDIF image file:

```
pnmtoddif {{path/to/image.pnm}} > {{path/to/image.ddif}}
```

- Explicitly specify the horizontal and vertical resolution of the output image:

```
pnmtoddif {{[-r|-resolution]}} {{horizontal_dpi}}
{{vertical_dpi}} {{path/to/image.pnm}} > {{path/to/
image.ddif}}
```

pnmtofiasco

Convert a PNM image to a compressed FIASCO file.

More information: https://netpbm.sourceforge.net/doc/pnmtofiasco.html.

- Convert a PNM image to a compressed FIASCO file:

```
pnmtofiasco {{path/to/file.pnm}} > {{path/to/file.fiasco}}
```

- Specify the input files through a pattern:

```
pnmtofiasco {{[-i|--image-name]}} "{{img[01-09+1].pnm}}" >
{{path/to/file.fiasco}}
```

- Specify the compression quality:

```
pnmtofiasco {{[-q|--quality]}} {{quality_level}} {{path/to/
file.pnm}} > {{path/to/file.fiasco}}
```

- Load the options to be used from the specified configuration file:

```
pnmtofiasco {{[-f|--config]}} {{path/to/fiascorc}} {{path/to/
file.pnm}} > {{path/to/file.fiasco}}
```

pnmtofits

This command has been superseded by **pamtofits**.

More information: https://netpbm.sourceforge.net/doc/pnmtofits.html.

- View documentation for the current command:

```
tldr pamtofits
```

pnmtojpeg

Convert a PNM image file to the JPEG/JFIF/EXIF image format.

More information: https://netpbm.sourceforge.net/doc/pnmtojpeg.html.

- Read a PNM image as input and produce a JPEG/JFIF/EXIF image as output:

```
pnmtojpeg {{path/to/file.pnm}} > {{path/to/file.jpg}}
```

- Display version:

```
pnmtojpeg -version
```

pnmtopalm

Convert a PNM image to a Palm bitmap.

More information: https://netpbm.sourceforge.net/doc/pnmtopalm.html.

- Convert a PNM image to a Palm bitmap:

```
pnmtopalm {{path/to/file.pnm}} > {{path/to/file.palm}}
```

- Specify the color depth of the resulting bitmap:

```
pnmtopalm {{[-dep|-depth]}} {{1|2|4|8|16}} {{path/to/
file.pnm}} > {{path/to/file.palm}}
```

- Choose a compression method for the resulting bitmap:

```
pnmtopalm -{{scanline_compression|rle_compression|
packbits_compression}} {{path/to/file.pnm}} > {{path/to/
file.palm}}
```

- Build a custom colormap and include it in the resulting bitmap:

```
pnmtopalm {{[-c|-colormap]}} {{path/to/file.pnm}} > {{path/
to/file.palm}}
```

- Specify the bitmap's density:

```
pnmtopalm {{[-den|-density]}} {{72|108|144|216|288}} {{path/
to/file.pnm}} > {{path/to/file.palm}}
```

pnmtopclxl

Convert a PNM file to an HP LaserJet PCL XL printer stream.

More information: https://netpbm.sourceforge.net/doc/pnmtopclxl.html.

- Convert PNM files to an HP LaserJet PCL XL printer stream:

```
pnmtopclxl {{path/to/input1.pnm path/to/input2.pnm ...}} > {{path/to/output.pclxl}}
```

- Specify the resolution of the image as well as the location of the page from the upper left corner of each image:

```
pnmtopclxl -dpi {{resolution}} {{[-x|-xoffs]}} {{x_offset}} {{[-y|-yoffs]}} {{y_offset}} {{path/to/input1.pnm path/to/input2.pnm ...}} > {{path/to/output.pclxl}}
```

- Generate a duplex printer stream for the specified paper format:

```
pnmtopclxl {{[-du|-duplex]}} {{vertical|horizontal}} {{[-fo|-format]}} {{letter|legal|a3|a4|a5|...}} {{path/to/input1.pnm path/to/input2.pnm ...}} > {{path/to/output.pclxl}}
```

pnmtoplainpnm

This command is an alias of **`pamtopnm -plain`**.

- View documentation for the original command:

  ```
  tldr pamtopnm
  ```

pnmtopng

Convert a PNM image file to PNG image format.

More information: https://netpbm.sourceforge.net/doc/pnmtopng.html.

- Read a PNM image as input and produce a PNG image as output:

```
pnmtopng {{path/to/file.pnm}} > {{path/to/file.png}}
```

- Display version:

```
pnmtopng {{[-vers|-version]}}
```

pnmtopnm

This command is an alias of **pamtopnm**.

- View documentation for the original command:

```
tldr pamtopnm
```

pnmtops

Convert a PNM image to a PostScript file.

More information: https://netpbm.sourceforge.net/doc/pnmtops.html.

- Convert a PNM image to a PS file:

```
pnmtops {{path/to/file.pnm}} > {{path/to/file.ps}}
```

- Specify the dimensions of the output image in inches:

```
pnmtops {{[-imagew|-imagewidth]}} {{imagewidth}} {{[-imageh|-imageheight]}} {{imageheight}} {{path/to/file.pnm}} > {{path/to/file.ps}}
```

- Specify the dimensions of the page the output image resides on in inches:

```
pnmtops {{[-w|-width]}} {{width}} {{[-h|-height]}} {{height}} {{path/to/file.pnm}} > {{path/to/file.ps}}
```

pnmtorast

Convert a PNM file to a Sun rasterfile.

More information: https://netpbm.sourceforge.net/doc/pnmtorast.html.

- Convert a PNM image to a RAST image:

```
pnmtorast {{path/to/input.pnm}} > {{path/to/output.rast}}
```

- Force either `RT_STANDARD` or `RT_BYTE_ENCODED` form for the output:

```
pnmtorast -{{standard|rle}} {{path/to/input.pnm}} > {{path/
to/output.rast}}
```

pnmtorle

Convert a PNM file to an Utah Raster Tools RLE image file.

More information: https://netpbm.sourceforge.net/doc/pnmtorle.html.

- Convert a PNM image to an RLE image:

```
pnmtorle {{path/to/input.pnm}} > {{path/to/output.rle}}
```

- Print PNM header information to `stdout`:

```
pnmtorle {{[-verb|-verbose]}} {{path/to/input.pnm}} > {{path/to/output.rle}}
```

- Include a transparency channel in the output image in which every black pixel is set to fully transparent and every other pixel is set to fully opaque:

```
pnmtorle {{[-a|-alpha]}} {{path/to/input.pnm}} > {{path/to/output.rle}}
```

pnmtosgi

Convert a PNM file to an SGI image file.

More information: https://netpbm.sourceforge.net/doc/pnmtosgi.html.

- Convert a PNM image to an SGI image:

```
pnmtosgi {{path/to/input.pnm}} > {{path/to/output.sgi}}
```

- Disable or enable compression:

```
pnmtosgi -{{verbatim|rle}} {{path/to/input.pnm}} > {{path/to/output.sgi}}
```

- Write the specified string into the SGI image header's `imagename` field:

```
pnmtosgi {{[-i|-imagename]}} {{string}} {{path/to/input.pnm}} > {{path/to/output.sgi}}
```

pnmtosir

Convert a PNM file to a Solitaire Image Recorder file.

More information: https://netpbm.sourceforge.net/doc/pnmtosir.html.

- Convert a PNM image to a SIR image:

```
pnmtosir {{path/to/input.pnm}} > {{path/to/output.sir}}
```

pnmtotiff

This command has been superseded by **pamtotiff**.

More information: https://netpbm.sourceforge.net/doc/pnmtotiff.html.

- View documentation for the current command:

```
tldr pamtotiff
```

pnmtotiffcmyk

Convert a PNM image to a CMYK encoded TIFF.

More information: https://netpbm.sourceforge.net/doc/pnmtotiffcmyk.html.

- Convert a PNM image to a CMYK encoded TIFF:

```
pnmtotiffcmyk {{path/to/input_file.pnm}} > {{path/to/
output_file.tiff}}
```

- Specify the TIFF compression method:

```
pnmtotiffcmyk -{{none|packbits|lzw}} {{path/to/
input_file.pnm}} > {{path/to/output_file.tiff}}
```

- Control the fill order:

```
pnmtotiffcmyk -{{msb2lsb|lsb2msb}} {{path/to/input_file.pnm}}
> {{path/to/output_file.tiff}}
```

pnmtoxwd

Convert a PNM file into an X11 window dump file.

More information: https://netpbm.sourceforge.net/doc/pnmtoxwd.html.

- Convert a PNM image file to XWD:

```
pnmtoxwd {{path/to/input_file.pnm}} > {{path/to/
output_file.xwd}}
```

- Produce the output in the DirectColor format:

```
pnmtoxwd {{[-d|-directcolor]}} {{path/to/input_file.pnm}} >
{{path/to/output_file.xwd}}
```

- Set the color depth of the output to b bits:

```
pnmtoxwd {{[-ps|-pseudodepth]}} {{b}} {{path/to/
input_file.pnm}} > {{path/to/output_file.xwd}}
```

pnpm audit

Scan project dependencies.

Check for known security issues with the installed packages.

More information: https://pnpm.io/cli/audit.

- Identify vulnerabilities in the project:

```
pnpm audit
```

- Automatically fix vulnerabilities:

```
pnpm audit fix
```

- Generate a security report in JSON format:

```
pnpm audit --json > {{path/to/audit-report.json}}
```

- Audit only dev dependencies:

```
pnpm audit {{[-D|--dev]}}
```

- Audit only production dependencies:

```
pnpm audit {{[-P|--prod]}}
```

- Exclude optional dependencies from the audit:

```
pnpm audit --no-optional
```

- Ignore registry errors during the audit process:

```
pnpm audit --ignore-registry-errors
```

- Filter advisories by severity (low, moderate, high, critical):

```
pnpm audit --audit-level {{severity}}
```

pnpm outdated

Check for outdated packages.

The check can be limited to a subset of the installed packages by providing arguments (patterns are supported).

More information: https://pnpm.io/cli/outdated.

- Check for outdated packages:

  ```
  pnpm outdated
  ```

- Check for outdated dependencies found in every workspace package:

  ```
  pnpm outdated {{[-r|--recursive]}}
  ```

- Filter outdated packages using a package selector:

  ```
  pnpm outdated --filter {{package_selector}}
  ```

- List outdated packages globally:

  ```
  pnpm outdated {{[-g|--global]}}
  ```

- Print details of outdated packages:

  ```
  pnpm outdated --long
  ```

- Print outdated dependencies in a specific format:

  ```
  pnpm outdated --format {{format}}
  ```

- Print only versions that satisfy specifications in `package.json`:

  ```
  pnpm outdated --compatible
  ```

- Check only outdated dev dependencies:

  ```
  pnpm outdated {{[-D|--dev]}}
  ```

pnpm

Fast, disk space efficient package manager for Node.js.

Manage Node.js projects and their module dependencies.

More information: https://pnpm.io/pnpm-cli.

- Create a `package.json` file:

```
pnpm init
```

- Download all the packages listed as dependencies in `package.json`:

```
pnpm {{[i|install]}}
```

- Download a specific version of a package and add it to the list of dependencies in `package.json`:

```
pnpm add {{module_name}}@{{version}}
```

- Download a package and add it to the list of dev dependencies in `package.json`:

```
pnpm add {{module_name}} {{[-D|--save-dev]}}
```

- Download a package and install it globally:

```
pnpm add {{module_name}} {{[-g|--global]}}
```

- Uninstall a package and remove it from the list of dependencies in `package.json`:

```
pnpm {{[rm|remove]}} {{module_name}}
```

- Print a tree of locally installed modules:

```
pnpm {{[ls|list]}}
```

- List top-level globally installed modules:

```
pnpm {{[ls|list]}} {{[-g|--global]}} --depth {{0}}
```

pnpx

Directly execute binaries from npm packages, using **`pnpm`** instead of **`npm`**.

Note: This command is deprecated! Use **`pnpm exec`** and **`pnpm dlx`** instead.

More information: https://cuyl.github.io/pnpm.github.io/pnpx-cli/.

- Execute the binary from a given `npm` module:

  ```
  pnpx {{module_name}}
  ```

- Execute a specific binary from a given `npm` module, in case the module has multiple binaries:

  ```
  pnpx --package {{package_name}} {{module_name}}
  ```

- Display help:

  ```
  pnpx --help
  ```

pocount

Translate Toolkit utility to get translation progress from file, supporting several formats.

More information: https://docs.translatehouse.org/projects/translate-toolkit/en/latest/commands/pocount.html.

- Print a colorful table with the translation progress of a file:

```
pocount {{path/to/file.po}}
```

- Print translation progress of various files, one line per file:

```
pocount --short {{translation_*.ts}}
```

- Generate a CSV file with the translation progress of various files:

```
pocount --csv {{translation_*.ts}} > {{path/to/
translation_progress.csv}}
```

podman build

Daemonless tool for building container images.

More information: https://docs.podman.io/en/latest/markdown/podman-build.1.html.

- Create an image using a `Dockerfile` or `Containerfile` in the specified directory:

```
podman build {{path/to/directory}}
```

- Create an image with a specified tag:

```
podman build {{[-t|--tag]}} {{image_name:version}} {{path/to/directory}}
```

- Create an image from a non-standard file:

```
podman build {{[-f|--file]}} {{Containerfile.different}} .
```

- Create an image without using any previously cached images:

```
podman build --no-cache {{path/to/directory}}
```

- Create an image suppressing all output:

```
podman build {{[-q|--quiet]}} {{path/to/directory}}
```

podman-compose

Run and manage Compose Specification container definition.

More information: https://github.com/containers/podman-compose.

- List all running containers:

  ```
  podman-compose ps
  ```

- Create and start all containers in the background using a local `docker-compose.yml`:

  ```
  podman-compose up {{[-d|--detach]}}
  ```

- Start all containers, building if needed:

  ```
  podman-compose up --build
  ```

- Start all containers using an alternate compose file:

  ```
  podman-compose {{[-f|--file]}} {{path/to/file.yaml}} up
  ```

- Stop all running containers:

  ```
  podman-compose stop
  ```

- Remove all containers, networks, and volumes:

  ```
  podman-compose down {{[-v|--volumes]}}
  ```

- Follow logs for a container (omit all container names):

  ```
  podman-compose logs {{[-f|--follow]}} {{container_name}}
  ```

- Run a one-time command in a service with no ports mapped:

  ```
  podman-compose run {{service_name}} {{command}}
  ```

podman export

Export the filesystem of a container and save it as a tarball on the local machine.

See also: **`podman import`**, **`podman save`**.

More information: https://docs.podman.io/en/latest/markdown/podman-export.1.html.

- Export a container's filesystem to a tar file:

```
podman export {{[-o|--output]}} {{path/to/file.tar}} {{container_name_or_id}}
```

- Export a container's filesystem to `stdout`:

```
podman export {{container_name_or_id}} > {{path/to/file.tar}}
```

podman image load

This command is an alias of **`podman load`**.

- View documentation for the original command:

```
tldr podman load
```

podman image pull

This command is an alias of **`podman pull`**.

- View documentation for the original command:

```
tldr podman pull
```

podman image

Manage OCI/Docker container images.

See also: **`podman build`**, **`podman import`**, **`podman pull`**.

More information: https://docs.podman.io/en/latest/markdown/podman-image.1.html.

- List local container images:

  ```
  podman image {{[ls|list]}}
  ```

- Delete unused local container images:

  ```
  podman image prune
  ```

- Delete all unused images (not just those without a tag):

  ```
  podman image prune {{[-a|--all]}}
  ```

- Show the history of a local container image:

  ```
  podman image history {{image}}
  ```

podman images

Manage OCI/Docker container images.

More information: https://docs.podman.io/en/latest/markdown/podman-images.1.html.

- List all container images:

```
podman images
```

- List all container images including intermediates:

```
podman images {{[-a|--all]}}
```

- List the output in quiet mode (only numeric IDs):

```
podman images {{[-q|--quiet]}}
```

- List all images not used by any container:

```
podman images {{[-f|--filter]}} dangling=true
```

- List images that contain a substring in their name:

```
podman images "{{*image|image*}}"
```

podman import

Import a tarball and save it as a filesystem image.

See also: **`podman export`**, **`podman save`**.

More information: https://docs.podman.io/en/latest/markdown/podman-import.1.html.

- Import a tarball from a local file and create an image:

```
podman import {{path/to/tarball.tar}} {{image:tag}}
```

- Import a tarball from a URL:

```
podman import {{https://example.com/image.tar}} {{image:tag}}
```

- Import a tarball and add a commit message:

```
podman import {{[-m|--message]}} "{{commit_message}}" {{path/to/tarball.tar}} {{image:tag}}
```

- Import a tarball and set a default command (required for running the container):

```
podman import {{[-c|--change]}} CMD={{/bin/bash}} {{path/to/tarball.tar}} {{image:tag}}
```

podman load

Load an image from an oci-archive or a docker-archive created using podman save.

See also: **`podman save`**, **`podman import`**.

More information: https://docs.podman.io/en/latest/markdown/podman-load.1.html.

- Load an image from a tar file:

```
podman load {{[-i|--input]}} {{path/to/file.tar}}
```

- Load an image from a compressed tar file:

```
podman load {{[-i|--input]}} {{path/to/
file.tar[.gz|.bz2|.xz|.zst]}}
```

- Load an image and display quiet output (only show the image ID):

```
podman load {{[-q|--quiet]}} {{[-i|--input]}} {{path/to/
file.tar}}
```

- Load an image from `stdin`:

```
podman < {{path/to/file.tar}} load
```

podman login

Log in to a container registry.

Note: The default authfile path on Linux is **`$XDG_RUNTIME_DIR/containers/auth.json`**, which is usually stored in a **`tmpfs`** (in RAM).

More information: https://docs.podman.io/en/latest/markdown/podman-login.1.html.

- Log in to a registry (non-persistent on Linux; persistent on Windows/macOS):

```
podman login {{registry.example.org}}
```

- Log in to a registry persistently on Linux:

```
podman login --authfile $HOME/.config/containers/auth.json {{registry.example.org}}
```

- Log in to an insecure (HTTP) registry:

```
podman login --tls-verify false {{registry.example.org}}
```

podman machine

Create and manage virtual machines running Podman.

Included with Podman version 4 or greater.

More information: https://docs.podman.io/en/latest/markdown/podman-machine.1.html.

- List existing machines:

```
podman machine {{[ls|list]}}
```

- Create a new default machine:

```
podman machine init
```

- Create a new machine with a specific name:

```
podman machine init {{name}}
```

- Create a new machine with different resources:

```
podman machine init --cpus {{4}} --memory {{4096}} --disk-size {{50}}
```

- Start or stop a machine:

```
podman machine {{start|stop}} {{name}}
```

- Connect to a running machine via SSH:

```
podman machine ssh {{name}}
```

- Inspect information about a machine:

```
podman machine inspect {{name}}
```

podman ps

List Podman containers.

More information: https://docs.podman.io/en/latest/markdown/podman-ps.1.html.

- List currently running Podman containers:

```
podman ps
```

- List all Podman containers (running and stopped):

```
podman ps {{[-a|--all]}}
```

- Show the latest created container (includes all states):

```
podman ps {{[-l|--latest]}}
```

- Filter containers that contain a substring in their name:

```
podman ps {{[-f|--filter]}} "name={{name}}"
```

- Filter containers that share a given image as an ancestor:

```
podman ps {{[-f|--filter]}} "ancestor={{image}}:{{tag}}"
```

- Filter containers by exit status code:

```
podman ps {{[-a|--all]}} {{[-f|--filter]}} "exited={{code}}"
```

- Filter containers by status:

```
podman ps {{[-f|--filter]}} "status={{created|running|
removing|paused|exited|dead}}"
```

- Filter containers that mount a specific volume or have a volume mounted in a specific path:

```
podman ps {{[-f|--filter]}} "volume={{path/to/directory}}" --
format "table {{.ID}}\t{{.Image}}\t{{.Names}}\t{{.Mounts}}"
```

podman pull

Pull images from a container registry.

More information: https://docs.podman.io/en/latest/markdown/podman-pull.1.html.

- Pull a specific container image:

```
podman pull {{image}}:{{tag}}
```

- Pull a container image in quiet mode:

```
podman pull {{[-q|--quiet]}} {{image}}:{{tag}}
```

- Pull all tags of a container image:

```
podman pull {{[-a|--all-tags]}} {{image}}
```

- Pull a container image for a specific platform, e.g. `linux/arm64`:

```
podman pull --platform {{linux/arm64}} {{image}}:{{tag}}
```

- Pull a container image without TLS verification:

```
podman pull --tls-verify={{false}} {{image}}:{{tag}}
```

- Display help:

```
podman pull {{[-h|--help]}}
```

podman rmi

Remove OCI/Docker images.

More information: https://docs.podman.io/en/latest/markdown/podman-rmi.1.html.

- Remove one or more images given their names:

```
podman rmi {{image:tag image2:tag ...}}
```

- Force remove an image:

```
podman rmi {{[-f|--force]}} {{image}}
```

- Remove an image without deleting untagged parents:

```
podman rmi --no-prune {{image}}
```

- Display help:

```
podman rmi {{[-h|--help]}}
```

podman run

Run a command in a new Podman container.

More information: https://docs.podman.io/en/latest/markdown/podman-run.1.html.

- Run command in a new container from a tagged image:

```
podman run {{image:tag}} {{command}}
```

- Run command in a new container in background and display its ID:

```
podman run {{[-d|--detach]}} {{image:tag}} {{command}}
```

- Run command in a one-off container in interactive mode and pseudo-TTY:

```
podman run --rm {{[-it|--interactive --tty]}} {{image:tag}}
{{command}}
```

- Run command in a new container with passed environment variables:

```
podman run {{[-e|--env]}} '{{variable}}={{value}}' {{[-e|--
env]}} {{variable}} {{image:tag}} {{command}}
```

- Run command in a new container with bind mounted volumes:

```
podman run {{[-v|--volume]}} /{{path/to/host_path}}:/{{path/
to/container_path}} {{image:tag}} {{command}}
```

- Run command in a new container with published ports:

```
podman run {{[-p|--publish]}} {{host_port}}:
{{container_port}} {{image:tag}} {{command}}
```

- Run command in a new container overwriting the entrypoint of the image:

```
podman run --entrypoint {{command}} {{image:tag}}
```

- Run command in a new container connecting it to a network:

```
podman run --network {{network}} {{image:tag}}
```

podman save

Save an image to a local file or directory.

See also: **`podman load`**, **`podman export`**.

More information: https://docs.podman.io/en/latest/markdown/podman-save.1.html.

- Save an image to a tar file:

```
podman save {{[-o|--output]}} {{path/to/file.tar}} {{image:tag}}
```

- Save an image to `stdout`:

```
podman save {{image:tag}} > {{path/to/file.tar}}
```

- Save an image with compression:

```
podman save {{image:tag}} | {{[gzip|bzip2|xz|zstd|zstdchunked]}} > {{path/to/file.tar[.gz|.bz2|.xz|.zst|.zst]}}
```

- Transfer an image to remote system with on-the-fly compression and progress bar:

```
podman save {{image:tag}} | zstd {{[-T|--threads]}} 0 --ultra | pv | ssh {{username}}@{{remote_host}} podman load
```

podman

Simple management tool for pods, containers, and images.

Podman provides a Docker-CLI comparable command-line. Simply put: **`alias docker=podman`**.

More information: https://github.com/containers/podman/blob/main/commands-demo.md.

- List all containers (both running and stopped):

```
podman ps {{[-a|--all]}}
```

- Create a container from an image, with a custom name:

```
podman run --name {{container_name}} {{image}}
```

- Start or stop an existing container:

```
podman {{start|stop}} {{container_name}}
```

- Pull an image from a registry (defaults to Docker Hub):

```
podman pull {{image}}
```

- Display the list of already downloaded images:

```
podman images
```

- Open a shell inside an already running container:

```
podman exec {{[-it|--interactive --tty]}} {{container_name}} {{sh}}
```

- Remove a stopped container:

```
podman rm {{container_name}}
```

- Display the logs of one or more containers and follow log output:

```
podman logs {{[-f|--follow]}} {{container_name}} {{container_id}}
```

poetry about

Get information about Poetry, an application to manage Python packages and dependencies.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#about.

- Display global information about Poetry, including the current version:

```
poetry about
```

poetry add

Add required packages to the **`pyproject.toml`** file in Poetry.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#add.

- Add required packages:

```
poetry add {{package_name}}
```

- Add required packages to a specific group of dependencies:

```
poetry add {{package_name}} --group {{group_name}}
```

- Add a specific version of a package:

```
poetry add {{package_name}}=={{version}}
```

- Add a specific version of a package equal to or earlier than a given version:

```
poetry add {{package_name}}<={{version}}
```

- Add a specific version of a package equal to or later than a given version:

```
poetry add {{package_name}}>={{version}}
```

poetry build

Build a Poetry package as a tarball and a wheel.

More information: https://python-poetry.org/docs/cli/#build.

- Build a tarball and a wheel for the project:

```
poetry build
```

- Build a wheel package:

```
poetry build {{[-f|--format]}} wheel
```

- Build a source distribution (sdist):

```
poetry build {{[-f|--format]}} sdist
```

- Clean the output directory before building:

```
poetry build --clean
```

- Set the output directory:

```
poetry build {{[-o|--output]}} {{path/to/directory}}
```

poetry cache

Manage Poetry's cache.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#cache.

- Display Poetry's available caches:

```
poetry cache list
```

- Remove all packages from a cache (e.g.: PyPI):

```
poetry cache clear PyPI --all
```

- Remove a specific package from a cache (Note: must be in format `cache:package:version`):

```
poetry cache clear {{pypi}}:{{requests}}:{{2.24.0}}
```

poetry check

Manage Poetry file validation and consistency.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#check.

- Check validation and consistency between `pyproject.toml` and `poetry.lock` for Poetry:

```
poetry check
```

- Verify that `poetry.lock` exists:

```
poetry check --lock
```

- Fail if warnings are reported:

```
poetry check --strict
```

poetry config

Edit poetry config settings and repositories.

More information: https://python-poetry.org/docs/cli/#config.

- List current configuration:

```
poetry config --list
```

- Remove the a previously set setting:

```
poetry config {{config_key}} --unset
```

- See the value of a specific setting:

```
poetry config {{config_key}}
```

- Change or add a new configuration setting by passing a value after the setting's name:

```
poetry config {{config_key}} {{config_value}}
```

- Migrate outdated configuration settings:

```
poetry config --migrate
```

- Set/Get settings that are specific to a project:

```
poetry config --local
```

poetry-debug

Debug issues with your Poetry project.

See also: **asdf**.

More information: https://python-poetry.org/docs/cli/#debug.

- Show debug info about Poetry and your project's virtual environment:

```
poetry debug info
```

- Attempt to resolve your project dependencies:

```
poetry debug resolve
```

- Show supported packaging tags for your project's active virtual environment:

```
poetry debug tags
```

poetry-env

Manage virtual environments associated with a Poetry project.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#env.

- Print the command to activate a virtual environment:

```
poetry env activate
```

- Display information about the current environment:

```
poetry env info
```

- Display the path of the current environment:

```
poetry env info {{[-p|--path]}}
```

- Display the path of the current environment's Python executable:

```
poetry env info {{[-e|--executable]}}
```

- List all virtual environments associated with the current project (optionally showing the full path):

```
poetry env list --full-path
```

- Remove specific or all virtual environments associated with the current project:

```
poetry env remove python {{path/to/executable|
environment_name}} | poetry env remove --all
```

- Activate or create a virtual environment for the project using the specified Python executable:

```
poetry env use python {{path/to/executable}}
```

poetry export

Export Poetry's lock file to other formats.

Provided by the Export Poetry Plugin.

More information: https://github.com/python-poetry/poetry-plugin-export#usage.

- Export dependencies to a `requirements.txt` file:

```
poetry export {{[-o|--output]}} {{requirements.txt}}
```

- Export dependencies including development dependencies:

```
poetry export {{[-o|--output]}} {{requirements-dev.txt}} --dev
```

- Export dependencies without hashes:

```
poetry export {{[-o|--output]}} {{requirements.txt}} --without-hashes
```

- Export dependencies for a specific format:

```
poetry export {{[-o|--output]}} {{requirements.txt}} {{[-f|--format]}} {{requirements.txt}}
```

- Export only specific dependency groups:

```
poetry export {{[-o|--output]}} {{requirements.txt}} --only {{main}}
```

- Display help:

```
poetry export {{[-h|--help]}}
```

poetry help

Display global help, or help for a specific **`poetry`** command.

More information: https://python-poetry.org/docs/cli/#help.

- Display global help:

```
poetry help
```

- Display help for a specific command:

```
poetry help {{config|show|...}}
```

poetry init

Create a basic **`pyproject.toml`** file interactively.

More information: https://python-poetry.org/docs/cli/#init.

- Create a `pyproject.toml` file interactively:

```
poetry init
```

- Create a `pyproject.toml` file with prefilled values:

```
poetry init --name {{package_name}} --author "{{author_name <email@example.com>}}"
```

- Create a `pyproject.toml` file without interaction (using defaults):

```
poetry init {{[-n|--no-interaction]}}
```

- Create a `pyproject.toml` file and add a dependency:

```
poetry init --dependency {{package_name}}
```

- Create a `pyproject.toml` file and add a development dependency:

```
poetry init --dev-dependency {{package_name}}
```

- Display help:

```
poetry init {{[-h|--help]}}
```

poetry install

Install all dependencies for a Python project as defined in the pyproject.toml file.

More information: https://python-poetry.org/docs/cli/#install.

- Install dependencies:

```
poetry install
```

- Skip installing the project itself as a dependency:

```
poetry install --no-root
```

- Install only production dependencies:

```
poetry install --without dev
```

- Install optional dependenciy groups:

```
poetry install --with test,docs
```

poetry list

List available Poetry commands.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#list.

- List all available Poetry commands:

```
poetry list
```

- List commands for a specific namespace:

```
poetry list {{namespace}}
```

poetry lock

Lock dependencies in **`pyproject.toml`** (without installing them).

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#lock.

- Lock dependencies from the current directory's `pyproject.toml` file:

  ```
  poetry lock
  ```

- Regenerate the existing lock file:

  ```
  poetry lock --regenerate
  ```

poetry new

Create a new Poetry project in a specific directory.

More information: https://python-poetry.org/docs/cli/#new.

- Create a new project (defaults to `src` layout):

```
poetry new {{path/to/directory}}
```

- Create a new project asking for configuration details interactively:

```
poetry new {{path/to/directory}} {{[-i|--interactive]}}
```

- Create a new project with a specific package name:

```
poetry new {{path/to/directory}} --name {{package_name}}
```

- Create a new project using the flat layout (without the `src` directory):

```
poetry new {{path/to/directory}} --flat
```

- Create a new project with a specific author:

```
poetry new {{path/to/directory}} --author "{{Name
<email@example.com>}}"
```

- Create a new project with a specific README format:

```
poetry new {{path/to/directory}} --readme {{md|rst|txt|...}}
```

poetry publish

Publish a package to a remote repository.

More information: https://python-poetry.org/docs/cli/#publish.

- Publish the current package to PyPI:

```
poetry publish
```

- Build the package before publishing:

```
poetry publish --build
```

- Publish to a specific repository:

```
poetry publish {{[-r|--repository]}} {{repository_name}}
```

- Publish with specific credentials:

```
poetry publish {{[-u|--username]}} {{username}} {{[-p|--password]}} {{password}}
```

- Perform a dry run to see what would be done without actually publishing:

```
poetry publish --dry-run
```

- Skip files that already exist in the repository:

```
poetry publish --skip-existing
```

poetry-python

Manage Python versions through Poetry.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#python.

- Install the specified Python version:

```
poetry python install {{3.13.1}}
```

- List all Python versions managed by System or Poetry:

```
poetry python list
```

- List all Python versions managed by Poetry:

```
poetry python list --managed
```

- Remove the specified Python version (if managed by Poetry):

```
poetry python remove {{3.13.1}}
```

poetry remove

Remove a package from the project dependencies.

More information: https://python-poetry.org/docs/cli/#remove.

- Remove one or more packages from the project's dependencies:

  ```
  poetry remove {{package1 package2 ...}}
  ```

- Remove a package from the development dependencies:

  ```
  poetry remove {{package}} {{[-D|--dev]}}
  ```

- Remove a package from a specific dependency group:

  ```
  poetry remove {{package}} {{[-G|--group]}} {{group_name}}
  ```

- Remove a package without making any changes (dry-run):

  ```
  poetry remove {{package}} --dry-run
  ```

- Update the lock file only, without removing the package from the environment:

  ```
  poetry remove {{package}} --lock
  ```

poetry run

Run a command in the project's virtual environment.

More information: https://python-poetry.org/docs/cli/#run.

- Run a command inside the virtual environment:

```
poetry run {{command}}
```

- Run a command with arguments:

```
poetry run {{command}} {{argument1 argument2 ...}}
```

- Run a script defined in `pyproject.toml`:

```
poetry run {{script_name}}
```

- Run a Python script:

```
poetry run python {{path/to/script.py}}
```

poetry search

Search for packages on a remote index.

Note: PyPI no longer supports searching via the command-line, so this command may fail on the default repository.

More information: https://python-poetry.org/docs/cli/#search.

- Search for a package:

```
poetry search {{package_name}}
```

- Search for multiple packages:

```
poetry search {{package1 package2 ...}}
```

poetry-self

Manage the Poetry installation/runtime environment itself.

These commands reference **`pyproject.toml`** and **`poetry.lock`** files in your Poetry configuration directory.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#self.

- Install a package:

```
poetry self add {{package_name}}
```

- Install dependencies from the Poetry installation's `pyproject.toml` file:

```
poetry self install
```

- Lock dependencies from the Poetry installation's `pyproject.toml` file:

```
poetry self lock
```

- Remove a package:

```
poetry self remove {{package_name}}
```

- List all installed packages:

```
poetry self show
```

- List all installed plugins:

```
poetry self show plugins
```

- Sync the runtime environment with the Poetry installation's `poetry.lock` file:

```
poetry self sync
```

- Update dependencies from the Poetry installation's `pyproject.toml` file:

```
poetry self update
```

poetry shell

Spawn a shell within the virtual environment.

Note: The **`shell`** command was moved to a plugin: **`poetry-plugin-shell`**.

More information: https://python-poetry.org/docs/cli/#shell.

- Spawn a shell within the virtual environment:

  ```
  poetry shell
  ```

poetry show

Show details of packages in your Poetry project.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#show.

- Display all packages:

```
poetry show
```

- Show details of a specific package:

```
poetry show {{package_name}}
```

- Show details as a dependency tree:

```
poetry show {{[-t|--tree]}}
```

- Only show top-level packages (those explicitly defined in `pyproject.toml`):

```
poetry show {{[-T|--top-level]}}
```

- Show outdated packages:

```
poetry show {{[-o|--outdated]}}
```

- Show the latest versions for all packages:

```
poetry show {{[-l|--latest]}}
```

- Exclude a specific dependency group/s:

```
poetry show --without {{group1,group2,...}}
```

- Only show a specific dependency group/s:

```
poetry show --only {{group1,group2,...}}
```

poetry source

Add source configurations to your Poetry project.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#source.

- Add a source configuration:

```
poetry source add {{source_name}} {{source_url}}
```

- Set the priority of a source:

```
poetry source add --priority {{primary|supplemental|
explicit}} {{source_name}} {{source_url}}
```

- Display info for all sources:

```
poetry source show
```

- Display info for a specific source:

```
poetry source show {{source_name}}
```

- Remove a source from your `pyproject.toml` file:

```
poetry source remove {{source_name}}
```

poetry sync

Syncs your project's environment with the **`poetry.lock`** file.

More information: https://python-poetry.org/docs/cli/#sync.

- Sync your project's environment with the `poetry.lock` file:

  ```
  poetry sync
  ```

- Exclude one or more dependency groups for the installation:

  ```
  poetry sync --without {{test|docs|...}}
  ```

- Select optional dependency groups:

  ```
  poetry sync --with {{test|docs|...}}
  ```

- Install all dependency groups including optional groups:

  ```
  poetry sync --all-groups
  ```

- Install specific dependency groups:

  ```
  poetry sync --only {{test|docs|...}}
  ```

- Install project without dependencies:

  ```
  poetry sync --only-root
  ```

- Specify extras to install:

  ```
  poetry sync {{[-E|--extras]}}
  ```

- Skip the defaulted package installation for your project:

  ```
  poetry sync --no-root
  ```

poetry update

Update the dependencies as according to the **`pyproject.toml`** file.

More information: https://python-poetry.org/docs/cli/#update.

- Update all dependencies:

  ```
  poetry update
  ```

- Update one or more specific packages:

  ```
  poetry update {{package1 package2 ...}}
  ```

- Update the lock file only, without installing the packages:

  ```
  poetry update --lock
  ```

- Synchronize the environment with the locked packages:

  ```
  poetry update --sync
  ```

- Update dependencies only for a specific group:

  ```
  poetry update --only {{group_name}}
  ```

- Simulate the update process without making changes:

  ```
  poetry update --dry-run
  ```

poetry version

Manage Poetry project version.

Assumes the following project stages: **`patch`**, **`minor`**, **`major`**, **`prepatch`**, **`preminor`**, **`premajor`**, **`prerelease`**.

See also: **`asdf`**.

More information: https://python-poetry.org/docs/cli/#version.

- Output the current version:

```
poetry version {{[-s|--short]}}
```

- Set project to a specific phase:

```
poetry version {{stage}}
```

- Increment the project to the next prerelease phase:

```
poetry version --next-phase
```

- Test project stage function without writing to `pyproject.toml`:

```
poetry version {{stage}} --dry-run
```

poetry

Manage Python packages and dependencies.

Some subcommands such as **`about`**, **`check`**, **`env`**, etc. have their own usage documentation.

See also: **`asdf`**, **`pipenv`**, **`hatch`**.

More information: https://python-poetry.org/docs/cli/.

- Create a new Poetry project in the directory with a specific name:

```
poetry new {{project_name}}
```

- Install and add a dependency and its sub-dependencies to the `pyproject.toml` file in the current directory:

```
poetry add {{dependency}}
```

- Install the project dependencies using the `pyproject.toml` file in the current directory:

```
poetry install
```

- Interactively (append `-n` for non-interactively) initialize the current directory as a new Poetry project:

```
poetry init
```

- Get the latest version of all dependencies and update `poetry.lock`:

```
poetry update
```

- Execute a command inside the project's virtual environment:

```
poetry run {{command}}
```

- Bump the version of the project in `pyproject.toml`:

```
poetry version {{patch|minor|major|prepatch|preminor|
premajor|prerelease}}
```

- Spawn a shell within the project's virtual environment (for versions below 2.0, use `poetry shell`):

```
eval "$(poetry env activate)"
```

pokeget

Display sprites of Pokemon in your terminal.

More information: https://github.com/talwat/pokeget-rs.

- Print a sprite of a given pokemon:

```
pokeget {{pokemon_name}}
```

- Print Mr. Mime (note the use of `-` instead of spaces):

```
pokeget mr-mime
```

- Print Mega Gengar:

```
pokeget gengar {{[-m|--mega]}}
```

- Print a random shiny Pokemon:

```
pokeget random {{[-s|--shiny]}}
```

- Print Alolan Meowth, without printing the Pokemon's name:

```
pokeget meowth {{[-a|--alolan]}} --hide-name
```

- Print a random Pokemon with 1/4096 chance to be shiny:

```
((RANDOM%4096 == 0)) && pokeget random --shiny || pokeget
random
```

polybar-msg

Control **`polybar`** using inter-process-messaging (IPC).

Note: IPC is disabled by default and can be enabled by setting **`enable-ipc = true`** in the Polybar config.

More information: https://polybar.readthedocs.io/en/stable/user/ipc.html.

- Quit the bar:

  ```
  polybar-msg cmd quit
  ```

- Restart the bar in-place:

  ```
  polybar-msg cmd restart
  ```

- Hide the bar (does nothing if the bar is already hidden):

  ```
  polybar-msg cmd hide
  ```

- Show the bar again (does nothing if the bar is not hidden):

  ```
  polybar-msg cmd show
  ```

- Toggle between hidden/visible:

  ```
  polybar-msg cmd toggle
  ```

- Execute a module action (the data string is optional):

  ```
  polybar-msg action "#{{module_name}}.{{action_name}}.
  {{data_string}}"
  ```

- Only send messages to a specific Polybar instance (all instances by default):

  ```
  polybar-msg -p {{pid}} {{cmd|action}} {{payload}}
  ```

polybar

A fast and easy-to-use status bar.

More information: https://github.com/polybar/polybar/wiki.

- Start Polybar (the bar name is optional if only one bar is defined in the config):

```
polybar {{bar_name}}
```

- Start Polybar with the specified config:

```
polybar --config={{path/to/config.ini}} {{bar_name}}
```

- Start Polybar and reload the bar when the configuration file is modified:

```
polybar --reload {{bar_name}}
```

pop

Send emails from your terminal.

More information: https://github.com/charmbracelet/pop.

- Launch the Text-based User Interface:

```
pop
```

- Send an email using the content of a Markdown file as body:

```
pop < {{path/to/message.md}} --from {{me@example.com}} --to
{{you@example.com}} --subject "{{On the Subject of
Ducks...}}" --attach {{path/to/attachment}}
```

- Display help:

```
pop --help
```

popd

Remove a directory placed on the directory stack via the pushd shell built-in.

See also: **`pushd`** to place a directory on the stack and **`dirs`** to display directory stack contents.

More information: https://www.gnu.org/software/bash/manual/bash.html#index-popd.

- Remove the top directory from the stack and cd to it:

```
popd
```

- Remove the Nth directory (starting from zero to the left from the list printed with `dirs`):

```
popd +N
```

- Remove the Nth directory (starting from zero to the right from the list printed with `dirs`):

```
popd -N
```

- Remove the 1st directory (starting from zero to the left from the list printed with `dirs`):

```
popd -n
```

popeye

Report potential issues with Kubernetes deployment manifests.

More information: https://github.com/derailed/popeye.

- Scan the current Kubernetes cluster:

  ```
  popeye
  ```

- Scan a specific namespace:

  ```
  popeye {{[-n|--namespace]}} {{namespace}}
  ```

- Scan specific Kubernetes context:

  ```
  popeye --context {{context}}
  ```

- Use a spinach configuration file for scanning:

  ```
  popeye {{[-f|--file]}} {{spinach.yaml}}
  ```

postcss

Transform styles with JS plugins.

More information: https://github.com/postcss/postcss-cli#usage.

- Parse and transform a CSS file:

```
postcss {{path/to/file}}
```

- Parse and transform a CSS file and output to a specific file:

```
postcss {{path/to/file}} {{[-o|--output]}} {{path/to/file}}
```

- Parse and transform a CSS file and output to a specific directory:

```
postcss {{path/to/file}} {{[-d|--dir]}} {{path/to/directory}}
```

- Parse and transform a CSS file in-place:

```
postcss {{path/to/file}} {{[-r|--replace]}}
```

- Specify a custom PostCSS parser:

```
postcss {{path/to/file}} --parser {{parser}}
```

- Specify a custom PostCSS syntax:

```
postcss {{path/to/file}} --syntax {{syntax}}
```

- Watch for changes to a CSS file:

```
postcss {{path/to/file}} {{[-w|--watch]}}
```

- Display help:

```
postcss {{[-h|--help]}}
```

postgres

Run the PostgreSQL database server.

More information: https://www.postgresql.org/docs/current/app-postgres.html.

- Start the server on a specific port (defaults to 5432):

```
postgres -p {{5433}}
```

- Set a runtime parameter (short form):

```
postgres -c {{shared_buffers=128MB}}
```

- Set a runtime parameter (long form):

```
postgres --{{shared-buffers}}={{128MB}}
```

- Start in single-user mode for a specific database (defaults to the user name):

```
postgres --single -D {{path/to/datadir}} {{my_database}}
```

powershell

This command may be mistaken as the cross-platform version of PowerShell (formerly known as PowerShell Core), which uses **`pwsh`** instead of **`powershell`**.

The original **`powershell`** command in Windows is still available to use the legacy Windows version of PowerShell (version 5.1 and below).

More information: https://learn.microsoft.com/powershell/module/microsoft.powershell.core/about/about_pwsh.

- View the documentation for the command referring to the latest, cross-platform version of PowerShell (version 6 and above):

  ```
  tldr pwsh
  ```

- View the documentation for the command referring to the legacy Windows PowerShell (version 5.1 and below):

  ```
  tldr powershell {{[-p|--platform]}} windows
  ```

ppmbrighten

This command has been superseded by **pambrighten**.

More information: https://netpbm.sourceforge.net/doc/ppmbrighten.html.

- View documentation for the current command:

```
tldr pambrighten
```

ppmchange

Change all pixels of one color in a PPM image to another color.

More information: https://netpbm.sourceforge.net/doc/ppmchange.html.

- Exchange the first color in each `oldcolor` - `newcolor` pair with the second color:

```
ppmchange {{oldcolor1 newcolor1 oldcolor2 newcolor2 ...}}
{{path/to/input.ppm}} > {{path/to/output.ppm}}
```

- Specify how similar colors must be in order to be considered the same:

```
ppmchange -closeness {{percentage}} {{oldcolor1 newcolor1
oldcolor2 newcolor2 ...}} {{path/to/input.ppm}} > {{path/to/
output.ppm}}
```

- Replace all pixels not specified in the arguments by a color:

```
ppmchange {{[-r|-remainder]}} {{color}} {{oldcolor1 newcolor1
oldcolor2 newcolor2 ...}} {{path/to/input.ppm}} > {{path/to/
output.ppm}}
```

ppmcie

Draw a CIE color chart as a PPM image.

More information: https://netpbm.sourceforge.net/doc/ppmcie.html.

- Draw a CIE color chart using the REC709 color system as a PPM image:

```
ppmcie > {{path/to/output.ppm}}
```

- Specify the color system to be used:

```
ppmcie -{{cie|ebu|hdtv|ntsc|smpte}} > {{path/to/output.ppm}}
```

- Specify the location of the individual illuminants:

```
ppmcie -{{red|green|blue}} {{xpos ypos}} > {{path/to/
output.ppm}}
```

- Do not dim the area outside the Maxwell triangle:

```
ppmcie {{[-f|-full]}} > {{path/to/output.ppm}}
```

ppmcolormask

Produce a mask of areas of a certain color in a PPM image.

More information: https://netpbm.sourceforge.net/doc/ppmcolormask.html.

- Produce a mask of areas of a certain color in the specified PPM image:

```
ppmcolormask {{[-c|-color]}} {{red,blue}} {{path/to/
input.ppm}} > {{path/to/output.pbm}}
```

ppmdim

Dim a PPM image.

Partly superseded by **`pamfunc -multiplier`**.

More information: https://netpbm.sourceforge.net/doc/ppmdim.html.

- Dim the specified PPM image by dimfactor:

```
ppmdim {{0.6}} {{path/to/input.ppm}} > {{path/to/output.ppm}}
```

ppmdist

Produce a grayscale version of a PPM image.

More information: https://netpbm.sourceforge.net/doc/ppmdist.html.

- Produce a grayscale version of the specified PPM image:

```
ppmdist {{path/to/input.ppm}} > {{path/to/output.pgm}}
```

- Use the specified method to map colors to graylevels:

```
ppmdist -{{frequency|intensity}} {{path/to/input.ppm}} >
{{path/to/output.pgm}}
```

ppmdither

Reduce the number of colors in an image by applying dithering.

More information: https://netpbm.sourceforge.net/doc/ppmdither.html.

- Read a PPM image, apply dithering, and save it to a file:

```
ppmdither {{path/to/image.ppm}} > {{path/to/file.ppm}}
```

- Specify the desired number of shades for each primary color:

```
ppmdither {{[-r|-red]}} {{2}} {{[-g|-green]}} {{3}} {{[-b|-blue]}} {{2}} {{path/to/image.ppm}} > {{path/to/file.ppm}}
```

- Specify the dimensions of the dithering matrix:

```
ppmdither {{[-d|-dim]}} {{2}} {{path/to/image.ppm}} > {{path/to/file.ppm}}
```

ppmdraw

Draw lines, text, and more on a PPM image by executing a script.

Documentation on the utilized scripting language can be found by following the link below.

More information: https://netpbm.sourceforge.net/doc/ppmdraw.html.

- Draw on the specified PPM image by executing the supplied script:

```
ppmdraw -script '{{setpos 50 50; text_here
"hello!"; }}' {{path/to/image.pnm}} > {{path/to/output.pnm}}
```

- Draw on the specified PPM image by executing the script in the specified file:

```
ppmdraw -scriptfile {{path/to/script}} {{path/to/image.pnm}}
> {{path/to/output.pnm}}
```

ppmfade

Generate a transition between two PPM images.

More information: https://netpbm.sourceforge.net/doc/ppmfade.html.

- Generate a transition between two PPM images ([f]irst and [l]ast) using the specified effect:

```
ppmfade -f {{path/to/image1.ppm}} -l {{path/to/image2.ppm}} -{{mix|spread|shift|relief|oil|...}}
```

- Generate a transition starting with the specified image and ending in a solid black image:

```
ppmfade -f {{path/to/image.ppm}} -{{mix|spread|shift|relief|oil|...}}
```

- Generate a transition starting with a solid black image and ending with the specified image:

```
ppmfade -l {{path/to/image.ppm}} -{{mix|spread|shift|relief|oil|...}}
```

- Store the resulting images in files named `base.NNNN.ppm` where `NNNN` is a increasing number:

```
ppmfade -f {{path/to/image1.ppm}} -l {{path/to/image2.ppm}} -{{mix|spread|shift|relief|oil|...}} -base {{base}}
```

ppmflash

Brighten a PPM image file.

More information: https://netpbm.sourceforge.net/doc/ppmflash.html.

- Generate a PPM image as output that is `flashfactor` times brighter than the input PPM image:

```
ppmflash {{flashfactor}} {{path/to/file.ppm}} > {{path/to/file.ppm}}
```

- Display version:

```
ppmflash {{[-v|-version]}}
```

ppmforge

Generate fractals resembling clouds, planets, and starry skies.

More information: https://netpbm.sourceforge.net/doc/ppmforge.html.

- Generate an image of a planet:

```
ppmforge > {{path/to/image.ppm}}
```

- Generate an image of clouds or the night sky:

```
ppmforge -{{night|clouds}} > {{path/to/image.ppm}}
```

- Use a custom mesh size and dimension for fractal generation and specify the dimensions of the output:

```
ppmforge {{[-m|-mesh]}} {{512}} {{[-d|-dimension]}} {{2.5}} {{[-x|-xsize]}} {{1000}} {{[-y|-ysize]}} {{1000}} > {{path/to/image.ppm}}
```

- Control the tilt and the angle from which the generated planet is illuminated:

```
ppmforge {{[-t|-tilt]}} {{-15}} {{[-ho|-hour]}} {{12}} > {{path/to/image.ppm}}
```

ppmglobe

Generate strips of an image suitable to be glued onto a sphere.

See also: **pnmmercator**.

More information: https://netpbm.sourceforge.net/doc/ppmglobe.html.

- Transform an image to strips that can be cut out and glues onto a sphere:

```
ppmglobe {{number_of_strips}} {{path/to/image.ppm}} > {{path/to/output.ppm}}
```

- Use the specified color for the areas between the strips:

```
ppmglobe {{[-b|-background]}} {{red}} {{number_of_strips}} {{path/to/image.ppm}} > {{path/to/output.ppm}}
```

ppmhist

Print a histogram of the colors present in a PPM image.

See also: **`pgmhist`**.

More information: https://netpbm.sourceforge.net/doc/ppmhist.html.

- Generate the histogram for human reading:

```
ppmhist {{[-nom|-nomap]}} {{path/to/image.ppm}}
```

- Generate a PPM file of the colormap for the image, with the color histogram as comments:

```
ppmhist {{[-m|-map]}} {{path/to/image.ppm}}
```

- Display version:

```
ppmhist {{[-v|-version]}}
```

ppmlabel

Add text to a PPM image.

More information: https://netpbm.sourceforge.net/doc/ppmlabel.html.

- Add text to a PPM image at the specified location:

```
ppmlabel -x {{pos_x}} -y {{pos_y}} {{[-t|-text]}} {{text}}
{{path/to/input_file.ppm}} > {{path/to/output_file.ppm}}
```

- Add multiple texts at different locations:

```
ppmlabel -x {{pos_x1}} -y {{pos_y1}} {{[-t|-text]}} {{text1}}
-x {{pos_x2}} -y {{pos_y2}} {{[-t|-text]}} {{text2}} {{path/
to/input_file.ppm}} > {{path/to/output_file.ppm}}
```

- Specify the line color, the background color, the tilt, and the size of the added text:

```
ppmlabel -x {{pos_x}} -y {{pos_y}} {{[-c|-color]}}
{{line_color}} {{[-b|-background]}} {{background_color}} {{[-
a|-angle]}} {{tilt}} {{[-s|-size]}} {{size}} {{[-t|-text]}}
{{text}} {{path/to/input_file.ppm}} > {{path/to/
output_file.ppm}}
```

ppmmake

Create a PPM image of a specified color and dimensions.

More information: https://netpbm.sourceforge.net/doc/ppmmake.html.

- Create a PPM image of the specified color and dimensions:

```
ppmmake {{color}} {{width}} {{height}} > {{path/to/
output_file.ppm}}
```

ppmmix

Blend together two PPM images.

More information: https://netpbm.sourceforge.net/doc/ppmmix.html.

- Blend the specified PPM images using fadefactor to control the weight of each image:

```
ppmmix {{fadefactor}} {{path/to/input_file1.ppm path/to/
input_file2.ppm ...}} > {{path/to/output_file.ppm}}
```

ppmnorm

This command has been superseded by **`pnmnorm`**.

More information: https://netpbm.sourceforge.net/doc/ppmnorm.html.

- View documentation for the current command:

```
tldr pnmnorm
```

ppmntsc

Make the RGB colors in a PPM image compatible with NTSC or PAL color systems.

More information: https://netpbm.sourceforge.net/doc/ppmntsc.html.

- Make the RGB colors in a PPM image compatible with NTSC color systems:

```
ppmntsc {{path/to/input_file.ppm}} > {{path/to/
output_file.ppm}}
```

- Make the RGB colors in a PPM image compatible with PAL color systems:

```
ppmntsc --pal {{path/to/input_file.ppm}} > {{path/to/
output_file.ppm}}
```

- Print the number of illegal pixels in the input image to `stderr`:

```
ppmntsc {{[--verb|--verbose]}} {{path/to/input_file.ppm}} >
{{path/to/output_file.ppm}}
```

- Output only legal/illegal/corrected pixels, set other pixels to black:

```
ppmntsc --{{legalonly|illegalonly|correctedonly}} {{path/to/
input_file.ppm}} > {{path/to/output_file.ppm}}
```

ppmpat

Produce a PPM image with a pattern.

More information: https://netpbm.sourceforge.net/doc/ppmpat.html.

- Produce a PPM file of the specified pattern with the specified dimensions:

```
ppmpat -{{gingham2|gingham3|madras|tartan|poles|...}}
{{width}} {{height}} > {{path/to/file.ppm}}
```

- Produce a PPM file of a camo pattern using the specified colors:

```
ppmpat {{[-ca|-camo]}} {{[-co|-color]}} {{color1,color2,...}}
{{width}} {{height}} > {{path/to/file.ppm}}
```

ppmquant

This command has been replaced by **`pnmquant`** and **`pnmremap`**.

More information: https://netpbm.sourceforge.net/doc/ppmquant.html.

- View documentation for `pnmquant`:

```
tldr pnmquant
```

- View documentation for `pnmremap`:

```
tldr pnmremap
```

ppmquantall

This command has been superseded by **`pnmquantall`**.

More information: https://netpbm.sourceforge.net/doc/ppmquantall.html.

- View documentation for the current command:

```
tldr pnmquantall
```

ppmrainbow

Generate a rainbow.

More information: https://netpbm.sourceforge.net/doc/ppmrainbow.html.

- Generate a rainbow consisting of the specified colors:

```
ppmrainbow {{color1 color2 ...}} > {{path/to/
output_file.ppm}}
```

- Specify the size of the output in pixels:

```
ppmrainbow {{[-w|-width]}} {{width}} {{[-h|-height]}}
{{height}} {{color1 color2 ...}} > {{path/to/
output_file.ppm}}
```

- End the rainbow with the last color specified, do not repeat the first color:

```
ppmrainbow {{[-n|-norepeat]}} {{color1 color2 ...}} > {{path/
to/output_file.ppm}}
```

ppmrelief

Produce a relief of a PPM image.

More information: https://netpbm.sourceforge.net/doc/ppmrelief.html.

- Produce a relief of the specified PPM image:

```
ppmrelief {{path/to/input_file.ppm}} > {{path/to/
output_file.ppm}}
```

ppmshadow

Add simulated shadows to a PPM image.

More information: https://netpbm.sourceforge.net/doc/ppmshadow.html.

- Add simulated shadows to a PPM image:

```
ppmshadow {{path/to/input_file.ppm}} > {{path/to/
output_file.ppm}}
```

- [b]lur the image by the specified number of pixels:

```
ppmshadow -b {{n}} {{path/to/input_file.ppm}} > {{path/to/
output_file.ppm}}
```

- Specify the displacement of the simulated light source to the left and the top of the image:

```
ppmshadow -x {{left_offset}} -y {{top_offset}} {{path/to/
input_file.ppm}} > {{path/to/output_file.ppm}}
```

ppmshift

Shift the lines in a PPM image by a randomized amount.

More information: https://netpbm.sourceforge.net/doc/ppmshift.html.

- Shift the lines in the input image by a randomized amount not exceeding s to the left or to the right:

```
ppmshift {{s}} {{path/to/input_file.ppm}} > {{path/to/output_file.ppm}}
```

ppmspread

Displace the pixels in a PPM image by a randomized amount.

More information: https://netpbm.sourceforge.net/doc/ppmspread.html.

- Displace the pixels in a PPM image by a randomized amount that is at most a:

```
ppmspread {{a}} {{path/to/input_file.ppm}} > {{path/to/
output_file.ppm}}
```

- Specify a seed to a the pseudo-random number generator:

```
ppmspread {{a}} {{path/to/input_file.ppm}} {{[-r|-
randomseed]}} {{seed}} > {{path/to/output_file.ppm}}
```

ppmtoacad

Convert a PPM image to an AutoCAD database or slide.

More information: https://netpbm.sourceforge.net/doc/ppmtoacad.html.

- Convert a PPM image to an AutoCAD slide:

```
ppmtoacad {{path/to/file.ppm}} > {{path/to/file.acad}}
```

- Convert a PPM image to an AutoCAD binary database import file:

```
ppmtoacad {{[-d|-dxb]}} {{path/to/file.ppm}} > {{path/to/file.dxb}}
```

- Restrict the colors in the output to 8 RGB shades:

```
ppmtoacad -8 {{path/to/file.ppm}} > {{path/to/file.dxb}}
```

ppmtoapplevol

Convert a PPM image into an Apple volume label image.

More information: https://netpbm.sourceforge.net/doc/ppmtoapplevol.html.

- Convert a PPM image into an Apple volume label image:

```
ppmtoapplevol {{path/to/image.ppm}} > {{path/to/output}}
```

ppmtoarbtxt

Convert a PPM image to an arbitrary text format according to a template.

More information: https://netpbm.sourceforge.net/doc/ppmtoarbtxt.html.

- Convert a PPM image to text as specified by the given template:

```
ppmtoarbtxt {{path/to/template}} {{path/to/image.ppm}} >
{{path/to/output_file.txt}}
```

- Convert a PPM image to text as specified by the given template, prepend the contents of the specified head template:

```
ppmtoarbtxt {{path/to/template}} -hd {{path/to/
head_template}} {{path/to/image.ppm}} > {{path/to/
output_file.txt}}
```

- Convert a PPM image to text as specified by the given template, append the contents of the specified tail template:

```
ppmtoarbtxt {{path/to/template}} -hd {{path/to/
tail_template}} {{path/to/image.ppm}} > {{path/to/
output_file.txt}}
```

- Display version:

```
ppmtoarbtxt {{[-v|-version]}}
```

ppmtoascii

Convert a PPM image to an ASCII image using ANSI terminal color codes.

See also: **ppmtoterm**, **pbmtoascii**, **pbmto4425**.

More information: https://netpbm.sourceforge.net/doc/ppmtoascii.html.

- Convert a PPM image to an ASCII image, combining an area of 1x2 pixels into a character:

```
ppmtoascii {{path/to/input.ppm}} > {{path/to/output.txt}}
```

- Convert a PPM image to an ASCII image, combining an area of 2x4 pixels into a character:

```
ppmtoascii -2x4 {{path/to/input.ppm}} > {{path/to/
output.txt}}
```

ppmtobmp

Convert a PPM image to a BMP file.

More information: https://netpbm.sourceforge.net/doc/ppmtobmp.html.

- Convert a PPM image to a BMP file:

```
ppmtobmp {{path/to/file.ppm}} > {{path/to/file.bmp}}
```

- Explicitly specify whether or not a Windows BMP file or an OS/2 BMP file should be created:

```
ppmtobmp -{{windows|os2}} {{path/to/file.ppm}} > {{path/to/file.bmp}}
```

- Use a specific number of bits for each pixel:

```
ppmtobmp {{[-b|-bbp]}} {{1|4|8|24}} {{path/to/file.ppm}} > {{path/to/file.bmp}}
```

ppmtoeyuv

Convert a PPM image to an Berkeley YUV file.

More information: https://netpbm.sourceforge.net/doc/ppmtoeyuv.html.

- Read a PPM image from the input file, convert it to a Berkeley YUV image, and store it in the specified output file:

```
ppmtoeyuv {{path/to/input_file.ppm}} > {{path/to/
output_file.eyuv}}
```

ppmtogif

This command has been superseded by **pamtogif**.

More information: https://netpbm.sourceforge.net/doc/ppmtogif.html.

- View documentation for the current command:

```
tldr pamtogif
```

ppmtoicr

Convert a PPM image to NCSA ICR format.

More information: https://netpbm.sourceforge.net/doc/ppmtoicr.html.

- Convert a PPM image to a ICR file:

```
ppmtoicr {{path/to/file.ppm}} > {{path/to/file.icr}}
```

- Display the output in name:

```
ppmtoicr {{[-w|-windowname]}} {{name}} {{path/to/file.ppm}} >
{{path/to/file.icr}}
```

- Expand the image by the specified factor:

```
ppmtoicr {{[-e|-expand]}} {{factor}} {{path/to/file.ppm}} >
{{path/to/file.icr}}
```

- Display the output on the screen with the specified number:

```
ppmtoicr {{[-d|-display]}} {{number}} {{path/to/file.ppm}} >
{{path/to/file.icr}}
```

ppmtoilbm

Convert a PPM image to an ILBM file.

More information: https://netpbm.sourceforge.net/doc/ppmtoilbm.html.

- Convert a PPM image to an ILBM file:

```
ppmtoilbm {{path/to/file.ppm}} > {{path/to/file.ilbm}}
```

- Write a maximum of n planes to the ILBM file and produce a HAM/24bit/direct color file if this number is exceeded:

```
ppmtoilbm {{[-mp|-maxplanes]}} {{n}} -{{hamif|24if|dcif}}
{{path/to/file.ppm}} > {{path/to/file.ilbm}}
```

- Produce a ILBM file with exactly n planes:

```
ppmtoilbm {{[-fp|-fixplanes]}} {{n}} {{path/to/file.ppm}} >
{{path/to/file.ilbm}}
```

- Select the compression method to be used:

```
ppmtoilbm -{{compress|nocompress|savemem}} {{path/to/
file.ppm}} > {{path/to/file.ilbm}}
```

ppmtojpeg

This command has been superseded by **pnmtojpeg**.

More information: https://netpbm.sourceforge.net/doc/ppmtojpeg.html.

- View documentation for the current command:

```
tldr pnmtojpeg
```

ppmtoleaf

Convert a PPM image to the Interleaf image format.

More information: https://netpbm.sourceforge.net/doc/ppmtoleaf.html.

- Convert a PPM image to a LEAF file:

```
ppmtoleaf {{path/to/file.ppm}} > {{path/to/file.leaf}}
```

ppmtolj

Convert a PPM file to an HP LaserJet PCL 5 Color file.

More information: https://netpbm.sourceforge.net/doc/ppmtolj.html.

- Convert a PPM file to an HP LaserJet PCL 5 Color file:

```
ppmtolj {{path/to/input.ppm}} > {{path/to/output.lj}}
```

- Apply a gamma correction using the specified gamma value:

```
ppmtolj {{[-g|-gamma]}} {{gamma}} {{path/to/input.ppm}} > {{path/to/output.lj}}
```

- Specify the required resolution:

```
ppmtolj {{[-r|-resolution]}} {{75|100|150|300|600}} {{path/to/input.ppm}} > {{path/to/output.lj}}
```

ppmtomap

This command has been superseded by **pnmcolormap**.

More information: https://netpbm.sourceforge.net/doc/ppmtomap.html.

- View documentation for the current command:

```
tldr pnmcolormap
```

ppmtomitsu

Convert a PPM image to a Mitsubishi S340-10 file.

More information: https://netpbm.sourceforge.net/doc/ppmtomitsu.html.

- Convert a PPM image to a MITSU file:

```
ppmtomitsu {{path/to/file.ppm}} > {{path/to/file.mitsu}}
```

- Enlarge the image by the specified factor, use the specified sharpness and produce n copies:

```
ppmtomitsu {{[-e|-enlarge]}} {{1|2|3}} {{[-s|-sharpness]}}
{{1|2|3|4}} {{[-c|-copy]}} {{n}} {{path/to/file.ppm}} >
{{path/to/file.mitsu}}
```

- Use the given medium for the printing process:

```
ppmtomitsu {{[-m|-media]}} {{A|A4|AS|A4S}} {{path/to/
file.ppm}} > {{path/to/file.mitsu}}
```

ppmtompeg

Encode an MPEG-1 stream.

More information: https://netpbm.sourceforge.net/doc/ppmtompeg.html.

- Produce an MPEG-1 stream using the parameter file to specify inputs and outputs:

```
ppmtompeg {{path/to/parameter_file}}
```

- Encode the GOP with the specified number only:

```
ppmtompeg {{[-g|-gop]}} {{gop_num}} {{path/to/
parameter_file}}
```

- Specify the first and last frame to encode:

```
ppmtompeg {{[-fr|-frames]}} {{first_frame}} {{last_frame}}
{{path/to/parameter_file}}
```

- Combine multiple MPEG frames into a single MPEG-1 stream:

```
ppmtompeg -combine_frames {{path/to/parameter_file}}
```

ppmtoneo

Convert a PPM image to an Atari Neochrome file.

More information: https://netpbm.sourceforge.net/doc/ppmtoneo.html.

- Convert a PPM image to a NEO file:

```
ppmtoneo {{path/to/file.ppm}} > {{path/to/file.neo}}
```

ppmtopcx

Convert a PPM image to a PCX file.

More information: https://netpbm.sourceforge.net/doc/ppmtopcx.html.

- Convert a PPM image to a PCX file:

```
ppmtopcx {{path/to/file.ppm}} > {{path/to/file.pcx}}
```

- Produce a PCX file with the specified color depth:

```
ppmtopcx -{{8bit|24bit}} {{path/to/file.ppm}} > {{path/to/file.pcx}}
```

ppmtopgm

Convert a PPM image to a PGM image.

More information: https://netpbm.sourceforge.net/doc/ppmtopgm.html.

- Convert PPM image to PGM image:

```
ppmtopgm {{path/to/file.ppm}} > {{path/to/file.pgm}}
```

- Display version:

```
ppmtopgm {{[-v|-version]}}
```

ppmtopi1

Convert a PPM image to an Atari Degas PI1 image.

See also: **`pi1toppm`**.

More information: https://netpbm.sourceforge.net/doc/ppmtopi1.html.

- Convert a PPM image into an Atari Degas PI1 image:

```
ppmtopi1 {{path/to/image.ppm}} > {{path/to/output_image.pi1}}
```

ppmtopict

Convert a PPM image to a Macintosh PICT file.

More information: https://netpbm.sourceforge.net/doc/ppmtopict.html.

- Convert a PPM image to a PICT file:

```
ppmtopict {{path/to/file.ppm}} > {{path/to/file.pict}}
```

ppmtopj

Convert a PPM file to an HP PaintJet file.

More information: https://netpbm.sourceforge.net/doc/ppmtopj.html.

- Convert a PPM file to an HP PaintJet file:

```
ppmtopj {{path/to/input.ppm}} > {{path/to/output.pj}}
```

- Move the image in the x and y direction:

```
ppmtopj {{[-x|-xpos]}} {{dx}} {{[-y|-ypos]}} {{dy}} {{path/to/input.ppm}} > {{path/to/output.pj}}
```

- Explicitly specify a gamma value:

```
ppmtopj {{[-g|-gamma]}} {{gamma}} {{path/to/input.ppm}} > {{path/to/output.pj}}
```

ppmtopjxl

Convert a PPM image into an HP PaintJet XL PCL file.

More information: https://netpbm.sourceforge.net/doc/ppmtopjxl.html.

- Convert a PPM image into an PJXL file:

```
ppmtopjxl {{path/to/image.ppm}} > {{path/to/output.pjxl}}
```

- Resize the input image:

```
ppmtopjxl {{[-xsi|-xsize]}} {{10cm}} {{[-ysi|-ysize]}}
{{5cm}} {{path/to/image.ppm}} > {{path/to/output.pjxl}}
```

- Shift the input image:

```
ppmtopjxl {{[-xsh|-xshift]}} {{10pt}} {{[-ysh|-yshift]}}
{{5pt}} {{path/to/image.ppm}} > {{path/to/output.pjxl}}
```

- Do not use the normal TIFF 4.0 compression method:

```
ppmtopjxl {{[-n|-nopack]}} {{path/to/image.ppm}} > {{path/to/
output.pjxl}}
```

ppmtoppm

Copy a PPM image.

More information: https://netpbm.sourceforge.net/doc/ppmtoppm.html.

- Copy a PPM image (i.e. a PBM, PGM, or PPM image) from `stdin` to `stdout`:

```
ppmtoppm < {{path/to/image.ppm}} > {{path/to/output.ppm}}
```

- Display version:

```
ppmtoppm {{[-v|-version]}}
```

ppmtopuzz

Convert a PPM image to an X11 puzzle file.

More information: https://netpbm.sourceforge.net/doc/ppmtopuzz.html.

- Convert a PPM image to an X11 puzzle file:

```
ppmtopuzz {{path/to/file.ppm}} > {{path/to/file.puzz}}
```

ppmtorgb3

Separate the color components of a PPM file into three separate PGM files.

See also: **`rgb3toppm`**.

More information: https://netpbm.sourceforge.net/doc/ppmtorgb3.html.

- Separate the color components of a PPM file, saving the outputs to `file.red`, `file.grn` and `file.blu`:

```
ppmtorgb3 {{path/to/file.ppm}}
```

ppmtosixel

Convert a PPM image to DEC sixel format.

More information: https://netpbm.sourceforge.net/doc/ppmtosixel.html.

- Convert a PPM image to DEC sixel format:

```
ppmtosixel {{path/to/file.ppm}} > {{path/to/file.sixel}}
```

- Produce an uncompressed SIXEL file that is much slower to print:

```
ppmtosixel {{[-r|-raw]}} {{path/to/file.ppm}} > {{path/to/
file.sixel}}
```

- Add a left margin of 1.5 inches:

```
ppmtosixel {{[-m|-margin]}} {{path/to/file.ppm}} > {{path/to/
file.sixel}}
```

- Encode control codes in a more portable (although less space-efficient) way:

```
ppmtosixel -7bit {{path/to/file.ppm}} > {{path/to/
file.sixel}}
```

ppmtospu

Convert a PPM file to an Atari Spectrum 512 image.

More information: https://netpbm.sourceforge.net/doc/ppmtospu.html.

- Convert a PPM file to an Atari Spectrum 512 image:

```
ppmtospu {{path/to/input.ppm}} > {{path/to/output.spu}}
```

- Use a dithering matrix of the specified size (0 means no dithering):

```
ppmtospu -d{{0|2|4}} {{path/to/input.ppm}} > {{path/to/
output.spu}}
```

ppmtoterm

Convert a PPM image to an ANSI ISO 6429 ASCII image.

See also: **`ppmtoascii`**, **`pbmtoascii`**, **`pbmto4425`**.

More information: https://netpbm.sourceforge.net/doc/ppmtoterm.html.

- Convert a PPM image to an ANSI ISO 6429 ASCII image, mapping each pixel to an individual character:

```
ppmtoterm {{path/to/input.ppm}} > {{path/to/output.txt}}
```

ppmtotga

This command has been superseded by **pamtotga**.

More information: https://netpbm.sourceforge.net/doc/ppmtotga.html.

- View documentation for the current command:

```
tldr pamtotga
```

ppmtouil

This command has been superseded by **pamtouil**.

More information: https://netpbm.sourceforge.net/doc/ppmtouil.html.

- View documentation for the current command:

```
tldr pamtouil
```

ppmtowinicon

This command has been superseded by **pamtowinicon**.

More information: https://netpbm.sourceforge.net/doc/ppmtowinicon.html.

- View documentation for the current command:

```
tldr pamtowinicon
```

ppmtoxpm

Convert a PPM image to an X11 version 3 pixmap.

More information: https://netpbm.sourceforge.net/doc/ppmtoxpm.html.

- Convert a PPM image to a XPM image:

```
ppmtoxpm {{path/to/input_file.ppm}} > {{path/to/
output_file.xpm}}
```

- Specify the prefix string in the output XPM image:

```
ppmtoxpm {{[-n|-name]}} {{prefix_string}} {{path/to/
input_file.ppm}} > {{path/to/output_file.xpm}}
```

- In the output XPM file, specify colors by their hexadecimal code instead of their name:

```
ppmtoxpm {{[-h|-hexonly]}} {{path/to/input_file.ppm}} >
{{path/to/output_file.xpm}}
```

- Use the specified PGM file as a transparency mask:

```
ppmtoxpm {{[-a|-alphamask]}} {{path/to/alpha_file.pgm}}
{{path/to/input_file.ppm}} > {{path/to/output_file.xpm}}
```

ppmtoyuv

Convert a PPM image to an Abekas YUV file.

More information: https://netpbm.sourceforge.net/doc/ppmtoyuv.html.

- Read a PPM image from the input file, convert it to an Abekas YUV image, and store it in the specified output file:

```
ppmtoyuv {{path/to/input_file.ppm}} > {{path/to/
output_file.yuv}}
```

ppmtoyuvsplit

Convert a PPM image to three subsampled Abekas YUV files.

More information: https://netpbm.sourceforge.net/doc/ppmtoyuvsplit.html.

- Read a PPM image from the input file, convert it to three subsampled Abekas YUV image and store these images to output files starting with the specified basename:

```
ppmtoyuvsplit {{basename}} {{path/to/input_file.ppm}}
```

ppmtv

Make a PPM Image look like taken from an American TV.

Dim every other row of image data down by the specified dim factor (a number between 0 and 1).

More information: https://netpbm.sourceforge.net/doc/ppmtv.html.

- Give the PPM image an American TV appearance:

```
ppmtv {{dim_factor}} {{path/to/file.ppm}} > {{path/to/output.ppm}}
```

- Suppress all informational messages:

```
ppmtv {{[-q|-quiet]}}
```

- Display version:

```
ppmtv {{[-v|-version]}}
```

ppmwheel

Generate a PPM image of a color wheel.

More information: https://netpbm.sourceforge.net/doc/ppmwheel.html.

- Generate a color wheel of type `Ppmcirc`:

```
ppmwheel {{diameter}} > {{path/to/output.ppm}}
```

- Generate a color wheel of type `Hue-value`:

```
ppmwheel {{[-huev|-huevalue]}} {{diameter}} > {{path/to/
output.ppm}}
```

- Generate a color wheel of type `Hue-saturation`:

```
ppmwheel {{[-hues|-huesaturation]}} {{diameter}} > {{path/to/
output.ppm}}
```

pppd

Establish Point-to-Point connection to another computer.

It should not be invoked manually.

More information: https://ppp.samba.org/pppd.html.

- Start the daemon:

```
pppd
```

pprof

Visualize and analyze profiling data.

More information: https://github.com/google/pprof/tree/main/doc#pprof.

- Generate a text report from a specific profiling file, on fibbo binary:

```
pprof -top {{./fibbo}} {{./fibbo-profile.pb.gz}}
```

- Generate a graph and open it on a web browser:

```
pprof -svg {{./fibbo}} {{./fibbo-profile.pb.gz}}
```

- Run pprof in interactive mode to be able to manually launch `pprof` on a file:

```
pprof {{./fibbo}} {{./fibbo-profile.pb.gz}}
```

- Run a web server that serves a web interface on top of `pprof`:

```
pprof -http={{localhost:8080}} {{./fibbo}} {{./fibbo-
profile.pb.gz}}
```

- Fetch a profile from an HTTP server and generate a report:

```
pprof {{http://localhost:8080/debug/pprof}}
```

pr

Paginate or columnate files for printing.

More information: https://www.gnu.org/software/coreutils/manual/html_node/pr-invocation.html.

- Print multiple files with a default header and footer:

```
pr {{path/to/file1 path/to/file2 ...}}
```

- Print with a custom centered header:

```
pr {{[-h|--header]}} "{{header}}" {{path/to/file1 path/to/file2 ...}}
```

- Print with numbered lines and a custom date format:

```
pr {{[-n|--number-lines]}} {{[-D|--date-format]}} "{{format}}" {{path/to/file1 path/to/file2 ...}}
```

- Print all files together, one in each column, without a header or footer:

```
pr {{[-m|--merge]}} {{[-T|--omit-pagination]}} {{path/to/file1 path/to/file2 ...}}
```

- Print, beginning at page 2 up to page 5, with a given page length (including header and footer):

```
pr +2:5 {{[-l|--length]}} {{page_length}} {{path/to/file1 path/to/file2 ...}}
```

- Print with an offset for each line and a truncating custom page width:

```
pr {{[-o|--indent]}} {{offset}} {{[-W|--page_width]}} {{width}} {{path/to/file1 path/to/file2 ...}}
```

pre-commit

Create Git hooks that get run before a commit.

More information: https://pre-commit.com/#command-line-interface.

- Install pre-commit into your Git hooks:

```
pre-commit install
```

- Run pre-commit hooks on all staged files:

```
pre-commit run
```

- Run pre-commit hooks on all files, staged or unstaged:

```
pre-commit run --all-files
```

- Clean pre-commit cache:

```
pre-commit clean
```

- Update pre-commit configuration file to the latest repos' versions:

```
pre-commit autoupdate
```

prename

This command is an alias of **`rename`**.

- View documentation for the original command:

```
tldr {{[-p|--platform]}} common rename
```

presenterm

A terminal-based slideshow tool that renders markdown presentations.

More information: https://mfontanini.github.io/presenterm/.

- Display a presentation:

```
presenterm {{path/to/slides.md}}
```

- Display a presentation with a specific theme:

```
presenterm --theme {{dark|light|tokyonight-storm|...}} {{path/to/slides.md}}
```

- List all available themes:

```
presenterm --list-themes
```

- Export a presentation to PDF:

```
presenterm --export-pdf --output {{path/to/output.pdf}} {{path/to/slides.md}}
```

- Display a presentation with code snippet execution enabled:

```
presenterm --enable-snippet-execution {{path/to/slides.md}}
```

- Validate that presentation content fits within the terminal:

```
presenterm --validate-overflows {{path/to/slides.md}}
```

prettier

An opinionated code formatter for JavaScript, JSON, CSS, YAML, and more.

More information: https://prettier.io/docs/cli.

- Format a file and print the result to `stdout`:

  ```
  prettier {{path/to/file}}
  ```

- Check if a specific file has been formatted:

  ```
  prettier --check {{path/to/file}}
  ```

- Run with a specific configuration file:

  ```
  prettier --config {{path/to/config_file}} {{path/to/file}}
  ```

- Format a file or directory, replacing the original:

  ```
  prettier --write {{path/to/file_or_directory}}
  ```

- Format files or directories recursively using single quotes and no trailing commas:

  ```
  prettier --single-quote --trailing-comma {{none}} --write {{path/to/file_or_directory}}
  ```

- Format JavaScript and TypeScript files recursively, replacing the original:

  ```
  prettier --write "**/*.{js,jsx,ts,tsx}"
  ```

pretty-bytes

Convert bytes to a human-readable string.

More information: https://github.com/sindresorhus/pretty-bytes-cli.

- Convert numeric bytes value to a human-readable string:

```
pretty-bytes {{1337}}
```

- Convert numeric bytes value from `stdin` to a human-readable string:

```
echo {{1337}} | pretty-bytes
```

- Display help:

```
pretty-bytes --help
```

print

print can refer to multiple commands with the same name.

- View documentation for the Zsh builtin:

  ```
  tldr print.zsh
  ```

- View documentation for the `print` alias of `run-mailcap`:

  ```
  tldr {{[-p|--platform]}} linux print.runmailcap
  ```

- View documentation for printing text files on Windows:

  ```
  tldr {{[-p|--platform]}} windows print.win
  ```

print

Z Shell (**zsh**) builtin. Print arguments, similar to **echo**.
